

imagePRESS C800/C700/C60 Series

Service Manual

Application

This manual has been issued by Canon Inc. for qualified persons to learn technical theory, installation, maintenance, and repair of products. This manual covers all localities where the products are sold. For this reason, there may be information in this manual that does not apply to your locality.

Corrections

This manual may contain technical inaccuracies or typographical errors due to improvements or changes in products. When changes occur in applicable products or in the contents of this manual, Canon will release technical information as the need arises. In the event of major changes in the contents of this manual over a long or short period, Canon will issue a new edition of this manual.

The following paragraph does not apply to any countries where such provisions are inconsistent with local law.

Trademarks

The product names and company names used in this manual are the registered trademarks of the individual companies.

Copyright

This manual is copyrighted with all rights reserved. Under the copyright laws, this manual may not be copied, reproduced or translated into another language, in whole or in part, without the consent of Canon Inc.

(C) CANON INC. 2014

Caution

Use of this manual should be strictly supervised to avoid disclosure of confidential information.

Explanation of Symbols

The following symbols are used throughout this Service Manual.

Symbols	Explanation	Symbols	Explanation
	Check.		Remove the claw.
	Check visually.		Insert the claw.
	Check a sound.		Push the part.
	Disconnect the connector.		Connect the power cable.
	Connect the connector.		Disconnect the power cable.
	Remove the cable/wire from the cable guide or wire saddle.		Turn on the power.
	Install the cable/wire to the cable guide or wire saddle.		Turn off the power.
	Remove the screw.		Loosen the screw.
	Install the screw.		Tighten the screw.

Symbols	Explanation	Symbols	Explanation
	Cleaning is needed.		Measurement is needed.

The following rules apply throughout this Service Manual:

- Each chapter contains sections explaining the purpose of specific functions and the relationship between electrical and mechanical systems with reference to the timing of operation.
In the diagrams, represents the path of mechanical drive; where a signal name accompanies the symbol, the arrow indicates the direction of the electric signal.
The expression "turn on the power" means flipping on the power switch, closing the front door, and closing the delivery unit door, which results in supplying the machine with power.
- In the digital circuits, '1' is used to indicate that the voltage level of a given signal is "High", while '0' is used to indicate "Low". (The voltage value, however, differs from circuit to circuit.) In addition, the asterisk (*) as in "DRMD*" indicates that the DRMD signal goes on when '0'.
In practically all cases, the internal mechanisms of a microprocessor cannot be checked in the field. Therefore, the operations of the microprocessors used in the machines are not discussed: they are explained in terms of from sensors to the input of the DC controller PCB and from the output of the DC controller PCB to the loads.

The descriptions in this Service Manual are subject to change without notice for product improvement or other purposes, and major changes will be communicated in the form of Service Information bulletins.

All service persons are expected to have a good understanding of the contents of this Service Manual and all relevant Service Information bulletins and be able to identify and isolate faults in the machine.

Safety Precautions

- Laser Safety
- Handling of Laser System
- Turn power switch ON
- Safety of Toner
- Notes When Handling a Lithium Battery
- Notes Before it Works Serving
- Points to Note at Cleaning

Laser Safety

Since radiation emitted inside the machine is completely confined within protective housings and external covers, the laser beam cannot escape from the machine during any phase of user operation.

Therefore this machine is classified in Class 1 laser products that are regarded as safe during normal use according to International Standard IEC60825-1.

Handling of Laser System

This machine is classified in Class 1 laser products.

However, inside the machine, Class 3B laser beam is emitted and is hazardous when entered into an eye.

When servicing the area around the laser assembly, be sure to turn off the main power.

If you must service while the power is turned on, be sure to keep the followings:

- Do not use a screwdriver or tools that have a high level of reflectance in the laser path.
- Remove watches and rings before starting the work. (They can reflect the laser beam, possibly hitting an eye.)

The machine's covers that confine laser beam radiation are identified by means of warning labels (Figure). If you must open the cover, be sure not to enter the laser beam into an eye during the work.

The following warnings are given to comply with Safety Principles (EN60950-1).

Diese Maschine ist der Klasse 1 der Laserprodukte zugeordnet.

Innerhalb der Maschine wird jedoch ein Laserstrahl der Klasse 3B ausgestrahlt und es ist gefährlich, wenn dieser Strahl in die Augen gerät.

Bei Servicearbeiten am oder in der Nähe des Laserteils zuerst das Hauptgerät abschalten.

Bei Servicearbeiten, die unbedingt bei eingeschaltetem Gerät durchgeführt werden müssen, auf jeden Fall die folgenden Vorsichtsmaßnahmen beachten.

- Keine stark reflektierenden Schraubenzieher oder ähnliche Werkzeuge direkt in den Lichtpfad des Laserstrahls bringen.
- Vor Beginn der Arbeit Uhren, Ringe und ähnliche Gegenstände abnehmen. (Reflektierende Laserstrahlen könnten sonst in die Augen geraten.)

Die Geräte-Abdeckungen, die Laserstrahlen reflektieren können, werden durch besondere Warnaufkleber gekennzeichnet (siehe Bild).

Muss die Abdeckung geöffnet werden, besondere Vorsicht walten lassen, damit der Laserstrahl nicht in die Augen gerät.

F-0-1

Turn power switch ON

The machine is equipped with 2 power switches: main power switch and control panel power switch.

The machine goes on when the main power switch is turned on (i.e., other than in low power mode, sleep mode).

CAUTION:

Do not turn off the main power switch while the progress bar is indicated, during which access is made to the HDD. If deprived of power, the HDD can suffer a fault (E602).

F-0-2

Safety of Toner

About Toner

The machine's toner is a non-toxic material made of plastic, iron, and small amounts of dye.

CAUTION:

Do not throw toner into fire. It may cause explosion.

Toner on Clothing or Skin

- If your clothing or skin has come into contact with toner, wipe it off with tissue; then, wash it off with water.
- Do not use warm water, which will cause the toner to jell and fuse permanently with the fibers of the cloth.
- Toner is easy to react with plastic material, avoid contact with plastic.

Notes When Handling a Lithium Battery

 CAUTION:
RISK OF EXPLOSION IF BATTERY IS REPLACED BY AN INCORRECT TYPE.
DISPOSE OF USED BATTERIES ACCORDING TO THE INSTRUCTIONS.

The following warnings are given to comply with Safety Principles (EN60950).

 CAUTION:
Wenn mit dem falschen Typ ausgewechselt, besteht Explosionsgefahr.
Gebrauchte Batterien gemäß der Anleitung beseitigen.

警告

如果更換不正確之電池型式會有爆炸的風險
請依製造商說明書處理用過之電池

F-0-3

Notes Before it Works Serving

 CAUTION:
At servicing, be sure to turn OFF the power source according to the specified steps and disconnect the power plug.

Points to Note at Cleaning

 CAUTION:
When performing cleaning using organic solvent such as alcohol, be sure to check that the component of solvent is vaporized completely before assembling.

Features

Product feature

F-1-6

1. Laser Scanner Unit (Refer to page 2-31)
 - Adoption of a Laser Scanner Unit supporting 2400dpi
 - Adoption of multiple laser exposure
 - Adoption of VCSEL laser
2. Developing Assembly (Refer to page 2-39)
 - Addition of a cooling function
3. ITB (Refer to page 2-39)
 - Adoption of elastic ITB
4. Feed Unit (Refer to page 2-134)
 - Addition of highly accurate registration function
5. Pickup Unit (Refer to page 2-134)
 - Adoption of high performance Feed/Separation Roller
 - Increased rigidity of Pickup Unit Frame
6. Fixing Assembly (Refer to page 2-104)
 - Adoption of a high output IH Heater and a Fixing Belt method (Induction Heater: Induction Heating)
 - Addition of a cooling function to the Fixing Belt
 - Addition of a Refresh Roller
7. Toner
 - Adoption of next generation CV toner
 - [Improvement in surface characteristics]
 - Stability of the hue of large volume printing has been improved.
 - The transferability has been improved to support a wide variety of media.
 - [Improvement in dispersion of coloring agent]
 - The image quality required for production printing has been realized.
 - [Improvement of the fusing characteristics]
 - The heat resistance has been improved to reduce coarseness.
 - Including heavy paper and coated paper, the print speed has been increased.

Features at servicing

User Replacement of Waste Toner Container

The Toner Container of this machine can be removed from the front side. In addition, user replacement has been made possible by enabling the replacement without using any tools. As a result, the Waste Toner Container can now be replaced even if a technician is not dispatched.

Current machine
(iR-ADV C9200 PRO/C7200 Series)

This machine

F-1-7

Preventing paper setting errors in the standard cassette

Paper jam can be caused by users incorrectly setting paper. This has resulted in a case where a service request is made and a technician is dispatched. In order to prevent this, the following three improvements have been made to the standard cassette.

(3) The Slide Rail has been moved to the back side of the cassette.

F-1-8

Improvement in the operability of the Tab Paper Guide (option)

Due to user's operation mistakes, there was a case where the guide was damaged or could not be removed from the cassette, resulting in a service dispatch. Therefore, the following improvement has been made.

Current machine: Attachment by sliding (Fixation Claws on the guide side)

This machine: Attachment by a Knurled Screw (Knurled Screw on the guide side)

F-1-9

Improvement in the replaceability of the Pickup/Feed/Separation Roller

The fixation method of the Pickup/Feed/Separation Roller used in the standard cassette of the host machine has been changed.

As a result, the time taken to replace these rollers is reduced.

Current machine: Stopper Spring, Resin Ring

This machine: Fixation by a claw

F-1-10

Improvement in the replaceability of the standard cassette

Replaceability of the standard cassette has been improved by the reduction of the fixation screws.

Current machine: Fixation by 4 screws

This machine: Fixation by 1 screw

Current machine
(iR-ADV C9200 PRO/C7200 Series)

This machine

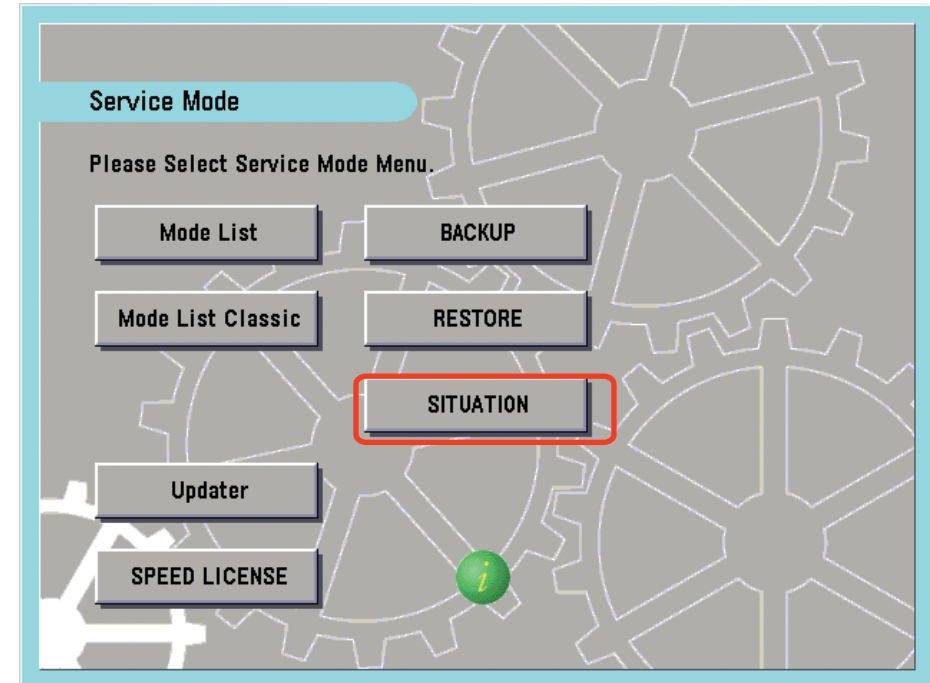

F-1-11

Introduction of situation mode

SITUATION mode has been newly added to improve workability and searchability of on-site technicians.

This mode makes it possible to easily use the service mode appropriate for the scene at the site.

Paper type

Usable paper types are shown on the next page and later.

For irregular-sized paper, refer to the table below.

Type	Feeding direction (mm)	Width direction (mm)
Irregular size 0-1	148.0 to 487.7	100.0 to 139.6
Irregular size 0-2	148.0 to 181.9	139.7 to 330.2
Irregular size 1-1	182.0 to 487.7	139.7 to 181.9
Irregular size 2-1	182.0 to 432.0	182.0 to 209.9
Irregular size 2-2	432.1 to 457.2	
Irregular size 2-3	457.3 to 487.7	
Irregular size 3-1	182.0 to 279.3	210.0 to 256.9
Irregular size 3-2	279.4 to 432.0	
Irregular size 3-3	432.1 to 457.2	
Irregular size 3-4	457.3 to 487.7	
Irregular size 4-1	182.0 to 228.6	257.0 to 297.0
Irregular size 4-2	228.7 to 279.3	
Irregular size 4-3	279.4 to 363.9	
Irregular size 4-4	364.0 to 432.0	
Irregular size 4-5	432.1 to 457.2	
Irregular size 4-6	457.3 to 487.7	257.0 to 330.2
Irregular size 5-1	182.0 to 228.6	297.1 to 304.8
Irregular size 5-2	228.7 to 279.3	
Irregular size 5-3	279.4 to 363.9	
Irregular size 5-4	364.0 to 457.2	
Irregular size 6-1	182.0 to 228.6	304.9 to 320.0
Irregular size 6-2	228.7 to 279.3	304.9 to 330.2
Irregular size 6-3	279.4 to 363.9	
Irregular size 6-4	364.0 to 457.2	
Irregular size 7-1	182.0 to 228.6	320.1 to 330.2
Irregular size 8	487.8 to 762.0	100.0 to 330.2

Power Switch

Types of Power Switches

This machine has the Main Power Switch and the Environment Heater Switch.

Turning ON the Main Power Switch supplies the power in the usual case (except when the machine is in sleep mode).

The Environment Heater Switch supplies or blocks the power to the Drum Heater, the Cassette Heater and the Reader Heater.

Points to Note on Turning ON/OFF the Power Switch

- Do not turn OFF the Main Power Switch while the progress bar (to be displayed when the power is turned ON) is displayed, which indicates access to the HDD.
- Be sure to turn OFF the main power switch when turning OFF the power. (The conventional shut-down sequence process is not needed.)
- After turning OFF the power (after turning OFF the Main Power Switch), do not turn ON the main power switch again unless the screen disappears.
Do not turn OFF the power during downloading.

Checking the breaker

This machine has a breaker that detects excess current or leakage current. Make sure to test the breaker once a month by following the procedure below.

F-1-18

- 1) Turn OFF the main power and check that the Control Panel LED is off.
- 2) Using a pen point, press the test button of the breaker on the rear side of the host machine.
- 3) Check that the breaker switch is OFF ("o" side).
- 4) Return the breaker switch to ON ("I" side).
- 5) Turn ON the main power.

Control Panel

For PRISMAsync model, refer to PRISMAsync service manual.

Basic Configuration

Functional Configuration

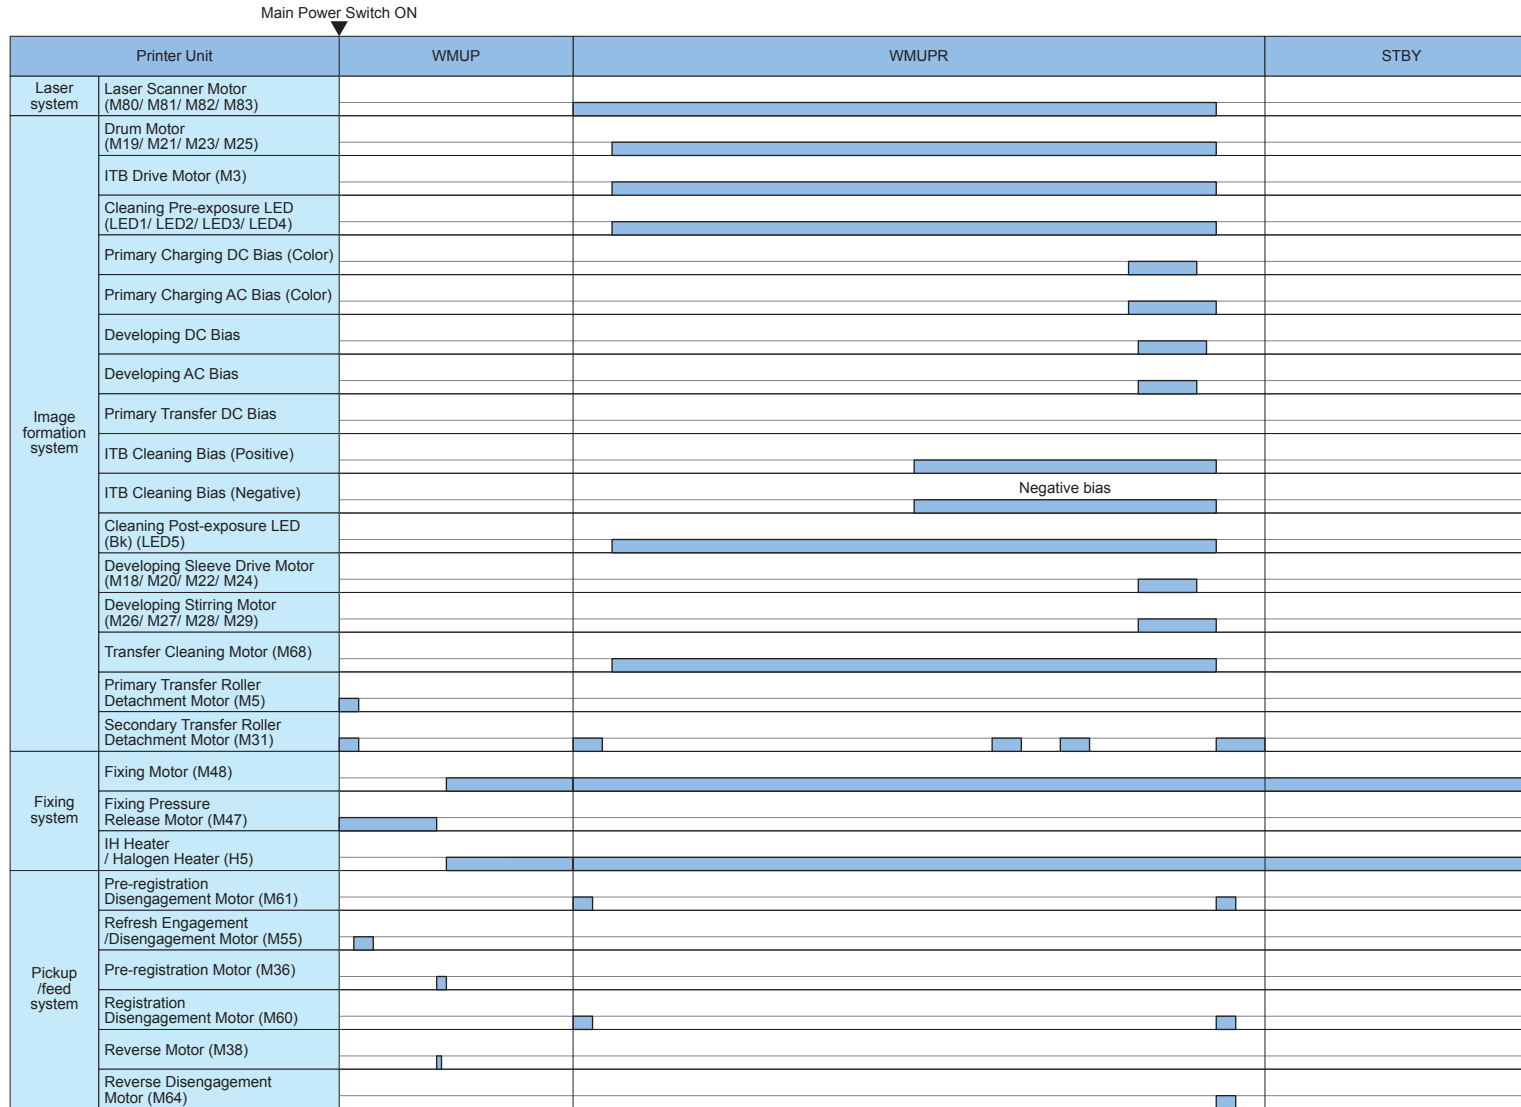

The machine may broadly be divided into the following functional system blocks; document exposure system block, controller system block, laser exposure system block, image formation system block, fixing system block and pickup/feed system block.

F-2-1

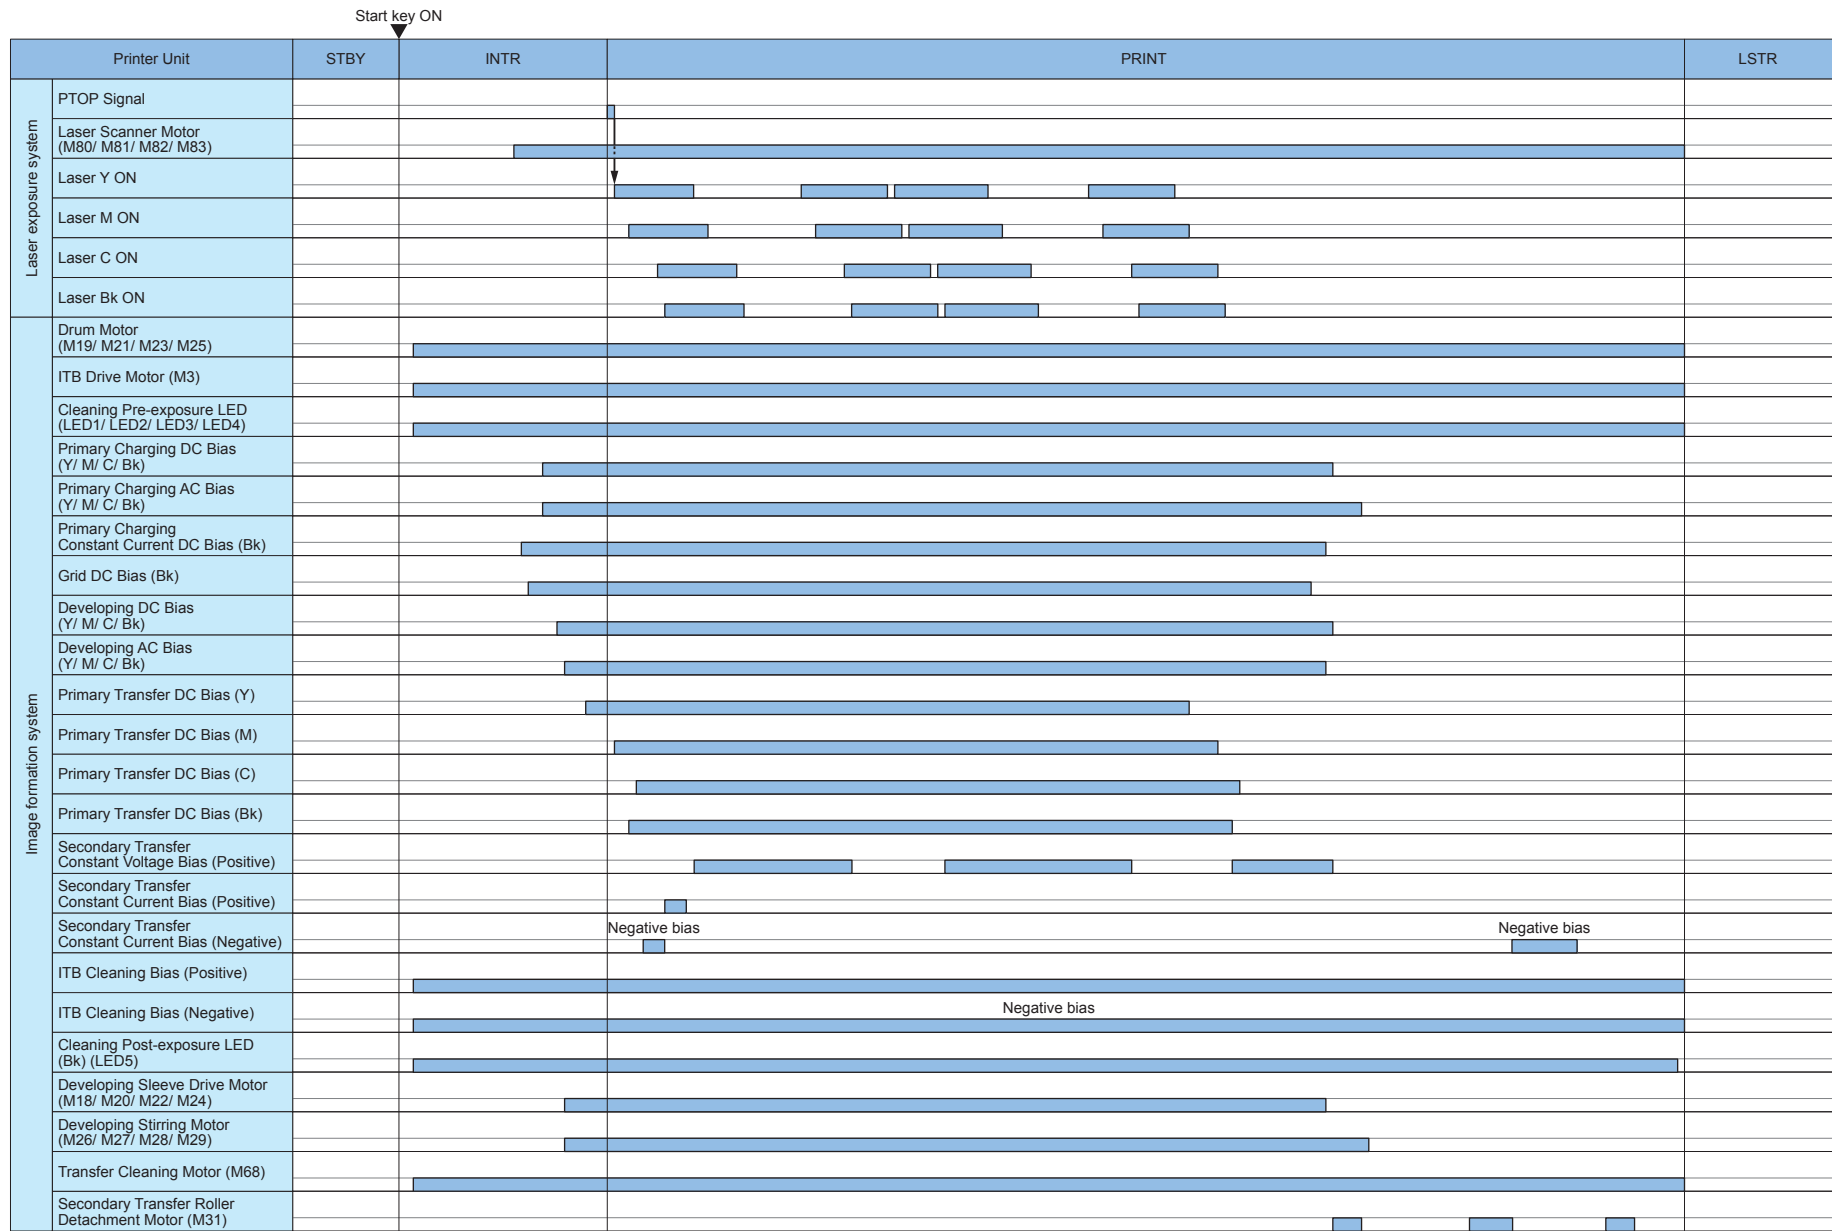

Basic Sequence

Basic sequence at power ON

F-2-2

Basic sequence at printing <Condition:Full color, Cassette 3, A3 2-sided (2sheet)> (1/2)

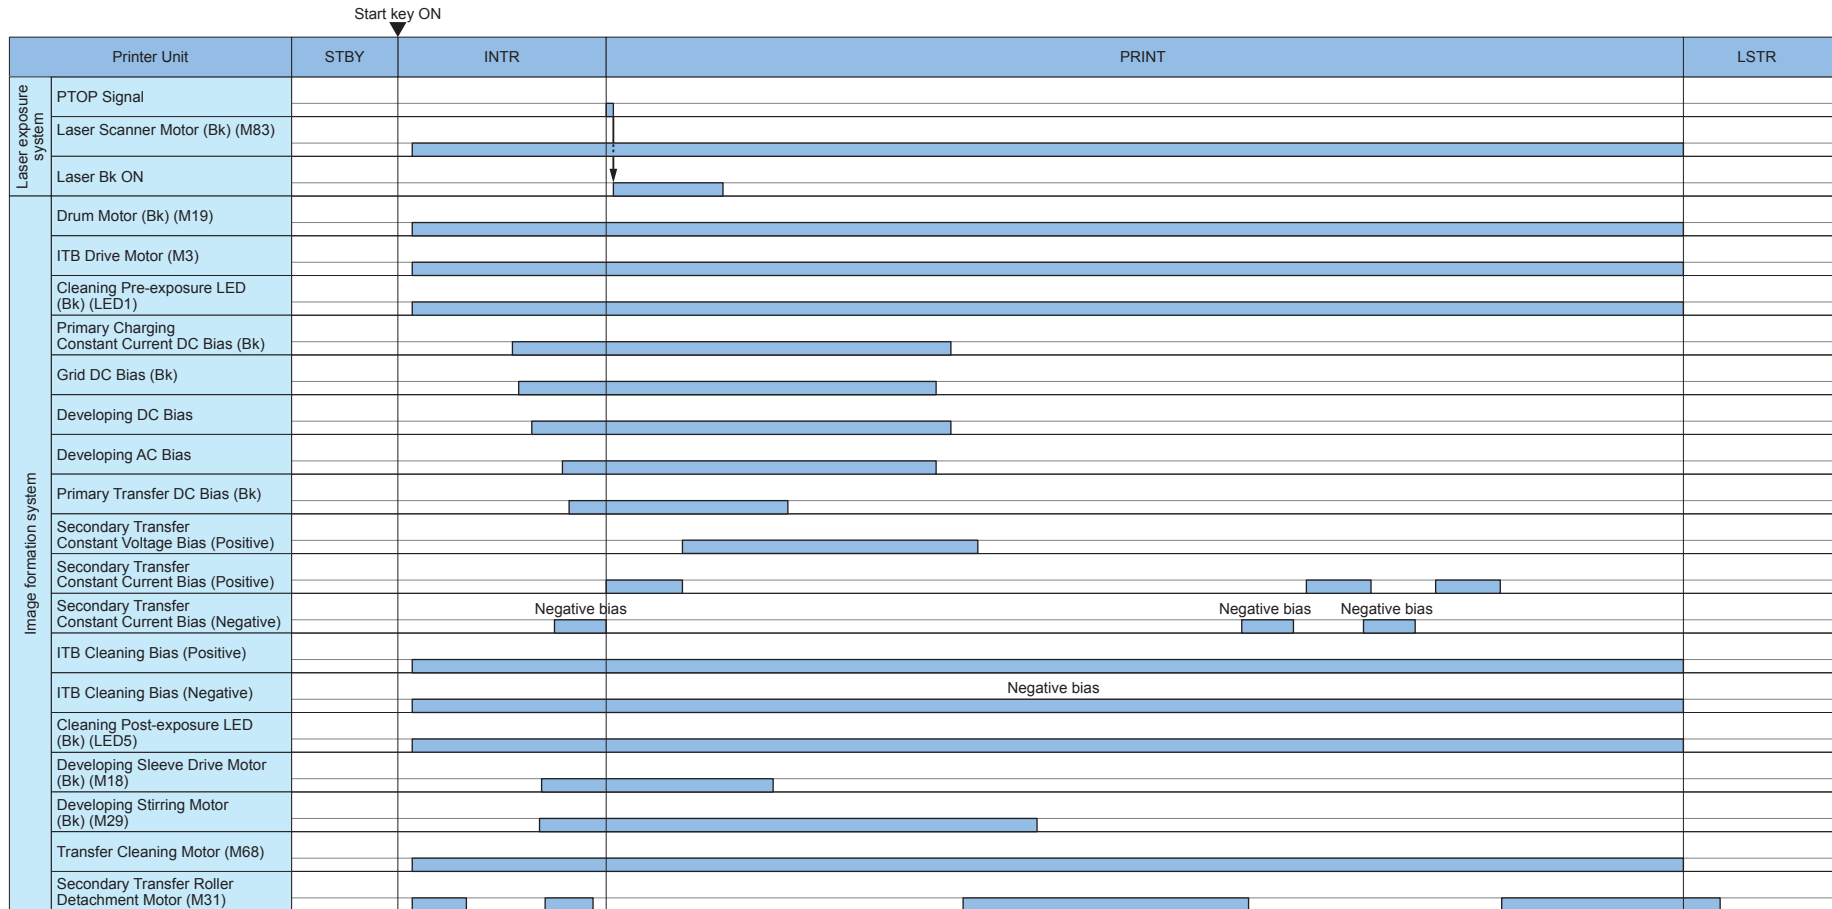

F-2-3

Basic sequence at printing <Condition:Full color, Cassette 3, A3 2-sided (2 sheet)> (2/2)

F-2-4

Basic sequence at printing <Condition:Monochrome, Cassette 3, A4 1-sided (1 sheet)> (1/2)

F-2-5

Basic sequence at printing <Condition:Monochrome, Cassette 3, A4 1-sided (1 sheet)> (2/2)

F-2-6

Controller System

Overview

Main controller PCB 1 controls the entire system. Main controller PCB 2 mainly controls image processing.

F-2-7

Main controller PCBs 1 and 2 are connected through the riser PCB. This configuration improves installability / removability of the main controller PCBs. (Slot-in / out)

F-2-8

Specifications/configuration

PCBs

F-2-9

Parts name	Function, specifications, features
Main controller PCB 1	CPU: 1.66 GHz, Control of the entire system Various controls (memory, control panel, electric power, voice), I/Fs (PCI, USB (host), RTC)
Flash PCB	Boot program
TPM PCB	To generate and save encryption key Available only when TPM settings is ON: Management Settings > Data Management > TPM Settings (default: OFF) Not available with China models
Main controller PCB 2	CPU: 400 MHz, 200 MHz, Image control Various image processing (color space conversion, enlarge, reduction, rotation, composition, compression, rasterizing, resolution conversion, image binarization), delay memory control between drums, HDD control, I/Fs (reader, USB (device))
Bypass PCB	Internal bus connection Remove this PCB when using imagePRESS Server(F200/G100) (to be attached to the main unit) and install the open I/F PCB.
Riser PCB	I/F (main controller 1 - 2, main controller - HDD, main controller - DC controller)
HDD	3.5 inch SATA I/F Standard: 1 TB Up to 2 HDDs can be mounted in the case of mirroring configuration. BOX data, Address book, security information (password, certificate) Op.: 3.5 inch / 1 TB Option HDD-M1, 3.5 inch / 1 TB HDD MIRROR KIT-D3 The details are appendixes : Backup Data

● HDD

F-2-16

■ Boot / Shutdown sequence

● Boot sequence

F-2-17

NOTE :

Due to the high speed startup, the progress bar and the activating PCB are not synchronized. For this reason, the progress bar cannot be utilized for troubleshooting. See the following error code list for the troubleshooting.

Related Error Codes (major error codes):

Error Code	Error description
E602	Error in HDD
0001	Failure in recognizing HDD Boot partition (BOOTDEV) is not found at startup.
0002	There is no system software for the main CPU.
0006	There is no system software for the sub CPU.
E613	Failure in memory (main controller PCB 2)
1536	Capacity shortage of DDR2-SDRAM (M0, M1) (1.5GB required)
E748	Error in board (Flash PCB)
2010	IPL (Initial Program Loader) is not found.
2011	OS is not found.

T-2-8

● Shutdown sequence

Before turning OFF the main power switch, it is necessary to perform HDD completion processing (to prevent damage on the HDD), cooling of the internal printer (to prevent fixed toner due to high temperature) and exhaust (to prevent smeared image due to chemical reaction of ozone in the machine and photosensitive drum). This sequential processing is called "shutdown sequence" and was executed on the legacy models manually (by holding down the power supply switch on the Control Panel for a specific duration).

When the main power switch is turned OFF on the main body, Main Controller PCB 1 detects this operation and then the shutdown sequence starts / executes automatically.

In addition, hardware shutdown sequence exists. If shutdown sequence is not executed normally due to occurrence of software trouble, the machine is shut down in after during some period of time progress by the timer in the AC Driver PCB. If it is not shut down within after during some period of time progress, failure of the AC Driver PCB is suspected.

Controls

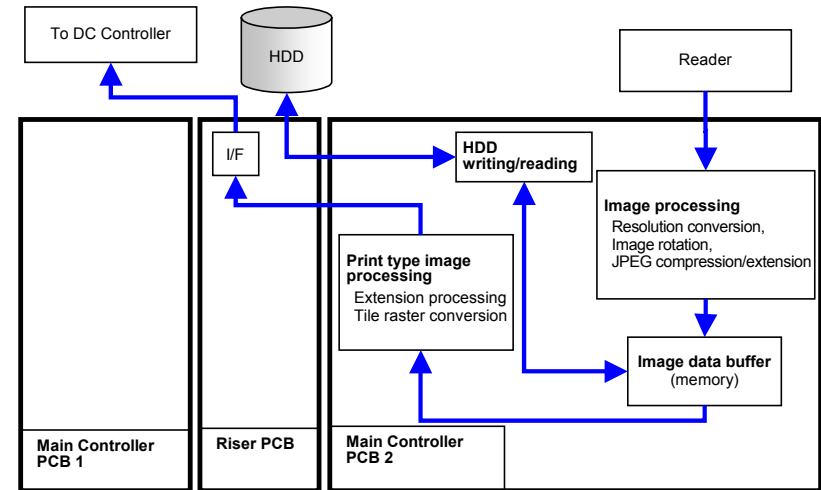

Overview

Item	Control Detail	Reference
Image processing control	Convert the image data input from the external device or reader unit into the video data and send it to DC controller.	p. 2-14
Backup battery	Data backup battery in case of power failure or disconnection of power plug.	p. 2-15
Power save function	Reduce the power consumption at standby mode.	p. 2-16
Security function	Encryption key, certificate, protection of password	p. 2-16
HDD mirroring function (option)	Mirroring processing of HDD data	p. 2-25
Removable HDD (option)	HDD is installable/removable by user.	p. 2-29

■ Backup Battery

Main controller PCB of the host machine has one lithium battery as a data backup battery in case of power failure or disconnection of the power plug.

● Main Controller PCB1

Type of battery	Lithium battery (3V, 620 mAh)
Life of battery	Approx 5 years (when the power plug is disconnected)
Replacement of battery	Battery cannot be replaced independently on service site.

T-2-10

● Main Controller PCB2

Type of battery	Lithium battery (3V, 620 mAh)
Life of battery	Approx 5 years (when the power plug is disconnected)
Replacement of battery	Battery cannot be replaced independently on service site.

T-2-11

● DC Controller PCB

Type of battery	Lithium battery (3V, 600 mAh)
Life of battery	Approx 5 years (when the power plug is disconnected)
Replacement of battery	Battery cannot be replaced independently on service site.

T-2-12

Power-saving function

F-2-21

Sleep standby

Control panel is turned OFF.

Power supply other than the control panel is the same with Standby mode.

Power-saving

Control panel is turned OFF.

Power supply other than the control panel is the same with Standby mode.

Deep Sleep

3V for all-night power PCB is only supplied. If a next job is submitted, the machine moves to Standby mode.

- Print job
- Control panel power switch is pressed.

Security Features (Encryption Key, Certificate, Password Protection)

Overview

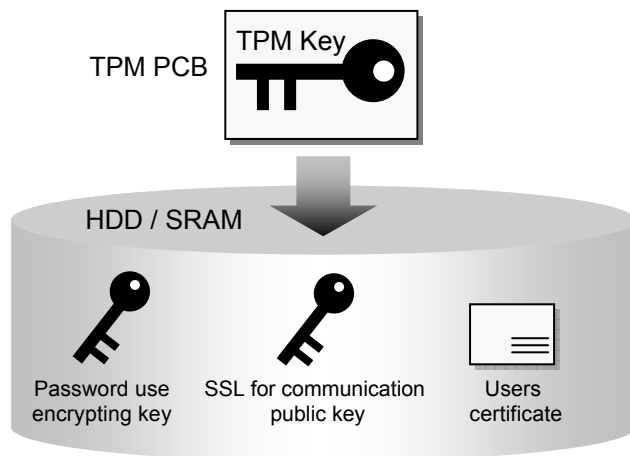

The main controller PCB 1 of the host machine holds a new PCB named "TPM PCB". "TPM" stands for "Trusted Platform Module", which collectively refers to the chip set for generating and storing encryption keys and computing public key encryption.

F-2-22

The TPM PCB protects security information (passwords, certificates, and encryption keys) stored in the HDD and SRAM. Note that this PCB does not protect set, registered or stored data other than security information.

The TPM key embedded in the chip is used to encrypt / decrypt security information.

F-2-23

The TPM key is protected from illegal access in a virtually perfect manner, thus the security information of the host machine is securely protected even in the following conditions.

- When the HDD and / or the main controller PCB is taken out from the host machine and installed in the MFP with the different serial number (the model information held in the TPM PCB is specific to the machine originally enabled the TPM setting)
- When the system of the host machine is hacked via the network

Enable this function in Setting / Registration mode.

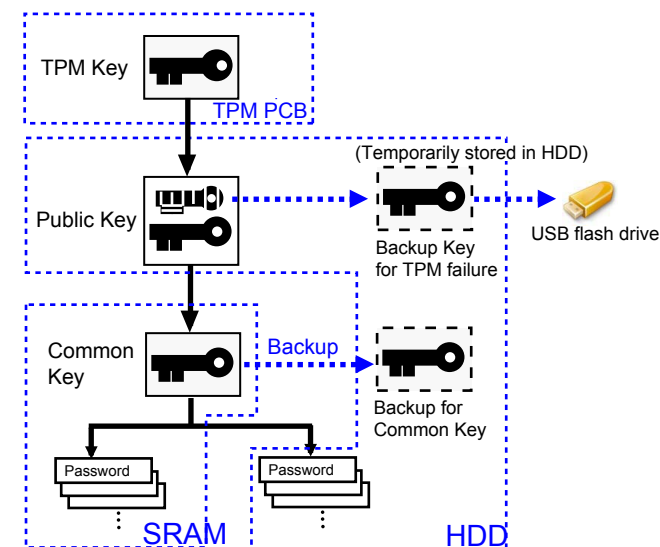

Management Setting > Data Management > TPM Setting -> ON (OFF by default)

● Configuration of Security Information

The security functionality behaves differently depending on the TPM setting on the UI.

This machine provides the two types of TPM settings. See the figure below for the security information flow in each setting.

- When the TPM setting is ON

F-2-24

When the TPM setting is ON, the TPM key is enabled to secure information with the three keys. Therefore, the security information held in each machine is safely protected.

The security information in this setting can be accessed by the three keys and multiple passwords stored in the SRAM and HDD.

Each data is stored in the specified location (enclosed with blue dots in the figure above).

Since the data in the upper layer are linked to those in the lower layer, security information is activated only when data in all the layers are linked.

For the backup purpose, the backup key is temporarily stored also in the HDD to be prepared for a TPM failure (only for the initial failure after the TPM setting is ON).

This key can be backed up using the USB flash drive. Once backed up, the backup key is deleted from the HDD.

The common key information is stored in the HDD as well as the SRAM. The common key stored in the SRAM is cleared when the main controller PCB 2 (SRAM) is replaced or after MN-CON clear. However, the common key stored in the HDD automatically restores that in the SRAM so that the security information is decodable even after servicing. Note that the security information is not decodable correctly in case the HDD is failed or formatted because

the public key information stored in the HDD is cleared. If this occurs, execute “Initialize All Data / Settings” in user mode to set the TPM setting to OFF. This will maintain the password information in the SRAM even after the password information is initialized.

- When the TPM setting is OFF:

F-2-25

When the TPM setting is OFF, the TPM key is disabled. Thus, the security information is protected only by the common key.

Under this setting, the security information held in this machine is protected at the level equivalent to the conventional machines.

The security functionality in this setting is configured by the common key and multiple passwords stored in the SRAM and HDD.

When the TPM setting is set to OFF, the security information is protected by the common key and multiple passwords stored in SRAM and HDD.

The common key information is stored in the HDD as well as the SRAM. The common key stored in the SRAM is cleared when the main controller PCB 2 (SRAM) is replaced or after MN-CON clear. Since the common key stored in the HDD will automatically restore the common key in the SRAM, the security information is decodable correctly even after servicing. Unlike the case that the TPM setting is set to ON, the password information stored in the HDD is initialized when the HDD is replaced or formatted. However, the password information is maintained in the SRAM.

TPM Setting for Security Information

The security information can be protected with or without TPM by switching between TPM settings in Setting / Registration mode.

- When the TPM setting is ON
The security functionality is enabled in 4 levels (TPM key, public key, common key and password).
- When the TPM setting is OFF
The security functionality is enabled in 2 levels (common key and password).

● Preparation before Installing TPM

Before installing TPM, ask the user to back up data.

Follow the steps below to back up data.

- 1) From Remote UI, execute Setting / Registration > Management Setting > Data Management > Import / Export. The following data types should be backed up.
 - Address book (see *1)
 - Device settings (transfer settings, address book, frequently-used Send functions) (see *2)
 - Setting / Registration
 - Printer settings can be exported
 - Favorites stored in the web browser (only when the web browser is enabled) (see *3)

*1 Each of address books can be exported. If the address book is seen as a part of device settings, this step can be disregarded.

*2 Among settings in the main menu, only “Frequently-used Setting” under “Scan and Send” can be backed up.

*3 These are available only in the specific models or configurations.

- 2) Select “Export” from Custom Menu of the Remote UI to back up “Custom Menu Setting Information”.
- 3) Log in to the system as Administrator from User Management of Advanced Box on Remote UI. Then, execute “Export” to back up “User Information of Advanced Box”.

Works before / after introduction

Execute the following in Setting / Registration mode (“TPM setting” is OFF by default).

1. Enable the feature
2. Backup the TPM key
3. Restore the TPM key
4. Disable the feature

The works above are basically done by users.

CAUTION:

When the TPM setting is set to “ON”, advice users on the following:

Back up the TPM key swiftly after the setting is ON

Keep the password used at backup securely

Never lose the USB flash drive with the backup TPM key file saved

The TPM key should be restored after the TPM PCB is replaced due to failures or the like.

(TPM key restoration is enabled only at TPM PCB replacement.)

Unless the key is restored, the security information (passwords, encryption key, and certificates) cannot be used.

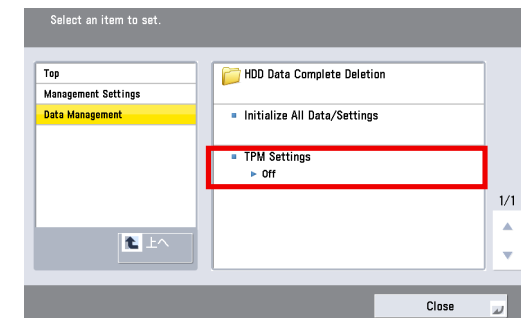

When the key restoration is failed due to the USB flash drive lost or others, “Initialize All Data / Settings” should be executed to reactivate TPM functionality. The security may be undermined if the old Setting / Registration data are maintained as it is.

1. Enable Functionality

MEMO: Setup of “System Management PIN”

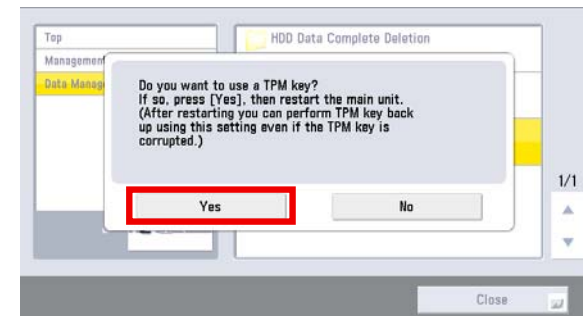

It is recommended for users (administrators) to set the system management PIN before installing TPM. The TPM key is backed up after the TPM setting is set to “ON”. However, the key backup is permitted only once. Unless the key is properly backed up, users other than administrators may illegally obtain the backup file. To avoid such risks effectively, the system management PIN should be set.

- 1) Set Management Setting > Data Management > TPM Setting to “ON”.
Setting / Registration

F-2-26

- 2) Click “Yes”, and restart the machine.

F-2-27

This setting is enabled after the machine is restarted.

2. TPM Key Backup

The TPM key backup file can be stored only in USB flash drive (supported file system: FAT32).

Note that this file requires the memory free space of several MBs.

F-2-28

1) Insert the USB flash drive to the machine.

The USB I/F (host) is found at the side of the control panel as well as the main controller PCB.

CAUTION:

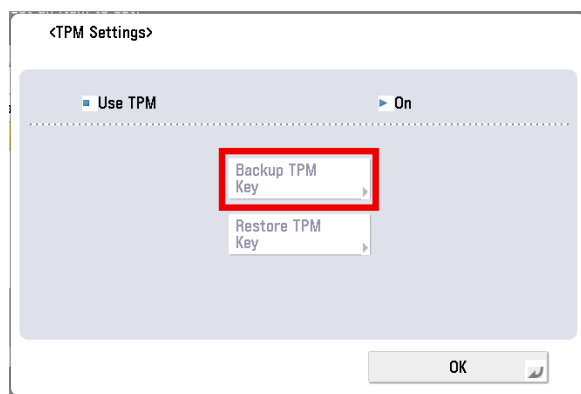

Ensure to insert only one USB flash drive.

If the backup job is started with 2 or more USB flash drives connected, the message is shown to notify that the backup is failed.

MEMO:

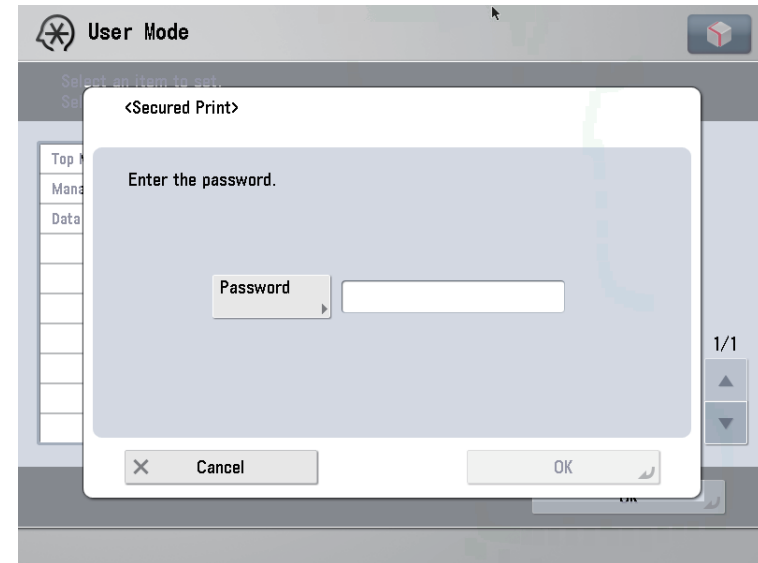

The USB flash drive holds the TPM key backup files by serial number. Thus, backup files for multiple machines can be saved in a USB flash drive.

2) Click [Back up TPM Key] in Management Setting > Data Management > TPM Setting.

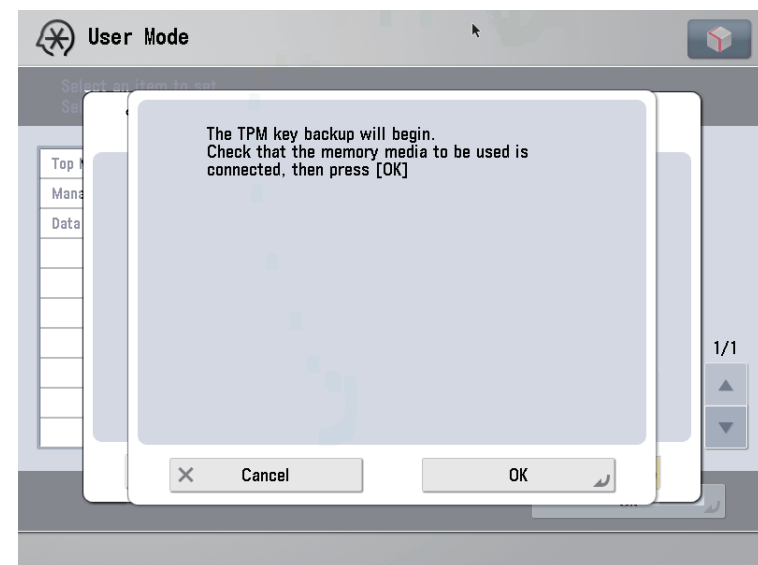

F-2-29

3) Click [Password] to enter the password (4-12 digits). Then, enter the password for confirmation.

F-2-30

4) Click [OK] to initiate TPM key backup.

F-2-31

5) Click [OK] on Backup Completion Screen and remove the USB flash drive.

CAUTION: The following may cause failures in backup.

If any of the following is detected, the backup process is aborted and the message and the cause for the failure are shown on the screen. Take an appropriate measure to recover this.

- The USB flash drive is not inserted to the machine
- 2 or more USB flash drives are inserted to the machine
- The USB flash drive has insufficient free memory space
- The USB flash drive is write-protected
- No key is found

CAUTION: The USB flash drive should be securely stored.

Give advice users on the following points.

- The USB flash drive should be securely stored
- Once the TPM key backup file is saved in the USB flash drive, never save the backup file on a server or the like accessible to unanimous users.

MEMO: Name of TPM key backup file

The serial number for the machine is automatically assigned as the backup file name.

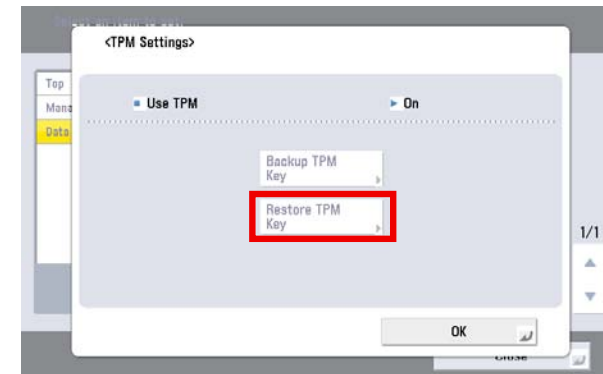

3. Restore of TPM key

Procedure is about the same as the backup work.

Difference between restore work and backup work:

Rebooting is necessary (turn OFF and then ON the main power) after completion of restore work.

- 1) Connect the USB memory that saves TPM key.
- 2) Select the following: Management setting > Data management > TPM setting; and click [Restore TPM key].

F-2-32

- 3) Enter the password set in the backup process.
- 4) Click [OK] on Start Restoration Screen. The restoration process is started.
- 5) Click [OK] on Restoration Completion Screen. Remove the USB flash drive and turn OFF/ ON the main power switch.

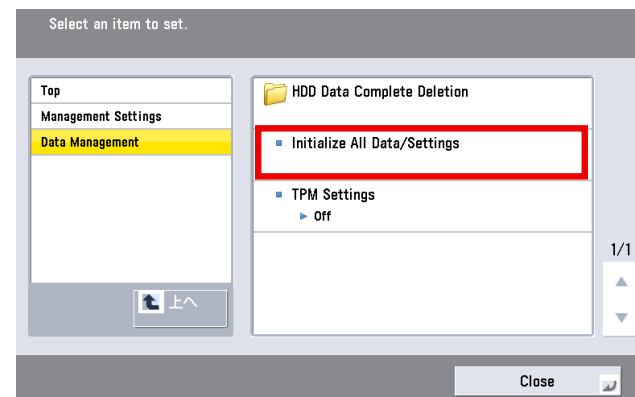

CAUTION: The following may cause failures in restoration.

If any of the following is detected, the restoration process is aborted and the message and the cause for the failure are shown on the screen. Take an appropriate measure for recovery.

- The USB flash drive is not inserted to the machine
- 2 or more USB flash drives are inserted to the machine
- The USB flash drive is security-protected
- No TPM key is saved in the USB flash drive
- The TPM key saved in the USB flash drive is not for the machine
- The wrong password is entered
- After the TPM key was backed up, [Initialize All Systems/ Settings] was executed
- SRAM (the main controller PCB 1) or HDD is crashed

4. Disable the feature

To set "OFF" for the TPM setting, execute [Initialize All Data / Settings].

F-2-33

CAUTION: Points to note when disabling functionality

To disable the use of TPM, all data and settings should be initialized. If this is executed, user information saved in the HDD/ SRAM is totally cleared. Ensure to back up the data before disabling TPM settings.

List of data to be cleared

- Data saved in BOX/ Advanced Box
- Data saved in Inbox (Fax Box/ System Box)
- Destination data registered in Address Book
- Read mode registered using Send function
- Mode memory registered using Copy/ Box function
- MEAP applications and their license files
- Data saved using MEAP applications
- Password for MEAP SMS (Service Management Service)
(The password is returned to default if any change is made.)
- User authentication information registered by local device authentication via SSO-H (Single Sign-On H)
- Unsent documents (documents for scheduled transmission and reserved transmission)
- Job logs
- Contents set in Setting / Registration
- Image-composite registration form
- Registered transfer settings

- Key pair and server certificate registered in Management Setting (Setting/ Registration) > [Device Management] > [Certificate Settings]
- Audit log

Steps of data restoration after recovery

To restore data, select the following on UI: Settings/Registration > Management Settings > Data Management > Import > Import of Settings/Registration.
The data listed below cannot be restored, thus should be set again.

Environment Settings

- Paper settings
- Display settings in the destination to save
- Time fine-adjustment for timer/ power settings
- Date/ time settings (excluding time zone and daylight-saving settings)
- User settings for SNMPv3
- Context settings
- Firewall settings (excluding MAC address filter)

Function Settings

- Image-composite form for the common print operation
- Printer settings
- Transfer settings for the common receipt/ transfer settings
- Inbox settings
- Frequently-used Copy settings
- Registered short-cuts in “Other Functions”
- Frequently-used Send settings
- Frequently-used settings for saving/ using files

Address Settings

- Address Book

Management Settings

- Sheet counts in Department ID Management
- Settings for device information distribution
- Certificate settings
- License registration
- Remote operation settings
- Box backup/ restoration
- TPM Settings
- Setting of audit log collection

● Overview of Actions taken against Troubles

Location with failure	TPM Setting = ON	TPM Setting = OFF	Relevant Error Code
TPM PCB	<ol style="list-style-type: none"> 1. Check the TPM PCB connection 2. Replace the TPM PCBs 3. Turn OFF/ ON the power 4. See the section of “Restoring TPM Key” to restore the TPM key. 5. Turn OFF/ ON the main power for recovery 	N/A (TPM PCB is not in use when the TPM setting is set to OFF.)	Initially E746-0031 is shown on the screen. When the power is turned OFF/ON after the TPM PCB is replaced, E746-0032 is shown (only when the TPM setting is set to ON).
HDD	<ol style="list-style-type: none"> 1. Replace the HDDs. 2. Format the HDD. 3. Download the system software. 4. See the section of “Disabling Functionality” to execute “Initialize All Data/ Settings”. 5. Turn OFF/ON the power. The TPM setting is automatically set to OFF. 6. Set the TPM setting to ON (the public key and the common key are automatically set). 	<ol style="list-style-type: none"> 1. Replace the HDDs. 2. Format the HDD. 3. Download the system software. 4. Restore the password information stored in the HDD. 	Initially E602-xxxx is shown (the different extension is shown depends on cases). After the system software is reinstalled, E746-0033 is shown.
Main Controller PCB 2 (SRAM)	<ol style="list-style-type: none"> 1. Replace the main controller PCB 2. 2. The common key backed up in the HDD will be automatically restored in the SRAM. 3. The TPM setting on the control panel is reset to OFF. Manually set the TPM setting to ON (the machine is operated in the TPM setting ON). 4. Restore the password information stored in the SRAM (see *1). 	<ol style="list-style-type: none"> 1. Replace the main controller PCB 2. 2. The common key backed up in the HDD will be automatically restored in the SRAM. 3. Restore the password information stored in the SRAM (see *1). 	E747-xxxx (the different extension is shown depends on cases).

T-2-13

*1 If “No” is indicated in the field of Backup Column in the table of “Security Information Storage Location”, the relevant information should be set manually again.

● Related Error Code

Error Code	Error description, Assumed cause, remedy	
E746	Error in encryption	
0031	Error in hardware	
	Assumed cause	The TPM PCB is not mounted; the TPM PCB for the other machine is mounted; the TPM chip is crashed.
	Remedy	Mount the TPM PCB for the machine; replace with the new TPM PCB
0032	Error occurred but the system is recoverable	
	Assumed cause	Keys are unmatched
	Remedy	Restore the TPM key
0033	Error occurred and the system is unrecoverable	
	Assumed cause	Security information cannot be found in the HDD/ SRAM
	Remedy	Execute "Initialize All Data/ Settings"
0035	TPM version error	Install the supported TPM.

T-2-14

● Security Information Storage Location

Storage Location	Data Type	Function	Name of Data	Backup Availability	
HDD	Password/ PIN	BOX	BOX Password	Yes	
		SEND	Password for a file destination of Address Book	Yes	
		MEAP	Authentication information registered by local device authentication via SSO-H	Yes	
	Certificate/ Secret Key	SSL,AMS	Device key pair (SSL, AMS)	No	
		Signature SEND	User key pair	No	
	Others	User setting information	Key information linked to user (password)	No	
	SRAM	Password/ PIN	BOX	Password for encryption at BOX backup	No
				Password for SMB server at BOX backup	No
			SEND	Password for LDAP server	Yes
				Password for POP3 server	Yes
Password for time-stamped PDF				Yes	
		PIN for destination list (in destination setting)	Yes		
UI		Password for service mode	No		
Network		Password for IPP authentication	Yes		
		Password for FTP authentication	Yes		
		User name and password for client in Proxy authentication	Yes		
		Login password for Netware print server	Yes		
		Policy common key for IPSec	Yes		
		User name and password for PEAP/TLS authentication	Yes		
Others		Department management data (including System Manager password)	Yes		
Encryption key	MIB	Authentication and encryption keys for SNMPv3	No		
Password/ PIN	MEAP	SMS login password	Yes		

T-2-15

■ HDD mirroring feature (option)

● Overview

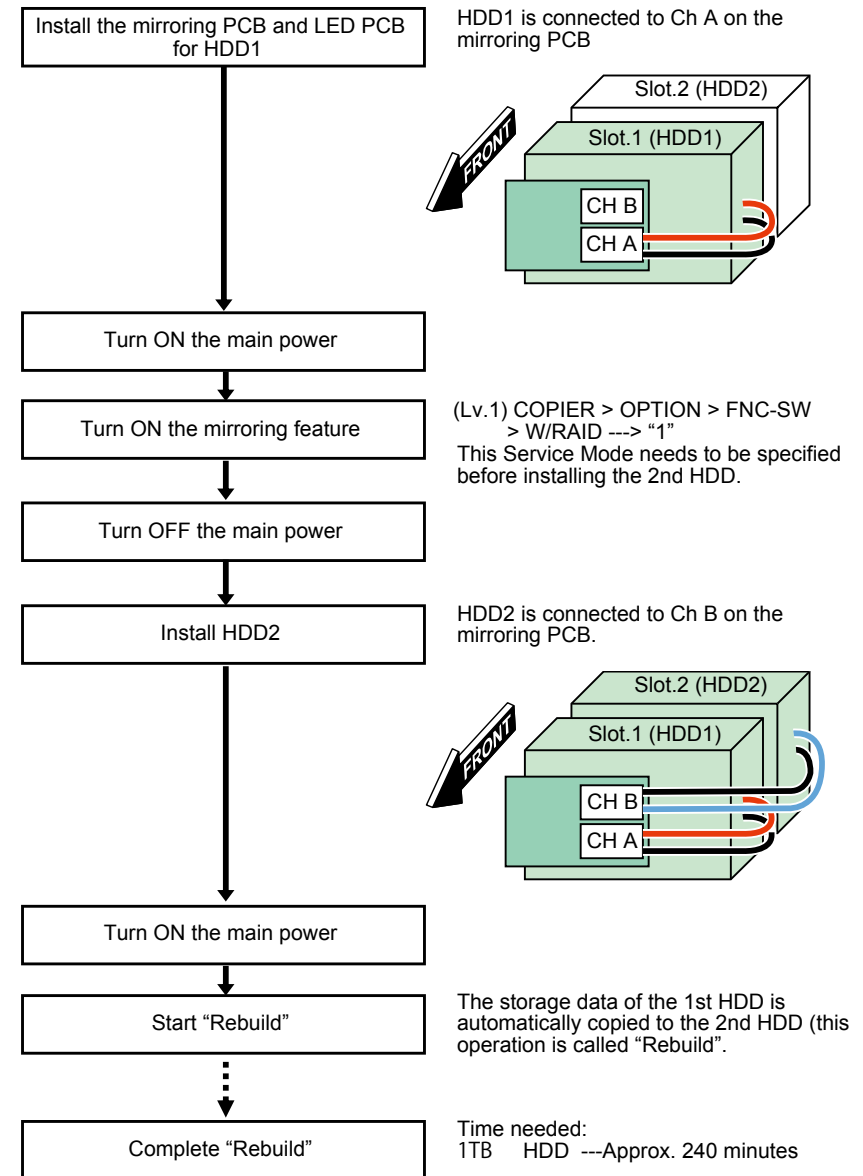

This option enables HDD data mirroring (RAID1).

If one of the HDDs is faulty, the other one operates as "master".

F-2-34

● Works before using this functionality (installation)

F-2-35

Rebuild progress is shown as messages on the status line of the control panel.
"Copying data to HDD. xx%"

MEMO:

- This machine can be used even during “rebuild” process (operation is performed with HDD1)
- The HDD will not be damaged even if turning OFF the power during “rebuild” process. “Rebuild” is resumed once the power is turned ON the next time. This does not apply in the case of blackout or disconnecting the power code during “rebuild” process

● HDD reading / writing operation

At reading:

Data is read by HDD1 (master HDD) only

At writing:

The same data is written to each HDD at the same timing

F-2-36

The ACT LED (green) on the LED PCB is lighted up / blinking if reading / writing to each HDD is performed properly.

In the case of failure:

- The LED (red) on the LED PCB is blinking. If one of the HDDs is faulty, the operation continues by using the other one as “master”.
- If both two HDDs are faulty, E602 error is shown on the control panel to stop the operation.

● List of operation status (LED)

HDD operation statuses are indicated with 4 LEDs mounted on the LED PCB.

The green LED shows that the operation is normally in progress, while the red LED indicates any failures.

F-2-37

The table below lists HDD statuses indicated by each LED.

For example, when HDD1 is in access, the green LED on the side of HDD1 (ChA) blinks in a high speed.

Status	HDD 1 (Ch A)		HDD 2 (Ch B)		Name of Mode
	Green LED	Red LED	Green LED	Red LED	
Normal (standby)	---	---	---	---	Mirror mode
Accessing to HDD1	A (*1)	---	---	---	
Accessing to HDD2	---	---	A (*1)	---	
HDD1 failed	---	A	---	---	Degrade mode
HDD2 is faulty	---	---	---	A	Degrade mode
Copying data to HDD1 (Rebuild)	--- / A	B	--- / A	---	Rebuild mode
Copying data to HDD2 (Rebuild)	--- / A	---	--- / A	B	Halt mode
Both HDDs failed or Master HDD failed	--- (*2)	A	--- (*2)	A	Halt mode

T-2-16

--- : Not lit A : Lit B : Blinking at an interval of 0.5 seconds

*1: The LED is blinking in a high speed

*2: The green LED may be lit

Description of Modes

The mirroring system of this machine consists of 4 modes.

The modes in parentheses show the mirroring system statuses.

The status flows among the modes below during operation.

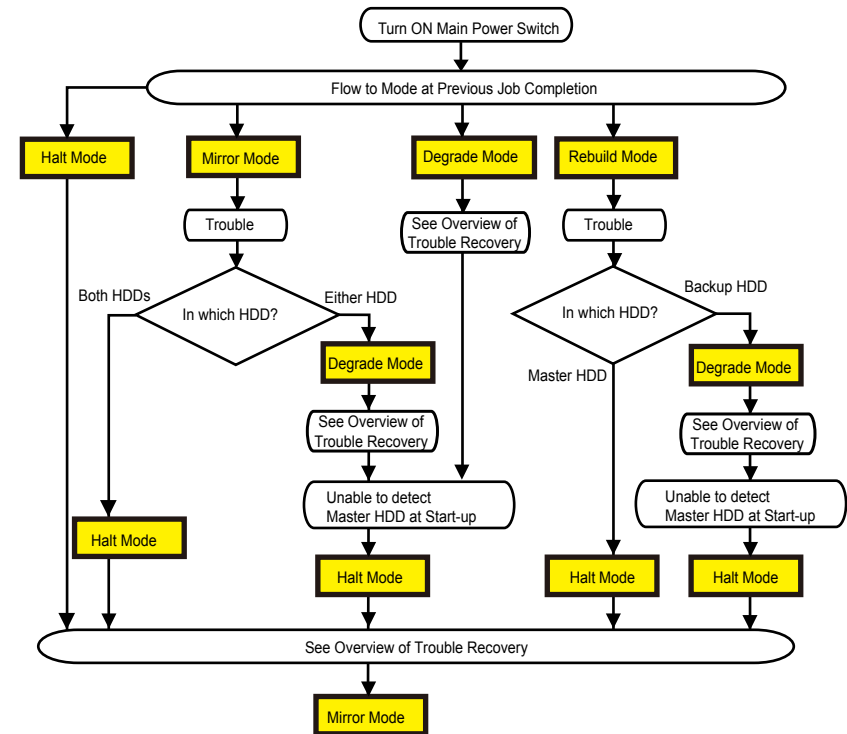

The table below lists descriptions of modes and operational overview.

Name of Mode	Description	Master HDD Status	Backup HDD Status
Mirror Mode	Both HDDs are normally operated	In normal operation	In normal operation
Degrade Mode	Any trouble occurred in the backup HDD suspends mirroring operation. The machine can be used under this condition, however, the backup HDD should be replaced at the earliest convenience.	In normal operation	With troubles (HDD not installed/ HDD in trouble)
Rebuild mode	The data of the master HDD is copied (rebuilt) to the backup HDD. The machine can be used under this condition.	In normal operation	In recovery from the trouble (Copying data of Master HDD)
Halt mode	Both HDDs are in trouble (see *1)	In trouble (HDD not installed/ HDD installed not registered/ HDD disconnected while the mirroring board is in operation)	With troubles (HDD not installed/ HDD installed not registered/ HDD disconnected while the mirroring board is in operation)

T-2-17

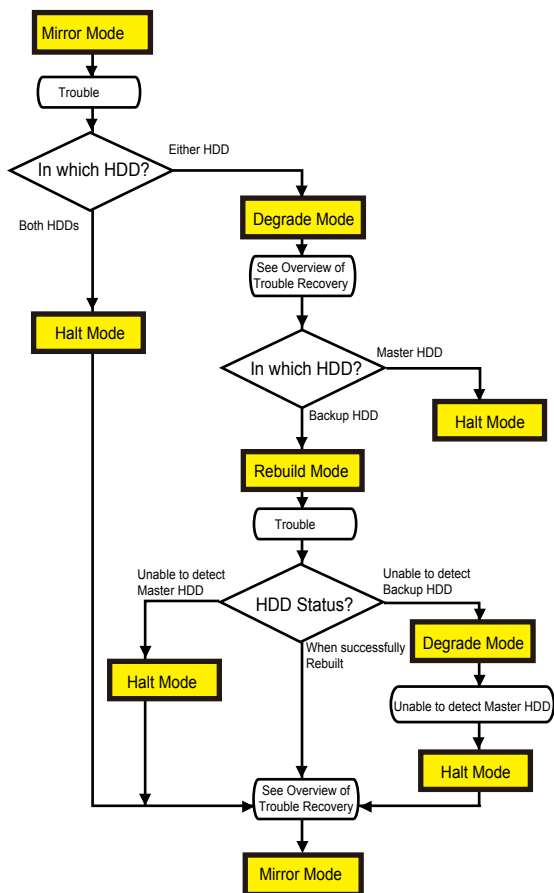

*1: Turn OFF/ ON the power in this mode, the mode returns to the previous mode.

Mode Flow at Start-up

F-2-38

Mode Flow during Operation

F-2-39

● Overview of Trouble Recovery

When any trouble occurs in the mirroring system, take the action for recovery appropriate to each mode.

The HDD in trouble can be located by the red LED on the LED PCB.

In case the master HDD cannot be located, turn OFF/ ON the power to check whether the green LED is lit on the LED PCB.

The firstly blinked green LED (ChA or ChB) in a high speed tells the Master HDD, which is accessed firstly.

The green LED not lit on a channel tells the location of Backup HDD.

Name of Mode	Status	Action for Recovery	HDD1 (ChA)	HDD2 (ChB)
			Red LED	Red LED
Mirror Mode	Normal (at standby)	Under normal operation	---	---
Degrade Mode (see *2)	HDD1 in trouble	1. Check the connection between HDD1 and Mirroring Board or Main Controller PCB 2. When the trouble is not recovered, replace the HDD1.	A	---
	HDD2 in trouble	1. Check the connection between HDD2 and Mirroring Board or Main Controller PCB 2. When the trouble is not recovered, replace HDD2.	---	A
Rebuild mode	Copying data to HDD1 (Rebuild)	Copying (under Rebuild)	B	---
	Copying Data to HDD2 (Rebuild)	Copying (under Rebuild)	---	B
Halt mode	Both HDDs in trouble	1. Check Master HDD and Backup HDD (see *1) 2. When the trouble is not recovered, replace the two HDDs (format the replaced HDD and download the system software).	A	A

T-2-18

---: Not lit A: Lit B: Blinking at an interval of 0.5 seconds

*1: Never install the HDD used in the other model. The used HDD holds the ID specific to the firstly-installed machine, thus this machine is unable to recognize it. If done, you need to reinstall the HDD recognized in this machine.

*2: Degrade or Halt mode is a condition where data protection that is the purpose of mirroring is not enabled. It is necessary to swiftly replace the faulty HDD with a new one and perform Rebuild process.

"The hard disk needs to be replaced. (Call service rep.)" is displayed on the Touch Panel Display. The alarm history of the service mode COPIER > DISPLAY > ALARM-2, 310006 is displayed by CODE list.

● Points to Note in Servicing concerning Mirroring Functionality

1. The modes other than Mirror Mode indicate troubles, which require swift recovery.
The power can be turned OFF even during Rebuild process. However, it is recommended not to turn off the power and wait until the mode flows to Mirror Mode. In addition, HDD removal after power-OFF is guaranteed only in Mirror Mode.
2. The mirroring board controls Master HDD and Backup HDD. This control is performed based on the HDD serial number and the model serial number instead of slot locations. If HDDs are replaced in a careless manner during servicing in the field, the Master and Backup HDDs may be switched.
Ex) When the master HDD is in trouble, the mirroring board automatically recognizes the backup HDD as the master. Thus, the master and backup HDDs are switched even without changing the slot locations.
If the Master HDD cannot be located, turn OFF/ ON the power to check on which channel the green LED is lit on the LED PCB.
The firstly-blinked LED (ChA or ChB) shows the Master HDD, which is accessed firstly after power-on.
3. For users who intend to use the removable and mirroring functionality concurrently, instruct them not to change the removable HDD location in advance.
Change of HDD locations after power-OFF is allowed as specifications only in Mirror Mode. Otherwise, HDD removal or change of location is not guaranteed.
4. The following conditions are required to replace HDDs at power-ON.
 - Removable HDD is extended
 - Either HDD is in trouble

CAUTION:

Be sure to use a new HDD when replacing the HDD.

5. Upgrading should be done only in Mirror Mode while mirroring in ongoing. Upgrading in Degrade or Rebuild mode is basically prohibited. Always prioritize Mirror Mode when you take any actions.

■ Removable HDD (option)

With this option, users can easily install or remove the HDD (slot-in/out).

This option is assumed to be used for: enhancing information security at government/public offices or private companies.

- Remove the HDD after the close of work to be kept in a safe.
- Install the HDD at the start of work. Make the HDD locked during operation.

F-2-40

NOTE:

- To use this option, no setting is required with the software.
- The user needs to prepare a key because there is no key with this kit.

Laser Exposure System

Overview

Overview

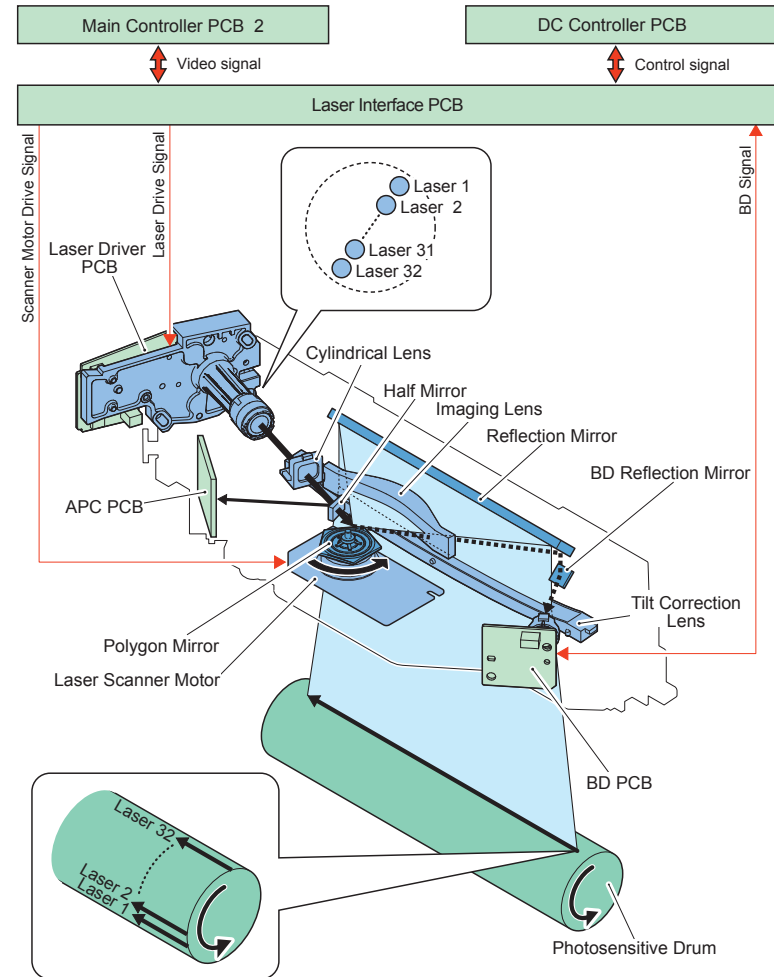

This machine is equipped with the total of 4 Laser Scanner Units on the upper side of the station for each color.

<Bk>

F-2-41

<CL>

On this machine, the laser is emitted to the image part on the Drum that is negatively charged.

Enlarged view

Characteristics

Adoption of new Laser Scanner Units

High image quality

- 2400 dpi resolution

In the horizontal direction the laser lighting interval has been reduced while in the vertical scanning direction the width between the emission ports has been narrowed.

- Multiple exposure

This machine performs exposure twice by overlapping the 16 beams which are half the total beams. This has enabled the formation of clearer latent image.

Higher speed

- Simultaneous emission of laser beams producing 32 lines

By simultaneously emitting laser beams that produce 32 lines at a time, high-speed printing has been realized.

F-2-44

■ Specifications

Item		Description
Laser team	Wave length	682 nm
	Laser type	Red color laser
	Laser output	1 mW
	Number of laser beams	32 beams
Resolution		2400 dpi
Scanner motor	Type	Brushless motor
	Number of rotations	Approx. 24600 rpm
Number of Polygon Mirror surfaces		5
Controls	Laser ON timing control	Laser ON/OFF control Main scanning synchronization control Sub scanning synchronization control
	Laser beam intensity control	APC control
	Image position correction control	Correction of write start position in horizontal scanning direction (To be explained in Image Formation.)
		Correction of write start position in vertical scanning direction (To be explained in Image Formation.)
		Correction of magnification in horizontal scanning direction (To be explained in Image Formation.)
		Correction of magnification in vertical scanning direction (To be explained in Image Formation.)
	Others	Duplex print magnification correction
		Laser scanner motor control Control to Turn OFF Laser (Safety of Laser)

BOTTOM VIEW

F-2-46

<CL>

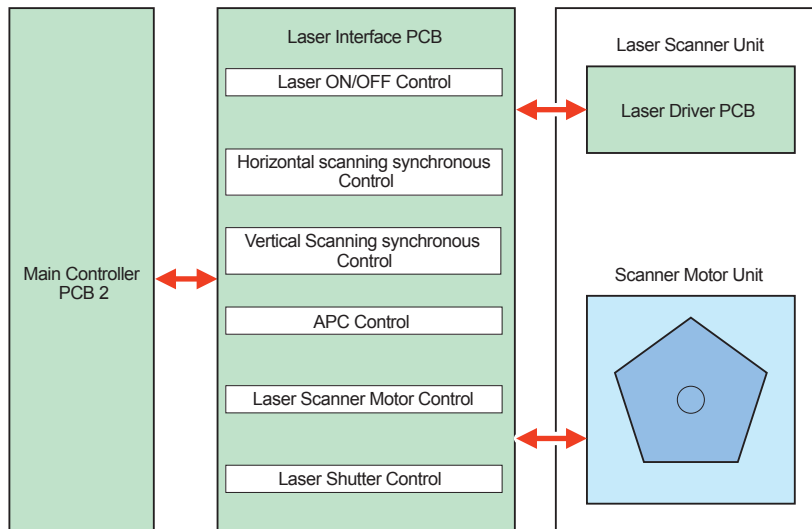

F-2-47

Name	Role
Laser Driver	Output a laser beam.
Cylindrical Lens	To focus the laser light in a straight line.
Half Mirror	To reflect a part of the laser light to the APC PCB.
Imaging Lens	To emit laser light, and form an image on the drum.
Reflection Mirror	Reflect a laser beam to the drum.
BD Reflection Mirror	Reflect a laser beam in the direction of the BD detection PCB.
APC PCB	Performed to keep a specified level of laser beam for each line.
Polygon Mirror	Perform scanning with a laser beam in the main scanning direction.
Laser Scanner Motor	Performed to rotate the polygon mirror at a specified speed.
BD PCB	Detect a laser beam as a BD signal.

T-2-20

Controls
Overview

F-2-48

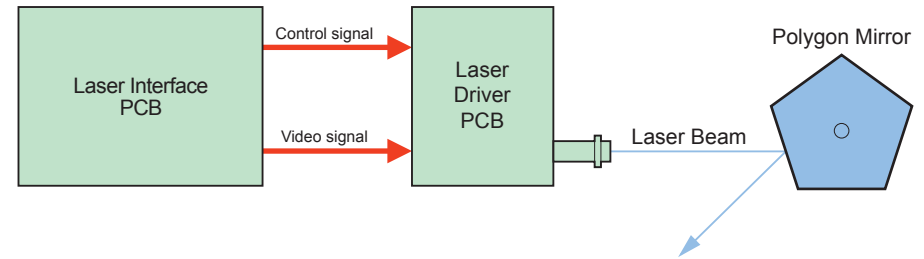

tem		Purpose/Description
Laser ON timing control	Laser ON/OFF control	Turn ON/OFF a laser beam according to the combination of laser control signals.
	Main scanning synchronization control	Performed to adjust the writing position in the main scanning direction.
	Sub scanning synchronization control	Performed to adjust the writing position in the sub scanning direction.
Laser beam intensity control	APC control	Performed to keep a specified level of laser beam for each line.
Duplex print magnification correction control		To correct the magnification ratio on the front and back sides by performing image processing.
Laser scanner motor control		Performed to rotate the polygon mirror at a specified speed.
Laser shutter control		Prevent irradiation of a laser beam in the machine.

T-2-21

Laser ON Timing Control

Laser ON/OFF Control

This control is performed to turn ON/OFF a laser beam according to the combination of laser control signals.

F-2-49

<Timing of Execution>

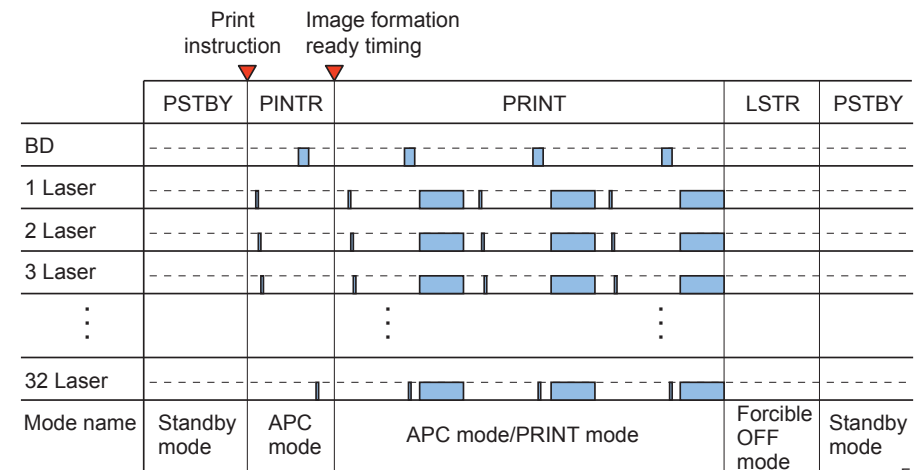

After the power is turned ON

<Details of the Control>

The Laser Interface PCB switches the mode among four modes (Forcible OFF mode, APC mode, Print mode, Standby mode) according to the laser control signal.

Mode	Laser status	Remarks
Forcible OFF	OFF	Clear the laser beam intensity setting determined by APC.
APC	ON	Adjust the laser beam intensity.
Print mode	OFF/ON	Irradiate a laser beam according to the video signal.
Standby mode	OFF	The main unit is placed in the standby status.

T-2-22

F-2-50

Main Scanning Synchronization Control

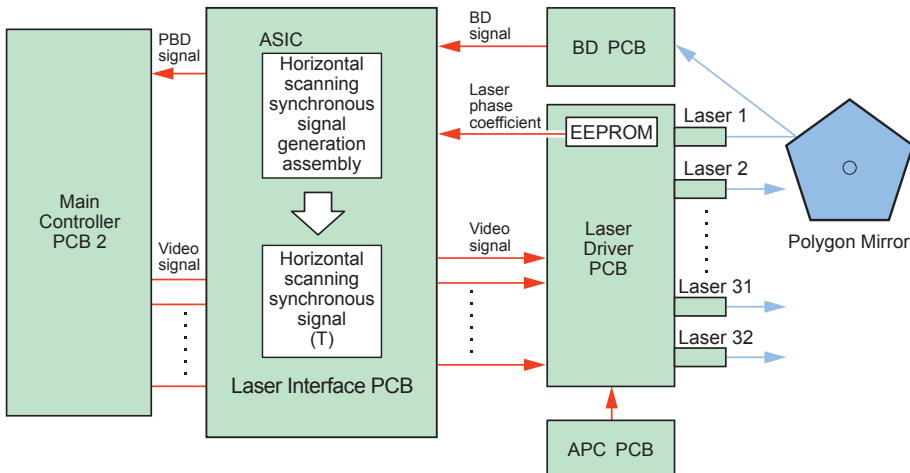

This control is performed to adjust the writing position in the main scanning direction.

Timing of Execution

For every 32 lines

Details of the Control

- 1) The laser phase coefficient in the ROM on the laser driver is sent to the Laser Interface PCB.
- 2) The Laser Interface PCB forcibly irradiates the laser diode of Laser 1 in the laser driver PCB by setting the Laser 1 laser control signal to APC mode.
- 3) The Laser 1 laser beam irradiates into the BD PCB, which is mounted in the scanning light path.
- 4) The BD PCB detects the Laser 1 laser beam, creates a standard BD signal, and sends it to the Laser Interface PCB.
- 5) The Laser Interface PCB creates a main scanning synchronization signal for every 32 lines based on the laser phase coefficient and the standard BD signal.
- 6) The video signal sent from the main controller is output to the laser driver PCB according to the main scanning synchronization signal.

F-2-51

F-2-52

● Sub Scanning Synchronization Control

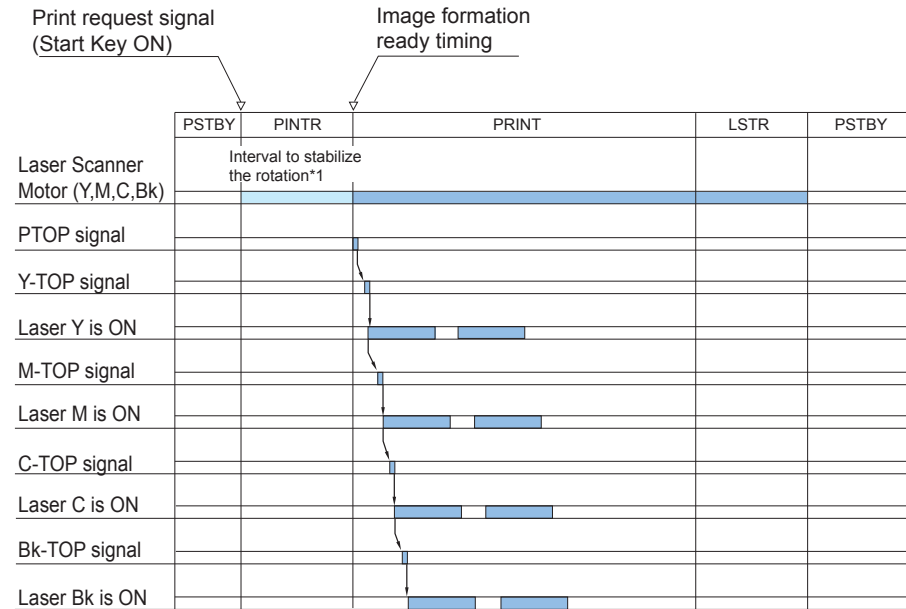

This control is performed to adjust the writing position in the sub scanning direction.

<Timing of Execution>

For every printing operation

<Details of the Control>

- Synchronization control in the sub scanning direction is performed based on the PTOPI signal (image formation start signal).
- When the machine is ready to form an image, a PTOPI signal (image formation start signal) is created. Based on this signal, each color laser beam is turned on at the delayed timing of drum interval.

F-2-53

■ Laser Beam Intensity Control

● APC (Auto Power Control) Control

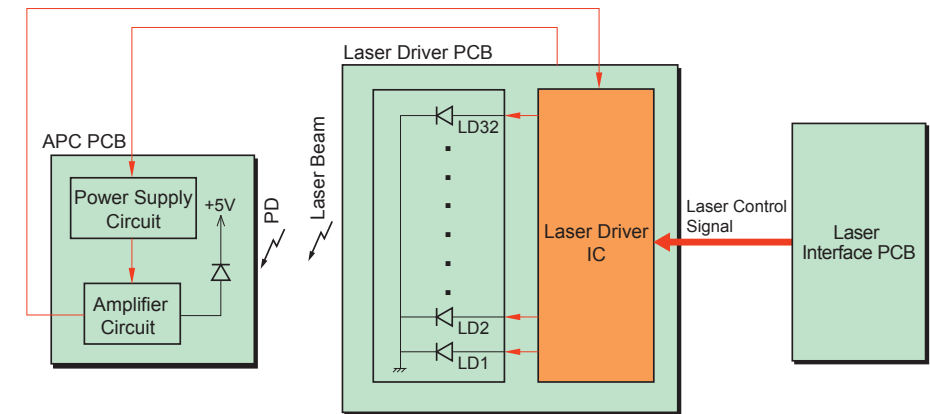

This control is performed to keep laser beam intensity at every 32 beams (every 1BD) at a specified level.

<Timing of Execution>

Every 8 beams (every 1BD)

<Details of the Control>

- 1) The Laser Interface PCB outputs a laser control signal to the laser driver IC in the laser driver PCB.
- 2) The APC mode is set for the laser driver IC, and laser diodes (LD1 to LD8) are emitted forcibly and sequentially. The laser driver IC also monitors the laser diodes (LD1 to LD8) by the photo diode (PD) at the same time, and adjusts the output of the laser diodes until they reach a specified level of intensity.

F-2-54

■ Duplex print magnification correction

Magnification difference between 1st and 2nd sides due to the different amount of paper shrinkage between 1st and 2nd sides is corrected.

As for the duplex print, when the paper passes through the fixing assembly after the image formation on the 1st side, it is shrunk temporarily. After the image is formed on the 2nd side and the paper is ejected from the main body, the 2nd side image is enlarged when the paper size is returned. That is, the image size of the 2nd side becomes larger than the 1st side, so the magnification mismatch occurs.

Execution timing

When forming the image on the 2nd side at duplex print

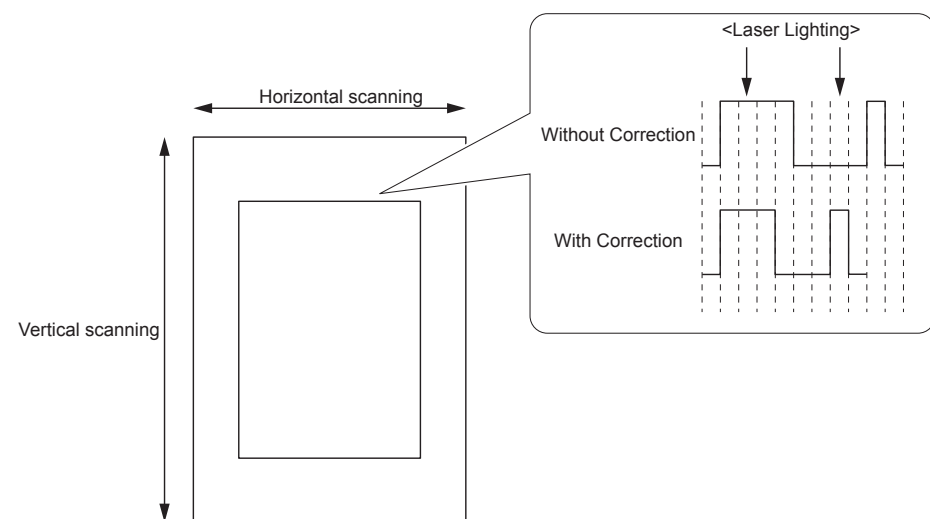

Description of control

Considering the paper shrinkage level, conduct the following control for the 2nd side image formation.

Horizontal scanning direction:

By skipping the image data pixel, image in horizontal scanning direction is shrunk.

When enlarging the image, enlarge it in horizontal scanning direction by adding image data.

F-2-55

■ Laser Scanner Motor Control

This control is performed to rotate the polygon mirror at a specified speed.

<Timing of Execution>

At the time of power-on/start-up

<Details of the Control>

- 1) The motor speed control unit in the Laser Interface PCB forcibly rotates the motor.
- 2) When a speed detection signal (FG, BD) is detected, the unit compares it with the standard signal created by the standard signal creation unit, and controls the acceleration signal (ACC) and deceleration signal (DEC) to keep a specified speed.

F-2-56

Related Error Code

E100: Failure to detect PLOCK signal during BD rotation

E110: Failure to detect VLOCK signal during FG rotation

Control to Turn OFF Laser (Safety of Laser)

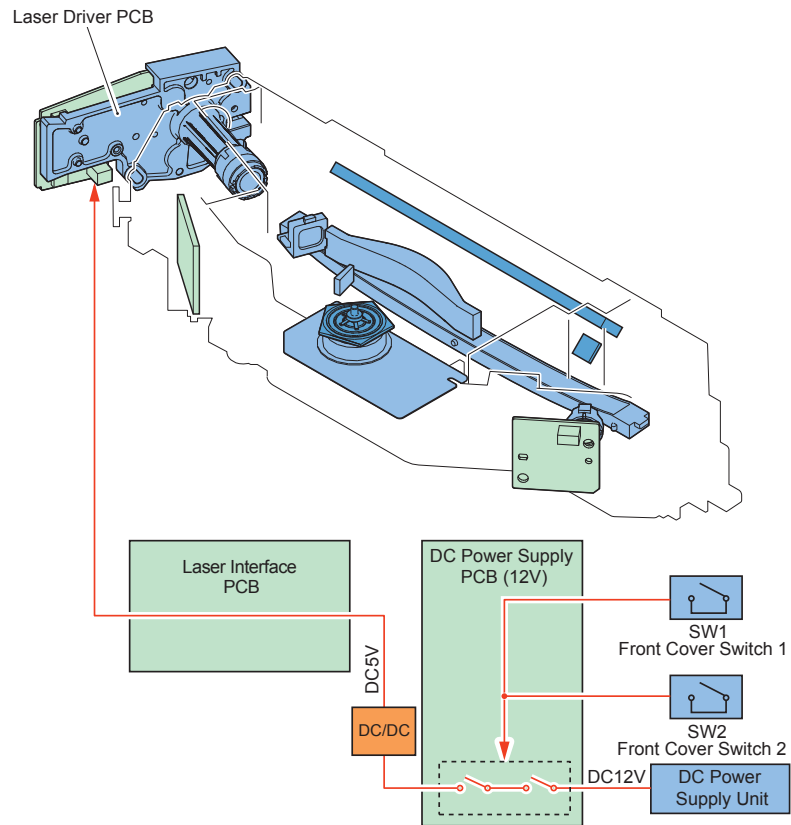

This control is performed to prevent irradiation of a laser beam in the machine.

<Timing of Execution>

At the time of power-on/startup

<Details of the Control>

When the front cover is opened, the DC Power Supply PCB (12V) stops power supply and an output signal from the laser driver. This prevents irradiation of a laser beam.

F-2-57

Image Formation System

Overview

Overview

The ITB of this machine's image formation system adopts an elastic ITB to achieve optimal secondary transfer to various types of paper. The elastic ITB, whose material has been changed from resin to rubber, realizes highly-reproducible images with increased transfer efficiency even on rough-surfaced texture paper.

In addition, high image quality has been realized by the addition of a cooling function to the Color Developing Assembly, which lowers the temperature in the area surrounding the Developing Assembly to improve stability of hue and prevent deterioration of developer and toner.

F-2-58

Role / function

Item		Role / function		
Drum Unit / Developing Assembly (Bk)	Configuration			
	Drum unit (drum, charging assembly, cleaner, patch detection sensor, Cleaning Post-exposure) + Developing assembly			
	Photosensitive drum	Material	OPC

Secondary post-transfer static eliminator bias	DC component rated voltage use range	DC 0 to 6,500 V
	DC component voltage correction factor	Absolute water volume (ENV1), Paper type

T-2-31

■ inting Process

Static electricity formation block	1	Primary charging	Charge the photosensitive drum surface with a uniform negative potential. The Drum Unit / Developing Assembly (Y/M/C) uses the direct charging roller method, in which charges are directly applied from the charging roller to the photosensitive drum. The Drum Unit / Developing Assembly (Bk) uses the primary charging method, in which charges are indirectly applied from the charging wire.
	2	Laser exposure	Form a latent image on the photosensitive drum surface by irradiating a laser beam. When a laser beam irradiates to the negatively charged photosensitive drum surface, the negative potential in the irradiated area is neutralized.
Developing block	3	Development	Attach negatively charged toner to the static latent image on the photosensitive drum surface from the developing cylinder by dry 2-component toner projection so that it becomes visualized.
Transfer block	4	Primary pre-transfer charging (Bk)	Charge the toner on the photosensitive drum with a uniform potential.
	5	Primary transfer	Apply a positive potential to the primary transfer roller, and transfer the toner on the photosensitive drum to the ITB.
	6	Secondary transfer	Apply a positive charge to the secondary transfer external roller, and transfer the toner on the ITB to the paper.
	7	Separation	Separate the paper from the ITB by curvature separation. Application of a negative charge to the static eliminator according to the paper type makes it easier to separate paper from the ITB.
Fixing block	8	Fixing	Melt and adhere the toner on paper to the paper by heat and pressure.
ITB cleaning block	9	ITB cleaning	Remove the residual toner on the ITB by the 2 Fur Brushes.
Drum cleaning block	10	Drum cleaning pre-exposure	Remove the drum charging memory on the photosensitive drum surface by irradiating light from the drum cleaning pre-exposure LED to prevent dirt on the photosensitive drum.
	11	Drum cleaning	Remove the residual toner on the photosensitive drum by the cleaning blade

T-2-32

F-2-74

Controls

Overview

Item	Overview
Drum Unit / Developing Assembly (Bk)	
Primary Charging Wire Bias Control	The primary charging bias charges the photosensitive drum surface with a uniform negative potential.
Primary Charging Wire Cleaning Control	This control is performed to prevent a charging failure caused by dirt on the primary charging wire and the grid plate.
Primary Charging Shutter Control	To prevent uneven potential on the Photosensitive Drum caused by discharge products (nitrogen oxide) accumulated on the Primary Charging Assembly.
Developing Bias Control	This control is performed to apply a developing bias (AC component, DC negative component) to the developing cylinder and attach the toner on the developing cylinder to the photosensitive drum (bright section) to form a toner image.
Collection Roller Bias Control	Toner scattered from the Developing Assembly is returned to the Developing Cylinder by the difference of biases of the Toner Collection Roller and the Developing Cylinder at the time of development.
ACR Control	The purpose of ACR (Auto Carrier Refresh) control is to keep long life of the developer, and developer is supplied from the toner container while gradually discharging developer in the developing assembly.
Developing Assembly Cooling Control	A cooling mechanism has been added to the Developing Assembly to prevent toner deterioration by heat.
Primary Pre-transfer Charging bias control	This control is performed to increase transfer efficiency by securing a proper toner charging volume on the photosensitive drum.
Primary Pre-transfer Charging Wire Cleaning Control	This control is performed to prevent a charging failure caused by dirt on the primary pre-transfer charging wire.
Primary Pre-transfer Charging Wire Shutter Control	To prevent uneven potential on the Photosensitive Drum caused by discharge products (nitrogen oxide) accumulated on the Pre-transfer Charging Assembly.
Drum Cleaning Pre-exposure	This control is performed to emit light from the pre-exposure LED to remove the drum memory on the photosensitive drum surface.

Drum Cleaning Post-exposure LED	Control in which light is emitted from the Post-exposure LED in order to remove residual charge on the surface of the Photosensitive Drum
Drum Cleaning Control	This control is performed to remove residual toner on the photosensitive drum by the blade engaged with the drum.
Drum Rotation Speed Control	This control is performed to keep a uniform drum rotation speed in order to increase accuracy of the image position (color displacement).
Drum Heater Control	This control is performed to keep the temperature of the photosensitive drum at a specified level and stabilize potential characteristics of charging and exposure, etc.
Drum Unit / Developing Assembly (CL)	
Primary Charging Roller Bias Control	The primary charging bias (CL) charges the photosensitive drum surface with a uniform negative potential.
Developing Bias Control (CL)	This control is performed to apply the developing bias (AC component, DC negative) to the developing cylinder and to adhere the toner on the developing cylinder to the photosensitive drum (bright section) to form a toner image.
Toner Collection Sheet Bias Control	Toner scattered from the Developing Assembly is returned to the Developing Cylinder by the difference of biases of the Toner Collection Roller and the Developing Cylinder at the time of development.
Drum Cleaning Pre-exposure (CL)	This control is performed to prevent reverse transfer of toner on the cleaning blade caused by drum memory.
Drum Heater Control	The drum heater is installed in the ITB unit to realize stable charging and exposure to deal with environmental changes in the machine.

T-2-33

■ Drum Unit / Developing Assembly (Bk)

● Primary Charging Wire Bias Control

Overview

The primary charging bias charges the photosensitive drum surface with a uniform negative potential.

The primary charging bias (DC negative) created by the primary charging high voltage PCB (Bk) (UN37) is applied to the primary charging wire and the grid plate.

Primary charging DC bias: Applied to the primary charging wire (Constant current)

Grid DC bias: Applied to the grid plate

Details of the Control

The value of the primary charging DC bias is determined based on the absolute water volume and process speed.

The value of the grid DC bias is determined by potential control (Bk) based on the fogging removal potential (V_{back}) and the contrast potential (V_{cont}), which are determined based on the absolute water volume and process speed. (See "Potential Control (Bk)" for the details.)

COPIER > DISPLAY > HV-STS > PRIMARY : Display of primary charging current

● Primary Charging Wire Cleaning Control

Overview

This control is performed to prevent a charging failure caused by dirt on the primary charging wire and the grid plate.

Timing of Execution

- At the time of automatic adjustment of paper interval (Every printing of 4000 images on an accumulation basis)
- At the time of automatic adjustment of last rotation (Every printing of 2000 images on an accumulation basis)
- At the time of multiple initial rotations (Fixing temperature is less than 100 deg C/Total 2000-sheet from previous D-half control)
- When "Wire Cleaning" is executed via the user mode

Details of the Control

When the cleaner screw rotates normally/in reverse driven by the primary charging cleaning motor (M1), the primary charging cleaning pad and the grid plate cleaning pad move back and forth, and clean the primary charging wire and the grid plate.

NOTE:

This machine does not have a HP sensor for the cleaning pad. The position of the cleaning pad is detected based on the drive time of the primary charging wire cleaning motor (M1).

● Primary Charging Shutter Control

Overview

To prevent uneven potential on the Photosensitive Drum caused by discharge products (nitrogen oxide) accumulated on the Primary Charging Assembly.

Timing of Execution

- When turning OFF the main power
- When a specified period of time has passed after the machine moved to the energy saver mode

Details of the Control

The shutter is opened or closed by the cleaning mechanism of the Primary Charging Wire. The Primary Charging Shutter is made of fiber and usually taken up by the bobbin. The drive of the Primary Charging Wire Cleaning Motor (M1) moves the Cleaning Pad to the rear and the shutter taken up by the bobbin becomes extended to make the shutter closed. Because the shutter comes between the Grid Plate and the Photosensitive Drum, discharge products from the Primary Charging Assembly do not reach the Photosensitive Drum. The Primary Charging Shutter Position Sensor (PS92) detects open/close of the shutter.

● Developing Bias Control

Overview

This control is performed to apply a developing bias (AC component, DC negative component) to the developing cylinder and attach the toner on the developing cylinder to the photosensitive drum (bright section) to form a toner image.

Details of the Control

- Developing DC bias
This bias generates a potential difference against the photosensitive drum. The bias value is determined by the relative humidity and process speed based on the charging DC bias (Vd) determined by potential control (Bk).
- Developing AC bias
This bias improves an image quality. The value of the developing AC bias is determined by relative humidity and process speed.

<Related Service Mode>

COPIER > DISPLAY > DENS > DEV-DC-K : Display of developing DC bias (Bk)

● Collection Roller Bias Control

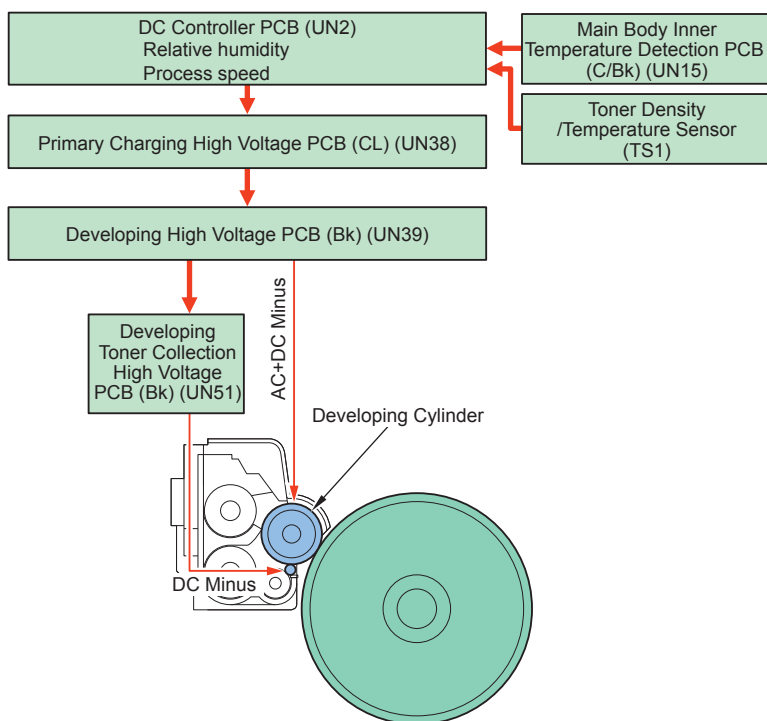

Overview

Toner scattered from the Developing Assembly is returned to the Developing Cylinder by the difference of biases of the Toner Collection Roller and the Developing Cylinder at the time of development.

Details of the Control

The collection roller bias (DC negative) created by the developing toner collection high voltage PCB (Bk) (UN51) is applied to the collection roller.

The value of the Toner Collection Roller bias is determined by the developing DC bias and the developing AC bias.

F-2-77

● ACR Control

Overview

The purpose of ACR (Auto Carrier Refresh) control is to keep long life of the developer, and developer is supplied from the toner container while gradually discharging developer in the developing assembly.

Details of the Control

The exit slot is located at the downstream side of the developer. The developer is discharged when the volume of the developer increases.

The same control is performed in the developing assembly of the Drum Unit / Developing Assembly (CL).

F-2-78

Developing Assembly Cooling Control

Overview

A cooling mechanism has been added to the Developing Assembly to prevent toner deterioration by heat.

F-2-79

Details of the Control

The Developing Assembly of each color sends cold air into the Cooling Duct using the Developing Cooling Fan (FM41, FM42, or FM43) on the front side of the host machine. The cold air sent into the Cooling Duct is discharged from the Developing Cooling Exhaust Fan (FM40) on the rear side of the host machine.

In the Cooling Duct, heat is exchanged between cold air in the duct and heat in the Developing Assembly by the Aluminum Fin and the Aluminum Guide [A]. This prevents deterioration of toner due to heat and allows significant reduction of toner ejection also in the case of low duty images.

● Primary Pre-transfer Charging bias control

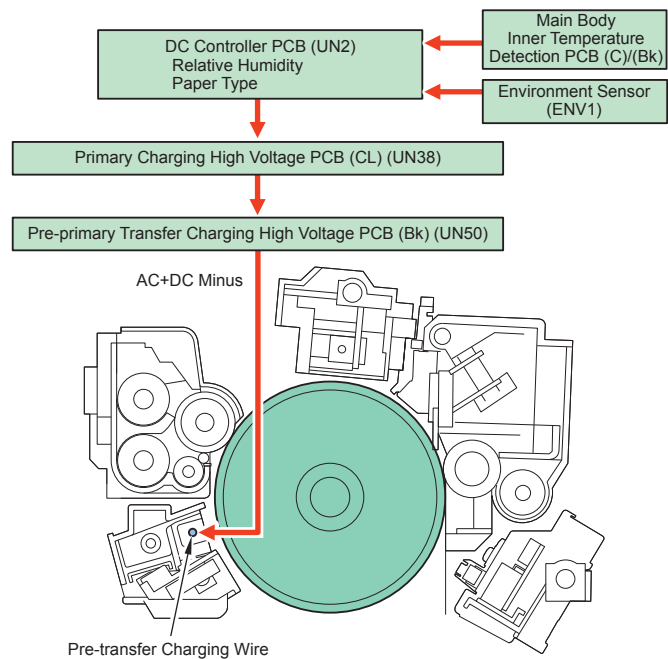

Overview

This control is performed to increase transfer efficiency by securing a proper toner charging volume on the photosensitive drum.

Details of the Control

The pre-primary transfer charging AC bias (5500Vpp) and the pre-primary transfer DC bias (0 to -350μA), which are generated on the pre-primary transfer charging high voltage PCB (Bk), are applied to the pre-primary transfer charging wire.

The primary pre-transfer charging bias value is determined based on the absolute water volume, relative humidity, and paper type.

F-2-80

● Primary Pre-transfer Charging Wire Cleaning Control

Overview

This control is performed to prevent a charging failure caused by dirt on the primary pre-transfer charging wire.

Timing of Execution

- At the time of automatic adjustment of paper interval (Every printing of 4000 images on an accumulation basis)
- At the time of automatic adjustment of last rotation (Every printing of 2000 images on an accumulation basi)
- At the time of multiple initial rotations(Fixing temperature is less than100 deg C)
- When "Wire Cleaning" is executed via the user mode

Details of the Control

When the screw rotates normally/in reverse driven by the primary pre-transfer charging wire cleaning motor (M2), the primary pre-transfer charging wire cleaning pad moves back and forth and cleans the primary pre-transfer charging wire.

<Related Service Mode>

● Primary Pre-transfer Charging Wire Shutter Control

Overview

To prevent uneven potential on the Photosensitive Drum caused by discharge products (nitrogen oxide) accumulated on the Pre-transfer Charging Assembly.

Timing of Execution

To be executed together with the Pre-transfer Charging Wire cleaning control at the same time.

Details of the Control

The shutter is opened or closed by the cleaning mechanism of the Pre-transfer Charging Wire.

The Pre-transfer Charging Shutter is made of fiber and usually taken up by the bobbin. The drive of the Pre-transfer Charging Wire Cleaning Motor (M2) moves the Cleaning Pad to the rear and the shutter taken up by the bobbin becomes extended to make the shutter closed.

Because the shutter comes between the Pre-transfer Charging Wire and the Photosensitive Drum, discharge products from the Pre-transfer Charging Wire do not reach the Photosensitive Drum.

The Pre-transfer Charging Wire Shutter HP Sensor (PS93) detects open/close of the shutter.

■ Cleaning

● Overview

This control is performed to remove residual toner on the photosensitive drum.

F-2-81

Parts name		Role
Drum cleaning unit		Scrape and collect the residual toner on the drum.
	Drum cleaning fur brush	Polish surface of the photosensitive drum to form a thin toner coated layer.
	Drum cleaning blade	Scrape the toner adhered to the drum surface.
	Waste toner feed screw	Feed the waste toner on the drum cleaning unit.
	Scoop-up sheet	Scoop up the waste toner which dropped from the drum cleaning unit.

T-2-34

Parts name		Role
M30	Drum cleaning/waste toner feed drive motor	Drive the drum cleaning fur brush and the waste toner feed screw.
LED1	Drum cleaning pre-exposure LED	Remove the drum memory on the photosensitive drum surface.
LED5	Drum Cleaning Post-exposure LED	It removes residual charge under toner that failed to be removed by the Pre-exposure LED.

T-2-35

● Drum Cleaning Pre-exposure

Overview

This control is performed to emit light from the pre-exposure LED to remove the drum memory on the photosensitive drum surface.

Details of the Control

Light is emitted from the drum cleaning pre-exposure LED on the patch sensor unit to remove the drum memory on the photosensitive drum surface so that dirt on the surface is prevented.

NOTE:

A potential difference at the edges of the toner layer transferred onto the ITB at primary transfer forms a minute gap between the photosensitive drum and the ITB, making a discharge symptom occur. This causes drum memory to occur on the photosensitive drum. The residual toner adhered to the cleaning blade is attracted to the drum memory, causing dirt on the photosensitive drum.

● Drum Cleaning Control

Overview

This control is performed to remove residual toner on the photosensitive drum by the blade engaged with the drum.

Details of the Control

- 1) The drum cleaning fur brush rotates, driven by the drum cleaning/waste toner feed drive motor (M30).
- 2) The drum cleaning fur brush polishes the surface of the photosensitive drum to form a thin toner coated layer.
- 3) The drum cleaning blade scrapes the residual toner on the drum surface.
- 4) The scraped waste toner is fed to the waste toner container by the waste toner feed screw.

NOTE:

Two sheets of Scoop-up Sheet are used to prevent the toner scraped by the drum cleaning blade from spilling into the unit.

● Drum Rotation Speed Control

Overview

This control is performed to keep a uniform drum rotation speed in order to increase accuracy of the image position (color displacement).

Details of the Control

- 1) The drum rotates, driven by the drum motors (Y: M19 / M: M20 / C: M21 / Bk: M22).
- 2) There is an encoder on the drum shaft, of which rotation is monitored by the two drum speed detection PCBs (Bk: UN18/19, Y: UN20/21, M: UN22/23, C: UN24/25).
- 3) The drum speed detection PCB counts the drum count based on a pulse, and feeds back the drum rotation speed to the drum ITB driver PCB (UN6) to perform speed control.

<Related Error Codes>

E012-04xx : Drum Motor (Bk) rotation detection error

● Drum Heater Control

Overview

This control is performed to keep the temperature of the photosensitive drum at a specified level and stabilize potential characteristics of charging and exposure, etc.

Details of the Control

The temperature of the photosensitive drum is controlled by the drum heater mounted inside of the photosensitive drum and by the drum thermo pile and the drum thermistor mounted on the photosensitive drum surface.

Operation Condition

		Main power SW	
		ON	OFF
Environment heater SW	ON	Follow the Environment Control.	ON*
	OFF	OFF	OFF

T-2-36

* When a power plug is inserted into the power outlet

Environment Control

- The control is always ON when the absolute moisture content is 11.1g or more (high-temperature and humidity environment).
- When absolute moist volume is less than 11g (normal temperature/low humidity environment), this control is OFF.

<Related Service Mode>

COPIER > ADJUST > HV-PRI > DHT-ON : Setting of Drum Heater (Bk) temperature

Details of the Control

- 1) The temperature on the drum surface is detected by the thermo pile.
- 2) The drum heater ON/OFF operation is repeated based on the detected temperature on the drum surface so that the temperature is kept at a specified level
- 3) When the upper limit temperature (50 degree C) is detected by the drum thermistor, the drum heater is turned OFF.

NOTE:

A thermo pile is an infrared sensor, which generates thermo electromotive force according to the amount of energy when receiving an infrared ray irradiated from an individual substance on a noncontact basis. The thermo pile enables accurate detection of the temperature on the drum surface.

F-2-85

■ Drum Unit / Developing Assembly (CL)

● Primary Charging Roller Bias Control

Overview

The primary charging bias (CL) charges the photosensitive drum surface with a uniform negative potential.

The primary charging bias (AC component, DC negative) created by the primary charging high voltage PCB (CL) (UN38) is applied to the primary charging roller.

Primary charging DC bias (CL): DC bias applied to the primary charging roller

Primary charging AC bias (CL): AC bias applied to the primary charging roller

Details of the Control

The primary charging DC bias is determined based on the absolute water volume (ENV1), total drum charging time, and process speed. The primary charging AC bias is dependent on the absolute water volume (ENV1), total drum charging time, and process speed, and the bias value is determined by discharged current control. (See "Discharged Current Control (CL)" for the details.)

F-2-86

COPIER > DISPLAY > DPOT > CHG-DCY3/M3/C3 : Dspl Y/M/C-clr primary charge DC bias:1/2SPD

● Developing Bias Control (CL)

Overview

This control is performed to apply the developing bias (AC component, DC negative) to the developing cylinder and to adhere the toner on the developing cylinder to the photosensitive drum (bright section) to form a toner image.

Details of the Control

• Developing DC Bias

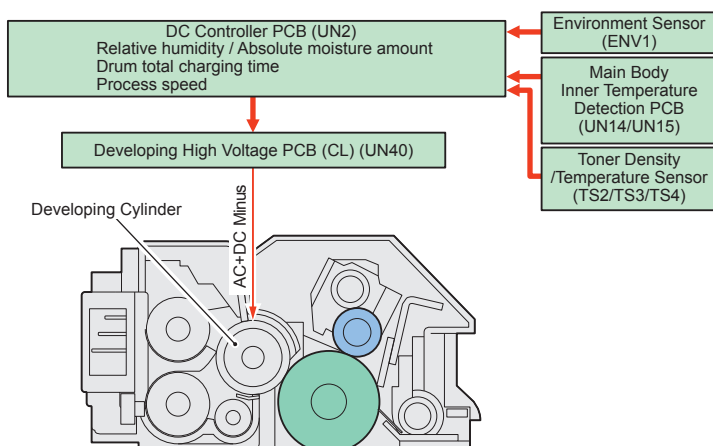

The developing DC bias generates a potential difference against the photosensitive drum.

The charging amount of the Drum is changed depending on the moisture content. The characteristics of the Drum change gradually while the Drum is used, therefore the charging amount of the Drum needs to be changed.

• Developing AC Bias

The developing AC bias improves the image quality.

The value of the developing AC bias is determined by relative humidity and process speed.

F-2-87

<Related Service Mode>

COPIER > DISPLAY > DENS > DEV-DC-Y/M/C : Display of developing DC bias (Y/M/C)

● Toner Collection Sheet Bias Control

Overview

Toner scattered from the Developing Assembly is returned to the Developing Cylinder by the difference of biases of the Toner Collection Roller and the Developing Cylinder at the time of development.

Details of the Control

The toner collection sheet bias (DC negative) created by the developing toner collection high voltage PCB (Y) / (M) / (C) (UN52/UN53/UN54) is applied to the toner collection sheet.

The value of the Toner Collection Sheet bias is determined by the developing DC bias and the developing AC bias. Toner dropped from the Toner Collection Sheet accumulates on the Toner Catch Sheet located under the Developing Assembly.

F-2-88

● Cleaning

Overview

F-2-89

Parts name	Role
Drum cleaning assembly	Scrape and collect the residual toner adhered to the drum.
Drum cleaning blade	Scrape the toner adhered to the drum surface.
Waste toner feed screw	Feed the waste toner in the drum cleaning unit.
Scoop-up sheet	Scoop up the waste toner dropped from the drum cleaning unit.
Light guide	Carry the light irradiated by the LED to the drum surface.

T-2-37

Parts name	Role
M30 Drum cleaning/waste toner feed drive motor	Drive the drum cleaning fur brush and the waste toner feed screw.
LED1 Drum cleaning pre-exposure LED	Remove the drum memory on the photosensitive drum surface.

T-2-38

● Drum Cleaning Pre-exposure (CL)

Overview

This control is performed to prevent reverse transfer of toner on the cleaning blade caused by drum memory.

Details of the Control

Light is emitted from the drum cleaning pre-exposure LEDs (LED 2 to 4) in the ITB cleaning unit to remove the drum memory on the photosensitive drum surface and prevent dirt on the surface.

The light emitted from the drum cleaning pre-exposure LEDs (LED 2 to 4) is exposed to the drum surface via the light guide.

NOTE:

A potential difference at the edges of toner layer transferred onto the ITB at primary transfer forms a minute gap between the photosensitive drum and the ITB, making a discharge symptom occur. This causes drum memory to occur on the photosensitive drum. When the residual toner adhered to the cleaning blade is attracted to the drum memory, causing dirt on the photosensitive drum.

F-2-90

● Drum Unit / Developing Assembly Presence Detection

This machine does not perform Drum Unit / Developing Assembly presence detection.

● Drum Unit Old/New Detection

This machine does not have a mechanism to detect whether the drum unit is old or new.

NOTE:

The drum unit potential characteristics (durability) change according to the total drum charging time. Therefore, the total charging time is internally maintained and used for bias control, etc. The charging time can be checked via the following service mode. When replacing the drum unit, the total charging time needs to be cleared via the service mode.

<Related Service Mode>

COPIER > FUNCTION > DPC > DRMRSETY/M/C/K: Forcible execution of the drum replacement mode. Clear the total drum charging time.

COPIER > DISPLAY > DPC > D-CONT-Y/M/C/K: Display the total drum charging time.

● Drum Heater Control

Overview

The drum heater is installed in the ITB unit to realize stable charging and exposure to deal with environmental changes in the machine.

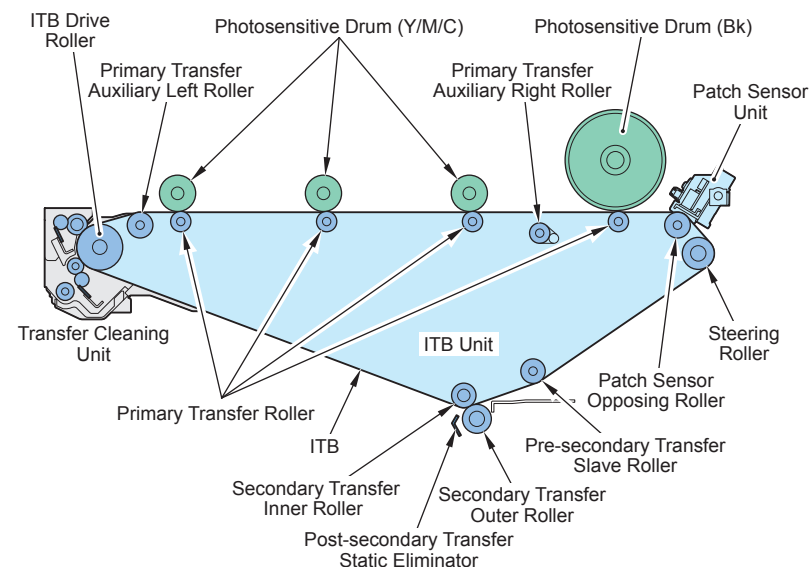

Operation Condition

- If the Environment Heater Switch is ON, while the host machine is OFF, the Drum Heater is always ON. While the host machine is ON, the Drum Heater is ON if the internal temperature is 25 deg C or less.

■ Transfer Assembly (ITB Unit)

● Overview

Toner on the photosensitive drum is transferred to the paper.

F-2-91

Parts name	Role
ITB unit	Transfer the toner on the photosensitive drum to the paper.
ITB (Intermediate Transfer Belt)	Transfer the toner on the photosensitive drum.
Primary transfer roller	Attract the toner on the photosensitive drum to the ITB.
ITB drive roller	Rotate the ITB.
Primary transfer auxiliary roller (left)	Form the ITB surface against the drum.
Primary transfer auxiliary roller (right)	Form the ITB surface against the drum (when the primary transfer roller is disengaged).
Steering roller	Correct the ITB displacement.
Transfer Cleaning unit	Remove residual toner on the ITB.
ITB cleaning screw	Feed the waste toner in the ITB cleaning unit.
Secondary pre-transfer slave roller	Stabilize the belt operation by belt displacement control.
Patch sensor unit	Detect the image density and registration patch for the patch image on the ITB.
Secondary transfer unit	Transfer the toner on the ITB to the paper.
Secondary transfer external roller	Feed the paper transferred. The roller is disengaged from the ITB when scanning a patch image.
Secondary transfer static eliminator	Remove a potential on the paper after secondary transfer is performed.

T-2-39

● Primary Transfer Bias Control

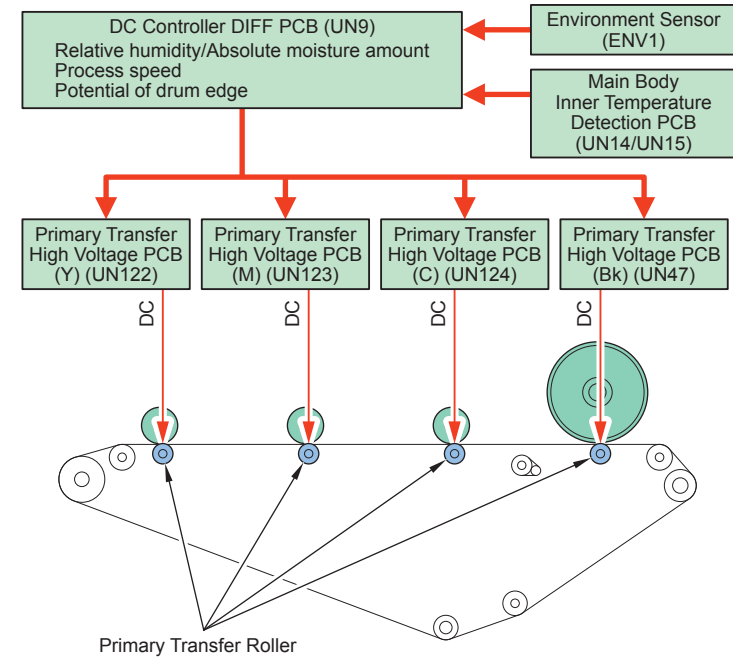

Overview

This control is performed to transfer the toner on the photosensitive drum to the ITB.

Details of the Control

The primary transfer bias (DC positive, DC negative (Bk)) created by the primary transfer high voltage PCB (UN43 to UN46) is applied to the primary transfer roller.

The primary transfer bias is dependent on the absolute water volume (ENV1), relative humidity (UN14/UN15), process speed, and drum dark section potential (Vd), and the bias value is determined by primary transfer ATVC control.

● Primary Transfer Roller Disengagement Control

Overview

To prolong the life of image formation parts (photosensitive drum, ITB), the primary transfer roller for color is disengaged at Bk single-color mode.

Engagement/Disengagement Condition

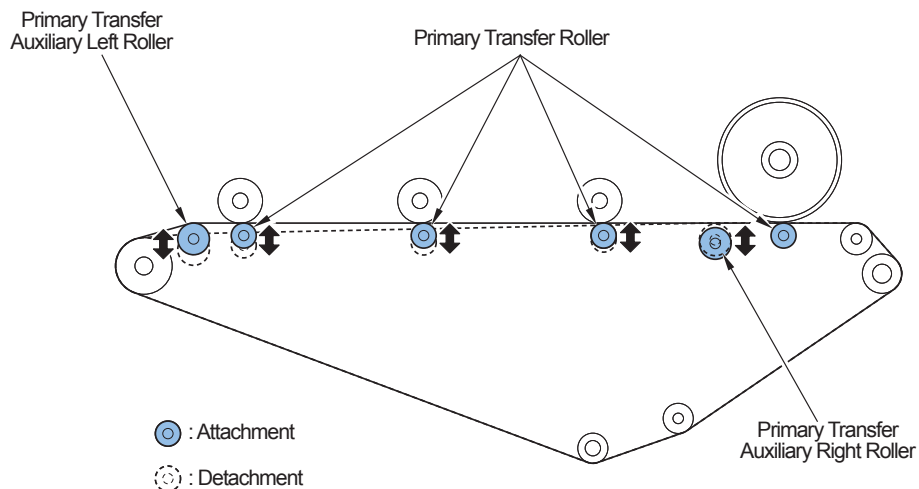

Engagement: When a color mode is specified

Disengagement: At the timing other than that mentioned above. However, disengagement operation is not performed when the machine starts up with 4-color mode and the mode is switched to Bk single-color mode. (High voltage is turned off.)

Mode	Bk		YMC	
	Roller	High voltage	Roller	High voltage
Bk single-color mode	Engagement	ON	Disengagement	OFF
Color mode	Engagement	ON	Engagement	ON
Bk single-color mode (disengagement) - > Color mode	Engagement - > Engagement	ON- > ON	Disengagement - > Engagement	OFF- > ON
Color mode - > Bk mode	Engagement - > Engagement	ON- > ON	Engagement - > Engagement	ON- > OFF
Bk single-color mode (engagement) - > Color mode	Engagement - > Engagement	ON- > ON	Engagement - > Engagement	OFF- > ON
At 248 mm/sec , 174 mm/ sec (coated paper, etc.)	Engagement	OFF	Engagement	OFF

T-2-40

* When the mode is switched from Bk mode (disengagement) to 4-color mode, the drive of the Bk drum and ITB is stopped and then engagement operation is performed.

F-2-93

Details of the Control

- 1) The cam rotates, driven by the primary transfer roller disengagement motor (M5).
- 2) The link lever slides, driven by the rotation force of the cam.
- 3) The pressure release lever rotates when the link lever slides, and the primary transfer roller for color is disengaged from the ITB.
- 4) At the same time, the pressure release cam also rotates. The primary transfer auxiliary roller (right) moves up and the primary transfer auxiliary roller (left) moves down.
- 5) The position of the primary transfer roller is detected by the primary transfer roller attachment/detachment HP sensor (PS5).

● Secondary Post-transfer Static Eliminator Bias Control

Overview

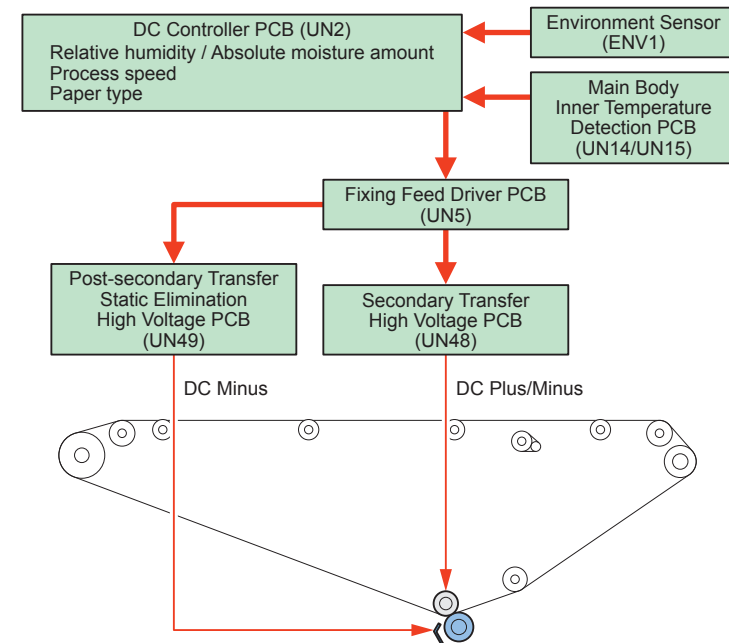

This control is performed to make it easier to separate the paper from the ITB.

Details of the Control

The secondary transfer static eliminator bias (DC negative) created by the secondary post-transfer static eliminator high voltage PCB (UN49) is applied to the secondary post-transfer static eliminator.

The secondary transfer static eliminator bias (DC negative) is determined based on the absolute water volume (ENV1) and paper type.

In an environment other than a low temperature and low humidity, apply -1000 V only to the 2nd side of thin paper (52 to 79 g)

F-2-95

<Related Service Mode>

COPIER > DISPLAY > HV-ST5 > 2EL : Set of Sec Trns Static Eliminator bias

● Secondary Transfer External Roller Disengagement Control

Overview

This control is performed to prevent dirt on the secondary transfer external roller.

Timing of Execution

Engagement: At the time of printing, cleaning of the secondary transfer roller

Disengagement: At the timing other than that mentioned above

Details of the Control

- 1)The detachment cam rotates, driven by the secondary transfer external roller detachment motor (M31).
- 2)When the detachment cam rotates, the secondary transfer external roller is engaged with and disengaged from the ITB.
- 3)The position of the secondary transfer external roller is detected by the secondary transfer external roller detachment HP sensor (PS22).

F-2-96

<Related Error Codes>

E077 : Secondary Transfer Roller Detachment HP Sensor timeout error

Secondary Transfer External Roller Cleaning Control

Overview

This control is performed to prevent dirt on the backside of paper caused by dirt on the secondary transfer external roller.

Timing of Execution

- At the time of initial rotation
- At the time of last rotation
- During printing

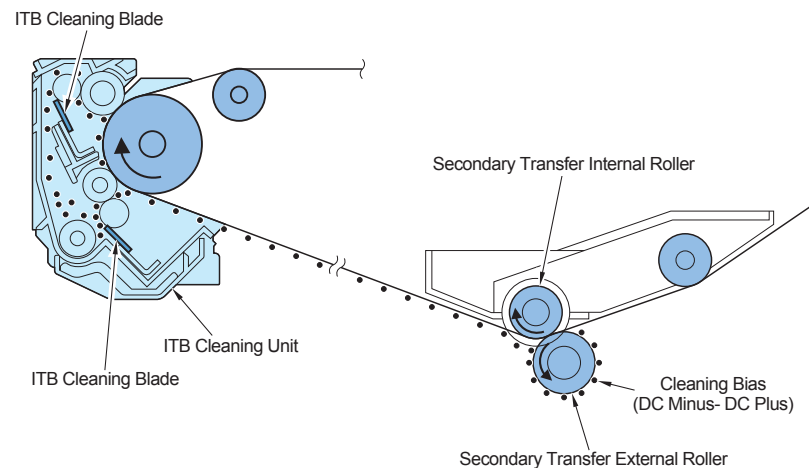

NOTE:

Cleaning of the Secondary Transfer Roller is executed together when the following controls are executed.

- D-max control
- D-half control
- ARCDAT control
- ATR control (patch formation)
- Low Duty Toner Ejection Sequence
- Black Band Sequence
- Image position correction

Details of the Control

- 1)The secondary transfer cleaning bias (DC positive, DC negative) created by the secondary transfer high voltage PCB (UN48) is alternately applied to the secondary transfer external roller.
- 2)The toner on the secondary transfer external roller adheres to the ITB, and is collected by the ITB cleaning unit.

F-2-97

● Separation

Overview

Paper is separated from the ITB.

Separation is performed using the curvature separation mechanism (mechanical method) and the Static Eliminator (static method).

DC bias is applied to the Static Eliminator to absorb excess electric charge on paper for improved paper separation. The value of the Static Eliminator DC bias varies depending on the absolute moisture content (ENV1), paper type and process speed.

In an environment other than a low temperature and low humidity, apply -1000 V only to the 2nd side of thin paper (52 to 79 g)

By grounding the Attraction Plates, attract paper toward the Attraction Plate.

F-2-99

● ITB Displacement Correction Control

Overview

This control is performed to prevent damage to the ITB caused by ITB displacement.

Timing of Execution

During ITB rotation

Details of the Control

- 1) When the ITB is displaced to the front side or rear side, the edge of the ITB activates the ITB displacement sensor (Right) flag.
- 2) The position of the ITB Displacement sensor (Right) flag is detected by the ITB displacement sensor (PS2) (Refer to <Detection of ITB position >). The ITB steering motor (M4) is driven according to the position of the ITB.
- 3) When M4 is driven, the steering cam rotates and the support arm moves up and down. This operation tilts the steering roller.
- 4) When the steering roller tilts, a difference of tension is generated on the ITB, and the ITB moves to the front side or rear side.
- 5) The operation from Step 1 to 4 is repeatedly performed to correct ITB displacement.
- 6) The position of the steering roller is detected by the steering roller HP sensor (PS3).
- 7) The HP mark (white) on inside of the ITB is used when correcting unevenness on the edge of the ITB that is detected by PS3 (Refer to <Profile of ITB edge shape >).
- 8) Skew of the ITB is measured on the basis of information of the ITB Displacement Sensor (Left) (PS128) and the ITB Displacement Sensor (Right) (PS2).
On the basis of this ITB skew information, the position of each color transferred onto the ITB (the position on the Drum irradiated with laser) is adjusted to reduce color displacement.

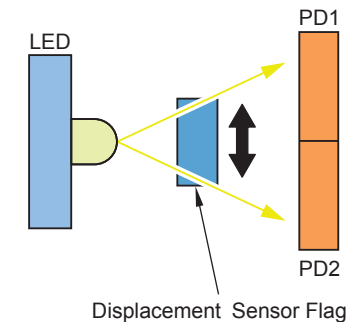

F-2-100

Detection of ITB position

The ITB Displacement Sensors (PS2 and PS128) each consist of an LED and 2 photodiodes (PD).

The amount of light received by the 2 PDs in the ITB Displacement Sensor changes depending on the position of the displacement sensor flag.

By detecting this amount of light received, the shift amount of the Displacement Sensor Flag is calculated to determine the displacement amount of the belt position.

F-2-101

Profile of ITB edge shape

ITB edge is shaped in the wavy line, not in the straight line. Therefore, if the ITB position is detected without considering this ITB edge shape, the correct position cannot be detected. This edge shape varies in each ITB.

At ITB replacement, the profile of ITB edge shape is created using the service mode and recorded. By referring to this profile and measurement result by ITB Displacement Sensor, the correct ITB position is detected.

ITB HP Sensor (PS5) detects the HP mark (white) on inside of the ITB, creates the profile and recognizes the standard position at ITB displacement correction.

NOTE:

When replacing the belt, be sure that the HP mark (white) is located on the rear side.

Neutral position of Steering Roller

This control shifts ITB by tilting Steering Roller. Neutral position of Steering Roller is memorized and ITB displacement is corrected by tilting Steering Roller. This neutral position is detected and recorded by executing the service mode.

NOTE:

- Because the ITB edge shape differs depending on the ITB, a profile for the edge shape needs to be created via the service mode when replacing the ITB. The ITB HP sensor (PS5) detects the standard position for profile creation and ITB displacement correction. ITB displacement is corrected by matching the profile with the result of measurement by the ITB displacement sensor.
- In this control, ITB movement is determined by the tilt of the steering roller. The neutral position of the steering roller is memorized, and the steering roller is slanted to correct ITB displacement.

● ITB Speed Control

Overview

This control is performed to keep a constant ITB speed to increase accuracy of the image position.

Details of the Control

To keep a constant ITB speed, the encoder connected to the ITB drive roller is monitored. The rotation of the encoder is counted by the ITB drive roller speed detection PCB 1/2 (UN16/UN17) on a pulse basis so that the rotation volume of the ITB drive roller is fed back to the DC controller interface PCB (UN2) for speed control.

Toner Supply Assembly

Overview

Toner in the toner container is supplied to the developing assembly.

Open/close operation of Toner Container is executed automatically. Therefore, Toner Container cannot be normally installed/removed before the toner in the Toner Container runs out.

F-2-103

Parts name	Role
Toner supply drive unit	Supply the toner in the toner container to the hopper unit.
Cap drive link	Connect to the toner cap to open/close the toner cap.
Cap release holder	Release the connection between the toner cap and the cap drive link.
Release holder shift cam	Send the motor rotation drive to the cap drive link as back-and-forth movement.
Hopper unit	Supply the toner in the hopper unit to the developing assembly.
Toner feed screw	Feed the toner in the hopper unit.
Stirring plate	Stir the toner in the hopper unit.
Toner supply screw	Supply toner to the developing assembly.
Toner container	Supply the toner in the toner container to the hopper unit, driven by the toner supply drive unit.
Cap lock shaft	Lock the toner cap.
Toner supply plate	Pump the toner in the toner container.

T-2-41

● Toner Cap Automatic Open/Close Control

Overview

This control is performed to automatically open and close the toner container cap.

Timing of Execution

At the time of replacement of the toner container

Details of the Control

- 1) The toner cap HP sensors (PS8/PS11/PS14/PS17) detect the toner cap position, and the toner cap rotation phase sensors (PS81 to PS84) detect the phase of the toner cap and the cap release holder against the toner container.
- 2) When the toner container drive motors (M7/M10/M13/M16) are driven re-clockwise, the cap drive link and the cap release holder move to the right side (to the toner container side).
- 3) The toner cap is fixed with the cap drive link. At the same time, the cap lock shaft is pressed to the right side, and the cap is unlocked.
- 4) The toner container drive motors (M7/M10/M13/M16) are further driven, and the cap release holder and the cap drive link move to the left side in this order.

Closing Operation

- 1) When the toner container drive motors (M7/M10/M13/M16) are driven re-clockwise, the cap drive link and the cap release holder move to the right side (to the toner container side).
- 2) The toner cap is closed to the toner container. At the same time, the cap release holder bends the cap release claw, and the cap fixed to the cap drive link is released.
- 3) The motor is driven, and the cap drive link and the release holder move to the left so that the toner container can be removed.

F-2-104

	Release holder shift cam HP sensor	Toner cap rotation phase sensor
Closed	Light shielding	Light shielding
Moving (Closed => Opened)	Transmission	Transmission
Opened	Light shielding	Transmission

Detection Method	-	-	Hopper Toner Level Sensor *3	Toner Supply Count *1*2
Message	-	-	Replace the toner cartridge	No toner *4
Operation of the host machine	-	-	Continuous printing is enabled	Host machine is stopped
Detection timing	-	Prediction from the toner supply count (Judged from the number of supplying toner to the Hopper Unit.)	When no toner is detected by the Toner Level Sensor in the hopper after the toner level inside the Toner Container becomes 0%	When the number of counts by the video counter has reached the specified value since no toner is detected by the Toner Level Sensor in the hopper after the toner level inside the Toner Container becomes 0%
The exchange right or wrong of the toner bottle	Impossible * The value can be changed in service mode	Impossible * The value can be changed in service mode	Possible	Possible
Alarm code	-	10-0017 10-0018 10-0019 10-0020	-	10-0001 10-0002 10-0003 10-0004

F-2-107

- *1The counter counts 1 up when Toner Supply Screw rotates once.
- *2Estimation based on the toner supply count accumulation value
- *3Detection by Hopper Toner Level Sensor. Even the sensor output changes from H to L and Toner Container Drive Motor is driven, the sensor output remains to be L. Toner Container Drive Motor drives for 2 seconds and stops for 1 second, and these operations are repeated 20 times at maximum. (Repeated operation)
- *4When the Toner Container is empty, how and when the message is displayed differs between Bk and color.
 Bk: When the toner level status is "End", a pop-up is displayed to prompt replacement.
 Color: When the toner level status is "End", a message is displayed in the warning bar. (No pop-up is displayed)
 When a color printing job is received later, a message is displayed in a pop-up to prompt replacement.
- *5Position of near-end line varies due to the number of prints and image duty during repeated operation. Approximately 1,500 prints can be made from near-end line to end line (A4; 5% image).

● New toner bottle detection

F-2-108

Each Toner Bottle has a unique bottle ID.

The bottle ID is printed as a bar code on the Toner Bottle, and is read by the Toner Container ID Read Sensor (UN112, UN113, UN114, or UN115) when the Toner Bottle is installed to the host machine.

The read Toner Bottle ID is saved in the D-CON, where up to 1,000 IDs can be stored. The host machine determines whether the Toner Container is new or old on the basis of the read number.

Toner Bottle counters (X = 1 to 4: Bk, Y, M, and C)

Common name	Counter number	Advancement of the counter
Toner Bottle counter	007X	When a new part (a new bottle ID number) is detected
Toner Bottle replacement (including premature removal)	008X	When a new part (a new bottle ID number) is detected When the same bottle ID number as that of a Toner Bottle which had been inserted before is detected When a Toner Bottle with an unidentified bar code is detected
Unidentified toner replacement	018X	When a Toner Bottle with an unidentified bar code is detected

T-2-44

<Related alarms >

- Toner Bottle replacement alarm: 100100-XXXX (-XXXX represents the foregoing counter number.)
- An alarm is generated when 007X or 008X advances.
- The alarm 008X is generated only when a Toner Bottle that was removed before it becomes empty is inserted into the host machine again. (The alarm 008X is not generated when a new Toner Bottle or a Toner Bottle with an unidentified bar code is detected.)
- The alarm log is maintained in the host machine, and a notification is sent to UGW.

■ Waste Toner Feed Assembly

● Overview

The waste toner in the drum cleaning unit and the ITB cleaning unit is fed to the waste toner container.

F-2-109

Parts name	Role
Waste toner feed unit	Feed the waste toner to the waste toner container.
Waste toner feed screw	Feed the toner in the waste toner feed unit.
Waste toner container	Store the waste toner.

T-2-45

● Waste Toner Full Level Detection

Overview

The following two types of detection are performed to detect the volume of the waste toner collected into the waste toner bottle.

- Detection by the waste toner counter (Count-up Sheets)
- Detection by the waste toner full level sensor (TS9)

Message type	Machine operation	Waste toner level	Detection condition
Advanced notice for full level waste toner	"Waste toner reached the full level" is displayed on the control panel.	80%	-In case of reaching stated sheets*1 of waste toner counter [count-up sheets] or -In case of detection of the toner by waste toner full sensor [TS9] [8.5% manuscript notes of average image duty are equivalent to 90,000 sheets.]
Full level waste toner	"Waste toner reached the full level is displayed, and the machine operation stops.	100%	When 12,500 sheets are printed after the advanced notice for full level waste toner was displayed (Waste toner counter)

T-2-46

The DC controller checks TS9 and the waste toner counter every time when the power is turned on and the front door is opened/closed, and it sends the two types of messages (Advanced notice for full level waste toner, Full level waste toner) to the main controller.

● Waste Toner Container Presence Detection

Overview

This machine does not perform waste toner container presence detection.

F-2-110

Presence of the Waste Toner Container is detected by the Waste Toner Shutter Open/Close Sensor (PS138).

The sensor is turned ON when the Waste Toner Container is pushed into place.

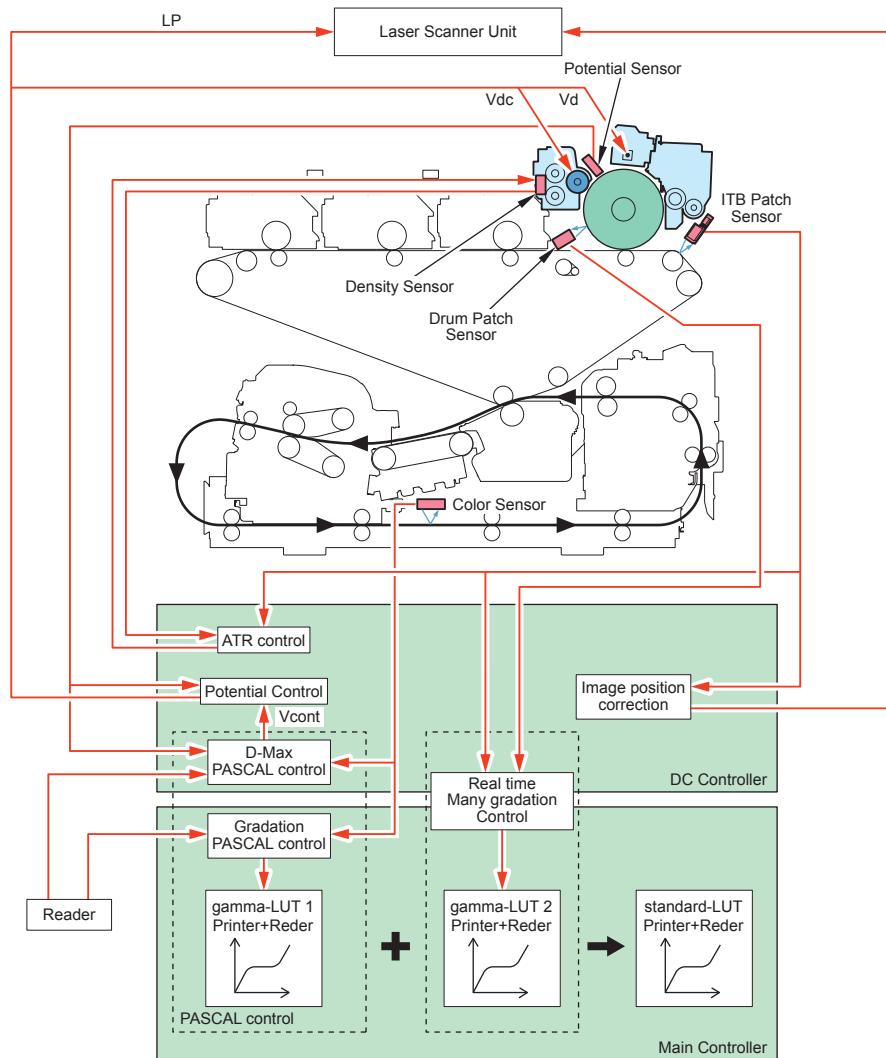

When pulling out the Waste Toner Container, the shutter part is moved toward the front by spring force so that the sensor is turned OFF and the lid is closed to prevent toner spilling.

Image Stabilization Control

Overview

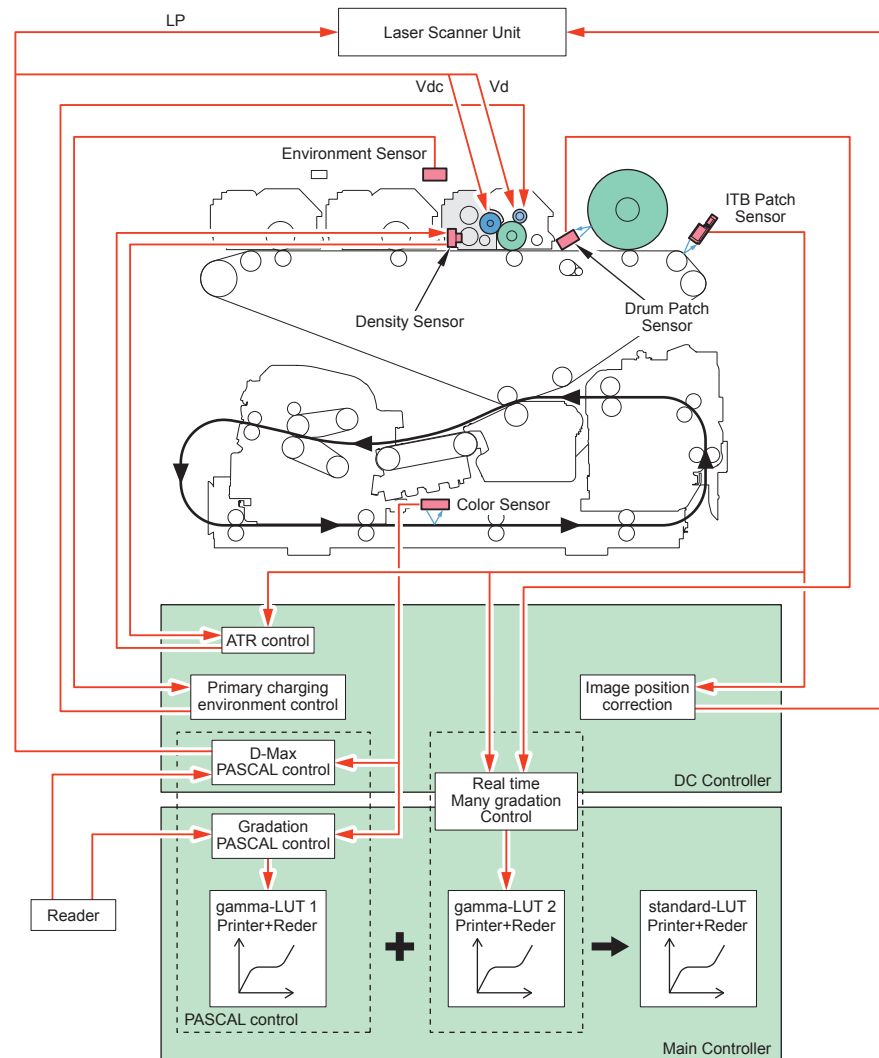

This control is performed to prevent an image failure caused by environmental changes and deterioration of the photosensitive drum, etc. so that stable printing operation can be performed.

<Bk >

T-2-47

A: Executed

B: Executed only when the specific conditions are satisfied

D-maxPASCAL Control

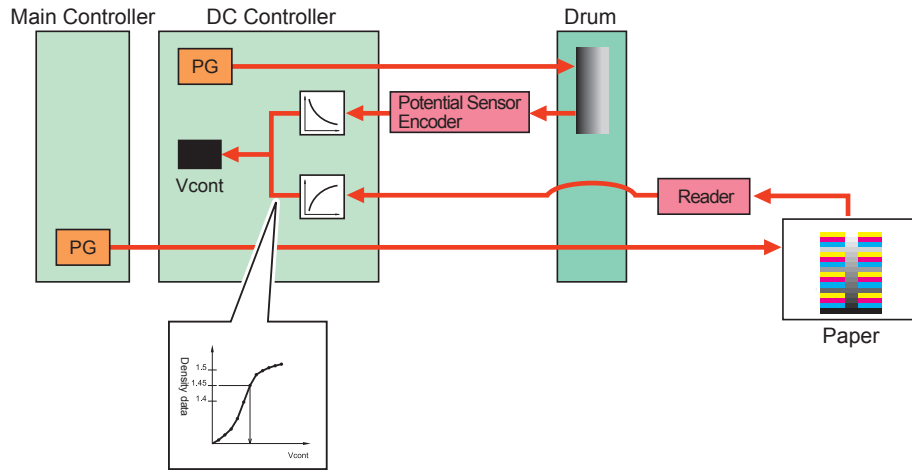

Overview

This control is performed to correct the target density for D-max control.

Timing of Execution

At the time of PASCAL control (1st page in test print)

For Bk

F-2-114

Details of the Control

1. Measuring the bright section potential

A solid image (test print) created by the DC controller is formed on the photosensitive drum. While changing the laser power value by 8 levels (halftone), the potential sensor measures the bright section potential.

The DC controller calculates the laser emission time and the bright section potential (VL) according to the measurement result.

F-2-115

2. Measuring the patch density

A solid image (test print) created by the main controller is printed.

While changing the laser power value by 8 levels, a halftone image is formed.

The halftone image is read by the reader and reported to the DC controller.

The DC controller calculates the laser emission time and the characteristics of the density.

F-2-116

3. Determining the target density "Vcont" for D-max control

The bright section potential "VL_target" needed to obtain the target density (1.7) is calculated based on the two characteristics calculated in the above-mentioned procedure.

F-2-117

The target density "Vcont" for D-max control is calculated based on VL_target.

$$V_{cont} = V_d - V_{L_target} - V_{back}$$

Vd: Bright section potential

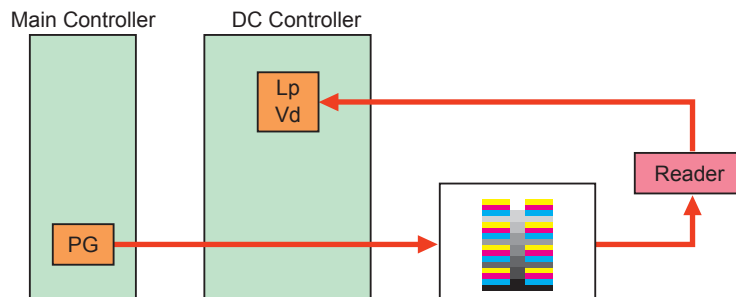

Vback: Voltage to remove fogging in copy operation

F-2-118

<Related Service Mode>
 COPIER > DISPLAY > DPOT > VCONT-K : Dspl Bk dev contrast potential: 1/1 SPD

For Color

F-2-119

Details of the Control

1. Measuring the patch density

A solid image (test print) created by the main controller is printed.

The solid image is read by the reader and reported to the DC controller.

The DC controller determines the laser power and the charging DC bias so that the density of 1.7 can be obtained.

F-2-120

Test Print

For automatic gradation correction, test print is performed to 3 sheets. Dmax-Pascal control is performed, using 1 out of these 3 sheets.

Potential Control (Bk)

Overview

A potential on the photosensitive drum surface changes due to factors of static latent images such as deterioration in sensitivity of the photosensitive drum and environmental changes, etc., even when the same voltage is applied.

Changes due to factors of static latent images are corrected by potential control so that stable printing operation is performed.

In potential control, a laser power where the target contrast potential (V_{cont}) is obtained is determined by measuring a potential while changing laser power (L_p) after charging the photosensitive drum surface with a uniform potential.

Timing of Execution

- At auto gradation adjustment
- At warm-up rotation auto adjustment (at power-on)

Details of the Control >

1. Determining the grid bias (V_g_target)

V_g_target is the grid bias required to set the target potential on the drum surface (approx. -650V) to V_d_target . V_d_target varies depending on the environment and process speed.

V_d_rgh is the result of measurement by the potential sensor when $V_g_rgh = V_g_target - 100$ (V) is applied to the primary grid plate.

The grid bias V_g_target is determined based on the ratio of this measurement result and the target potential.

$V_g: V_d = V_g_target: V_d_target = V_g_rgh: V_d_rgh$

$V_g_target = V_d_target * V_g_rgh / V_d_rgh$

2. Determining the laser power (L_p) and the developing DC bias (V_{dc})

Exposure is performed while changing the laser power (L_p) by 11 levels (H40 to HD9), and a potential in the bright section (V_L) is measured by the potential sensor.

The laser power (L_p) where the target contrast potential (V_{cont}) can be obtained is determined.

$V_L = V_d_target + (V_{cont} * V_{back})$

*Determined by auto gradation adjustment control and the environmental table

● PASCAL Control

Overview

This machine carries out PASCAL control (gradation density correction control) to obtain ideal image characteristics.

There are 2 types of PASCAL controls: printer PASCAL and reader PASCAL.

Details of the Control

<Printer PASCAL >

The patch patterns on the test print are scanned by the Auto Gradation Sensor (option), and the image characteristics are corrected based on the results.

Operation of this control is shown below.

1. D-max PASCAL: Output a sheet of paper where 10 patch patterns for each color are contained.
2. Gradation PASCAL: Output 8 sheets of paper in total where 22 patch patterns for each color are contained.
3. Based on the results, the machine recreates the image characteristic table.

D-max PASCAL patterns

F-2-122

Gradation PASCAL patterns

F-2-123

<Reader PASCAL >

The patch patterns on the test print are scanned by the Reader, and the image characteristics are corrected based on the results.

Operation of this control is shown below.

1. D-max PASCAL: Output a sheet of paper where 32 patch patterns for each color (Y, M, and C) and 8 patch patterns for Bk are contained.
2. Gradation PASCAL: Output 2 sheets of paper in total where 60 patch patterns for each color are contained.
3. Based on the results, the machine recreates the image characteristic table.

● Real-time Multiple Tone Control

Overview

After image patches for each color are formed on the ITB, gradation of the entire density area is corrected by scanning the patches with the Patch Sensor.

There are 2 types of the control and they operate according to the condition of the machine.

1. Real-time multiple tone correction (full adjustment)

Execution timing

At power-on

At recovery from sleep state (in the case that the fixing temperature is below 100 deg C)

Number of patches

160 patches (40 patches for each color)

Time required for the control

Approx. 9 seconds

2. Real-time multiple tone correction (quick adjustment)

Execution timing

At initial rotation (when switching process speed, when switching Bk/color mode)

At paper interval (approx. every 40 to 82 images on an accumulated basis) (see note 1)

At last rotation (approx. every 40 images on an accumulated basis)

Number of patches

40 patches (10 patches for each color)

Time required for the control

Approx. 5 to 11 seconds (see note 1)

Note 1: It differs depending on the process speed.

SPD

● Primary Charging Environment Control (CL)

Overview

This machine carries out control for obtaining optimal primary charging bias in response to changes in temperature and humidity.

Owing to this control, the primary charging AC bias is determined on the basis of the temperature information from the Main body Temperature Sensors (UN14 and 15) in order to stabilize the primary charging applied to the Drum.

Timing of Execution

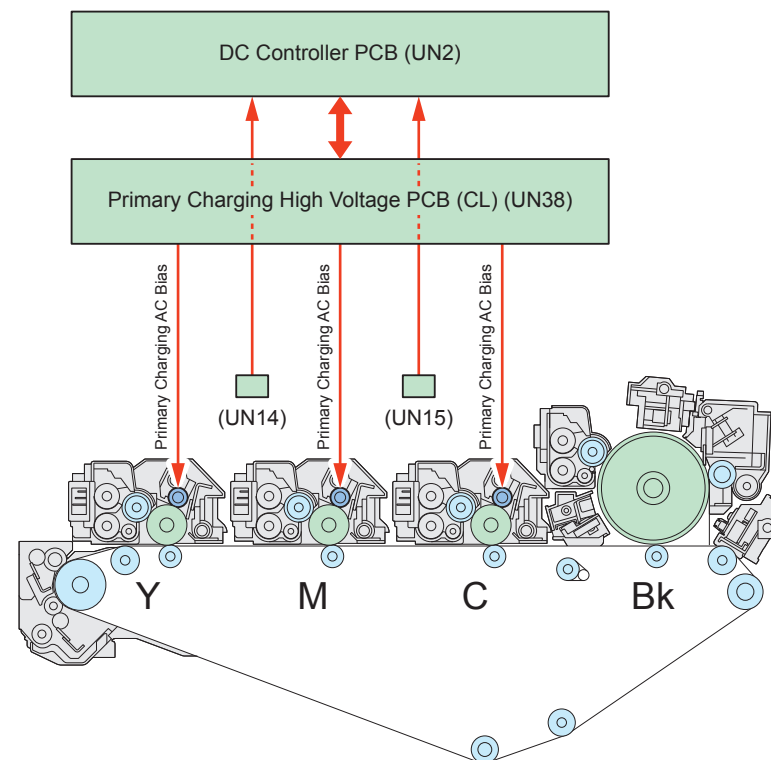

- At power-on
- At auto gradation adjustment
- Before printing the first sheet of each job
- Every 20 sheets printed in a job

Details of the Control

- 1) The Main body Temperature Sensors (UN14 and 15) detect the temperature of the Developing Assembly of each color.
- 2) The primary charging AC bias for each color is determined on the basis of the foregoing temperature information.

F-2-126

F-2-127

● ATR Control

Overview

This control is performed to supply developer so that an ideal ratio of the toner and carrier (T/D ratio) can be obtained in the developing assembly.

Timing of Activation

- Control of the supply volume by video count: Executed for each print during printing
- Correction by the toner density sensor for the developing assembly: Executed for each print during printing
- Correction by the patch sensor
 - At the time of power-on (Fixing temperature at lower than 100 degree C)
 - Every image
 - Real-time Multiple Tone Control
 - Low Duty Discharge Sequence
 - Last rotation auto adjustment (equivalent to 50 images on an accumulation basis or more than 8-sheet of A4 size solid images with the accumulation video count)
 - Paper interval (equivalent to 200 images on an accumulation basis or more than 60-sheet of A4 size solid images with the accumulation video count)
 - At interruption operation (equivalent to 400 images on an accumulated basis or 90 sheets or more of A4 size solid images with the accumulation video count)

Details of the Control

Developer is supplied to the developing assembly so that an ideal T/D ratio can be obtained. The DC controller interface PCB (UN2) judges the toner supply volume based on the following three types of data.

- Video count
- Density sensor
- Patch sensor

When the DC controller interface PCB (UN2) judges that toner needs to be supplied, it drives the hopper stirring/supply motors (M6/M9/M12/M15) and rotates the toner supply screw to supply toner into the developing assembly. When the number of rotations of the screw is detected by the toner feed screw rotation sensors (PS9/PS12/PS15/PS18), the toner supply volume can be detected.

Image Position (Color Displacement) Correction

Overview

This control is performed to correct color displacement caused by uneven irradiation by the laser scanner unit or uneven rotation of the drum and ITB.

Timing of Execution

At warm-up rotation

- 1) Every 1,000 images
- 2) When the temperature of the Laser Scanner Unit has changed by 2 deg C or more
- 3) When the temperature measured by the Environment Sensor has changed by 2 deg C or more

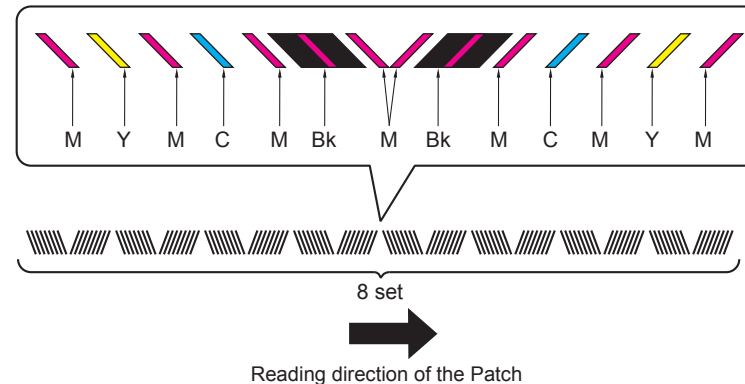

Details of the Control

Base is the M pattern. Displacement level of patch pattern (each color) is detected and image position is corrected.

F-2-129

<Patch >

F-2-130

Type of the control	<Details of the Control >	Patch pattern to be used
Correction of the writing position in the main scanning direction	Change the timing of laser writing.	Rear/Front/Center

● Primary Transfer ATVC Control

This control is performed to determine an appropriate transfer bias to prevent a transfer failure caused by environmental changes and durability variation of the primary transfer roller. Two types of primary transfer ATVC are performed. One is the primary transfer full ATVC, which is performed at the time of last rotation or initial rotation, and the other is the primary transfer paper interval ATVC, which is performed in paper interval.

Primary transfer FullATVC: to determine the primary transfer bias to run the target current
 Primary transfer paper interval ATVC: transfer bias calculated by the primary transfer FullATVC is corrected at paper interval to run the target primary transfer current

● Primary Transfer Full ATVC

Execution timing

Last rotation auto adjustment (every 300 images on an accumulated basis)

Auto adjustment of interruption operation during printing (every 400 images on an accumulated basis)

Control description

1. Determine the target current

The target current I_{target} is determined on the basis of temperature and humidity information obtained from the Environment Sensors (ENV1, UN14, and UN15).

2. Calculate the target voltage value

A target provisional current I' , which is estimated to be close to the target current I_{target} , is applied, and the voltage value V' at that moment is measured.

If V' is larger than the target current I_{target} , $V_a = V' - \Delta V_r$ (offset value) is applied. If V' is smaller, $V_b = V' + \Delta V_r$ is applied. Then, the current I_a or I_b at that moment is measured.

By connecting the two points (V_a, I_a) and (V_b, I_b) with a straight line, a linear graph of primary approximation is obtained.

The target voltage value V_{rough} for I_{target} is determined on the basis of this graph.

F-2-134

This control is performed for each of the process speeds (348 mm/s, 248 mm/s, and 174 mm/s).

● Primary Transfer ATVC Control

Timing of Execution

In printing

Details of the Control

At the time of printing operation, sampling of a transfer current is performed between each image. When the transfer current obtained in sampling is displaced from the target transfer current, correction of the transfer current is performed.

This control is performed for each of the process speeds (348 mm/s, 248 mm/s, and 174 mm/s) to determine the transfer voltage.

Secondary Transfer ATVC Control

Overview

This control is performed to determine an appropriate transfer bias to prevent a transfer failure caused by environmental changes and durability variation of the secondary transfer roller.

Please note that the primary transfer DC bias is determined based on the sum of the base voltage "Vb", which is determined by this control, and the paper shared voltage "Vp", which differs depending on the paper type.

Two types of secondary transfer ATVC are performed. One is the primary transfer full ATVC, which is performed at the time of last rotation and initial rotation, and the other is the primary transfer paper interval ATVC, which is performed at paper interval.

Secondary transfer FullATVC: to determine the secondary transfer bias to run the target current

Secondary transfer paper interval ATVC: transfer bias calculated by the secondary transfer FullATVC is corrected at paper interval to run the target secondary transfer current

Secondary Transfer Full ATVC Control

Timing of Execution

At the time of initial rotation

Details of the Control

The same control as that for the primary transfer full ATVC is performed.

This control is performed for each of the process speeds (348 mm/s, 248 mm/s, and 174 mm/s) to determine the transfer voltage.

```

Secondary Transfer Paper Interval ATVC

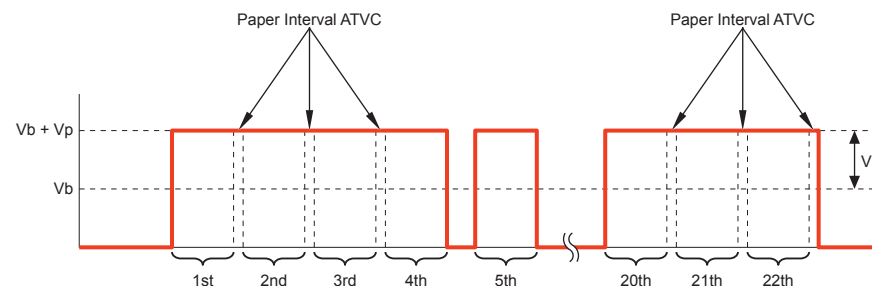

Timing of Execution

At paper interval

The base voltage Vb and the paper allotted voltage Vp are applied to the first 3 sheets of every 20 sheets being printed, and the transfer current at that moment is sampled.

If the sampled transfer current differs from the target transfer current, the secondary transfer bias is corrected.

In the case of continuous printing, this control is performed every 100 sheets only if the number of sheets exceeds 60.

Overview of Patch Sensor

With this machine, patch images of each color are read regularly by the Patch Sensors to perform halftone correction.

There are 2 types of Patch Sensors: sensors for color printing, and sensor for B&W printing. As for the Patch Sensor for color printing, 3 sensors are arranged to read patches on the ITB. (PS21, PS129, and PS130)

Since toner floats near the ITB, output of the light-emitting part may decrease due to soiling on the Patch Sensor.

Because of this, the Guide Plate has been provided on the shutter surface, and the Patch Sensor emits light and receives reflecting light from the Guide Plate on a regular basis. This enables to keep the sensor output always constant by increasing the output when decrease in output of the light-emitting part occurs.

Patch images cannot be read with the Patch Sensor for B&W printing because color of the ITB is black. Therefore, patch images are formed on the drum, and the sensor read the images. Because of that, the sensor for B&W printing is located opposite to the drum. (PS135)

F-2-136

<Shutter : Close>

<Shutter : Open> F-2-137

F-2-138

Sampling of the drum background (Bk)

To prevent uneven reflection from the drum, the background for a whole circumference of the drum is sampled by the Patch Sensor without forming patches.

When reading patch images, the sampling results of the drum background are corrected.

● Drum Idling Rotation

Overview

Drum idling is performed to remove discharge products generated on the drum surface. Foreign matters on the drum surface are removed.

Timing of Execution

At warm-up rotation auto adjustment (at power-on)

When "Clean Inside Main Unit" in user mode is executed

In the case of a specific environment (12 g or more in absolute moisture content)

Details of the Control

The Drum is rotated with a high voltage applied to the Drum. The Drum Cleaning Blade sweeps foreign matters from the Drum.

● Low Duty Discharge Sequence

Overview

This is performed to prevent a decrease of density caused by an increase in the toner potential volume when low duty images are continuously printed.

To prevent decrease in density caused by increased charge amount of toner when low duty images are continuously output.

Timing of Execution

At last rotation or paper interval after a specified number of sheets* have been printed in a job whose average image duty is lower than the specified value (default: 1%)

* It varies depending on the average image duty.

When a toner ejection sequence of a color is executed, if the conditions are close to the toner ejection conditions of another color, both of them are executed.

Details of the Control

If the foregoing conditions are met, after toner of the color is ejected to the Photosensitive Drum, toner is collected by the Photosensitive Drum Cleaner.

Fixing System

Overview

Overview

1) Adoption of a high output IH Heater and a Fixing Belt method

By adopting a high output IH Heater (Induction Heater: Induction heating) and a Fixing Belt method, the fixing performance of high reproducibility can be achieved even for heavy paper and coated paper.

2) Addition of a cooling function to the Fixing Belt

When a print job is switched from that of heavy paper to that of thin paper, the surface temperature of the Fixing Belt needs to be lowered in a short period of time because the belt temperature has become high. Therefore, a cooling function has been installed for the Fixing Belt in this machine so that an optimum temperature can be achieved in a short period of time even under the above printing conditions.

3) Addition of a Refresh Roller

During the continuous printing of coated paper, the edge of the coated paper comes into contact with the Fixing Belt, causing small damages to the surface of the belt. For this reason, a Refresh Roller has been installed in this machine to regularly even out the surface of the Fixing Belt and minimize the damages.

Basic Sequence

1) Power-ON

F-2-144

Name of the Interval	Difinition
Warm-up (Power-ON, Fixing belt is less than 100 deg C)	If each belt reaches the target temperature and also, the specified time has been elapsed from the power-ON, it moves to standby. • Fixing belt temperature: 180 deg C • Pressure belt temperature: 90 deg C • Fixing Motor: standby speed • Pressure Belt: detached
Recovery (Power-ON, Fixing belt is 100 deg C or more)	It moves to standby after each belt reaches the target temperature. • Fixing belt temperature: 180 deg C • Pressure belt temperature: 90 deg C • Fixing Motor: standby speed • Pressure Belt: detached
Standby	The following condition is kept • Fixing belt temperature: 170 deg C • Pressure belt temperature: 80 deg C • Fixing Motor: standby speed • Pressure Belt: detached

T-2-53

2) Print (Plain 1, A4, normal mode)

F-2-145

Name of the Interval	Difinition	
Print (A4, Plain paper)	Initial rotation	From print request is received until the image signal is output. • Fixing belt temperature: 170 deg C • Pressure belt temperature: 80 deg C • Fixing Motor: standby speed • Pressure Belt: Detached
	Print	From image formation start until the paper is delivered. • Fixing Belt temperature: 165 deg C* • Pressure belt temperature: 0 deg C • Fixing Motor: print speed • Pressure Belt: pressurized * The fixing temperature differs depending on the paper type, paper weight, installation environment and productivity setting.
	Last rotation	From the trailing edge of last paper passes through the Fixing Inner Delivery Sensor (PS75) until the Pressure Belt is detached. • Fixing belt temperature: 170 deg C • Pressure belt temperature: 80 deg C • Fixing Motor: standby speed • Pressure Belt: detached After the Pressure Belt is detached, it is shifted to standby.

T-2-54

Controls

Overview

No.	Controls/Function	Overview
1	Fixing temperature control	To prevent the fixing failure, temperature of Fixing Belt and Pressure Belt is adjusted.
2	Edge heat rising prevention control	To prevent the fixing failure and downtime due to edge temperature rising, keep the edge temperature during printing under the specified temperature.
3	Down sequence control	If there is a big difference between the target temperature and the detected temperature at print start or during printing, the productivity is decreased to prevent the fixing failure and the image failure.
4	Fixing belt cooling control	In order to reduce the down time and productivity decline caused by high temperature of the Fixing Belt, the temperature of the Fixing Belt is lowered to a target temperature.
5	Pressure belt cooling control	To prevent the image failure due to the high temperature on the Pressure Belt, the belt temperature is dropped by the target temperature.
6	Paper wrapping prevention control	To prevent the breakdown of Fixing Assembly due to paper wrapping over the Fixing Belt and the Pressure Belt, paper wrapping over each belt is detected.
7	Fixing/Pressure belt displacement control	To prevent the belt breakage due to displacement of Fixing/Pressure Belt, displacement of each belt is corrected.
8	Pressure belt pressurizing control	To prevent the fixing failure and to improve the jam handling, Fixing Belt and Pressure Belt are pressurized/detached.
9	Fixing belt refresh control	A fixing belt refresh mechanism has been implemented to engage/disengage the Refresh Roller for reduction of scratches on the Fixing Belt.
10	Fixing assembly life detection	To prevent the fixing failure due to the end of life of Fixing Assembly loads, the life of Fixing Assembly is detected.
11	Protective function	If the fixing temperature abnormally rises, the power supply to the heater is stopped. Also, if the Fixing/Pressure Belt gets ripped, the host machine is stopped.

T-2-55

Heat Control

Overview

On this machine, the following heating method is adopted to realize the high-speed full-color print in office machine size.

- Fixing Belt: IH (induction heating) method
- Pressure Belt: heat roller method (halogen heater)

IH (Induction Heating) method

This method makes metals heat themselves by using electromagnetic induction. When alternating current is applied to the coil, magnetic flux is generated around it and when this magnetic flux is passed through a metal, eddy current will be passed through the metal. When the current is passed through a metal, heat (Joule heat) is generated at the metal. This is called as Induction Heating.

Material of the fixing belt on this machine is metal and this induction heating method is used to make the Fixing Belt and the Steering Roller heat themselves.

F-2-146

Fixing Temperature Control

Overview

To prevent the fixing failure and downtime, temperature of Fixing Belt and Pressure Belt is adjusted.

Description

Perform temperature control according to the temperature control table specified by paper size and paper type at the following timing.

1	Warm-up temperature control	Temperature is controlled to reach the standby temperature, which is then kept for a specified period of time. (In case that the Fixing Belt is less than 100 deg C.)
2	Recovery temperature control	Perform temperature control so that the standby temperature is reached. (In case that the Fixing belt temperature is 100 deg C or more.)
3	Standby temperature control	Perform temperature control so that the machine can perform printing as soon as receiving a print request signal.
4	Print temperature control	Perform temperature control according to different temperature tables depending on the paper type and paper weight.

T-2-56

<Default (Priority on productivity) / normal temperature environment>

F-2-147

1) Warm-up Temperature Control

Fixing belt	180 deg C
Pressure belt	90 deg C

T-2-57

NOTE:

If the Fixing Belt temperature is less than 100 deg C at power ON, the machine does not move to standby unless the specified time has been elapsed from power ON even though the temperature of Fixing Belt and the Pressure Belt reaches the target temperature.

2) Recovery Temperature Control

Fixing belt	180 deg C
Pressure belt	90 deg C

T-2-58

NOTE:

If the Fixing Belt temperature is 100 deg C or more at power ON, the machine moves to standby when the temperature of Fixing Belt and the Pressure Belt reaches the target temperature.

3) Standby Temperature Control

Fixing belt	170 deg C
Pressure belt	80 deg C

T-2-59

NOTE:

Just after printing, if the temperature of Pressure Belt is high, it is cooled down by the Pressure Belt Cooling Fan (FM15, FM16) until the temperature of Pressure Belt is dropped to the standby temperature. (Refer to the Pressure Belt Cooling Control for details.)

Following shows the print temperatures.

<Default (Priority on productivity) / normal temperature environment>

T-2-60

4) Other Temperature Control

1. In case of recovery from sleep-mode

- Fixing temperature is less than 100 deg C -> Warm-up Temperature Control
- Fixing temperature is 100 deg C or higher -> Recovery Temperature Control

2. At Low-Power/Power Save Mode

This machine has the low power and power save mode for energy conservation. Reducing energy consumption is possible by lowering the fixing belt temperature target and turning off the pressure heater, respectively.

The control temperatures of the Fixing Belt and the Pressure Belt in low power mode or energy saver mode are shown below.

Mode		The control temperatures of the Fixing/ Pressure Belt and the recovery time	
Power save mode	-10%	Fixing belt	160 deg C
		Pressure belt	20 deg C
	-25%	Fixing belt	150 deg C
		Pressure belt	20 deg C
	-50%	Fixing belt	120 deg C
		Pressure belt	20 deg C
Lower power mode		Fixing belt	120 deg C
		Pressure belt	20 deg C
Standby		Fixing belt	170 deg C
		Pressure belt	80 deg C

Edge Heat Rising Prevention Control

Overview

To prevent the fixing failure, temperature of Fixing Belt and Pressure Belt is adjusted.

Control detail

Sub Thermistors for the Pressure Belt and the Fixing Belt monitor the temperature at the edge of the Belts. Once temperature rise at the edge is detected, electrical power supply to the Heater is reduced or cut.

< Fixing belt >

	Fixing sub thermistor temperature	IH power upper limit	Remarks
IH power upper limit change temperature 1	225 deg C	1050W	When the temperature of Fixing Sub Thermistor is less than 225 deg C, it gets back to normal IH power.
IH power upper limit change temperature 2	228 deg C	0W	When the temperature of Fixing Sub Thermistor is less than 228 deg C, it gets back to IH power upper limit change temperature 1

T-2-62

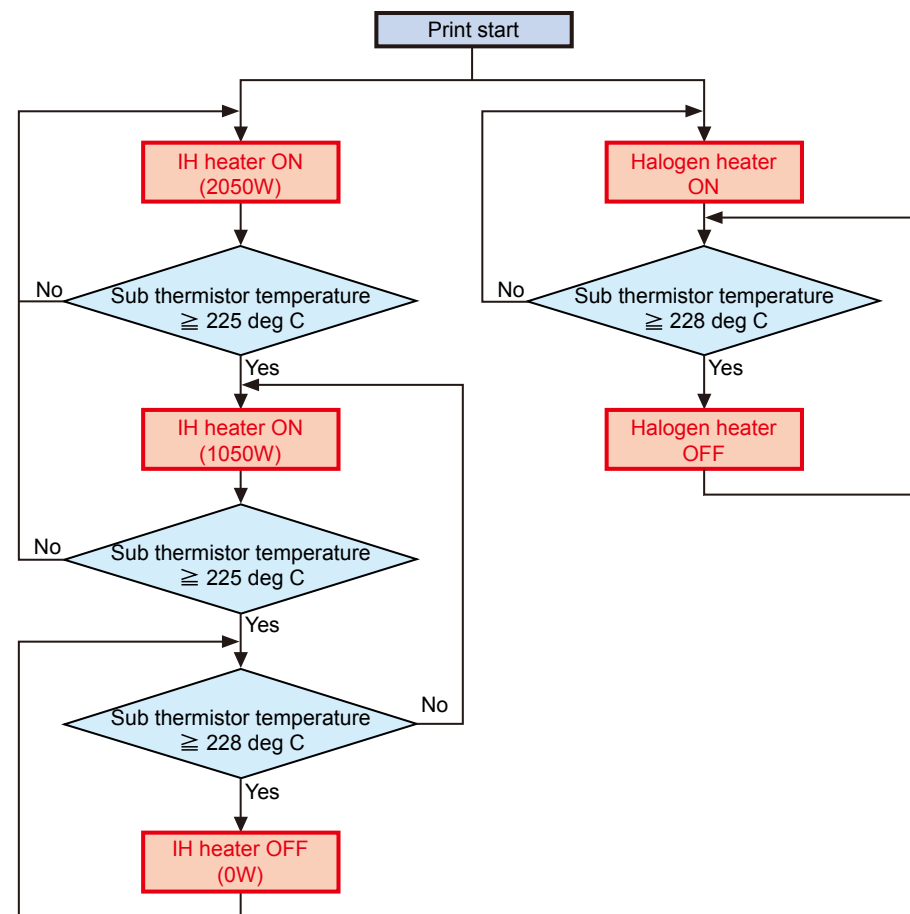

< Pressure belt >

	Pressure sub thermistor temperature	Remarks
Pressure heater forcible OFF temperature	228 deg C	When the Fixing Sub Thermistor is 228 deg C or less, the Pressure Heater is turned ON.

T-2-63

NOTE:

When temperature in either of 2 Sub Thermistors on each belt exceeds the specified value, this control is executed.

F-2-148

Down Sequence Control

Overview

If the difference between the target temperature and the detected temperature becomes significant during printing, the productivity is lowered to prevent fixing failures and image failures.

Execution timing

- During printing

Control detail

When the Fixing Main Thermistor detects a temperature lower than the down sequence criterion temperature, the print job start time is delayed to lower the productivity.

There are three types of down sequences shown below.

• Level 1

If the temperature becomes lower than the down sequence criterion temperature, start of the job is delayed for 3 seconds. This control is executed only once during a job, and is not executed after that.

• Level 2

If the temperature becomes lower than the down sequence criterion temperature, the paper interval time is prolonged to lower the productivity to approx. 88%. Once this control is implemented, the down sequence is not canceled during the job even if the temperature becomes higher than the criterion temperature.

• Level 3

If the temperature becomes lower than the down sequence criterion temperature, the paper interval time is prolonged to lower the productivity to approx. 75%. Once this control is implemented, the down sequence is not canceled during the job even if the temperature becomes higher than the criterion temperature.

<Down sequence judgment temperature table>

Paper type	Level 1	Level 2	Level 3

(-10 degC, -6 degC, -4 degC, -2 degC, -0 degC, and +3 degC)

■ Fixing Belt Cooling Control

● Overview

- When temperature shift of the Fixing Belt is required (when the paper type is changed), the Fixing Belt is cooled by the fan to reduce the downtime.
- The temperature at the edge of the Fixing Belt is lowered by the fan to reduce productivity decline caused by temperature rising at the edge of the Fixing Belt.

● Execution timing

- During standby
- During printing

● Control detail

- Cooling of the center of the Fixing Belt

The Fixing Belt is aired and cooled by turning ON the Delivery Upper Cooling Fan (FM47) and changing the airflow by the Delivery Upper Cooling Switch Flapper Solenoid (SL10) .

NOTE:

The Delivery Upper Cooling Fan (FM47) is also used to cool paper fed to the Reverse Delivery Unit by changing the air flow by the Delivery Upper Cooling Switch Flapper Solenoid (SL10).

F-2-149

<Conditions under which the fan is turned ON>

- Cooling of the center of the Fixing Belt
The fixing control temperature is higher than the print control temperature when a job is started.
The fixing control temperature is higher than the standby control temperature after completion of a job.
- Cooling of the edge of the Fixing Belt
ON (full speed), ON (half speed), or OFF of the fan is controlled according to the paper type and size during a job.
The correlation between the paper type/size and ON (full speed)/ON (half speed)/OFF is shown below.

Paper type	Paper width in the longitudinal direction		
	Over 305 mm	220 to 305 mm	Less than 220 mm
Thin paper 2	OFF	OFF	OFF
Thin paper 1	OFF	OFF	OFF

T-2-65

Pressure Belt Cooling Control

Overview

Temperature of the Pressure Belt is reduced during standby to prevent image fault due to high temperature of the Pressure Belt.

Execution timing

It is executed at the following timing:

- At the start of a job (when the Pressure Belt temperature is specified temperature or higher)
- During a job (when the paper type is plain paper or thin paper)
- At the time of waiting before the Pressure Belt shifts to applying pressure/disengaging during a job (when an interrupt action of 4 or more seconds occurs)
- After a job (when the Pressure Belt temperature is specified temperature or higher upon shifting to standby)

Control detail

The Pressure Belt Cooling Fan 1 (FM15) and Pressure Belt Cooling Fan 2 (FM16) are turned ON so that the Pressure Belt are aired and cooled down. When the temperature of Pressure Belt is cooled down by the specified temperature, the fans are turned OFF.

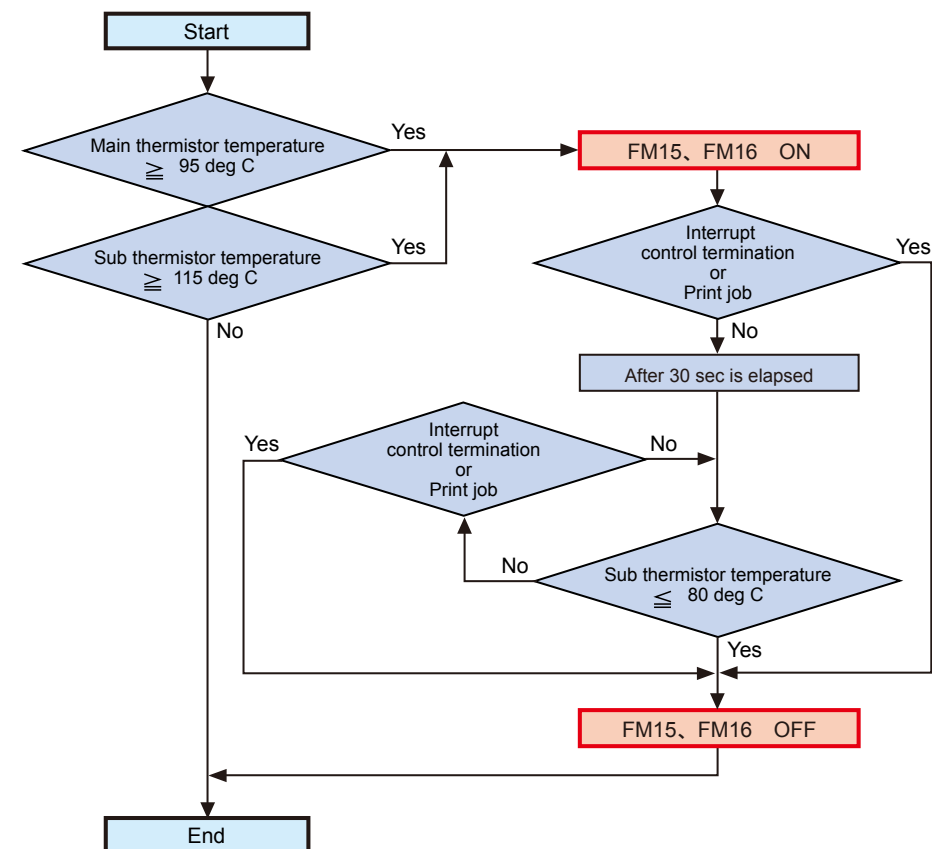

F-2-150

<Fan ON condition>

- Center of Pressure Belt: 95 deg C or higher
- Edge of Pressure Belt: 115 deg C or higher

<Fan OFF condition>

- Both edges of Pressure Belt: 80 deg C or less (forcibly turned ON for 30 sec from the control start)
- Print start
- Interruption control finish (interruption operation with 4 sec or longer)

F-2-151

● Related Service Mode

COPIER > OPTION > IMG-FIX > FX-FAN1

Change the temperature to drive the fan during standby. (-5 to +20 deg C)

Fixing Fan OFF condition temperature change

COPIER > OPTION > IMG-FIX > FX-FAN2

Change the temperature to stop the fan during standby. (-6 to +6 deg C)

Paper Wrapping Detection

Overview

To prevent the breakdown of Fixing Assembly due to paper wrapping over the Fixing Belt and the Pressure Belt, paper wrapping over each belt is detected.

Control detail

Whether the paper is wrapping over each belt is detected by 2 sensors according to the wrapping status.

Sensor	Status	Condition
Fixing Inner Delivery Sensor (PS75)	Paper leading edge sticks and wraps over the Fixing Belt or the Pressure Belt.	Paper feed delay -> PS75 detection
Fixing Wrap Sensor (PS74)	Paper leading edge is trapped on the delivery assembly and the paper is folded in center and wrapped over the Fixing Belt.	Due to the paper folding, the Delivery Guide is pushed. -> PS74 detection

T-2-66

After the paper wrapping is detected, DC Controller performs the following operations.

1. Brakes the Fixing Motor and stops it immediately (to minimize the paper wrapping).
2. Detaches the Fixing Belt from the Fixing Belt.
3. Jam display. (Jam code: PS74=0110, PS75=020F)

< Wrapped paper jam 1 >

Jam code = 0110

< Wrapped paper jam 2 >

Jam code = 0110

F-2-152

Residue paper detection

When recovering from fixing paper wrapping jam handling, to prevent to forget to remove the wrapped paper, the Fixing Inlet Sensor (PS70) performs the residue paper detection. (Jam code: 0A0E)

< Residual paper jam >

Jam code = 0A0E

F-2-153

Fixing/Pressure Belt Displacement Control

Overview

To prevent the belt breakage due to displacement of Fixing/Pressure Belt, displacement of each belt is corrected.

Execution timing

When the Fixing/Pressure Belt is rotating.

Basic configuration

1. Displacement detection

Displacement detection is executed on 2 belt position sensors (Fixing Belt: PS71/72, Pressure Belt: PS76/77).

When the Fixing/Pressure Belt rotates, the belt is displayed to either front or rear side.

There is the Contact Wheel at the belt edge and when the Contact Wheel moves following the belt movement, the Sensor Flag moves and the Fixing Belt Position Sensor 1 & 2 (PS71, PS72) are turned ON/OFF.

Belt displacement is detected according to the ON/OFF combination of those 2 sensors (see the following table for sensor combination). (Refer to page 2-123)

Jam code = 0A0E

F-2-154

2. Shifting movement

Shifting movement is executed by rotating the Belt Displacement Control Motor (Fixing Belt: M46, Pressure Belt: M49) positively or negatively. The Steering Roller moves up and down according to the motor movement and as a result, the belt tension is changed and the belt moves to the front or rear.

F-2-155

Control detail

Control differs between the Fixing Belt and the Pressure Belt.

1. Fixing belt

- 1) When the DC Controller detects that the Fixing Belt is displaced to the front (status of front1) because of sensor output, it positively-rotates the Fixing Displacement Control Motor (M46) so that the front side of Tension Roller is Lowered by the specified amount.
- 2) When the Tension Roller is Lowered, the Fixing Belt moves to the rear.
Even though the Tension Roller is Lowered, if it is still displaced to the front (status of front2), become error (E007).
- 3) If the Fixing Belt moves to the rear and as a result, it is displaced to the rear (status of rear1), the Fixing Displacement Control Motor (M46) is negatively-rotated and the front side of Tension Roller is lifted by the specified amount. Due to this movement, the Fixing Belt moves to the front.

4) After that, control of step 2) to 4) is repeated.

Belt position		Front 2	Front 1	Center	Rear 1	Rear 2
		-3.0 mm	-1.5 mm	0 mm	1.5 mm	3.0 mm
Belt position	Fixing Belt Position Sensor 1 (PS71)	OFF	ON	ON	OFF	OFF
	Pressure Belt Position Sensor 2 (PS72)	OFF	OFF	-	ON	OFF
	Sensor position	1	2	3	4	5
Status after belt position detection	Fixing Belt HP Sensor (PS69)	-	ON	-	OFF	-
	Fixing Belt Displacement Control Motor (M46)	-	Positive rotation	-	Negative rotation	-
	Tension roller position	-	2 deg	0	-2 deg	-

T-2-67

ON = Permeation, OFF = Light shielding

F-2-156

2. Pressure belt

- 1) When the DC Controller detects that the Pressure Belt is displaced to the front (status of front1) because of sensor output, it negatively-rotates the Pressure Displacement Control Motor (M49) so that the front side of Tension Roller is lifted by the specified amount.
- 2) When the Tension Roller is lifted, the Fixing Belt moves to the rear.
If the belt remains at the front side (does not return to the rear side) even after the Tension Roller is lifted, the machine moves to the Belt Displacement Restore Mode (refer to the following).
- 3) If the Fixing Belt moves to the rear and as a result, it is displaced to the rear (status of rear1), the Fixing Displacement Control Motor (M46) is positively-rotated and the front side of Tension Roller is lowered by the specified amount. Due to this movement, the Fixing Belt moves to the front.
- 4) After that, control of step 2) to 4) is repeated.

Belt position		Front 1	Center	Rear 1
		-1.0 mm	0 mm	1.0 mm
Belt position	Fixing Belt Position Sensor 1 (PS71)	ON	ON	OFF
	Pressure Belt Position Sensor 2 (PS72)	OFF	-	ON
	Sensor position	1	2	3
Status after belt position detection	Fixing Belt HP Sensor (PS69)	ON	-	OFF
	Fixing Belt Displacement Control Motor (M46)	Negative rotation	-	Positive rotation
	Tension roller position	-3.7 deg	0	-3.7 deg

T-2-68

ON = Permeation, OFF = Light shielding

F-2-157

● Belt displacement recovery mode (Pressure Belt only)

1. Overview

In the case that the pressure belt is fully displaced to one side even though the belt displacement correction has been executed, the host machine shows E007 (error in full displacement of the belt) to stop the operation. However, this equipment is made not to generate the full displacement error as much as possible by executing this control because stopping the host machine's operation can cause downtime.

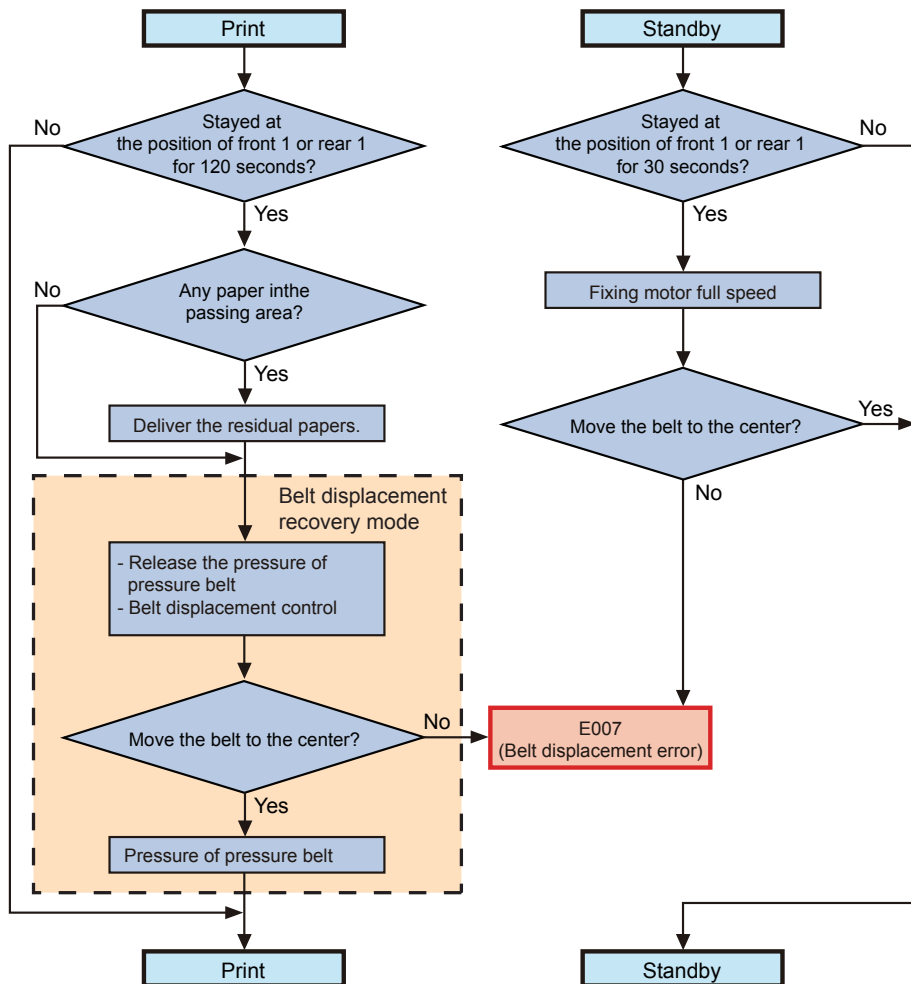

2. Execution timing

- During printing: when the belt edge remains at the front 1 or rear 1 position for 120 sec
- During standby: when the belt edge remains at the front 1 or rear 1 position for 30 sec

3. Control detail

- 1) Printing is interrupted, and the paper inside the machine is delivered, and then the pressure of the Pressure Belt is released. "Preparing the Printer" is shown on the control panel.
- 2) The belt is moved to the center by releasing the pressure.*1
- 3) In the case of full displacement even if the pressure has been released, E007 (error in full displacement of the belt) is displayed to stop the operation.
- 4) Once the belt is returned to the center position, the start-up sequence is executed to apply pressure to the Pressure Belt and print operation is resumed.

*1 Displacement force becomes the strongest when the belt is engaged (pressure is applied to the belt); therefore, displacement force is reduced by releasing the pressure to the belt in the case of belt displacement during printing.

■ Pressure Belt Pressurizing Control

● Overview

The Fixing Belt and the Pressure Belt are engaged or disengaged as needed basis to keep long life of the Fixing (Pressure) Belt and improve jam recovery performance.

● Execution timing

- Pressure applied: Print
- Pressure released: Warm-up, Standby, Jam occur, Interruption operation with 4 sec or longer

● Control detail

The Pressure Belt is pressurized/released by the drive of Fixing Pressure Release Motor (M47).

1. When the Fixing Pressure Release Motor (M47) makes positive rotation, the Pressure Cam rotates due to the motor drive.
2. When the Pressure Cam rotates, the Pressure Belt Unit is pushed up.
3. Because the Pressure Belt Unit is pushed up, the Pressure Belt applies the pressure on the Fixing Belt.

F-2-159

There are four states of pressure: one for plain paper, one for coated paper, one for heavy paper, and one for small size paper; and the pressure power is switched according to the stop position of the cam.

Mode	Paper type	Pressure force
Pressure 1 (Plain paper)	Thin paper, Plain paper	Strong
Pressure 2 (Coated paper)	Coat paper, Transparency	Slightly strong
Pressure 3 (Heavy paper)	Heavy paper, Envelope	Slightly weak
Pressure 4 (Small size paper)	Small size paper, Postcard	Weak

T-2-69

● Pressurized/detached detection

Print Whether the Pressure Belt is pressurized or detached is detected by the Fixing Pressure Release Sensor (PS73).

NOTE:

To maintain the life of Fixing/Pressure Belt, pressure is applied only when the paper passes through the fixing nip.

Refresh Pressure Control

Overview

The surface nature of the Fixing Belt is maintained/recovered by pressing the Refresh Roller against the Fixing Belt when necessary.

Execution timing

- Application of pressure: At automatic control after a job or manual control

Control detail

The Refresh Engagement/Disengagement Motor (M55) drives the Refresh Roller to apply/release pressure.

- 1) When the Refresh Engagement/Disengagement Motor (M55) rotates clockwise, the motor drives the Pressure Cam to rotate.
- 2) Rotation of the Pressure Cam lowers the Refresh Roller.
- 3) The lowered Refresh Roller applies pressure to the Fixing Belt.

F-2-160

Pressurized/detached detection

Engagement and disengagement of the Refresh Roller is detected by the Refresh Engagement/Disengagement HP Sensor (PS120).

Fixing Assembly life Detection

Overview

To prevent the fixing failure due to the end of life of Fixing Assembly loads, the life of Fixing Assembly is detected.

Control detail

The life of Fixing Unit is judged according to the following 2 values.

1. Current value of Fixing Drive Motor (torque)
2. Total rotation time of Fixing Belt

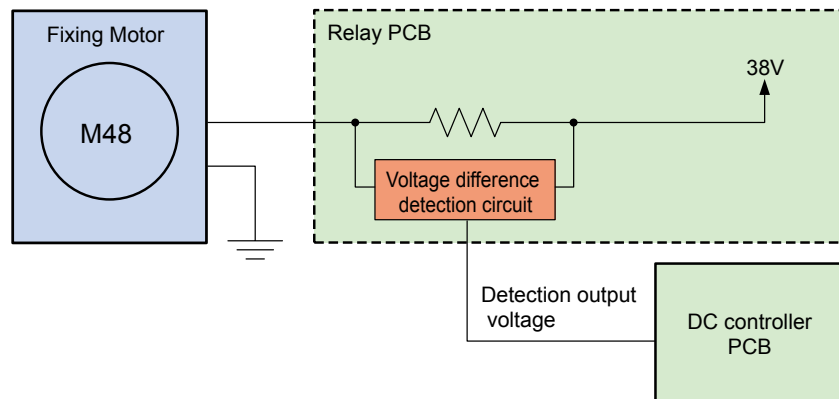

1. Current Value (Torque) Flowed Into the Fixing Drive Motor

By monitoring the current amount flowed into the fixing motor (M48), detect the life of the pressure belt unit.

As the pressure belt is worn, the amount of oil inside of the pressure belt decreases so that the frictional force inside of the belt becomes greater.

As the frictional force gets greater, the torque of the fixing motor becomes higher to rotate the drive roller; hence, the current amount (voltage) flown into the fixing motor also becomes higher. Monitor this current amount and when it reaches to the specified level (warning level), the warning message is displayed on the control panel. As the fixing/pressure belt is worn further, the current amount reaches to the specified level (error level) and E008-0001 is displayed (a message is also displayed on the service mode initial screen.)

As a rough estimation, the decrease of the oil amount that determines the life of the fixing unit starts around Pressure Belt Unit (600,000 sheets), (fixing delivered number).

F-2-161

Caution :

When E008-0001 occurs, and is handled without replacement of the Pressure Belt Unit, be sure to clear the log of the Fixing Motor current values in service mode. If you don't, E008-0001 will occur again.

COPIER > FUNCTION > CLEAR > FX-L-CLR

NOTE:

1. Expected number of sheets from alarm to error is approx. 10,000 sheets.
2. Hence, by checking the fixing delivered number with the service mode (COPIER > COUNTER > DRBL-1 > FX-BLT-L), the occurrence timing of the warning and the error can be predicted to some extent.
The estimated number of copies from the warning message to the error is about 10,000 sheets.

2. Total rotation time of the fixing assembly

When the pressure belt is separated and rotates for long period and at low speed (convenience store, etc), the lifetimes of thermistor and thermoswitch may end. Total rotation time should be included in the condition of the lifetime of the fixing belt unit. Total rotation time is found by combining the time at standby (Pressure Belt Unit is disengaged) and at printing (Pressure Belt Unit is engaged) and if the total time reaches 150,000 hours, an alarm message is displayed on the control panel and if usages is extended and it reaches 155,000 hours, E008-0002 is displayed.

Protective Function

Overview

Protective function of this machine is the function to prevent the host machine from breaking due to the following 2 causes.

- Abnormal temperature rising of Fixing/Pressure Belt
- Breakage of Fixing/Pressure Belt

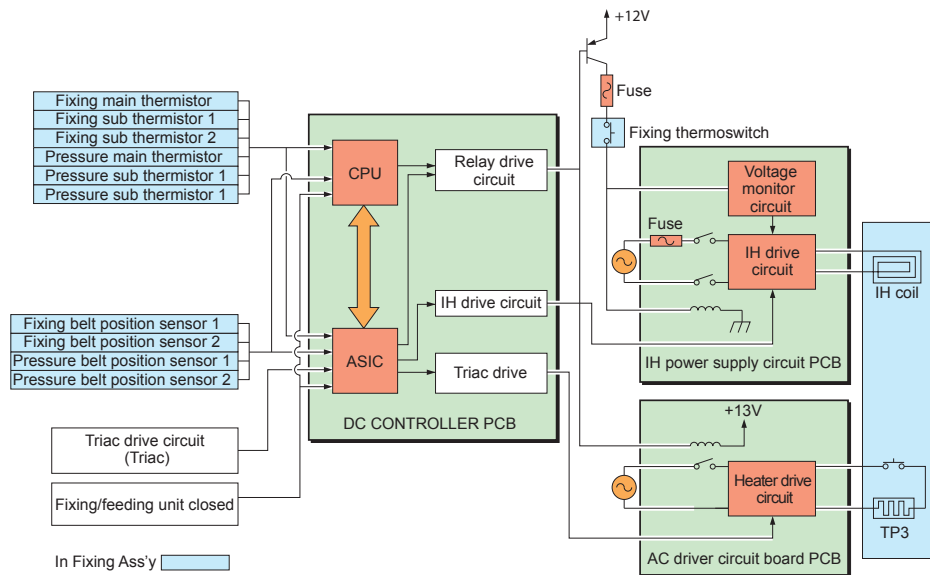

Abnormal temperature rising of Fixing/Pressure Belt	
1 Power shutdown by CPU	• Relay drive OFF -> DC12V power shutdown
2 Power shutdown by ASIC	• Relay drive OFF -> +12V shutdown • IH drive I/F OFF -> IH drive circuit OFF • Triac drive I/F OFF -> Heater drive circuit OFF
3 Power shutdown by thermo switch operation	• Fixing thermo switch OFF (253 deg C) -> DC12V power shutdown • Pressure thermo switch OFF (170 deg C) -> AC power shutdown
Breakage of Fixing/Pressure Belt	
4 Detection by thermo switch (The center/edge of the Fixing Belt)	• Fuse PCB blowout due to DC12V power line overcurrent -> DC12V power shutdown

Pickup / Feed System

Overview

- Paper position control utilizing new registration technology
- Life extension of the Pickup/Feed/Separation Rollers by changing the materials.
- With gentle curve of the feeding path, face-down delivery and duplex print can be done with the following paper types.
 - facedown delivery: 300 g/m² or less
 - 2-sided printing: 300 g/m² or less

F-2-165

Specifications

The following shows main specification for pickup feed system:

Item	Function/Method	
Paper Storage Method	Front Loading Method	
Pickup Method	Separation Retard Method	
Paper Feed Standard	Center	
Paper Loading Capacity	Cassette 1/2/3	550 sheets (normal paper: 80 g/m ² , height: 60.5 mm)
	Multi-purpose Tray	100 sheets (normal paper: 80 g/m ² , height: 11.0 mm)

T-2-78

Cassette Pickup Unit

Overview

F-2-172

Pre-registration Control

During registration control, in order to prevent the succeeding sheet from interfering with the preceding sheet, variation in pickup operation caused by the paper type, size, and environment is corrected.

Pickup operation varies depending on external causes such as the paper type, size, and environment, therefore paper is fed and stopped at the position from which paper can be fed reliably and stably.

This control is performed from the second sheet to be fed.

The stop position of each Cassette is shown below.

Position	Sensor	Motor	Stop Position ^{F-2-173}
Cassette 1	Vertical Path Sensor 1 (PS53)	Cassette 1 Pickup Motor (M43) Cassette 1 Vertical Path Motor (M39)	23 mm upstream of the Cassette 1 Vertical Path Roller.
Cassette 2	Vertical Path Sensor 2 (PS63)	Cassette 2 Pickup Motor (M44) Cassette 2/3 Vertical Path Motor (M67)	23 mm upstream of the Cassette 2 Vertical Path Roller.
Cassette 3	Vertical Path Sensor 3 (PS68)	Cassette 3 Pickup Motor (M45) Cassette 2/3 Vertical Path Motor (M67)	

T-2-79

Paper Size detection / Cassette detection

Cassette detection

Cassette is detected by Paper Size Detection Switch and Size Detection Sensor 1/2/3. When all actuators of the Paper Size Detection Switch (SW15/SW17/SW21) and Size Detection Sensor (PS139 to PS147) are not pressed, it is detected as no cassette installed.

Paper Size Detection

Paper size in cassette 1/2/3 is each detected by Size Detection Switch and 3 Size Detection Sensors.

ON/OFF of the Size Detection Switch (4 actuators) on the host machine side is changed according to the positions of the Paper Size Detection Circular Plate interlocked with the Side Slide Guide and the Paper Size Detection Lever interlocked with the Trailing Edge Slide Guide.

F-2-174

T-2-84

Note:

Example: When Setting G-LTR to Cassette 2

COPIER> OPTION> CST> CST2-U3> 31

Paper Level Detection / Paper Detection

Paper Level Detection

The paper level is judged by the rotation amount (pulse count) when the Pickup Motor is rotated in the direction opposite to the direction of pickup operation.

When the Cassette is open, "no paper" is displayed.

Open/close of the Cassette is detected by the Paper Size Detection Switch (SW15/SW17/ SW21) while the host machine is ON.

Paper Detection

If there is paper, the Detection Lever is pushed up when the Lifter ascends, and the Paper Sensor is turned OFF.

When paper runs out, the Detection Lever gets into the hole in the Lifter, and the Paper Sensor is turned ON.

F-2-176

	Control Panel Screen Display
Full (100% to 50%)	
Half (50% to 25%)	
Few (25% or less)	

T-2-85

Lifter Control

Lifter will raise paper to pickup position.

If cassette is set, the Pickup Motor will be driven in reverse direction from pickup movement, and lifter will be ascended until the paper surface arrives at the height of pickup position.

One-way Clutch is equipped to the shaft of both Lifter drive and Pickup Roller drive sides.

Therefore, the Pickup Roller does not operate when the Lifter is operated, and vice versa.

One-way clutch is attached in the Host Machine shaft, hence when deck/cassette is pulled out, lifter will descend.

F-2-177

Note:

- When a pickup failure occurs
- When double feed occurs

(Lv.2) COPIER > ADJUST > FEED-ADJ > CT1-PKLV (Cassette 1)

(Lv.2) COPIER > ADJUST > FEED-ADJ > CT2-PKLV (Cassette 2)

(Lv.2) COPIER > ADJUST > FEED-ADJ > CT3-PKLV (Cassette 3)

(Lv.2) COPIER > ADJUST > FEED-ADJ > DK1-PKLV (POD Deck Lite)

Lifter Error Detection

In case the Lifter does not stop ascending after the Paper Height Sensor (PS42, PS46, or PS67) is turned ON for some reason, the machine has an upper limiter mechanism to prevent breakage of the host machine due to excessive ascent

If the Paper Level Sensor and the Upper Limiter are not turned ON within 4 seconds after the Lifter starts to ascend, "no paper" is displayed for the paper source, a corresponding alarm is generated, and the machine enters limited functions mode.

Alarm	Details
04-0001	Cassette 1 Lifter error
04-0002	Cassette 2 Lifter error
04-0003	Cassette 3 Lifter error

T-2-86

Cassette Heater Control

To prevent paper in the Cassette from absorbing moisture, this machine has a Cassette Heater at the bottom of the Cassette 3.

- Timing when the Cassette Heater is turned ON

If the Environment Switch is ON, the Cassette Heater is always ON regardless of ON/OFF of the machine power or sleep state.

Power	Cassette Heater SW	
	ON	OFF
ON	ON	OFF
OFF	ON	OFF

T-2-87

Multi-purpose Tray Pickup Unit

Basic Movement

- 1) If the Multi-purpose Pickup Solenoid (SL4) is turned ON, the semi-toothed gear will rotate.
- 2) The holding plate Fixing Members will be released and the holding plate will ascend.

- 3) When the Pre-registration Multi-purpose Tray Drive Motor drives, the Multi-purpose Pull Out Roller and the Multi-purpose Feed Roller/Multi-purpose Separation Roller will rotate, and only 1 sheet of paper will be picked up/fed.

F-2-179

Paper Size Detection / Paper Detection

The setting is performed the Side Guide Plate and size code setting (or irregular size setting assignment) by and the Control Panel Unit.

Paper width is detected by the outputted value from the Variable Resistor Assembly (Multi-purpose Tray Paper Width Detection PCB (UN26)) which is linked to movement of the Side Guide Plate.

Paper length is detected by the Multi-purpose Tray Size Sensor (PS136).

Setting of the Side Guide Plate on the Multi-purpose Pickup Tray is executed by users after paper is set.

F-2-180

When paper is set, Paper Presence Detection Lever will be pushed, and the Multi-purpose Tray Paper Sensor (PS37) will turn ON.

F-2-181

Long Original Paper

This machine can feed the Long Original Paper.

Related Service Mode:
(Lv.2) COPIER > OPTION > USER > MF-LG-ST
Setting value 0: hide, 1: display

Maximum feedable size	330 x 762 mm
Resolution	600 dpi or Less than

T-2-88

Limitations on Printing on Paper Whose Length Is 630 mm to 762 mm

When printing on paper whose length exceeds 630 mm, a print server needs to be connected.

	Versions which allow printing
print server	imagePRESS server : V 1.1 or later PRISMAsync: 1.2 or later
Host machine version	MN-CON 10.xx or later

T-2-89

Points to note when using:

If the firmware version is earlier than that shown above, up to 762 mm can be specified as the paper length in the custom size settings, but jobs with paper whose length exceeds 630 mm will be canceled.

Last Paper Detection

After the Last Paper Detection Wheel rotates, the Multi-purpose Last Paper Sensor (PS38) will detect whether it is last paper or not.

Last Paper Detection Wheel only rotates when the last paper is picked up.

Since there is slit in the Last Paper Detection Wheel, the output of the Multi-purpose Tray Last Paper Sensor (PS38) is pulse shape. If 5 or more pieces of pulse are detected, it is the last paper is determined.

F-2-182

Registration Unit

Overview

F-2-183

Control Name	Details
Pre-registration Stop Control	The Pre-registration Roller temporarily stops paper feed in order to reduce noise of paper fed to the Registration Roller.
Reverse Registration Correction Control	To correct skew of paper.
Side Registration Correction Control	Control for aligning the left edge of the image formed on the ITB with the left edge of the paper
Pre-registration Roller disengagement controls	The Pre-registration Roller and Pre-registration Guide are disengaged to loosen paper being fed and form a registration arch
Leading edge registration control	Control for aligning the leading edge of the image formed on the ITB with the leading edge of paper
Transparency Detection	To detect whether or not the fed paper is transparency. It is detected by the Post-registration Sensor (PS123) and CIS (CIS1)

T-2-90

Pre-registration Stop Control

Overview of Controls

Purpose: The Pre-registration Roller temporarily stops paper feed in order to reduce noise of paper fed to the Registration Roller.

The Feed Motors are stopped immediately before the paper leading edge bumps against the Registration Roller. (At this moment, the paper leading edge has not reached the Registration Roller.) After a certain period of time, the motor is driven again.

Control timing: When paper is fed from the Pre-registration stop position to the Registration Roller

F-2-184

Related Service Mode:

- When skew correction is insufficient (Lv.2) COPIER > ADJUST > FEED-ADJ > REG-STOP (Adjust of stop position before registration)

Reverse Registration Correction Control

Overview of Controls

Purpose: To correct skew of paper.

When the leading edge of paper reaches the Registration Roller, the Pre-registration Roller rotates in the opposite direction to stop the paper feed and correct skew.

Control timing: When paper feed from the pre-registration to the Registration Roller is resumed by the pre-registration stop control.

F-2-185

Related Service Mode:

- When skew correction is insufficient
- When leading edge of paper is bent or flipped

(Lv.2) COPIER > ADJUST > FEED-ADJ >

REG-REV1 = Adjust of Registration Roller reverse rotation amount :1/1SPD

REG-REV2 = Adjust of Registration Roller reverse rotation amount :2/3SPD

REG-REV3 = Adjust of Registration Roller reverse rotation amount :1/2SPD

Side Registration Correction Control

Overview of Controls

Purpose: Control for aligning the left edge of the image formed on the ITB with the left edge of the paper

The side registration correction control consists of the following two controls.

	Overview of Controls	Control Timing
Control 1	Decision of the write-start position of laser in the horizontal scanning direction	At pre-registration stop control
Control 2	Side shift of paper by the Registration Roller	When the leading edge of paper passes by the Registration Roller.

T-2-91

Steps of the side registration correction control

<Step 1> Decision of the write-start position of laser in the horizontal scanning direction

The Contact Image Sensor (CIS1) detects the position of the left edge of the paper being fed.

On the basis of this detected position and the paper size, the write-start position of laser in the horizontal scanning direction is decided.

F-2-186

The first sheet	An image is formed after detection of the left edge of the first sheet of paper. Creation of the image is started after the paper edge is detected by the CIS, and yet time is not pressing.
The second sheet and later	The write-start position of laser in the horizontal scanning direction is decided on the basis of the previous sheet. The write start position is decided on the basis of the moving average of the results of the previous 10 sheets of paper.

T-2-92

Related Service Mode:

To adjust the image write start position in the horizontal scanning direction.

(Lv.1) COPIER > ADJUST > FEED-ADJ > ADJ-C1 (Cassette 1)

(Lv.1) COPIER > ADJUST > FEED-ADJ > ADJ-C2 (Cassette 2)

(Lv.1) COPIER > ADJUST > FEED-ADJ > ADJ-C3 (Cassette 3)

(Lv.1) COPIER > ADJUST > FEED-ADJ > ADJ-MF (MP tray)

(Lv.1) COPIER > ADJUST > FEED-ADJ > ADJ-DK (POD Deck Lite)

(Lv.1) COPIER > ADJUST > FEED-ADJ > ADJ-REFE (2nd side)

(Lv.1) COPIER > ADJUST > FEED-ADJ > ADJ-MDK1 (Multi Deck(Upper))

(Lv.1) COPIER > ADJUST > FEED-ADJ > ADJ-MDK2 (Multi Deck(Middle))

(Lv.1) COPIER > ADJUST > FEED-ADJ > ADJ-MDK3 (Multi Deck(Lower))

<Step 2> Side shift of paper by the Registration Roller

The result of <Step 1> indicates the position of the image formed on the ITB.

The CIS detects the left edge of the paper, and if the position is not correct, side registration of the Registration Roller is executed.

F-2-187

Maximum shift amount	±3mm
Minimum shift amount	0.05mm

T-2-93

Note:

The maximum shift amount is 3 mm, but the paper may skew if the shift amount exceeds 1 mm because the purpose of this control is fine adjustment.

Related Service Mode:

When an error occurs at pre-sampling of color paper or pre-printed paper
 (Lv.2) COPIER > OPTION > FEED-SW > CIS-LED
 (Lv.2) COPIER > OPTION > FEED-SW > CIS-LV

Leading edge registration control**Overview of Controls**

Purpose: Control for aligning the leading edge of the image formed on the ITB with the leading edge of paper

When the Registration Sensor detected the paper, the timer is set to adjust the timing for changing the paper feed speed of the Registration Roller according to the time the leading edge of paper takes to reach the Post-registration Sensor (PS123).

Control timing: When the leading edge of paper reaches the Post-registration Sensor.

Note:

Transparency and vellum paper cannot be detected by the Post-registration Sensor, therefore the deceleration timing is fixed.

Steps of Leading Edge Registration Control

<Step 1>

The time it took to feed paper from the pre-registration stop position to the Post-registration Sensor is detected, and the time it will take to feed the paper to the secondary transfer position is calculated.

<Step 2>

On the basis of the time calculated in step 1, the speed of the Registration Roller is adjusted. The paper feed speed from the Post-registration Sensor to the secondary transfer position is finely adjusted.

F-2-189

Related Service Mode:

To adjust the leading edge margin.

- COPIER > ADJUST > FEED-ADJ > REG-1 (1/1 SPD, 1st side)
- COPIER > ADJUST > FEED-ADJ > REG-2 (2/3 SPD, 1st side)
- COPIER > ADJUST > FEED-ADJ > REG-3 (1/2 SPD, 1st side)
- COPIER > ADJUST > FEED-ADJ > REG-MF-1 (1/1 SPD, MP)
- COPIER > ADJUST > FEED-ADJ > REG-MF-2 (2/3 SPD, MP)
- COPIER > ADJUST > FEED-ADJ > REG-MF-3 (1/2 SPD, MP)

Transparency Detection

To detect whether or not the fed paper is transparency. It is detected by the Post-registration Sensor (PS123) and CIS (CIS1)

Post-registration Sensor (PS123)	Detects whether or not transparency exists.
CIS (CIS1)	Judges on the basis of the transmittance of the fed paper.

In the case shown below, it is judged that wrong paper has been fed and it is notified as a jam. ^{T-2-94}

Settings	Fed paer	Jam Code
Transparency	Other than transparency	0D92

T-2-95

F-2-190

Note:

Transparency Sensor (PS29) is detect the only [Canon Clc Transparency].

Reverse Unit

Basic Movement

The Delivery Flapper Switch Motor (M69) switches the Delivery Flapper between delivery operation and reverse operation.

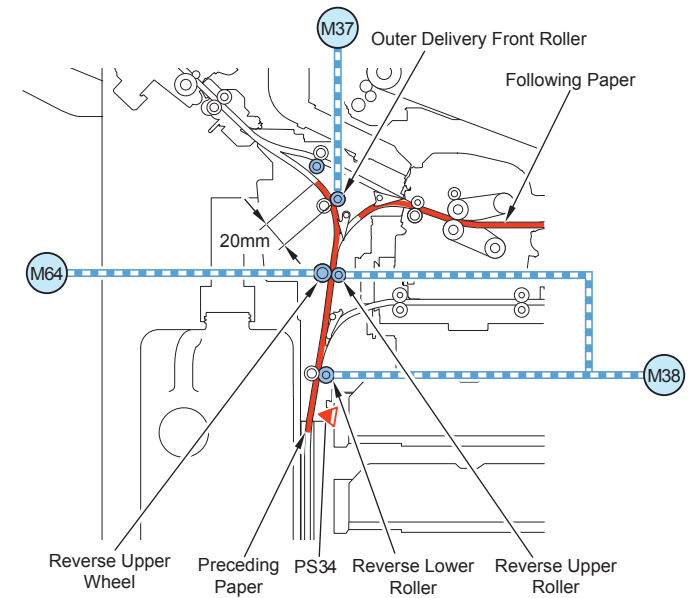

1) The Reverse Motor (M38) will stop/reverse-rotate when paper trailing edge arrives at the reverse stop position (20.0 mm upstream from the Reverse Upper Roller) in the specified time after the Reverse Vertical Path Upper Sensor (PS34) (Paper length: less than 437.7 mm) is turned ON.

If the paper length is 437.7 mm or more, reverse operation is performed based on the Reverse Vertical Path Lower Sensor (PS35).

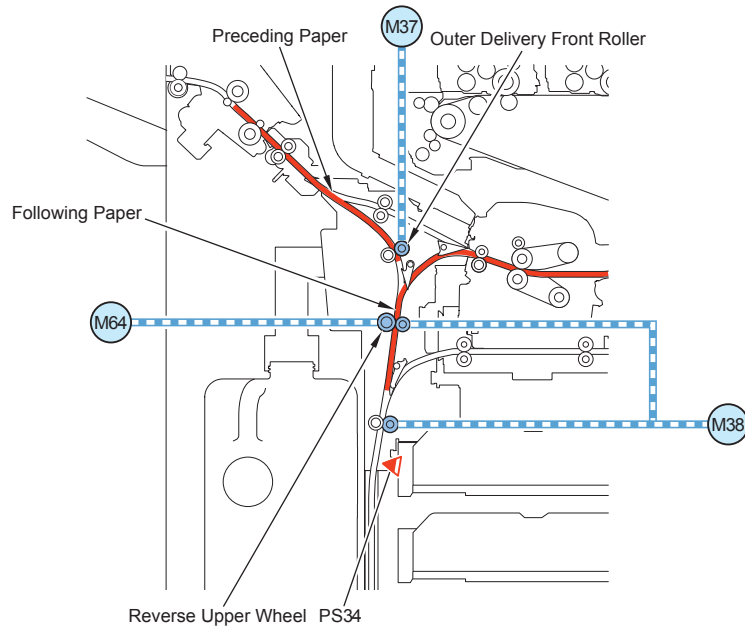

F-2-191

2) In the point when the leading edge of preceding paper exceeds the position 20 mm lowstream from the Outer Delivery Front Roller, in order to prepare for the following paper advancement, the Reverse Upper Wheel Detachment Motor (M54) is turned ON, and The Reverse Upper Wheel will detach.

F-2-192

- 3) The following paper will be fed to the Reverse Unit direction. Reverse Motor (M38) will stop/normal-rotates.
- 4) In the moment when the trailing edge of the preceding paper exceeds the position 10 mm upstream of the Outer Delivery Front Roller (for other than LTR paper), the Reverse Upper Wheel Detachment Motor (M54) is turned OFF and the Reverse Upper Wheel is attached.

F-2-193

Reverse Flapper Movement

F-2-194

Delivery of Face Up

F-2-195

Delivery of Face Down Up

F-2-196

Duplex Unit

Basic Movement

1) When the paper trailing edge arrives at the duplex reverse position (20.0 mm upstream from the Reverse Lower Roller), the Reverse Motor (M38) stops/reverses and the paper will be fed to the Duplex Unit.

2) Drive the Duplex Left Motor (M32) / Duplex Right Motor (M33) / Reverse Motor (M38) to feed paper to the duplex re-pickup position.

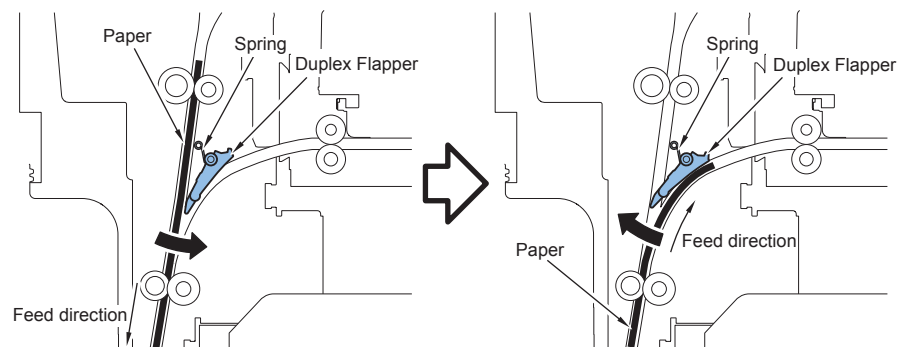

F-2-198

3) Paper stops in duplex re-pickup position, and after specified time, paper is fed to the Registration Unit.

F-2-199

Duplex Flapper Movement

Number of Sheets Circulation

The number of circulating sheets when paper is picked up in duplexing mode varies depending on the length of paper and the process speed

Paper Width / Process Speed	1/1 Speed (348mm/s)	2/3 Speed (248mm/s)	1/2 Speed (174mm/s)
145mm to 257mm	5	5	5
257.1mm to 297mm	5	5	3
297.1mm to 487.7mm	3	3	3

T-2-96

Duplex Standby Control

The standby position for duplex reverse is shown below.

Less than 297.1 mm in size/5 sheets in circulation.

More than 297.1 mm in size, 3 sheets in circulation.

F-2-200

F-2-201

Delivery Unit

Decurler control

Executed to reduce the loading height of delivered paper.

Decurler pressure is switched according to image density and material.

Related Error Code

Forced Paper Feed Control

If there is paper in the following place after jam is detected, the paper will be forcedly fed to downstream direction.

This control suppresses paper damage during jam handling.

Remarks	If paper of 258 to 297 mm in size (A4R) is staying at the duplex standby position, regardless of ON/OFF of the sensor, the paper staying at the duplex standby position is fed.

T-2-102

<Code description>

- Large : Large size paper (if the width in paper feed direction is over 364 mm/count up x1)
- Small : Small size paper (if the width in paper feed direction is 364 mm or less)
- Total : All (C + P), count up x 1
- Duplex : At auto duplexing copy, count up x 1
- Change the country code of CONFIG in COPIER > OPTION > BODY > CONFIG.
- 3-digit code in counter column is the setting value of the following service mode items.
COPIER > OPTION > USER > COUNTER1 to 8
- Counter 2 to 8 can be changed in service mode: COPIER > OPTION > USER.
- For 2-color printing or copy, switch the item to count up in the following service mode:
COPIER > OPTION > USER > 2C-CT-SW (Level 2)
 - 0: "Single Color" counter is advanced
 - 1: "Full Color" counter is advanced

*1: By default, not indicated; may be changed in service mode.

Count-up Timing

Count-up timing (timing to advance the counter) differs according to the following condition:

- Print mode (1-sided, 2nd side of the 2-sided print, 1st side of the 2-sided print)
- Delivery location (finisher)

Delivery location		Print mode		
		1-sided/ 2nd side of 2-sided print	1st side of 2-sided print	
Count-up timing

■ Effects of Spanning Tree-supported Hub

If you set the network as a loop, data keeps staying in this loop and efficiency of data transfer might be decreased. In order to prevent this symptom, some hubs have the function called “spanning tree”. If this function is enabled, the device newly connected to the hub can make data communication with network 10 to 50 seconds (time changes due to the conditions) after the connection. When the machine enters Deep sleep mode and restores from the sleep mode, the machine electrically disconnects with the network once. Therefore, if the machine connects with the spanning tree-installed hub, the machine cannot communicate with network for approximately 1 minute at a maximum after restoring from the Deep sleep mode. For this reason, right after restoring from the Deep sleep mode, the following symptoms might occur: Device status cannot be collected, printing cannot be made, and login using a login application cannot be made. If such symptoms become any problems, perform the following operations.

- Using user mode, set not to enter the Deep sleep mode.
Preferences > Timer/Energy Settings > Sleep Mode Energy Use > High
- Disable the spanning tree function of hub.
- Request users to use the hub which supports Rapid Spanning-Tree Protocol (RSTP) that resolved such problems.

● Protective Function

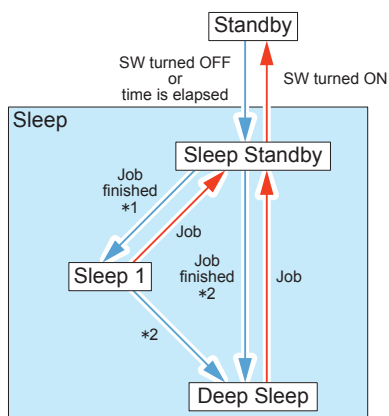

DC power PCB of the host machine and the power PCB of options have the overcurrent protective function and the abnormal high voltage protective function to prevent the power circuit brokerage by stopping the output voltage automatically when overcurrent or abnormal high voltage occur due to the problems such as short circuit etc on each load.

When an error occurs on 3VB (all-night power), all the power will be stopped.

An error occurs on the power other than above, all the power will be stopped except for 3VB (all-night power).

When an error occurs with 3 VB (all-night power supply), be sure to turn OFF the main power switch of the Printer Assembly, eliminate the cause which made the protection circuit active, and then replace the All-night Power Supply PCB.

Power-saving Function

F-2-210

Standby

The mode that the machine is running or is ready to start operation. All power is supplied in this mode.

Sleep Mode

Power-saving mode. Depending on the active controller, it is classified into the following 3 modes:

Sleep Standby	The Control Panel is OFF. Other power supply states are the same as those in the standby mode.
Sleep1	<ul style="list-style-type: none"> • Almost all the power supplies of engine system: OFF • HDD: ON • Main Controller PCB 1, 2: ON • All-night Power Supply PCB: ON
Deep Sleep	The state that only 3V on the All-night Power Supply PCB is supplied.

T-2-105

Conditions for not entering Deep Sleep

When the following conditions are met, the machine does not enter Deep Sleep.

Software status	
Common	Settings/Registration > Preferences > Timer/Energy Settings > Sleep Mode Energy Use is set to "High".
Fax	Settings/Registration > Function Settings > Receive/Forward > Fax Settings > Select RX Mode is not set to "Auto RX".
	Settings/Registration > Function Settings > Receive/Forward > Fax Settings > Remote RX is set to "ON".
	Settings/Registration > Preferences > Adjust Volume > Incoming Fax Ring is set to "ON".
	Settings/Registration > Function Settings > Send > Fax Settings > Modem Dial-in Settings > Set Line > either of the lines from Line 1 to Line 4 is set to "ON".
	Settings/Registration > Function Settings > Receive/Forward > Fax Settings > Set Number Display > either of the lines from Line 1 to Line 4 is set to "ON".
EFI	
	Service Mode > COPIER > OPTION > INT-FACE > IMG-CONT is not set to "0".
Hardware status	
	The Serial Coin Vendor is connected.
	The EFI (Video Option Board) is installed.
	The G4 Fax Board is installed.
	A USB device is connected to the host machine.
	The iSlot Extension Card is connected.
System Performance Status	
	A network application is communicating (with the TCP connection on the CPCA dedicated port and within 15 seconds of receiving UDP) via CPCA.
	A print job is being processed or waiting.
	A scan job is being processed or waiting.
	A fax communication is in progress.
	A phone communication is in progress.
	An IFAX communication is in progress.
	A job is being processed.
	A report job is being processed.
	A forward send job is in progress.
	A forward receive job is in progress.
	A SEND job is being processed.
	The distribution of device information is in progress.
	Export by RUI is in progress.
	Import by RUI is in progress.
	A VNC connection is in progress.
	MEAP Application is being executed.
	The Resource Downloader is executing a task (such as downloading font data and creating a backup).
	The Inbox is being backed up.

A file in the Super BOX is being opened (reading or writing). (*Common with WebDAV and SMB)
Operation is performed with the printer function stopped.
Operation is performed with the scanner function stopped.
A save job is being processed. (including a process to save in the Advanced Box or other storages after the scanning is completed, just like SEND)
A print job/save job using memory media is in progress.
The Alarm Service is set within 10 minutes.
* When one of the following is being executed, the Alarm Service (Time) is set.
<ul style="list-style-type: none"> Time setting for On/Off of the Memory Lock Settings/Registration > Function Settings > Receive/Forward > Common Settings > Set Fax/I-Fax Inbox > Memory Lock Start Time Settings/Registration > Function Settings > Receive/Forward > Common Settings > Set Fax/I-Fax Inbox > Memory Lock End Time
<ul style="list-style-type: none"> Output of report at a specified time Settings/Registration > Function Settings > Send > Common Settings > Communication Management Report > Specify Print Time (when not set to "Off") Settings/Registration > Function Settings > Send > Fax Settings > Fax Activity Report > Specify Print Time (when not set to "Off") Settings/Registration > Management Settings > Device Management > Device Information Distribution Settings > Communication Log > Report Settings > Specify Print Time (when not set to "Off")
<ul style="list-style-type: none"> Setting of send at a specified time (Fax, Send)
<ul style="list-style-type: none"> Pop setting Settings/Registration > Function Settings > Send > E-Mail/I-Fax Settings > Communication Settings > Next > POP Interval (when not set to "0")
<ul style="list-style-type: none"> DHCP setting (The interval specified by the server)
<ul style="list-style-type: none"> E-RDS setting (The interval specified by the server)
<ul style="list-style-type: none"> SNTP setting (The interval specified by the server)
<ul style="list-style-type: none"> Automatic distribution of device information
<ul style="list-style-type: none"> Backup of Inbox document at a specified time The auto sleep timer is running (for the time set by Settings/Registration > Preferences > Timer/Energy Settings > Auto Sleep Weekly Timer) The sleep mode exit timer is running (for 15 seconds after exiting DEEP SLEEP) The network timer is running (for the number of seconds set by Service Mode (Level 2) > COPIER > OPTION > NETWORK > WUEN-LIV.) The wake up timer is running (for 10 minutes after receiving a wake up packet). The hard disk drive protection timer is running (for 12 minutes after exiting from DEEP SLEEP and the hard disk drive is powered ON. However, after a printing, scanning, and fax job is completed, this timer is disabled.) The timer is running after link-up (for 1 minute after the machine is powered ON and the communication with the network is started). The sleep notification timer is running (for 10 minutes after notifying the network module of entering DEEP SLEEP. However, when the network module responds, this timer is disabled).
<ul style="list-style-type: none"> Setting of sleep mode exit time
<ul style="list-style-type: none"> Auto shutdown time
<ul style="list-style-type: none"> Setting of auto shutdown weekly timer

T-2-106

High-speed Startup

To realize faster startup, power configuration has been changed to always supply power to the All-night Power Supply PCB. Consequently, the main menu can be displayed after 7 seconds from turning ON the main power switch.

Although the Main Power Switch is OFF, power is supplied to the following PCBs.

- AC Driver PCB
- All-night Power Supply PCB
- Relay PCB
- Main Controller PCB 1

NOTE:

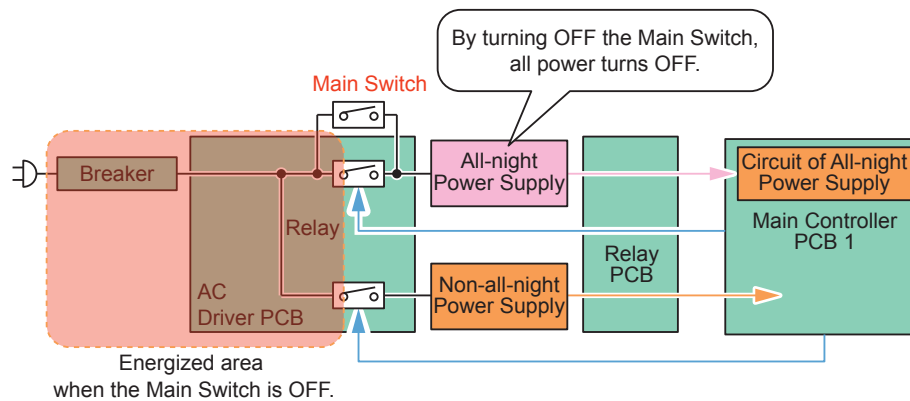

The function of high-speed startup can be set from "Settings/Registration".

- Settings/Registration > Preferences > Timer/Energy Settings > Quick Startup Settings for Main Power

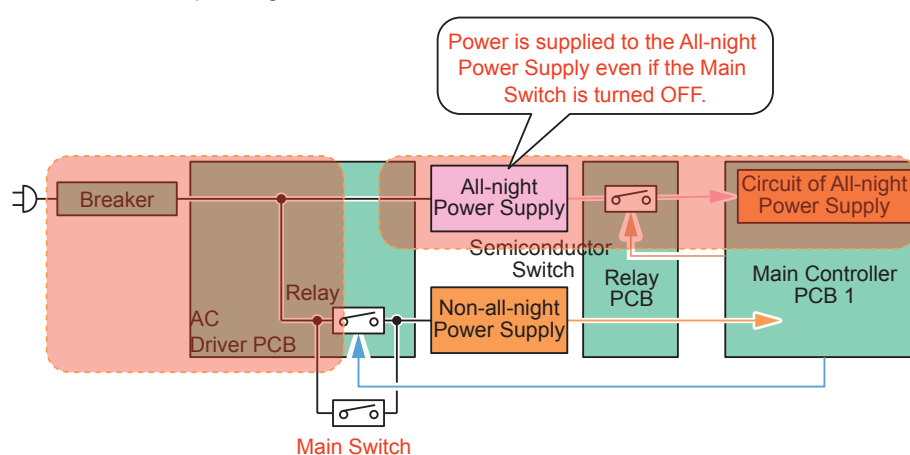

ON: High-speed startup is executed

OFF: High-speed startup is not executed (default)

When Quick Startup Settings for Main Power is OFF

When Quick Startup Settings for Main Power is ON

F-2-211

Disconnect the plug from outlet or turn OFF the breaker when performing work with the possibility to come in contact with the PCBs above. If a conductive material comes in contact with the PCB, short circuit may occur in the PCB, and may cause damage on it.

The following illustration is used at the place where attention is required. When the following label is affixed, be sure to disconnect the plug from outlet or turn OFF the Breaker.

F-2-212

In addition, quick startup is not performed under the following conditions.

At first startup after the AC Power Plug is connected to the outlet	
Under the following conditions (settings), the machine always starts up normally (even if quick startup is ON).	
	Either of the following devices is connected:
	<ul style="list-style-type: none"> • EFI Controller • Serial I/F coin vendor
	Either of the following network settings is set to "ON":
	<ul style="list-style-type: none"> • RARP • BOOTP • IPsec • IPv6 • NetWare

As for startup right after shutting down of the machine under either of the following conditions, it starts up normally (even if quick startup is ON).	
	Conditions related to Fax
	<ul style="list-style-type: none"> • There is a fax transmission reservation. • Within a specified period of time from disconnection of a fax line • Within a specified period of time from non-detection of reception from a fax line • Within a specified period of time from putting down the fax sub device or handset
	Condition related to MEAP
	During execution of MEAP application which prohibits entering Deep Sleep
	Conditions related to job processing
	<ul style="list-style-type: none"> • During print job processing • During SEND job processing • During I-Fax communication/job processing • During report job processing • During forwarding transmission job/reception job processing • During processing to save data in Advanced Box, etc. • During fax communication/phone communication • During distribution of device information • During Box backup • During export/import by RUI • During opening/reading/writing file of Advanced Box (common with SMR/WebDAV)
	Others
	<ul style="list-style-type: none"> • When the state of the machine remains unchanged for 110 hours or more after turning ON the power (by quick startup) or turning OFF the power <ul style="list-style-type: none"> →At the time of shutdown, it will be normal shutdown. * This is to prevent a risk of UI freeze caused by memory leak. • Within a specified period of time (20 seconds) from turning OFF the Main Power Switch <ul style="list-style-type: none"> →In such a case, the machine reboots and then starts up normally at startup. Therefore, it will take a few more seconds compared with the normal startup. * This is for starting up the machine normally at the time of failure (UI freeze, etc.). • After entering service mode or Settings/Registration screen of the RUI • After changing an item in Settings/Registrations that requires restart • The machine is shut down from RUI • When an error occurs • When resource downloader is active • In printer/scanner limited functions mode • When a login application is switched by SMS • A license has been registered. • Startup by pressing the Control Panel Key

T-2-107

MEAP

Preparation for Using SSO-H

Outline

When using Single Sign-On H (hereinafter referred to as SSO-H) for the login service, required system environments are different in server authentication or local device authentication.

See the following for system requirements in each of authentication methods:

Server authentication management

The system requirements necessary when using server authentication by SSO-H vary depending on the authentication server.

The system requirements for using each authentication server are shown below.

Active Directory authentication

In order to use Active Directory authentication in SSO-H, the following system environments are required.

- 1) Authentication server (Active Directory : Windows server)
 - Active Directory and Domain Name System (DNS) should be installed.
 - A group named "Canon Peripheral Admins" should be created on the Active Directory.
 - The OS should be one of the followings.
 - Microsoft Windows Server 2003 SP2 *
 - Microsoft Windows Server 2003 R2 SP2 *
 - Microsoft Windows Server 2008 SP2 *
 - Microsoft Windows Server 2008 R2 SP1
 - Microsoft Windows Server 2012
- * 64-bit version is not supported.
- 2) Users accessing the authentication server (Active Directory: Windows Server)
 - The user should belong to the "Canon Peripheral Admins" group on the Active Directory.
 - The user name should contain only single-byte alphanumeric characters, - (hyphen), _ (low line), and % (percent).

Note:

The difference in time setting between the authentication server (Active Directory) and the machine (and the computer for login) should be within 5 minutes. (If the difference in time setting is 5 minutes or longer, an error will occur at the time of login for the server authentication.)

Note:

As for the user name for logging into the machine, use the name registered as "User logon name (pre-Windows 2000)" in the Active Directory.

An example of the user registration screen (Windows Server 2003)

F-2-213

LDAP authentication

When using LDAP authentication by SSO-H, the following conditions need to be satisfied.

- 1) LDAP server
 - Novell eDirectory V8.8 SP6 for Windows
 - Lotus Domino V8.5 for Windows
- 2) OS where the LDAP server runs
 - It should comply with the specifications of the LDAP server product.

Operation check has been conducted for the following OS.

- Microsoft Windows Server 2003 Enterprise SP2
- Microsoft Windows Server 2008 Enterprise

Note:

When an LDAP server other than the server shown above is used, SSO-H may not work properly. Windows Active Directory works also as an LDAP server, but is not supported.

PC Environment of Administrator Users and General Users

The following environment is required to use this machine (managed by SSO-H) from a PC on the network.

OS of the PC and Other Environments

Classification	Operating System	IPv6	Supported browser	Java Runtime Environment
Client OS	Windows XP Professional SP3	✓	Internet Explorer 7 Internet Explorer 8	JRE5.0/JRE6/JRE7 (Exclude JRE6 update4/5.)
	Windows Vista SP2	✓	Internet Explorer 7 Internet Explorer 8 Internet Explorer 9	
	Windows 7 SP1	✓	Internet Explorer 8 Internet Explorer 9	
	Windows 8	✓	Internet Explorer 10	
Server OS	Windows Server 2003 SP2	✓	Internet Explorer 7 Internet Explorer 8	
	Windows Server 2003 R2 SP2	✓	Internet Explorer 7 Internet Explorer 8 Internet Explorer 9	
	Windows Server 2008 SP2	✓	Internet Explorer 7 Internet Explorer 8 Internet Explorer 9	
	Windows Server 2008 R2 SP1	✓	Internet Explorer 8 Internet Explorer 9	
Mac OS	Mac OS X v10.5		Safari 4.0.5 Safari 5.0.5	J2SE5.0 Java SE 6
	Mac OS X v10.6		Safari 4.0.5 Safari 5.0.5 Safari 5.1	Java SE 6
	Mac OS X Lion		Safari 5.1	Java SE 6 Java SE 7
	Mac OS X Mountain Lion		Safari 6.0	Java SE 7

JRE : Java Runtime Environment

T-2-108

J2SE : Java 2 Platform Standard Edition

Note: common to browsers

- The browser should support Java. (The environment such as Modern UI version of Internet Explorer on Windows 8 in which Java add-on cannot be used is not applicable.)
- JavaScript should be enabled.
- Refer to the website of JAVA (<http://java.com/>) for how to obtain the Java environment.

Note: Internet Explorer-related

- In order to use JRE6 Update24 with Internet Explorer 9/10, JRE6 Update24 or later is required.
- The ActiveX plug-in should be enabled in Internet Explorer.
- In Internet Explorer, if [Run ActiveX controls and plug-ins] is disabled in [Internet Options] > [Security] > [Custom level...], a warning message that JRE has not yet been installed is displayed.
- When using Windows XP in an IP v6 environment, IP v6 may need to be installed manually in some cases.

Note: MacOS-related

- Java does not work in the case of combination of MacOS 10.6.8, Java SE 6 update6 (Java for MacOS X 10.6 Update 6) and Safari5.0.5. Either of the following measures needs to be taken to make it run.
- Not installing Java SE 6 update6 (Java for MacOS X 10.6 Update 6) (it is however not possible to uninstall it if it is already installed and running)
- Providing a symbolic link again using the command of `ln -s /System/Library/Frameworks/JavaVM.framework/Resources/JavaPluginCocoa.bundle`
- Upgrading Safari to version 5.1

Network ports used

	Port No.	Application
Connecting	53	Communication with DNS server (fixed)
	88	Kerberos authentication with KDC (Key Distribution Center)
	1-65535 (default:389)	Communication with directory service using LDAP (default is 389, may be changed to any port on LDAP service side)
Listening	10000 - 10100	-

T-2-109

Preparation for Using SMS

To use SMS, a PC and browser used to access SMS are required, and the network settings need to be set up on the device.

Preparation of PC for Accessing SMS

Checking of operation environment

In order to access SMS using password authentication, the PC and browser need to comply with the following system environment.

Combination of the Browser and the OS

Operating System	Supported browser
Windows XP Professional SP3	Internet Explorer 7 Internet Explorer 8
Windows Vista SP2	Internet Explorer 7 Internet Explorer 8 Internet Explorer 9
Windows 7 SP1	Internet Explorer 8 Internet Explorer 9
Windows 8	Internet Explorer 10
Mac OS X v10.5	Safari 4.0.5 Safari 5.0.5
Mac OS X v10.6	Safari 4.0.5 Safari 5.0.5 Safari 5.1
Mac OS X Lion	Safari 5.1
Mac OS X Mountain Lion	Safari 6.0

T-2-110

In order to access SMS using RLS authentication, the environment should comply with the environment for using SSO-H as the login service. (For details, refer to "PC Environment of Administrator Users and General Users".)

PC and Browser Settings

The PC and browser used to access SMS need to satisfy the following conditions.

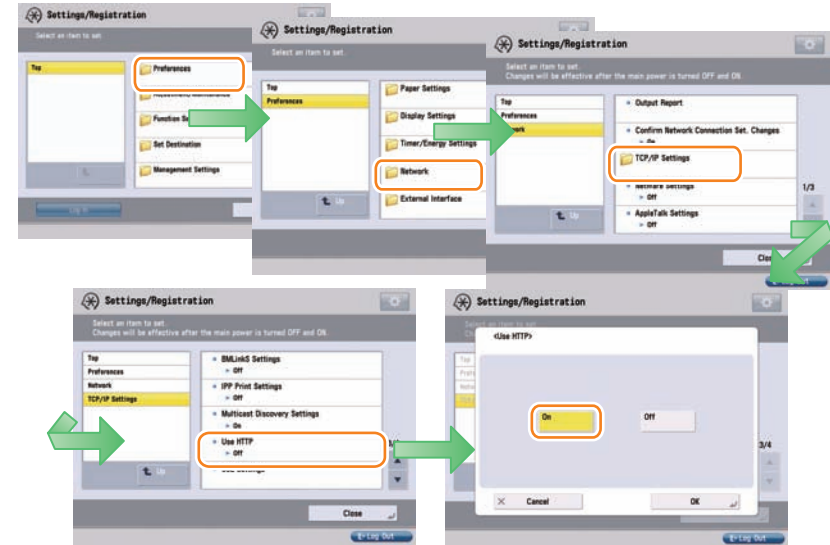

- The supported browser language should be the same with the language of the OS.
- Java Script should be enabled.
- The supported screen size should be 800 x 600 or larger (recommended size: 1024 x 768).
- Session cookie should be enabled.
- Only alphanumeric characters and some of the symbols ("-" or ".") should be used as the machine domain name and host name.
- If an invalid character string such as a low line ("_") is included in the host name, cookies cannot be enabled.

Settings on the Device Side

Network configuration process

In order to provide support for the machine via network such as SMS, the network settings need to be made from the touch panel of the machine. (this setting is [ON] by default).

- 1) Press [Settings/Registration], select [Preferences] > [Network] > [TCP/IP Settings] > [Use HTTP] and press [On].

F-2-214

Note:

In this machine series, the System Manager ID and the System PIN are configured by default, so [Network] and the items that follow are grayed out and cannot be selected. Return to the top screen, press [Login] at the lower left of the screen, login as the system manager, and configure the settings. The default setting for the System Manager ID is "7654321", and the password is "7654321".

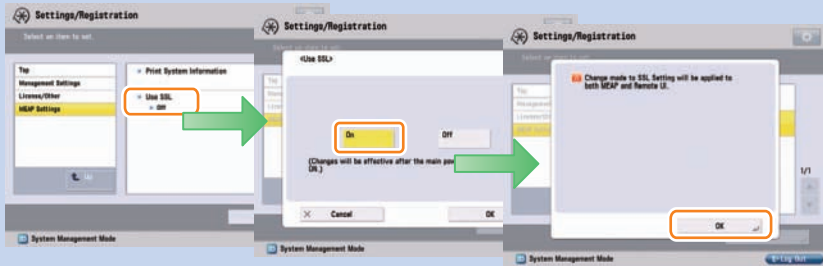

F-2-215

Note:

When using SSL, press [Settings/ Registration], select [Management Settings]>[License / Other] > [MEAP Settings] > [SSL Settings] and press [On]. (This setting is applied to SSL setting on RUI. Vice versa, [On] set for SSL on RUI is also applied to the touch panel.)

When [Use SSL] is set to On, the message dialog, [The Default Key is not set. Check the Key and Certificate List settings in Certificate Setting.], is shown. Press [OK] for this message.

F-2-216

- 2) Press [OK] to return to Main Menu screen.
- 3) Re this device.

CAUTION:

- The setting [Use HTTP] is not actually enabled/disabled until you have restarted the device.
- You cannot make a connection through a proxy server. If a proxy server is in use, enter the IP address of the MEAP device in the Exceptions field for the browser. Open Internet Options dialog of Internet Explorer and select [Connections] tab, [LAN Settings], Use a proxy server option, and [Advanced] of Proxy server group. Proxy Settings dialog will opens. The Exceptions field is in the dialog. As network settings vary among environments, consult the network administrator.
- If Cookie and JavaScript are not enabled in the Web browser, you will not be able to use SMS.
- To type text using the Web browser, use the characters compatible with the MEAP device's touch panel display. The MEAP device may not properly recognize some characters.
- When [Use SSL] is made available, it is necessary to set the key and the certificate necessary for the SSL communication. Set the key and the certificate by SSL with [SSL Settings] that exists in [Preferences] > [Network] > [TCP/IP Settings] > [SSL Settings] on the device.

● Key Pair and Server Certificate when Using Encrypted SSL Communication

To use SMS via SSL connection, it is required to specify a key pair and server certificate as the key to be used.

Since a key (default key) that can be used for encrypted SSL communication is installed as standard on the device, advance setting of the key pair and server certificate is not required. In order to use an encryption key other than the default key, follow the procedure "Generating a key pair" shown below to make settings for the key pair and server certificate necessary for encrypted SSL communication.

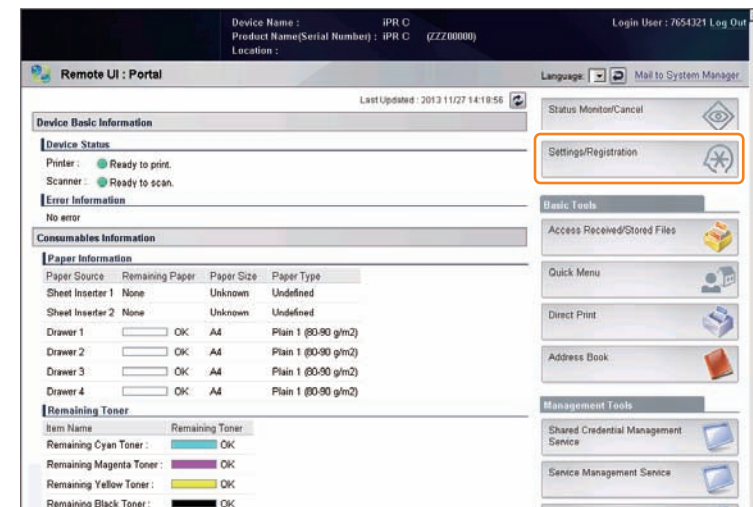

Note:

- MFP has a server certificate registered as standard.
- For detailed procedures of the Default Key setting, refer to [e-Manual > Security].
- As for SMS, by setting a Default Key, encrypted SSL communication is always executed regardless of the following setting: [Settings/Registration] > [Management Settings] (Settings/Registration) > [MEAP Settings] > [SSL Settings]: ON/OFF.

Generating a key pair

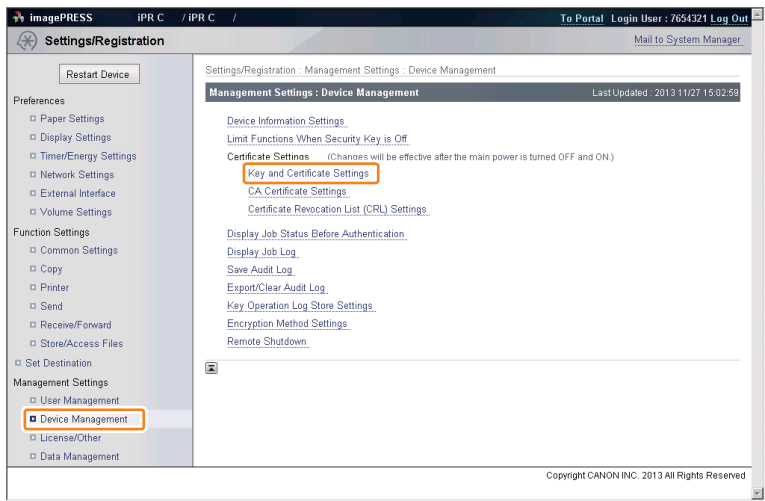

- 1) From a PC on the same network as the device, use a web browser to access the remote UI's portal page. Then, select [Settings/Registration] from the menu on the right side of the screen.

URL to access: <http://<device's IP address>:8000/>

F-2-217

2) Click [Management Settings] > [Device Management] > [Certificate Settings] > [Key and Certificate Settings].

F-2-218

3) Click [Generate Key...].

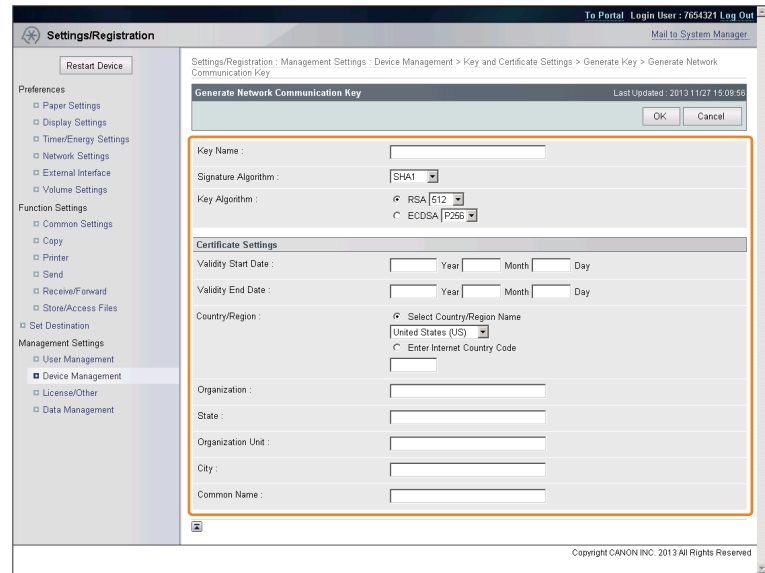

F-2-219

4) Click [Network Communication].

F-2-220

5) Enter the necessary information, and then click the [OK].

F-2-221

Input example

Item name	Type	Content	Entry
Key Settings			
Key Name	Compulsory	An arbitrary character string	Default Key
Signature Algorithm	Compulsory	Selected from:SHA1/SHA256/SHA384/SHA512	SHA1
Key Algorithm	Compulsory	Selected from:512/1024/2048/4096	1024
Certificate Settings			
Validity Start Date	Compulsory	Date	15/4/2012
Validity End Date	Compulsory	Date	15/4/2036
Country/Region	Compulsory	Country or region name	United States(US)
State	Arbitrary	State name	-
City	Arbitrary	City name	-
Organization	Arbitrary	Organization name	-
Organization Unit	Arbitrary	Organization unit	-
Common Name	Arbitrary	Common name* or IP address	192.168.1.210

T-2-111

Note:
When the IP address of the device has been entered in the [Common Name] entry field, if you install a server certificate to the browser (see "Installing a server certificate (reference information)"), the message "Certificate Error" that usually appears when access is made from Internet Explorer 7 or later will not be displayed.

6) Check to see that the generated key appears in [Registered Key and Certificate].

F-2-222

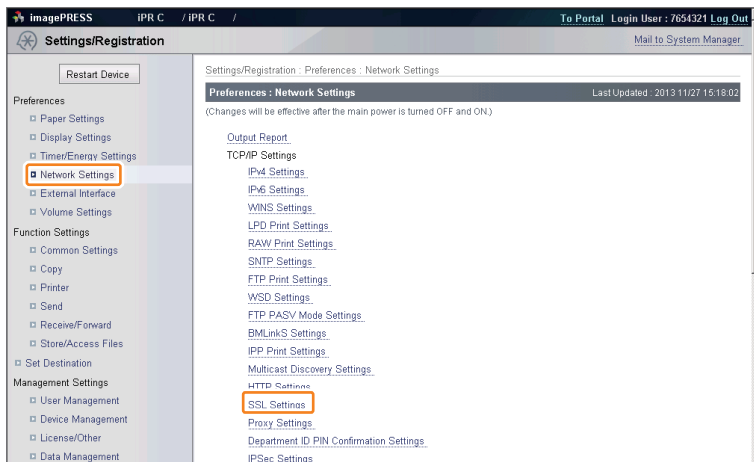

3) Click the generated key's [Use].

F-2-225

Default Key Settings

1) Click [Preferences] > [Network Settings] > [TCP/IP Settings] > [SSL Settings].

F-2-223

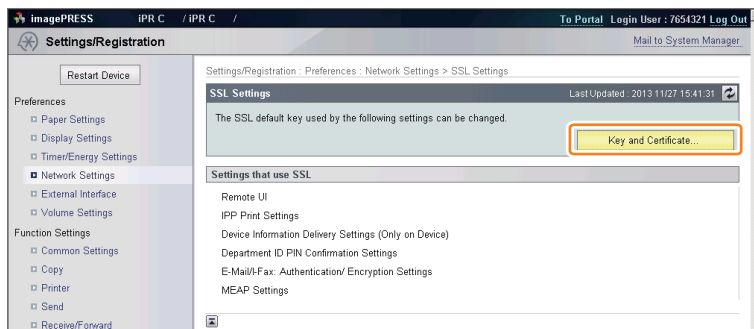

4) Check that [SSL] is displayed in the [Key Usage] entry field.

F-2-226

5) Log out from the remote UI, and then restart the device.

2) Click [Key and Certificate...].

F-2-224

Installing a server certificate (reference information)

When you access a device where the key installed as standard [default key] is set as the key for SSL, "Certificate Error" appears if the version of Internet Explorer (IE) is Version 7 or later.

Error display example

F-2-227

To disable display of "Certificate Error", use the following procedure (for IE8) to set the key generated in "Key Pair and Server Certificate when Using Encrypted SSL Communication" (i.e. the key with the IP address of the device specified as the shared name) as an SSL key.

1) Access SMS from the browser, and then click "Certificate Error" in the URL entry field.

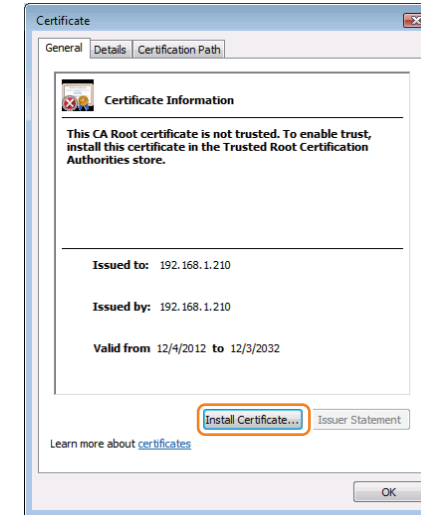

F-2-228

2) Click [View certificates].

F-2-229

3) Click the [Install Certificate...] on the [General] tab.

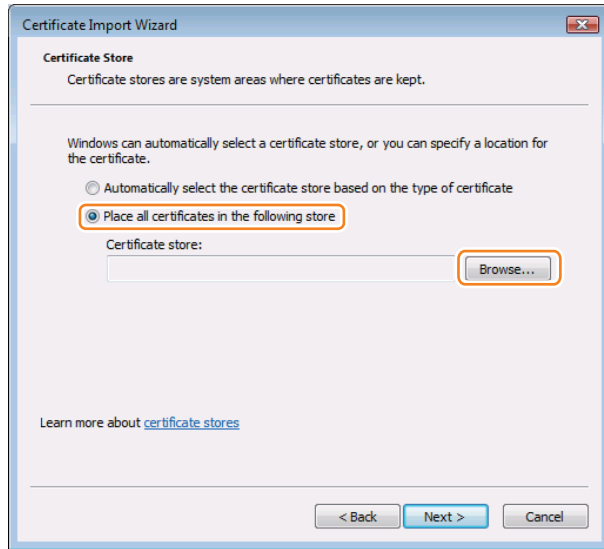

F-2-230

4) [Certificate Import Wizard] will appear. Click the [Next].

F-2-231

- 5) In [Certificate Store], select the [Place all certificates in the following store] option, and then click the [Browse].

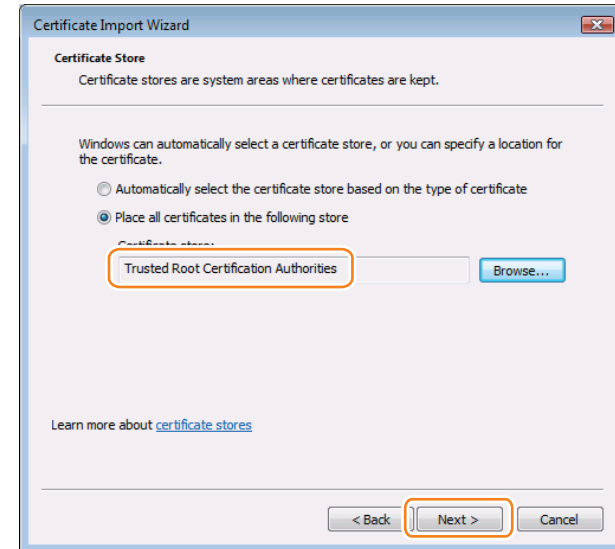

F-2-232

- 6) In [Select Certificate Store], select [Trusted Root Certification Authorities], and then click the [OK].

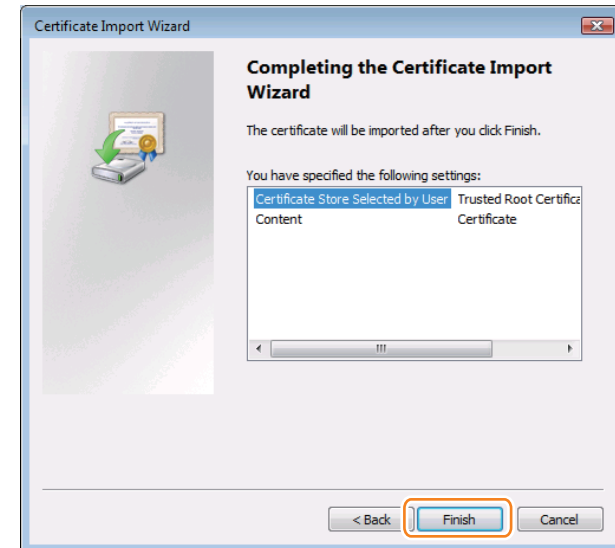

F-2-233

- 7) You will return to the [Certificate Store] dialog. Check that "Trusted Root Certification Authorities" appears in [Certificate], and then click the [Next].

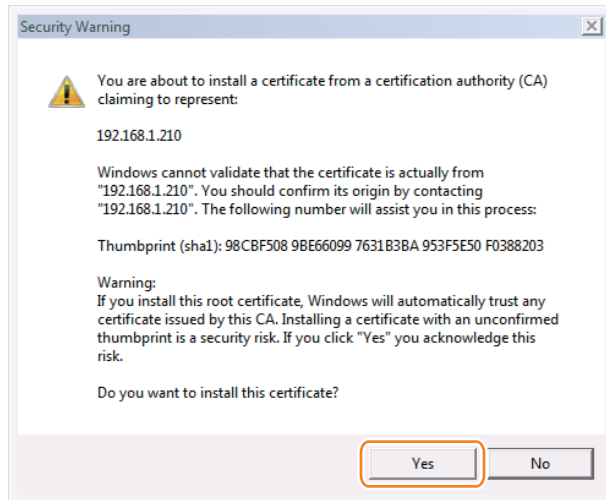

F-2-234

- 8) [Completing the Certificate Import Wizard] will appear. Click the [Finish].

F-2-235

- 9) If the [Security Warning] appears, click the [Yes]. (It does not appear when installing the same certificate again.)

F-2-236

- 10) A message will appear to indicate that import has been completed successfully. Click the [OK].

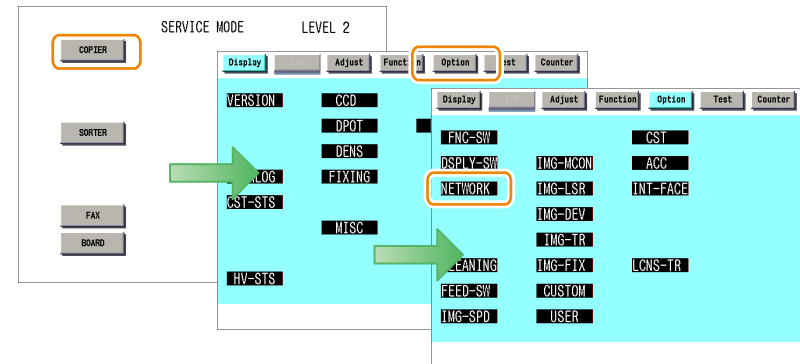

F-2-237

Network Port Settings

The default port of the HTTP server used for MEAP and MEAP applications to provide the servlet function is 8000, and the HTTPS server's default port is 8443. In the case that these ports have already used by the customer who is to introduce this application, the MEAP application cannot use the HTTP (or HTTPS) server(s).

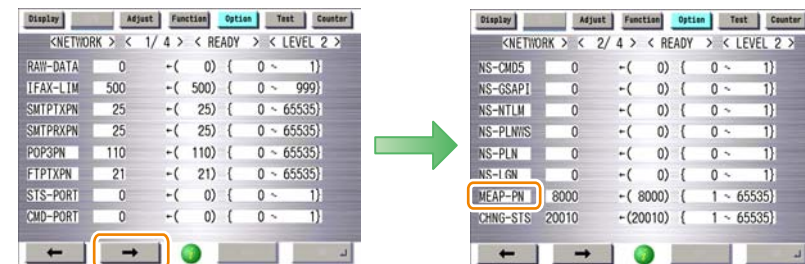

By changing the following ports to use, however, the MEAP application can be used as well as the existing system.

- 1) Start [SERVICE MODE] in Level 2.
- 2) Press [COPIER] > [Option] > [NETWORK].

F-2-238

- 3) To set up the HTTP server port, select [MEAP-PN]. To set up the HTTPS server port, select [MEAP-SSL].

F-2-239

- 4) Press the port number to specify on the control panel (the numerical value input in the field is displayed), and press [OK].

F-2-240

Note:

A port number can be any integer from 0 to 65535. To avoid port numbers that are frequently used, do not use any integer from 0 to 1023.

Server	Setting value	Default value / Value after RAM clear
HTTP Server	1024 to 65535	8000
HTTPS Server	1024 to 65535	8443

T-2-112

Note:

- If Print Server is connected, do not specify port 8080. If port 8080 is specified, it is not possible to access the remote UI of the device where the MEAP authentication application is running. (Port 8080 is reserved to allow the PS Print Server Unit to redirect to the device.)
- As for port on HTTPS server, it only applies to the device that supports SSL function.

- 5) Restart the device if the port number is set.

F-2-241

How to Check the Serial Number

When performing MEAP device support, the serial number of the device is necessary in some cases.

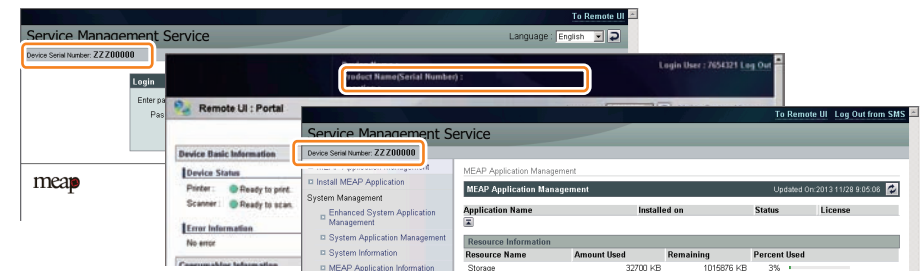

Examples of where the serial number is necessary

- When initializing SMS login password (obtaining a switch license)
- When obtaining a MEAP application license from LMS
- When obtaining a transfer license of MEAP application
- When obtaining a special license for reinstalling MEAP application

If a problem occurs in the MEAP device and you want to contact the support department of the sales company, you need to provide the serial number. Perform the following procedure to get the serial number.

Checking from the PC browser

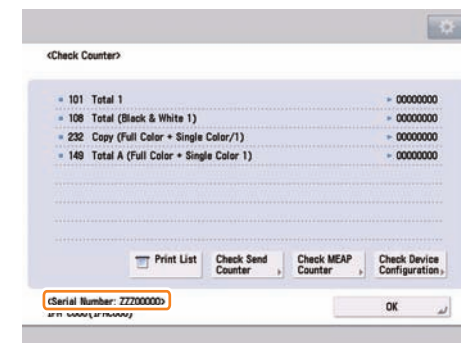

The serial number of the device is displayed on the SMS login screen, SMS screen, and remote UI portal screen.

F-2-242

Checking from the device's Touch Panel

You can see the number by pressing the List key on the Control Panel of the machine.

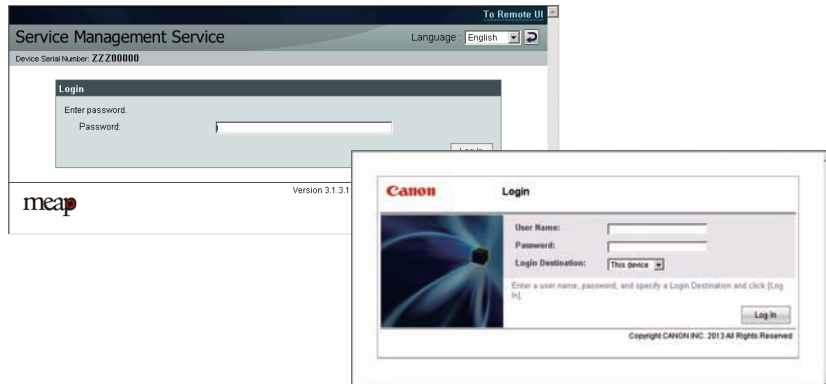

F-2-243

Login to SMS

Outline

SMS login may be done by entering a password for authentication, or by authentication via the Remote Login Service (RLS) login window (RLS authentication). Settings can be changed to allow either only one of these methods or both of them.

SMS login window (password auth) RLS login window (user name/ password auth)

F-2-244

Login method	Authentication method	Authentication service name	Users who may log in
Password authentication	Password authentication	SMS Installer Service (Password Authentication)	Users who know the SMS login password
RLS login	SSO-H	SMS Installer Service (Remote Login Service Authentication)	Users registered as administrators with SSO-H

T-2-113

Note:

If Default Authentication is selected as the device authentication method, "RLS Authentication" is not selectable as SMS Login method. Also, if "RLS Authentication" is selected, the device authentication method (Default Authentication, SDL, SSO) cannot be changed.

When SMS Cannot Be Accessed

If you forgot the password (SMS login password initialization)

After changing the default SMS login password, if you forgot the new password and cannot log in to SMS, you can use a switch license for password initialization to change the password back to the default value "MeapSmsLogin".

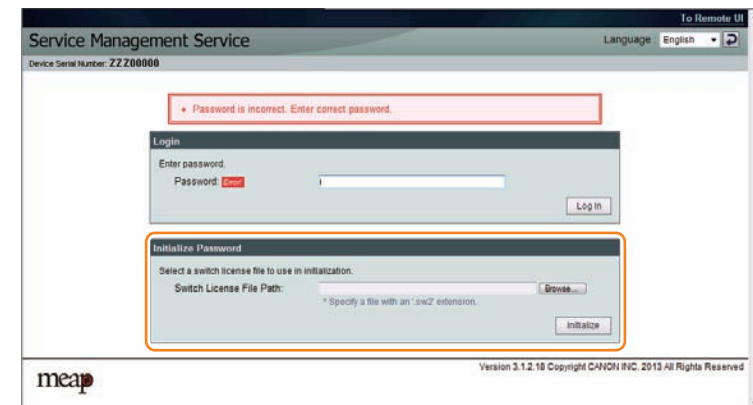

Note that there is no special password for service.

1) Obtain a switch license file for password initialization.

Contact the person in charge of support at the sales company, give the device's serial number, and have a switch license file for password initialization issued.

2) Load the switch license file.

With nothing entered, click the [Log in] to display the area for specifying a switch license file for password initialization.

F-2-245

3) Specify the switch license file.

Click the [Browse] and specify the switch license file.

4) Initialize the login password.

Click the [Initialize] to display an initialization confirmation page, and click the [OK].

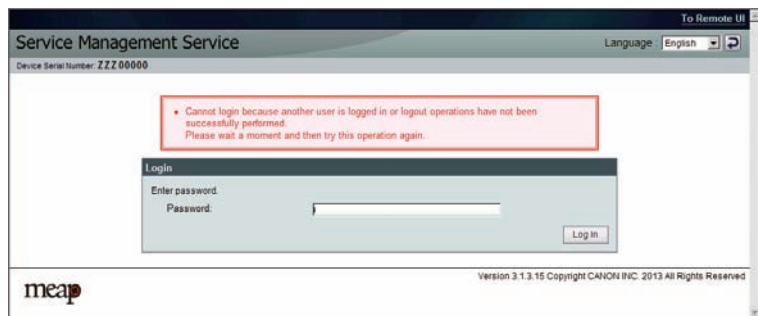

Note:

- The default password is "MeapSmsLogin." (The password is case-sensitive.)
- If you click [Cancel], the Login page opens without initializing the password.

● If login is not possible due to exclusive control

Since access to SMS is under exclusive control, you cannot log in if another user has already logged into the SMS of the same device.

An example of the exclusive control message

F-2-246

If you cannot log in due to exclusive control, you need to ask the other user to log out before you can try again.

Note:

If you close the browser without logging out, the session remains active. In that case, you cannot log in again.

If this problem occurs, you can wait for 5 minutes so that the session is disconnected. Or, you can restart the device to force the session to disconnect.

● If [Key and Certificate Settings] is not set

If [Key and Certificate Settings] is not set correctly, you cannot access the URL for SMS (<https://<device's IP address>:8443/sms/>). In that case, perform the following procedure.

- 1) Go to <http://<device's IP address>:8000/sms/>, and check to see that "HTTP 500 Internal Server Error" appears.
- 2) If it appears, perform the procedure "Key Pair and Server Certificate when Using Encrypted SSL Communication" in this chapter.

Note:

In the case of SMS, by setting the key to be used, encrypted SSL communication is always executed regardless of the following setting: [Settings/Registration] > [Management Settings] > [License/Other] > [MEAP Settings] > [Use SSL] > ON/OFF.

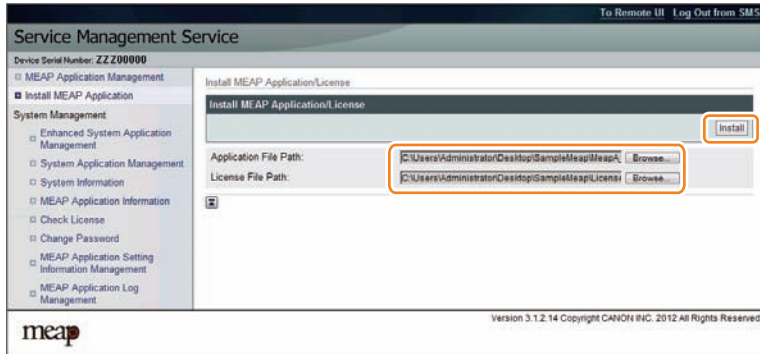

■ How to Deal with a Message "Certificate Error" That Appears at the Time of Access

When accessing from the browser to SMS, a message "Certificate Error" appears in some cases. In that case, perform the procedure "Installing a server certificate (reference information)" in this chapter.

Installing an MEAP Application

Outline

From the MEAP application installation screen, you can install the MEAP application as well as the license file.

F-2-247

Before installing the MEAP application, be sure to check the following items.

Device compatibility with the MEAP application

To find out whether the device is compatible with the MEAP application, check the devices supported by the MEAP application. Depending on the application, the device's firmware may require version upgrade.

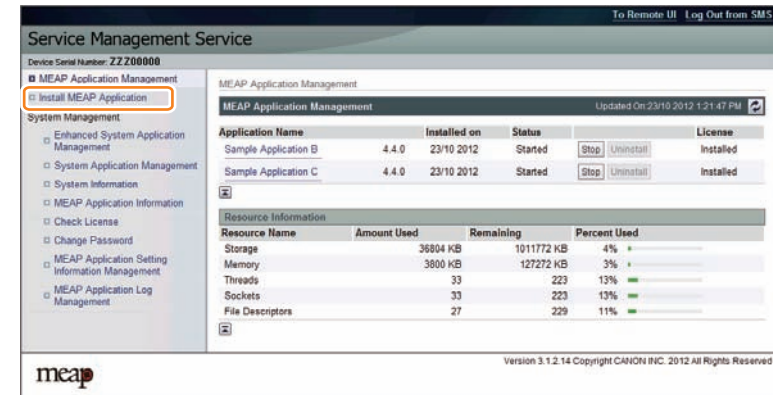

Resources availability (remaining amount)

The necessary resources (free storage space and free memory available) must be secured for an MEAP application to run; otherwise, you cannot install the MEAP application.

To check the resource information, see "Device's resources" in this manual.

Procedure to install applications

- 1) Long on to SMS.
- 2) Click [Install MEAP Application] on the menu.

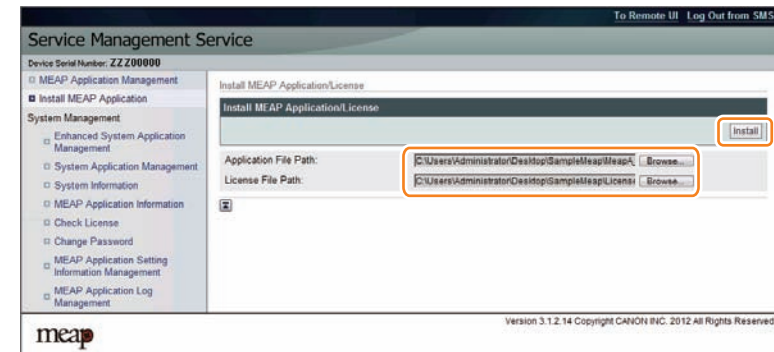

F-2-248

- 3) Check [Install MEAP Application/License] page appears.

- 4) Click [Browse..], and select the application file and the license file of the application; then, click [Install].

Note:

Application File: identified by the extension "jar".
License File: identified by the extension "lic".

F-2-249

CAUTION:

- You cannot install only the license.
- You will not be able to install the application without using the appropriate license. Be sure to select its license file.
- If you are adding a license to an existing application, see "Procedure adding a license file".
- If you are updating an existing application, stop the application; then, install the new application or its license file. You will not be able to update an application while it is running.

Note:

The license file is provided in text file format, enabling to view in a text editor. The application ID and device serial number shown in the file allow users to confirm which device to install with the license file.

Note that any changes added to the license file may disable installation. Cares should be taken when confirming the contents of the license file.

Sample file

```

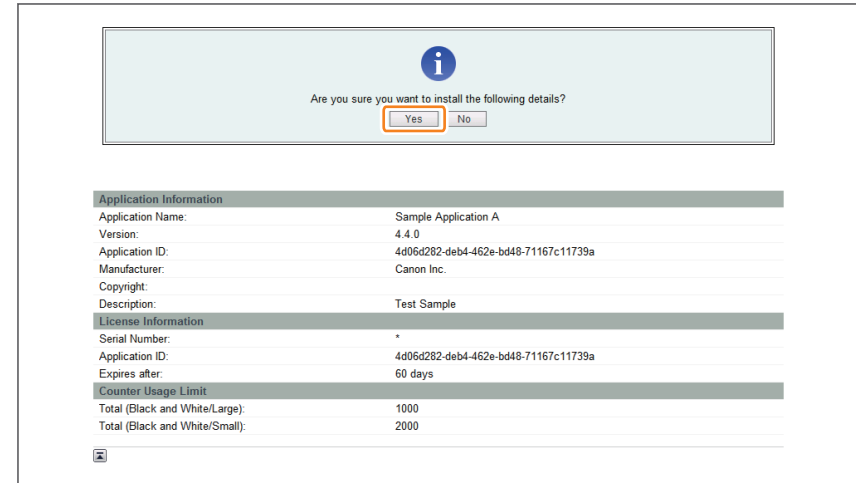

LicenseFile-Version: 1
LicenseFile-Id: 8b32c16d-e826-405f-a02a-0c547423ade0

```

F-2-250

5) Check the contents of the Confirm page; then, click [OK].

F-2-251

6) Some applications show a screen to indicate the terms of agreement. Read the terms, and click [OK].

7) Check the message "Installing...Please wait." appears, beginning the installation.

F-2-252

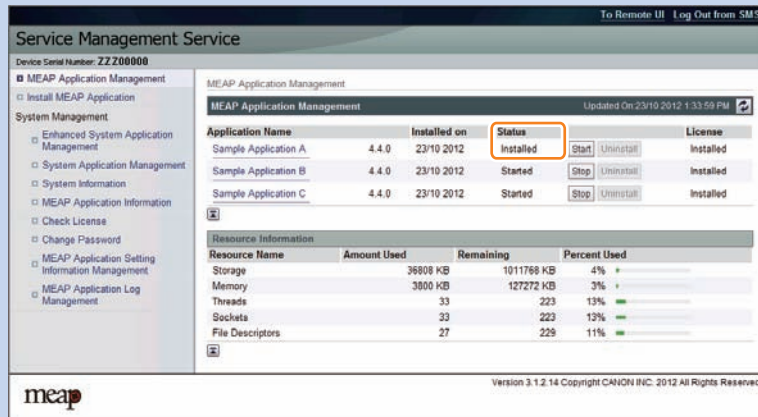

8) Upon installation completed, click [To MEAP Application Management] shown on the screen to view MEAP Application Management page.

F-2-253

Note:

As for an application that has just been installed, the status is "Installed". In order to use the application, it is necessary to click the [Start] to change the status to [Started].

F-2-254

Note:

There are two ways to install an MEAP application. You can install using SMS, or install using the [Register/Update Software] screen of the remote UI.

Screen example

F-2-255

[Register/Update Software] provides two types of installations. One is [Manual Installation] where you specify a jar file and a license file and then install. The other is [Delivered Installation] where you enter a license access number. For details of the procedures, please refer to the e-Manual.

Resource Information**Outline**

Application Management page shows [resource information] for information of the whole device resources including Amount Used, Remaining, and Percent Used.

This function enables users to judge the remaining resources before installing the additional application. Such resource information is shown based on the manifest header stated at the top of each application, which declares the resources required in the application. Therefore, the information does not necessarily show the resources actually in use.

The following resource information is shown:

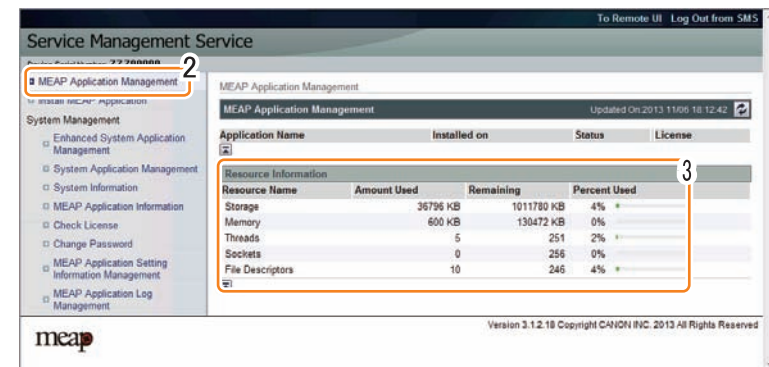

- Storage
- Memory
- Thread
- Socket
- File Descriptor

If the hard disk does not have enough free space for the application, the application cannot be installed.

Moreover, if the free space of any of the resources (Memory, Thread, Socket, and File Descriptor) is insufficient, the application cannot be started.

The following procedure shows how to check the resource information.

- 1) Log in to SMS.
- 2) Click [MEAP Application Management].
- 3) Check [Resource Information] for information of the whole device resources.

F-2-256

● Device's resources

When 1 MEAP application operates, the resource volume allocated to each device is as follows (loaded resource list). Since the following value is an estimate, when installing the MEAP applications, it needs to check the available resource of SMS.

Since the indication of SMS resource volume fluctuates by the login service (authentication function) and configuration (future model), which the user selected, it may show a bigger value than the following values.

List of Available Resources

Product Name	Storage	Memory	Thread	Socket	File Description
iPR C800 series	1024MB	128MB	256	256	256

T-2-114

Note:

- Among the resources, the free space of Storage is checked when installing an application. For other resources, the free space is checked when the application is started.
- Some applications call for a specific set of conditions for installation. For details, see the User's Guide that comes with the individual applications.
- Maximum installable application is up to 20 even if the remaining resource is adequate. (However, the Send function consumes 1, it must be 19 in practice.) Authentication application is not included in this number.
- The MEAP application, which can be started simultaneously, is up to 19. (Authentication application is not included in this number.)

CAUTION:

To install an application, the user needs to use the following URL when accessing the license control system to obtain a license file. In doing so, he/she needs to register the license access number of the application and the serial number of the device.

<http://www.canon.com/lms/license/>

● MEAP Specifications

■ What is MEAP Specifications (MEAP Spec Version)?

MEAP Specifications is one of the information required to judge whether MEAP applications can be operated or not. With MEAP Specifications, you can prevent an application that uses a specific function of device from being installed onto the device that does not have the function.

● About Name

The displayed name for Meap Specifications differs depending on the screen or the location where the name is displayed.

In this document, it is referred to as "Meap Specifications".

The location where the name is displayed/shown	Displayed name
Platform Information : SMS > [System Management] > [System Information] > [Platform Information]	MEAP Specifications
System Information Print : Local UI [Settings/Registration] > [Management Settings] > [License/Other] > [MEAP Settings] > [System Information Print]	
Manifest file of the MEAP application	MeapSpecVersion
SDK documents	

T-2-115

● Mechanism

MEAP platform judges whether MEAP applications can be operated on it using on the 2 information below:

- Device Specification ID
- MEAP Specifications

Device Specification ID shows information such as the original functions of MFP (including print, scan, and copy), and one that differs by model such as maximum copy number, thus each model has a different ID. (It is easy to determine the IDs for this reason.) MEAP application declares 1 or more Device Specification ID required for its execution. Declaration of multiple Device Specification IDs means that the application is operable in all the models declared. Upon installation of MEAP application in (using) SMS or MEAP Enterprise Service Manager, matching of Device Specification ID is executed on the side of MEAP platform machine. The machine which doesn't support the ID declared by the application rejects installation of such an application.

Meanwhile, MEAP Specifications shows other information than defined by Device Specification ID above, including network and security. Thus each model does not always have the same version.

MEAP application declares 1 or more MEAP Specifications required for its execution. Declaration of multiple Device Specification IDs means that the application is operable

in all the environments declared. Upon installation of MEAP application in SMS or MEAP Enterprise Service Manager, matching of MEAP Specifications is executed on the side of MEAP platform machine. The machine which doesn't support the version declared by the application rejects installation of such an application.

MEAP Specifications for each model

Product Name	Initial MEAP SpecVer	Remarks
iPR C800 series	5, 6, 7, 9, 10, 11, 13, 14, 15, 17, 18, 19, 25, 26, 27, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 44, 45, 46, 47, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 64, 65, 66, 67, 68, 69, 70, 71, 72, 74, 78, 79, 80, 82	

T-2-116

MEAP Specifications List

Ver	Description
1	MEAP basic function
2	MEAP Spec Version 1 function and SSL/TSL + Proxy
5	MEAP Spec Version 1 function and CPCA V2 + ERS (Error Recovery Service) + New SSL/TSL
6	Reserved
7	MEAP Spec Version 5 function and Compact PDF + OCR PDF (Text Searchable) + USB Host (Buffering of Interrupt Transfer)
9	Reserved
10	MEAP Spec Version 5 function and USB-Host (Exception + Clear Feature + Set Feature+ Hot Plug) + WINS address acquisition using MIB Agent + Timer Service + SSL client authentication
11	MEAP Spec Version 5 function and AMS
13	MEAP Spec Version 5 function and J2ME1.1 Support + Encrypted PDF + Trace and smooth PDF + CTK2.0
14	Device signature PDF
15	IMI + ERS (API addition for IMI) , IPv6, Extended encryption function (AES/RC4)
17	Acquiring images of JBIG format
18	Parsing XML documents (XML parser)
19	Enhancement of IMI function (IMI Version1.2 series)
21	Reserved
25	API to access the HID/Mass Storage class devices.
26	MEAP driver preference function
27	Symbols that can be used with MibAgent added. (symbols for IPv6 address acquisition)
29	IMI API added (IMI version 1.2.1 enabled)
30	Extended address book function. (e-mail/group/i-FAX/file)
31	Integrated ERS function
32	Extended Imaging function (function to generate PDF/OOXML (PowerPoint) with visible signature)
33	Extended function for imageRUNNER / iR ADVANCE series (API for address book/ CTK/ TopMenu)
34	Extended IMI Box function (v1.3.0)
35	Extended SIS function (function to check the network cable status, function to check PS print server unit status)
36	Reserved
37	CLS (Contextual Login Service) Supporting API Added
38	imageRUNNER / iR ADVANCE Series administrative privileges supported
39	MEAP Specifications added according to Jcrypto API Specification Change
40	ImagingAPI (Creation API of Visible Signature PDF) added
41	Reserved
42	Reserved
44	imageRUNNER / iR ADVANCE Series Remote Address Book Supported, RemoteFAX Supported
45	Addition of API that allows acquisition of the HID installation status
46	Multilingualization of the USB keyboard of the System Driver

Ver	Description
47	Addition of API which executes a print order from the MEAP application of the IMI encryption PDF document
48	ID expressing the scan function for iR-ADV C2030/C2025/C2020 series
49	Reserved
50	SecurityOptionalPackage
51	IMI function expansion of iR-ADV C5051 series (Ver.50.xx or later) or later
52	(iR-ADV C5051 series (Ver.50.xx or later)) Addition of registered API to enable SSL communication setting (On/Off) for each URL
53	Disclosure of registration/deletion function to/from Quick Menu
54	Function to notify an event to the application at recovery from the sleep mode.
55	System account release function
56	MEAP User Preference Service
57	MEAP Application Configuration Service
58	MEAP Application Log Service
59	Reserved
59	Integrated authentication service
60	SFP basic functions
61	AVS (Lightweight Applet Viewer Service) for LBP
62	SIS (Lightweight System Interface Service) for LBP
63	LDT
64	IMI customization
65	Extension of MEAP User Preference Service (Ver56) (preference shared among applications)
66	Reserved
68	Addition of Office Open XML's Word creation API
69	Extension of the encryption PDF function (AES 128-bit/256-bit)
70	Addition of 3 formats (uncompressed searchable PDF, XPS, and linearized searchable PDF)
71	Reserved
72	Reserved
73	API that supports A4 scanners and allows for specifying of the direction of the original image
74	Support for addition of the CN validation function
75	Reserved
76	Addition of the SFP ExtendedTextInputView class
77	Reserved
78	Reserved
79	Reserved
80	Reserved
81	Reserved
82	API to recover from Sleep 1

T-2-117

MEAP Application Management

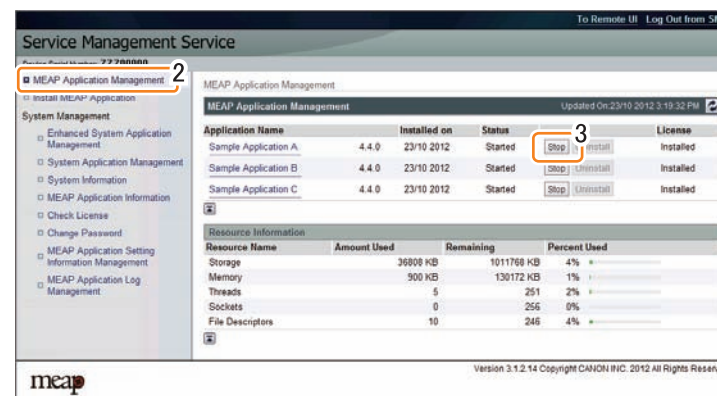

Outline

You can use the MEAP application management screen to perform basic management tasks of the MEAP application (start, stop, uninstall), or check the device's resource information.

Starting, Stopping, or Uninstalling the MEAP Application

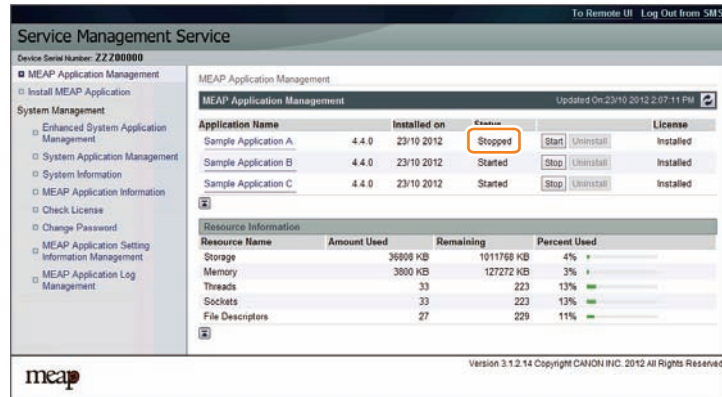

Procedure to start and stop a MEAP application

- 1) Log in to the SMS. (Refer to "Login to SMS" in this manual.)
- 2) Click [MEAP Application Management].
- 3) Click [Start] or [Stop] shown for the MEAP application to be started or stopped.

F-2-257

- 4) Check to see that the status of the MEAP application in question is either [Started] or [Stopped].

F-2-258

● If the MEAP application cannot be started

If the conditions to start the MEAP application are not satisfied, the MEAP application cannot be started.

If the MEAP application cannot be started, check the following items.

Is a valid license installed?

If the license has expired, you cannot start the application. If the license has already expired, obtain a new license and then update the license. (See "Managing the License File" in this manual.)

Are the necessary resources available?

If the resources such as memory capacity or number of threads are not sufficient, the application also cannot be started.

Delete any unnecessary data to secure sufficient resources.

If the application still cannot be started after checking the foregoing conditions, contact the support department of the sales company.

● Procedure to uninstall the MEAP application

Before uninstalling the MEAP application, check that the following conditions are met.

- The MEAP application has stopped.
- The license has been disabled or deleted. (The status is "Not Installed".)

F-2-259

For information on the procedure to stop the MEAP application, see the previous section "Procedure to start and stop a MEAP application".

For information on the procedure to delete the license file, see the following section "Managing the License File".

Note:

When a user tries to uninstall an application before deleting the license, the following message is shown.

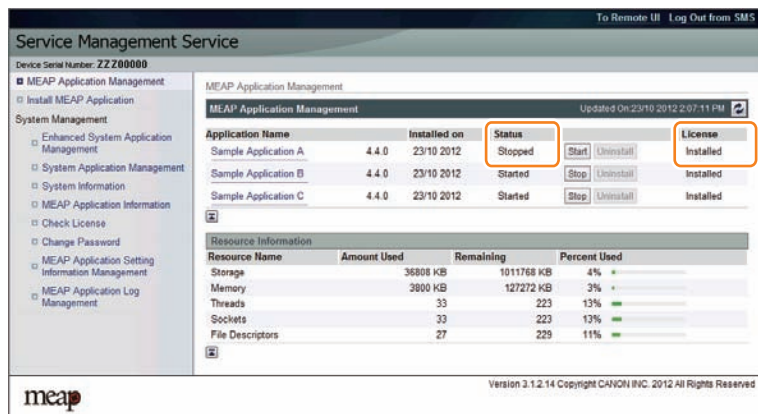

F-2-260

If the license file of the selected application cannot be deleted, the [Uninstall] is grayed out and therefore the application cannot be uninstalled.

CAUTION:

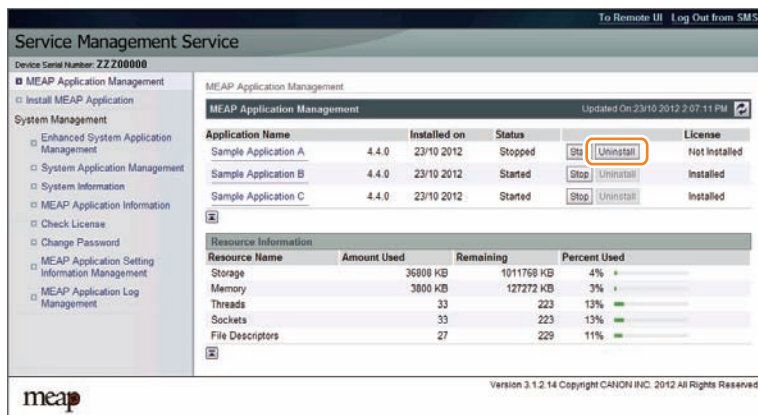

If the application you are uninstalling is associated with another application, a message will appear to indicate that the package exported by the application will no longer be available. Uninstalling such an application may also disable its associated applications.

- 1) Log in to SMS to click [MEAP Application Management] on the menu.
- 2) Check that the status of the application you want to uninstall is [Stop] and the license has been disabled. (The status is "Not Installed".)

F-2-261

- 3) Click [Uninstall] for the application to be uninstalled.

F-2-262

- 4) Check the application name to be uninstalled shown on the screen to click [Yes]. Upon [Yes] clicked, uninstallation process is started.

F-2-263

Managing the License File

Outline

The license file management functions allow you to perform the following operations related to the license file necessary for the MEAP application to run.

- Update the license which has already expired.
- Disable or delete the license file in order to uninstall the MEAP application.

These license management functions can be performed from the [MEAP Application Management] screen.

The main license management functions are as follows:

Adding a license

When the license has expired, you can add a license file.

Disabling a License File

Before uninstalling the MEAP application, the license needs to be deleted. In that case, you must first disable the license file because a license file which has not been disabled cannot be downloaded or deleted.

Downloading / Removing an Invalidated License File

Before uninstalling the MEAP application, you need to delete its license file which has already been disabled.

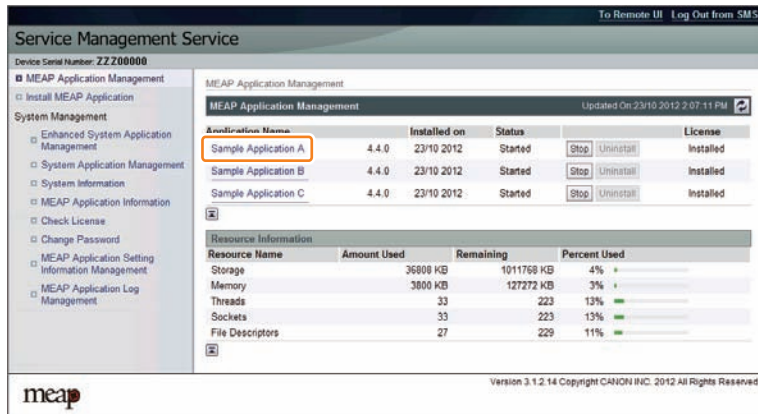

By downloading the license file to your PC before it is deleted, you can use it when installing the application again to the same device.

CAUTION:

After deleting the license file which has been disabled, you can no longer download the license file.

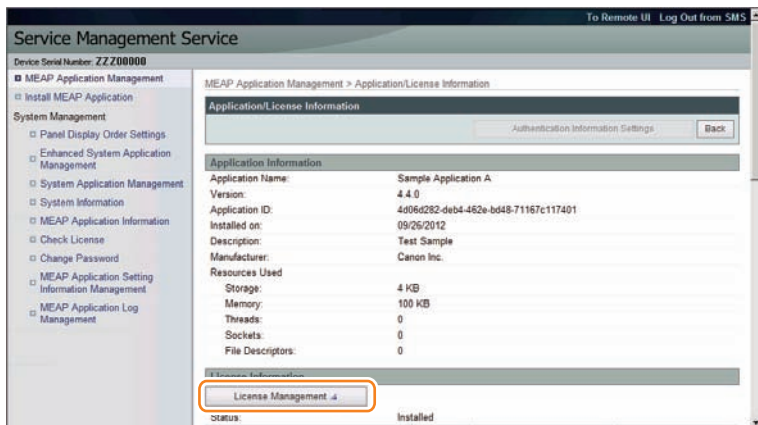

Procedure adding a license file

- 1) Log on to SMS.
- 2) On MEAP Application Management, click the name of the application to which you want to add a license file.

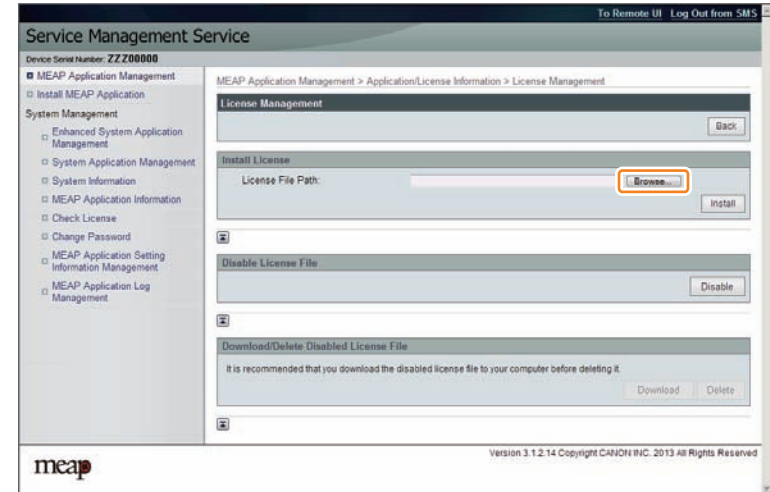

F-2-264

- 3) In [Application / License Information] page shown on the screen, click [License Management].

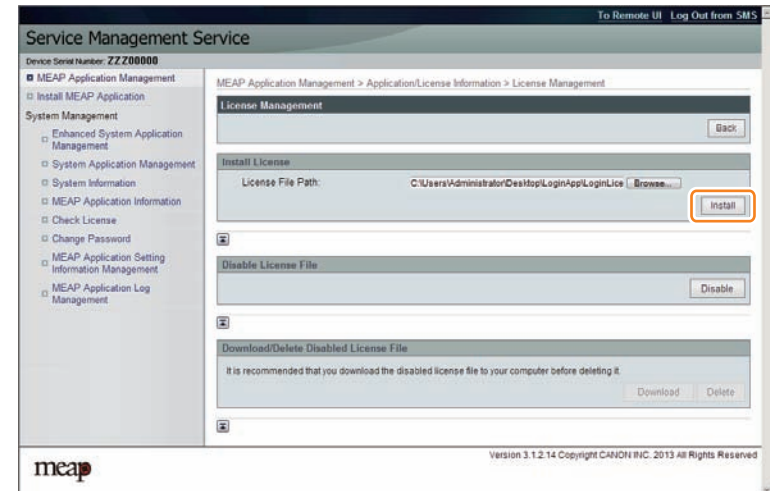

F-2-265

- 4) Click [Browse], and select the license file you want to install.

F-2-266

- 5) Click [Install].

F-2-267

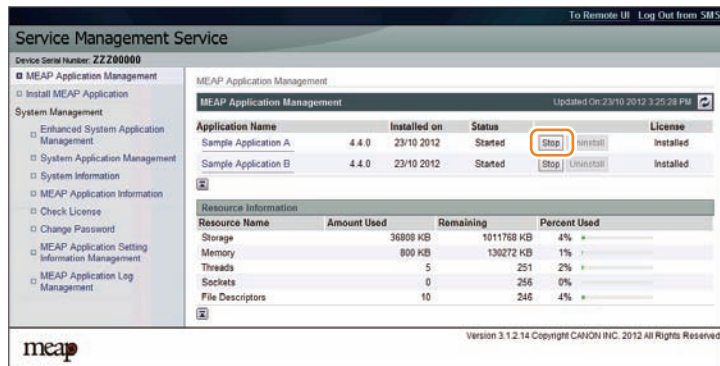

- 6) Check the content of the confirmation page, and click [OK].

Procedure disabling a license file (suspending a license)

CAUTION:

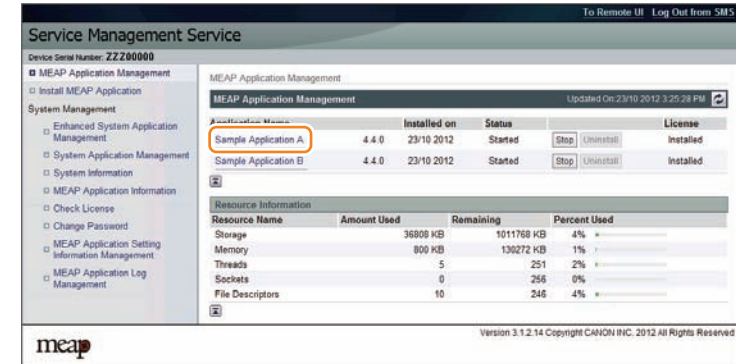

- Since the license file cannot be disabled when the application is still running, the application needs to be stopped before disabling the license file.
- Once suspended, the status of the license will be "Not Installed", and its application will no longer be available for use.
- You can later restore a suspended license file as long as you are doing so on the same device, the device with the same device serial number.
- If the machine needs to be replaced due to a device failure, use the transfer license during the replacement. (See "License for forwarding")

1) Stop the application you want to uninstall on MEAP Application Management page.

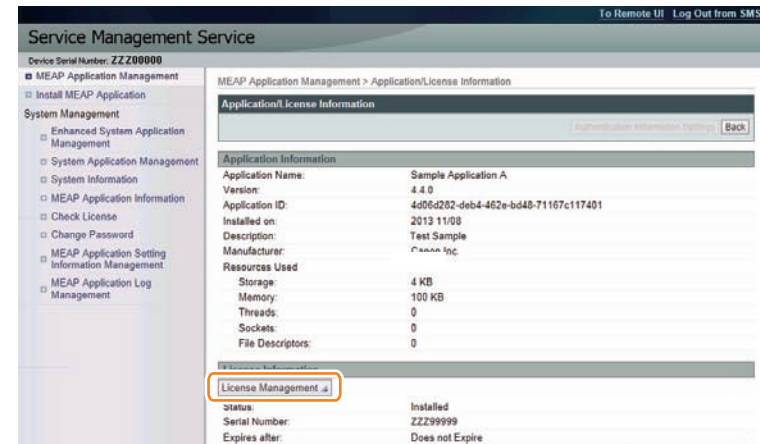

F-2-268

2) Click the name of the application that you want to disable.

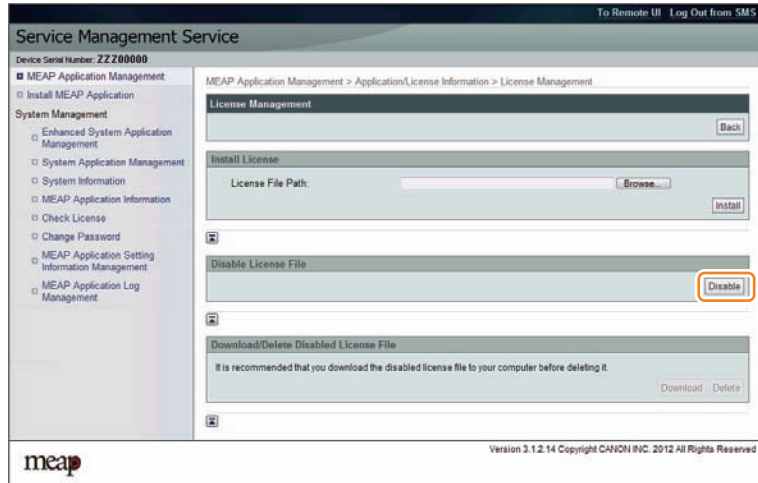

F-2-269

3) On Application/ License Information page, click [License Management].

F-2-270

4) License Management page appears. Click [Disable].

F-2-271

5) Click [Yes].

F-2-272

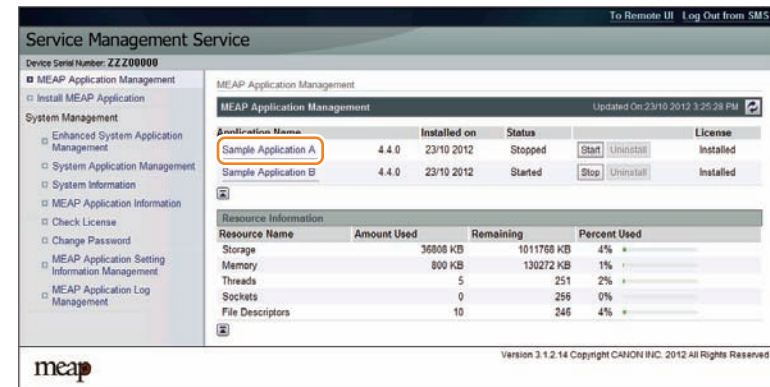

Procedure downloading / removing an invalidated license file

Note:

The downloaded license file can be used for reinstallation only in the same device (with the same device serial number).

1) Login to SMS. (See "Login to SMS")

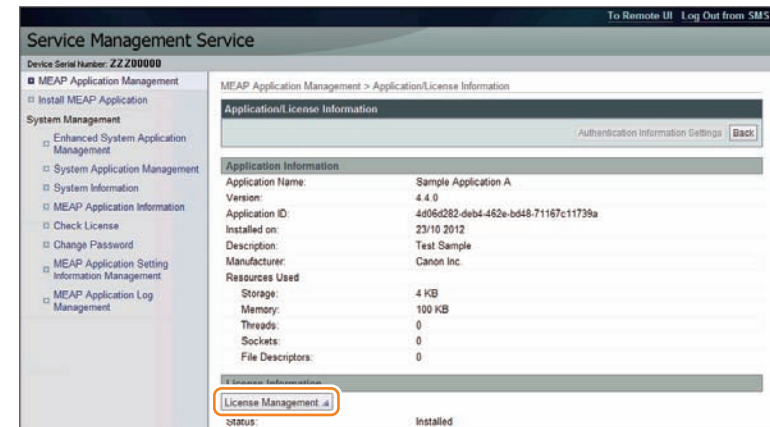

2) Application List page appears. On MEAP Application Management page, click the name of the application you want.

F-2-273

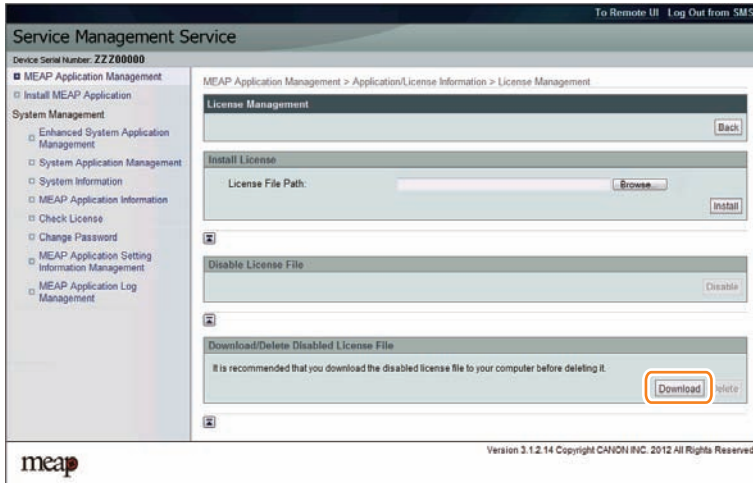

3) Check Application/ License Information page appears.

4) On Application / License Information page, click [License Management].

F-2-274

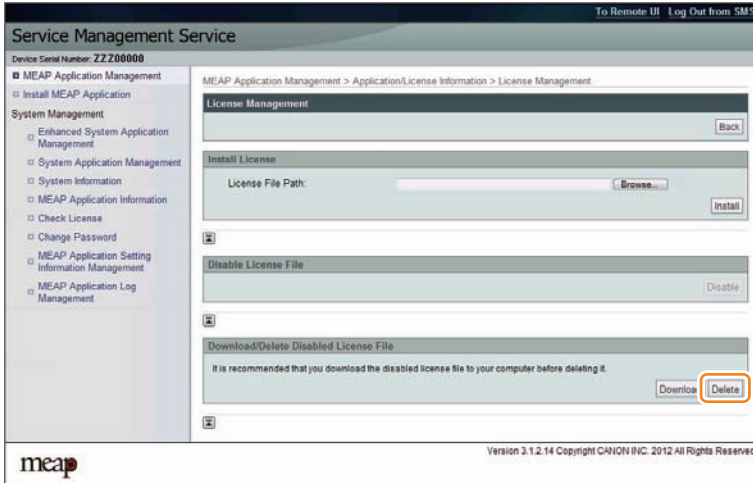

5) License Management page appears. To download, click [Download].

F-2-275

6) When you have selected [Download], specify where you want to store the file by following the instructions on the screen.

7) To delete, click [Delete].

F-2-276

8) When the dialog to confirm deletion is shown, click [Yes].

F-2-277

CAUTION:

Without the license file, an application cannot be reinstalled even to the MEAP device that the application had been installed last time. Download and save the license file before deleting the application.

Other License File Management Functions

Reusable license

When reinstalling, Disable License file should be downloaded (see "Procedure disabling a license file (suspending a license)" and see "Procedure downloading / removing an invalidated license file" in this manual) or a license for reinstallation should be obtained from LMS, before reinstallation.

This specification aims to prevent misuse of applications.

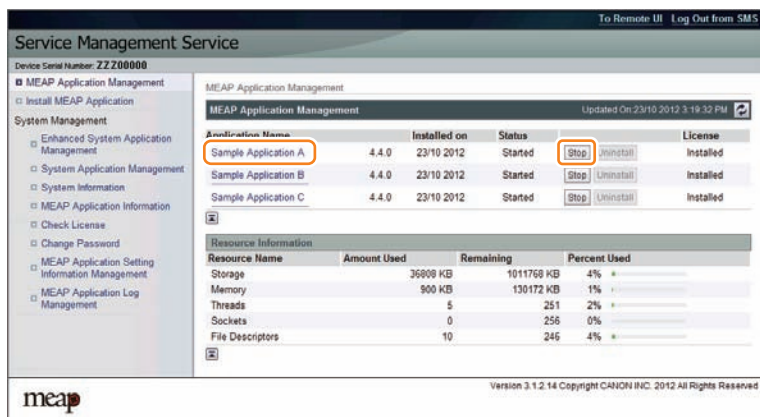

To increase convenience of users, only application with unlimited validity date and application counter (e.g. Portal Service, SDL, SSO) has been made to be able to install as many times as needed by the same license file. This kind of license is called "Reusable license".

License for forwarding

If the machine needs to be replaced due to a device failure, you can transfer the license information used in the MEAP application to the new machine and continue its usage. Service engineers are responsible for license transfer as this task requires the SMS hidden page (not open to users).

The procedure is shown below.

- 1) Log in to SMS, stop the application to be forwarded. (see "Starting, Stopping, or Uninstalling the MEAP Application".)

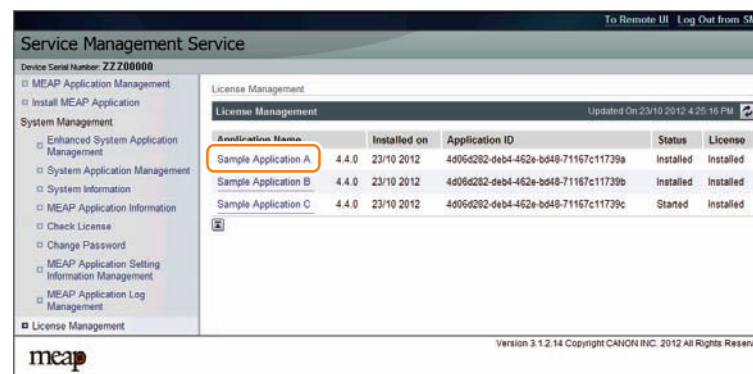

F-2-278

- 2) Move to the download page of license forwarded for the device as sender ([https:// IP address of device: 8443/sms/ForwardLicense](https://IP address of device: 8443/sms/ForwardLicense)).

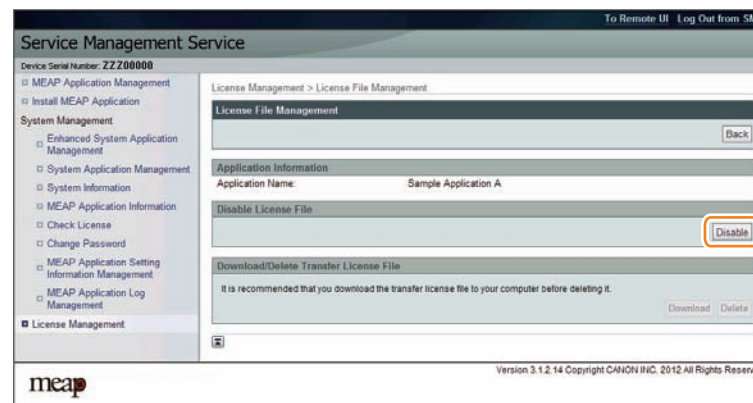

F-2-279

- 3) Specify the application to be forwarded.

F-2-280

- 4) Click [Disable] on the [Disable License File].

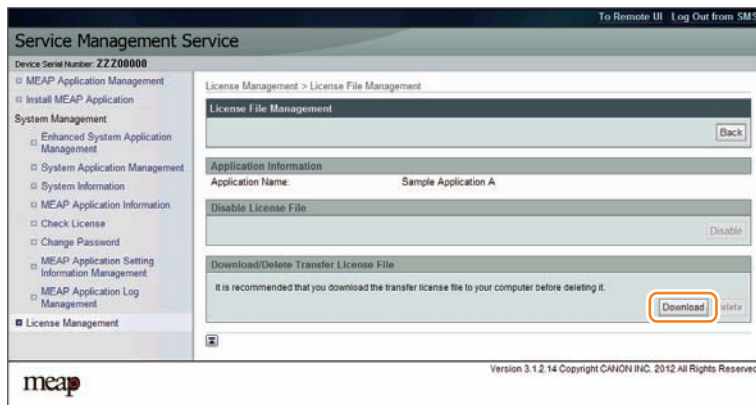

F-2-281

5) The window to confirm whether to create a transfer licence will be displayed. Click [Yes].

F-2-282

6) When [Download] on the [Download / Delete Transfer License File] becomes effective, click [Download].

F-2-283

7) The dialogue [File Download] is displayed. Click [Save].

F-2-284

8) Specify the download destination, click [Save].

F-2-285

9) After downloading the license file for forwarding, click [Delete] to display the confirmation screen and click [Yes] to delete the file (in consideration of breakage of license for forwarding, deleting disabled license can be executed after all steps have been completed).

F-2-286

10) Log out of SMS.

11) Since this downloaded transfer license is the file only to prove the license invalidation, it cannot be used for installation to the other device as it is. Send the transfer license to the service support contact of your nearest sales company to request issuance of the new license for installation in the new device.

Note:

When requesting issuance of license for forwarding, inform the sales company of the name of product name and serial No. of the device as sender, and of the name of product name and serial No. of the forwarding destination.

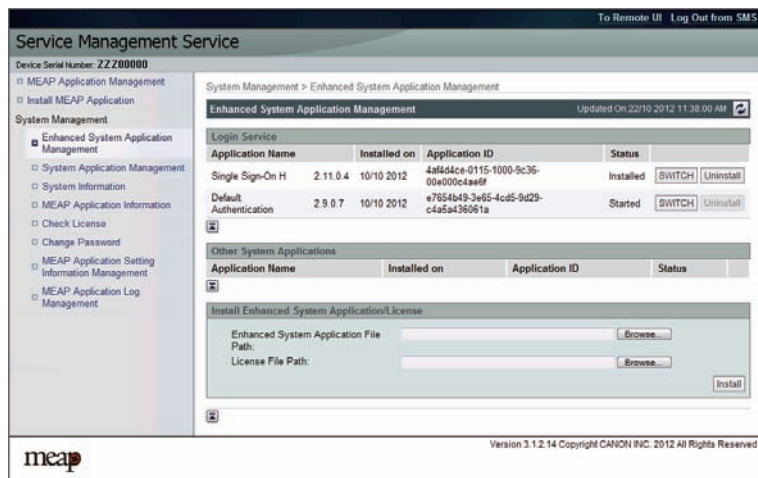

12) Install application using the license for forwarding issued by the sales company.

Enhanced System Application Management

Outline

[Enhanced System Application Management] mainly manages the login services for logging in to devices.

- Installing and uninstalling Enhanced System Application Management (login services, etc.)
- Switching login services (switching the method to log in to devices)
- Checking installation status of other System Applications

F-2-287

About Login Service

The login service is started up to authenticate the user when MEAP-enabled device is booted up. Login service changes and install/ uninstall are carried out from the [System Management] page.

The preinstalled login applications are Default Authentication and Single Sign On-H, and Default Authentication is enabled by default.

CAUTION:

- This device does not support SDL, conventional SSO and Security Agent.

Default Authentication overview

This login service is selected when the department ID management is enabled or no authentication function is set. Set the department ID management to [ON] on [Settings/Registration] of this device and register 7-digit ID and PIN by department. This setting restricts the use of this device only to users keying the registered ID and PIN. Department IDs/ and PINs can be registered on the touch panel of this device or Remote UI.

SSO-H (Single Sign-On-H) overview

This is a merger of the existing SDL and SSO login services and has the following features.

- The following three authentication methods may be selected from.
 - Server authentication
 - Server authentication and local authentication
 - Local device authentication
- Active Directory or LDAP can be used as the server for server authentication.
- It is not necessary to prepare a server for Security Agent (SA). (In the case of SSO, SA is necessary.)

Differences from conventional SSO

F-2-288

CAUTION:

- When the setting is SSO-H, the card reader for the option controller card cannot be used.
- When the setting is SSO-H, start up takes a little longer when compared to Default Authentication (because of the time required for object initialization).
- To use the SEND function when the setting is for SSO-H, when sending email, mail addresses need to be programmed against each user. If they are not, email cannot be sent. Note, however, that when sending i-Fax, the mail addresses set in the device are used.
- The system configuration is different from previous SSO, so individual management is required.
- Data porting of user information that was being used with the earlier SSO local device authentication and SDL can be done by exporting/ importing. However, application settings information cannot be ported.

● Environment confirmation

Refer to the section of "Preparation for Using SSO-H" of this manual for system requirements needed in each login service.

● Specification of SSO-H

Item		Specification
No. of local device users		Up to 5000
Maximum number of domains		Active Directory : 200 domains ("this device" not included)
IPv6		Authentication provided in IPv6 supports AD/KDC/DNS of Windows Server 2008 only)
Resource used		Memory : 3600KB Storage : 27000KB File Description : 27 Thread : 33 Socket : 33
Network ports used	Connecting	88 : KDC 53 : DNS 1 - 65535 (Default : 389) : LDAP
	Listening	10000 - 10100
Supported authentication server		Active Directory : Microsoft Windows Server 2003 SP2 * Microsoft Windows Server 2003 R2 SP2 * Microsoft Windows Server 2008 SP2 * Microsoft Windows Server 2008 R2 SP1 Microsoft Windows Server 2012 *64-bit OS is not supported. LDAP : Novell eDirectory V8.8 SP6 for Windows Lotus Domino V8.5 for Window
Availability of Department Management Linkage		Available only in local authentication

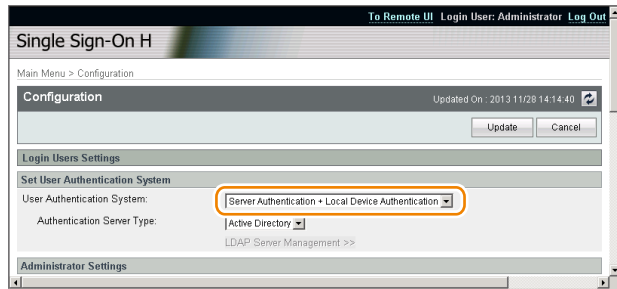

T-2-118

SSO/SDL handling

This model does not support older versions of SSO or SDL released in the past.

● Setting the Authentication Method

In the case of SSO-H, it is possible to use a combination of multiple authentication methods. The combination can be changed from the SSO-H setting screen. (For details, refer to e-Manual > MEAP > Menu for Administrators > Setting the SSO-H > "Setting the User Authentication System".)

F-2-289

Note:

The default settings are shown below.

- User authentication method : "Server Authentication + Local Device Authentication"
- Type of authentication : "Active Directory"

CAUTION:

- To ensure the security, it is recommended to change the password and the user name of the Local Device Authentication administrator from those at the time of shipment immediately after you have started using SSO-H.
- Since department ID and password are not assigned to domain users, distributing setting information where the department ID is enabled to a device where the server authentication is enabled may make the device unable to be logged in. If the device has become unable to be logged in, follow "Remedy to Be Performed When the Device Has Become Unable to Be Logged in" in this manual.

● Using an Accounting Product When SSO-H Is Used

SSO-H has collaborative linkage with NetSpot Accountant, imageWARE / iW Accounting Manager, imageWARE Enterprise Management Console / iW Management Console Access Management Plug-in, imageWARE Enterprise Management Console / iW Management Console Accounting Management Plug-in.

For details on the combination, refer to the User's Manual or Service Manual of the product.

● Conducting Department ID Management When SSO-H Is Used

Department ID Management can be conducted also when SSO-H is used for login service.

Usage Conditions

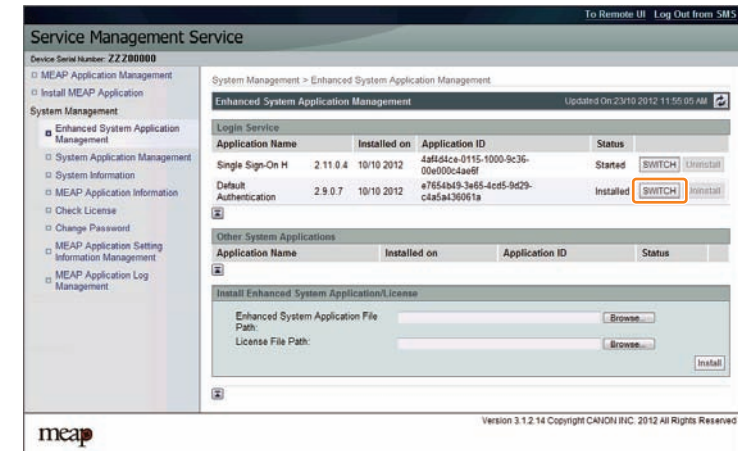

In order to allow coexistence of SSO-H and Department ID management, the following conditions need to be satisfied.

- Only "Local Device Authentication" can be used as the user authentication method.
- The department ID and password have been already set for the SSO-H login user before enabling department ID management.
- The information (the department ID and password) set for the login user coincides with the information registered in Department ID Management.

Setting Procedure

In order to allow coexistence of SSO-H and Department ID management, the following procedure needs to be performed to enable the setting.

- 1) Change the authentication method to DA (Default Authentication).
Access SMS, and select [Default Authentication] in [Enhanced System Application Management] > [Login Service]. (How to log in to SMS can be found in "Login to SMS".)

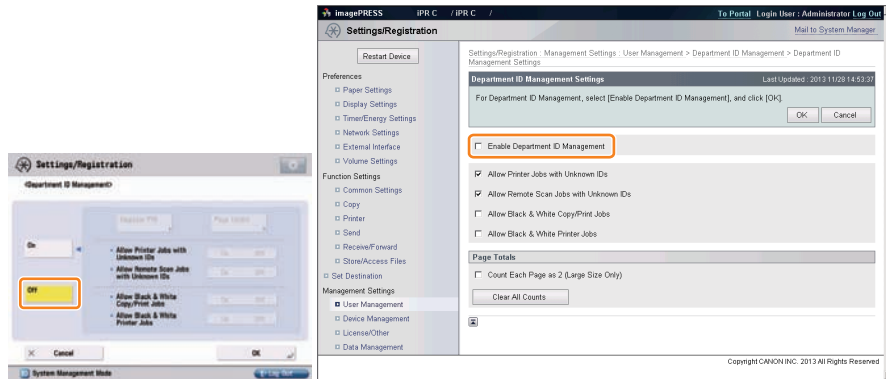

F-2-290

- 2) Restart the device.

Restart the device in order to reflect the changes in login service.

3) Disable Depart ID Management.

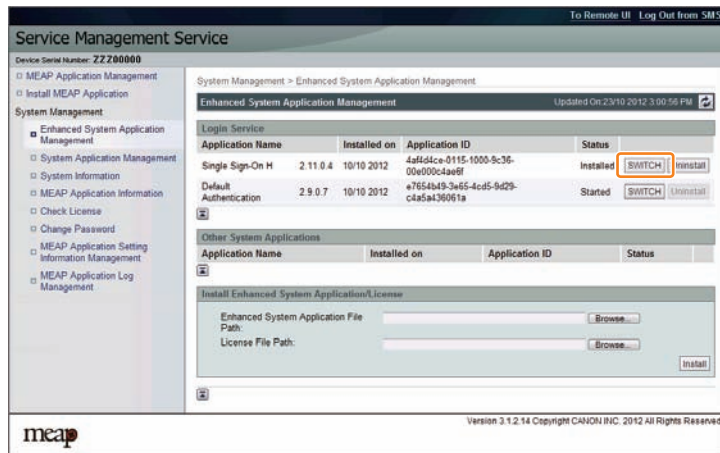

In [Settings/Registration], select [Management Settings] > [User Management] > [Department ID Management] > [OFF]. In the case of remote UI, access [Settings/Registration] > [Management Settings] > [User Management] > [Department ID Management] > [Department ID Management Settings], and deselect [Enable Department ID Management].

F-2-291

4) Change the authentication method back to SSO-H authentication.

Access SMS, and select [Single Sign-On H] in [Enhanced System Application Management] > [Login Service]. (How to log in to SMS can be found in "Login to SMS".)

F-2-292

5) Restart the device.

Restart the device in order to reflect the changes in login service.

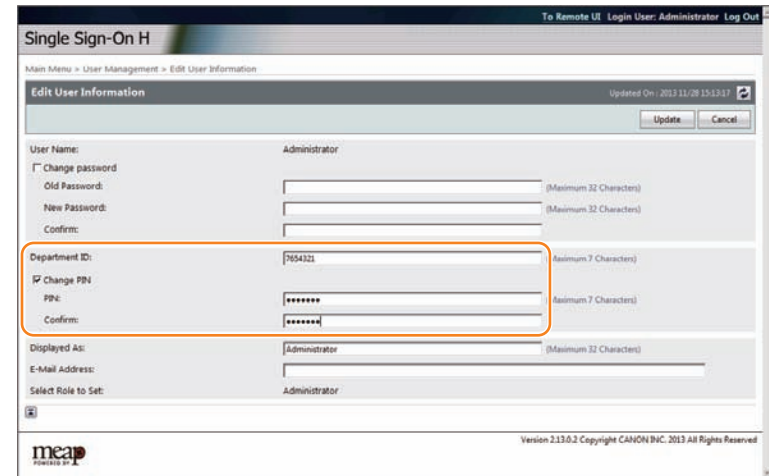

6) Change the user registration information of SSO-H.

Access the URL shown below, and change the content to the information registered in Department ID Management.

Or, import the setting file whose content you want to use.

SSO-H user registration information edition screen

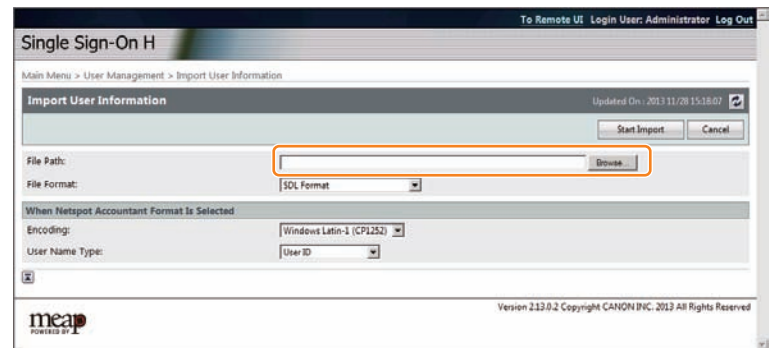

(SSO management screen [Main Menu] > [User Management] > [Edit User Information] or <https://<IP address>:8443/sso/Edit>).

F-2-293

SSO-H user registration information import screen

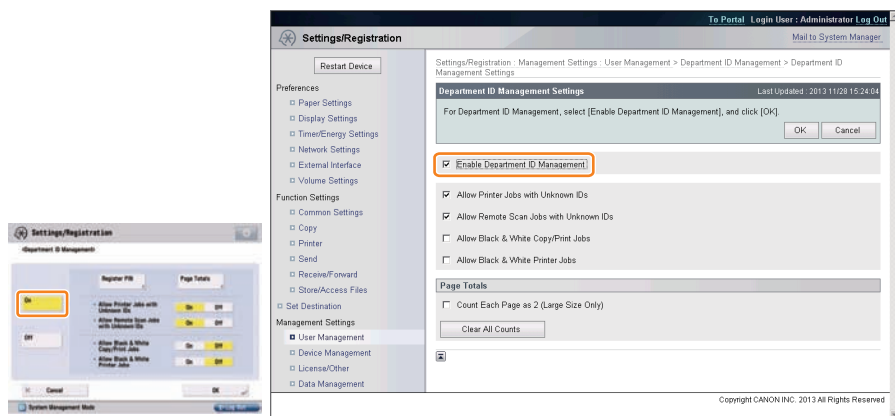

(SSO management screen [Main Menu] > [User Management] > [Import User Information] or (<https://<IP address>:8443/sso/Import>)).

F-2-294

7) Enable Depart ID Management.

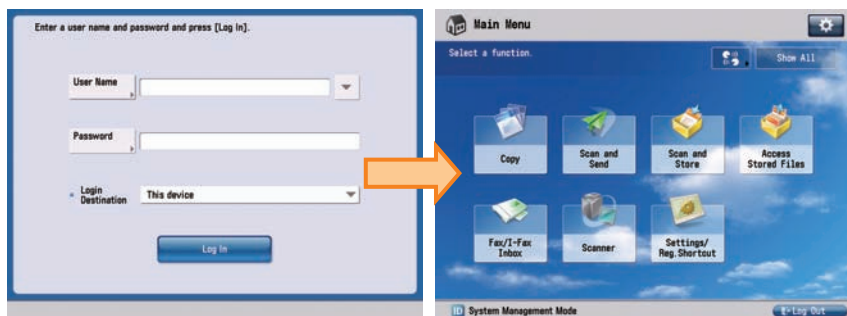

In [Settings/Registration], select [Management Settings] > [User Management] > [Department ID Management] > [ON]. In the case of remote UI, access [Settings/Registration] > [Management Settings] > [User Management] > [Department ID Management] > [Department ID Management Settings], and select [Enable Department ID Management].

F-2-295

8) Check that the device can be logged in.

Log off and then log on to check that the device can be logged in with an environment where Local Device Authentication and Department ID Management are enabled.

F-2-296

Note:

In the case of conventional SSO, department management can be conducted also when server authentication is used provided that iWAM/iW EMC account management is used, which is not supported by SSO-H.

● Setting the Administrator for Server Authentication

When using Server Authentication, the user who satisfies the specified conditions (user attribute and its match criteria) becomes the administrator (the device administrator and the SSO-H administrator).

The default user attribute and whether the setting value can be changed or not are shown below.

Item	Default value	Active Directory	LDAP
Search Criteria:	Exact Match	Not Available	Available
User Attribute:	memberOf	Not Available	Available
Character String:	Canon Peripheral Admins	Available	Available

The settings of the administrator can be changed on the following screen: remote UI > Single Sign-On H > Configuration (<http://device's IP address:8000/sso/ActionSet>)

F-2-297

● System Manager Linkage (automatic ID allocation to SystemManagers)

SSO provided the automated function conventionally on Security Agent (hereinafter "SA") to authenticate System Manager by allocating IDs set on SA to domain authentication managers (users belonging to Canon Peripheral Admins group). However, SSO-H does not support this function.

Local device authentication

It is one of the user authentication methods using SSO-H, and is used for an device on a stand-alone basis.

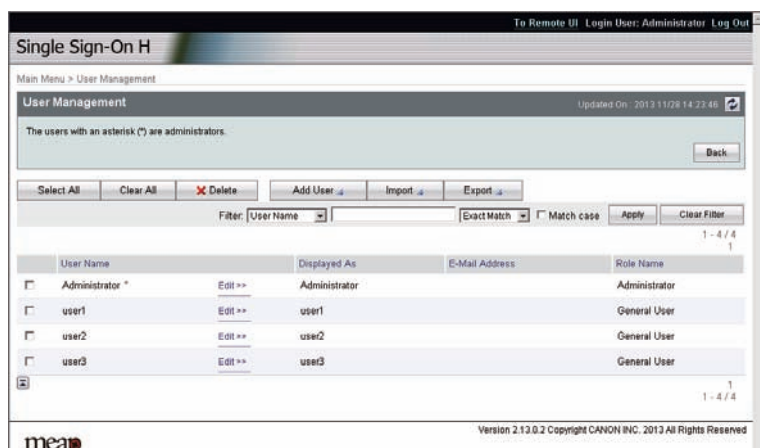

F-2-298

Register the user to be authenticated on the database in the device.

User management can be performed from the User Management screen (<http://device's IP address:8000/sso/>) or imageWARE Enterprise Management Console. The login destination is [This device].

User Management screen

F-2-299

Server authentication (Active Directory authentication)

Outline

It is one of the user authentication methods using SSO-H. User authentication is performed with the device linked with a domain controller on the network in an Active Directory environment. It is a user authentication where the user is authenticated by the domain on the network when the user logs into the device. In addition to users belonging to the domain that includes the device, users belonging to domains that have a reliable relationship with the domain (multi-domain) can also be authenticated. The domain name of the login destination can be selected by the users themselves upon login.

Using one of the options (Net Spot Accountant, imageWARE Accounting Manager, or imageWARE EMC Accounting Management Plug-in) makes it possible to analyze/manage the device usage.

The protocol used is as follows.

- Kerberos:LLS/RLS/ILS
- NTLMV2:WLS(Web Service Login Service)

User information acquisition is done by LDAP, so the Active Directory LDAP port needs to be made accessible. If LDAP connection fails, the authentication will end in error.

No. of supported domains: 200 (unchanged from SSO) Site access supported.

CAUTION:

In the case of using Server Authentication (Active Directory authentication), it is necessary to synchronize the time settings of the Active Directory server and the machine (and the PC for login). If the difference in time setting is 5 minutes or longer, an error will occur at the time of login. (The setting of the allowable difference in time can be changed.)

F-2-300

CAUTION:

Since department ID and password are not assigned to domain users, distributing setting information where the department ID is enabled to a device where the server authentication is enabled may make the device unable to be logged in. If the device has become unable to be logged in, follow "Remedy to Be Performed When the Device Has Become Unable to Be Logged in" in this manual.

● Access Mode in Sites

With SSO-H, access to Active Directory within site can be prioritized or restricted, so there is a setting called "Access Mode in Sites". Sites programmed in Active Directory comprise multiple subnets. In this mode, SSO-H uses site information to access the same site as the device, or the subnet Active Directory.

- The SSO-H default setting is with the site internal access mode OFF.
- Access Active Directory within same site only.
- If there is no Active Directory within the same site, or if connection fails, there will be an authentication error.
- Access another site if Active Directory within the same site cannot be located.
- If there is no Active Directory within the same site, or if connection fails, an Active Directory external to the site will be accessed.
- If all attempts to access Active Directory fail, there will be an authentication error.

The operating specifications of the site internal access mode are as described below.

When first logging in to the login service after booting device, the domain controller (DC) is obtained from the site list.

However, upon the first login, even if the site functionality is active, connection to DC is random. (This is because, if connection to DC should fail, the site to which the device belongs cannot be ascertained.)

If the device IP address or the domain name are changed, the site settings are acquired once more.

In this mode, at the first login (first authentication of domain to which the device belongs) LDAP-Bind is performed directly to DC and site information acquired by LDAP from DC.

From the acquired site list, the site to which the device subnet belongs is extracted and this becomes the site to which device belongs. Active Directory address is acquired (retrieved from DNS)

Note:

- The Active Directory subnet is assumed to be the same subnet as the device subnet.
- In the Active Directory addresses, the Active Directories of the same site are listed.
- Active Directories of the same subnet as the device are listed first.
- If there is no Active Directory with the same subnet as the device, Active Directories belonging to different subnets than the device are listed.
- The Active Directories within the same site are accessed in order. Note, however, that where there are multiple Active Directories within the same site, access to those Active Directories will be in the order in which the address list was obtained.
- If there is no Active Directory within the same site, if access outside of the site is programmed, Active Directories outside of the site will be accessed in the order in which the address list was obtained.

Site list acquisition

After booting up, upon the first login by LLS or ILS/ RLS, the site list is obtained from the Active Directory. In order to obtain the site list from the Active Directory, Active Directory needs to be accessed in LDAP, so SASL-Kerberos-Bind is used by the login user account. If authentication by Active Directory should fail, an authentication error will be generated and the site list will be acquired again from Active Directory upon the next login.

In SSO-H, the Active Directory to be accessed when acquiring the site list cannot be specified. In other words, if there is no site list, which site's Active Directory is accessed depends upon the order of the Active Directory addresses returned by DNS. Therefore, when acquiring the site list, LDAP may access the Active Directory of a different site. Therefore, in such cases, it is sometimes necessary to access across sites or subnets, which means that LDAP protocol needs to have continuity across sites (subnets) (normally, LDAP is port No. 389). Further, if connection with Active Directory fails when acquiring site information, another Active Directory will be accessed.

Site information, once it has been acquired, is cached within the device. The life settings of the cache can be set so that site information in the cache is updated upon the first login after the device boots up, or so that the cache is not updated once acquired.

Settings for access mode in sites

Switching between site internal access mode/ non site internal access mode, as well as detailed mode settings, are done via DMS or iWEMC.

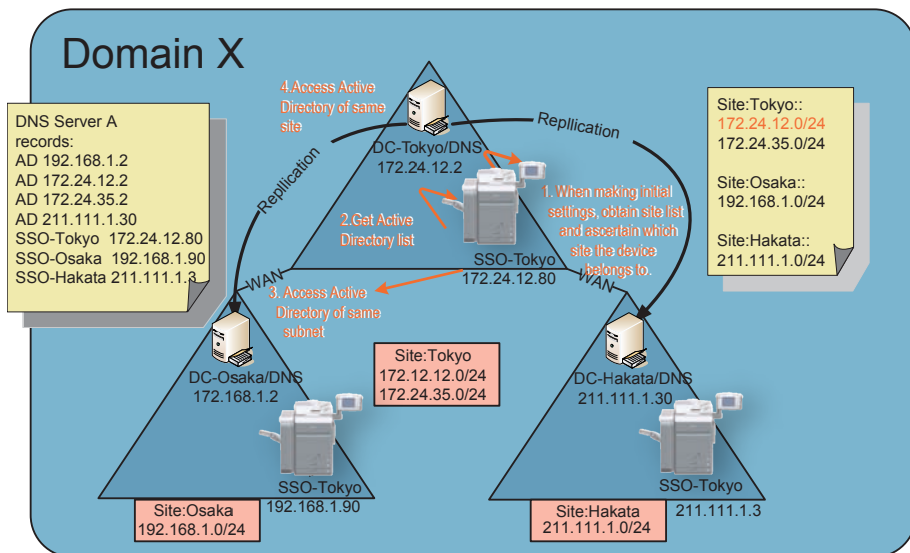

Site internal access mode settings window (DMS)

F-2-301

The figure below shows a sample of processing Access Mode in Sites.

Sample of Processing Access Mode in Sites

F-2-302

1) SSO-Tokyo acquires site lists from Active Directories.

Note, however, that the Active Directories accessed in order to acquire site lists are in the order in which they were returned by DNS, so there is no guarantee that the same Active Directory will be accessed as in the initial settings (upon device settings or changes to NW settings, etc.).

[Site subnet list]

Site: Tokyo: = 172.24.12.0/24, 172.24.35.0/24

Site: Osaka: = 192.168.1.0/24

Site: Hakata: = 211.111.1.0/24

As a result, since SSO-Tokyo is 172.24.12.80, the subnet is 172.24.12.0/24, and is judged as belonging to site Tokyo.

2) The DNS server obtains its Active Directory list from the primary or secondary DNS, as set in the device.

[Active Directory]

172.24.12.2, 172.24.35.2, 192.168.1.2, 211.111.1.30

3) Of the Active Directories in 2), above, the ones that belong to the same site (Tokyo) are 172.24.12.2 and 172.24.35.2.

Of these, the Active Directory that is the same subnet as SS-Tokyo is 172.24.12.2.

Therefore, this one will be accessed.

4) If access fails at step 3), above, the other Active Directory of the same site, 172.24.35.2, will be accessed.

5) If access fails at step 4), above, also, SSO-Osaka and SSO-Hakata will be accessed (the order will depend on the order of the Active Directories in DNS). Note, however, that this is an optional operation.

Logging into other domains at multi-domain

At multi-domain, if another domain is logged into, based on the site/ subnet information retrieved in the home domain, the Active Directories of the login destination domain/ KDC address list are computed. In the event that the domain controller IP addresses of other domains are outside of the site access range, and only the domain controller within the site is programmed for access, an error message will be displayed to the effect that the site information is incorrect.

Server Authentication (LDAP Authentication)

It is one of the user authentication methods using SSO-H. User authentication is performed with the device linked with the LDAP Server on the network in an LDAP environment.

F-2-303

LDAP server authentication can be used for devices that support MEAP User Preference Service (MEAP Specification Ver.56) and MEAP Application Setting Information Management (MEAP Specification Ver.57).

As for models that do not support MEAP User Preference Service and MEAP Application Setting Information Management, [LDAP Server] cannot be selected as the type of the authentication server on the SSO-H Configuration page. Moreover, it is not possible to access the LDAP Server Management screen and the Add Server screen.

Simple bind (a method where the password is not encrypted) is used as the bind (authentication) between SSO-H and LDAP server. It is therefore strongly recommended to always use SSL connection from a security standpoint.

As for the version of LDAP, only Ver.3 is supported.

ON/OFF of SSL connection can be changed on the LDAP Server Management page.

The time-out value of connection is 60 seconds.

In the case of using LDAP server authentication, the characters entered as the user name are not case-sensitive, but the characters entered as the password are case-sensitive.

In the case of SSO-H, authentication is not allowed when the user name includes "*" (asterisk)".

If authentication is performed with "*" (asterisk)" used in the user name, an authentication error occurs.

CAUTION:

Since department ID and password are not assigned to domain users, distributing setting information where the department ID is enabled to a device where the server authentication is enabled may make the device unable to be logged in. If the device has become unable to be logged in, follow "Remedy to Be Performed When the Device Has Become Unable to Be Logged in" in this manual.

Server authentication and local device authentication

It is a user authentication method provided with both the "server authentication" function and the "local device authentication" function.

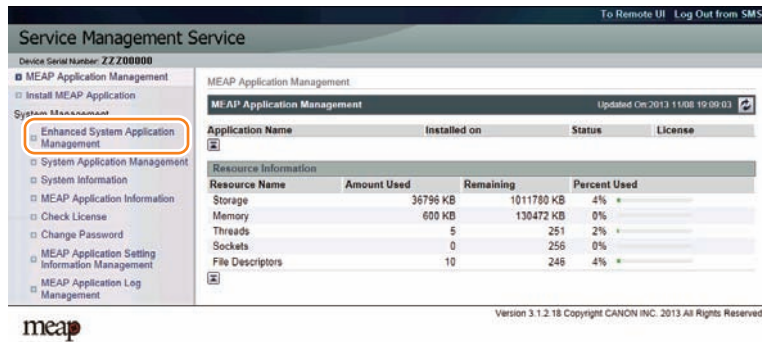

It is possible to use server authentication to authenticate the users registered on the authentication server under normal conditions and use local device authentication when a user who cannot be added to the authentication server needs to be temporarily authenticated. If a trouble occurs in the authentication server, local device authentication can be used as an emergency measure until recovery from the trouble.

F-2-304

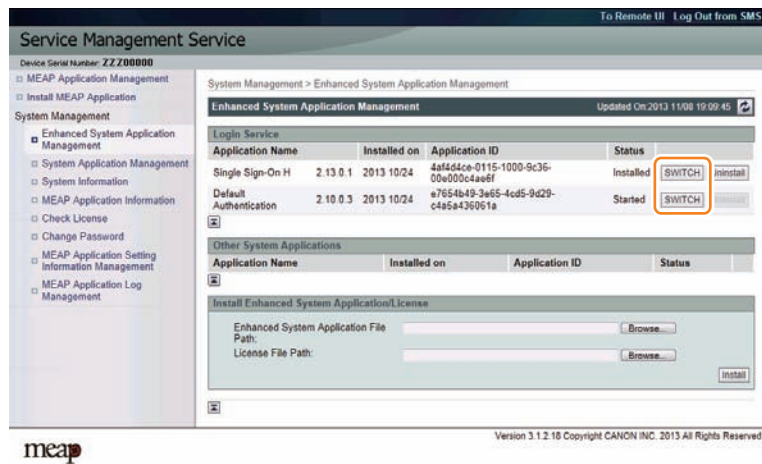

Steps to Change Login Services

1) Click [Enhanced System Application Management] on [System Management].

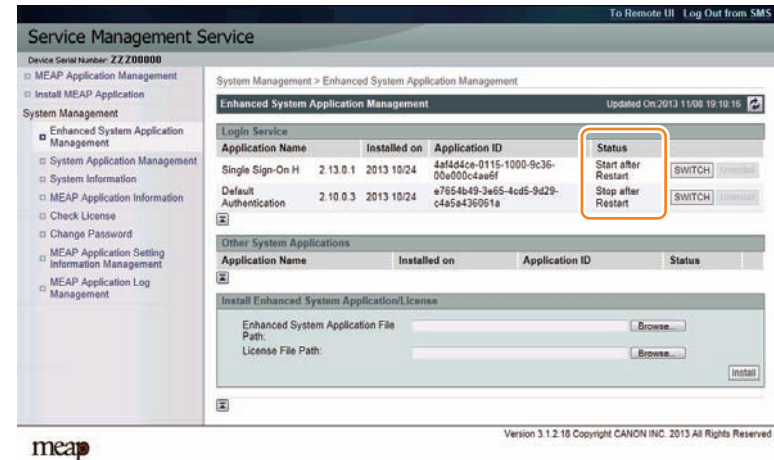

F-2-305

2) A page will appear showing the various selections you can make for the login service. Click [SWITCH] for the login service to be used.

F-2-306

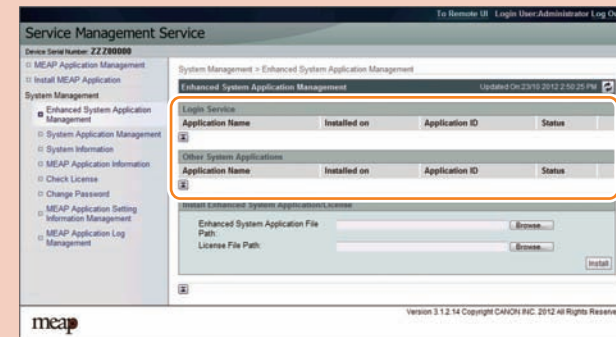

3) When login service application you have selected turns to Start after Restart, restart the device.

F-2-307

CAUTION:

In case that the login method to a device is set to SSO-H, if you log in SMS with RLS authentication, no selection is displayed although it is the screen to change the login method.

F-2-308

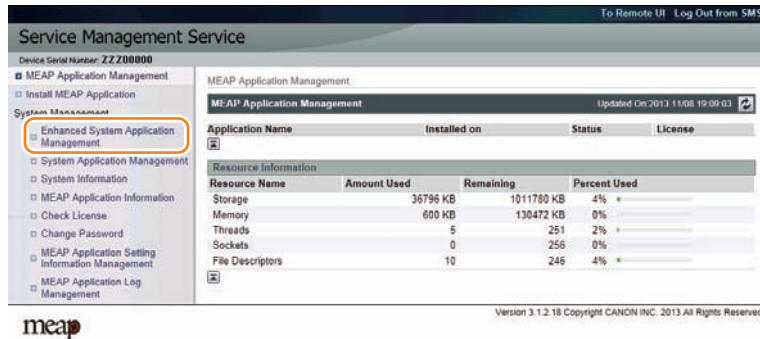

This is the specification to prevent the inconsistent setting which enables to stop SMS Installer Service (Password Authentication) by changing the login method to Default Authentication.

When you want to change the login method to a device, log in the SMS with the password authentication.

■ Login Service Installation Procedure

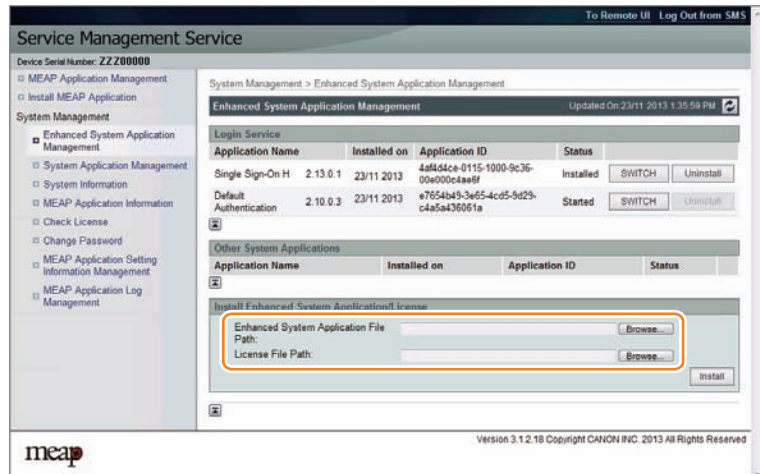

Follow the procedure show below to install login services.

- 1) Access SMS, and select [System Management] > [Enhanced System Application Management].

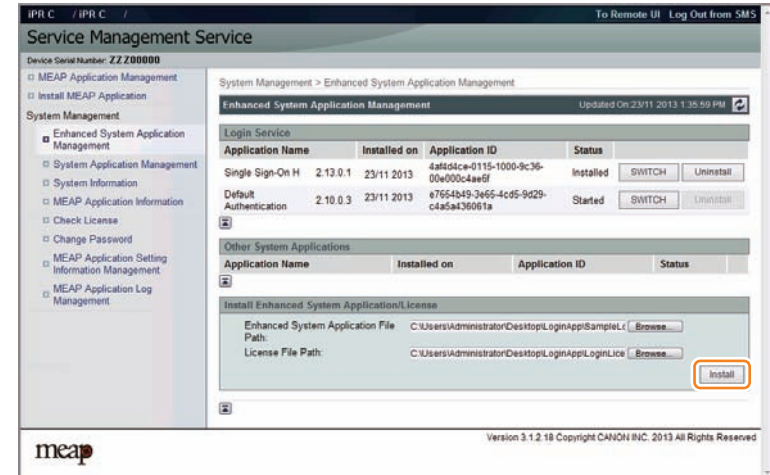

F-2-309

- 2) Click the [Browse], and specify the enhanced system application file and license file.

F-2-310

- 3) Click [Install].

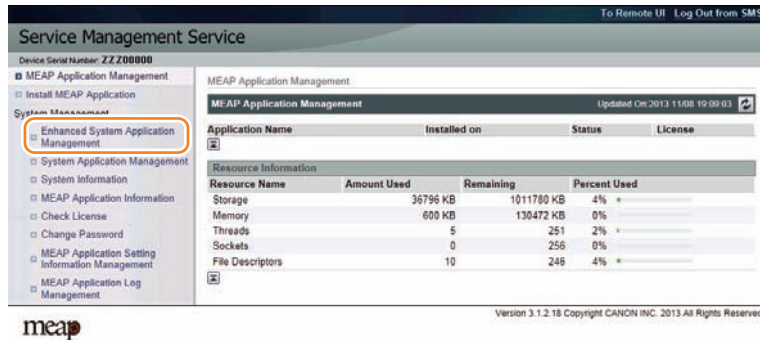

F-2-311

■ Login Service Uninstallation Procedure

Follow the procedure show below to uninstall login services.

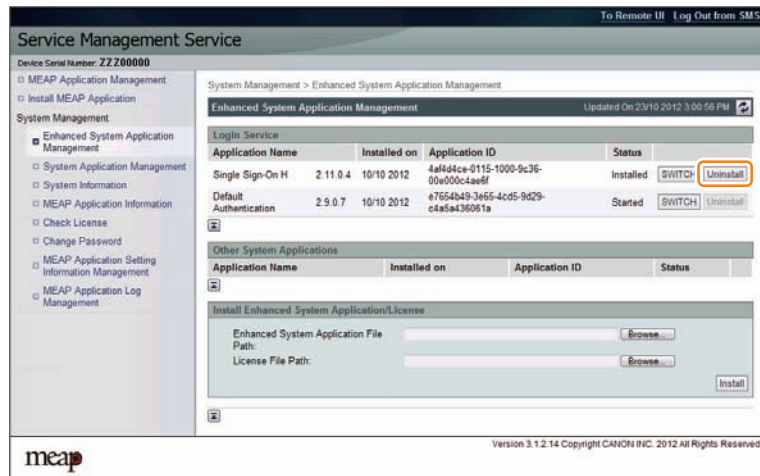

In order to uninstall a login service, the service needs to be stopped ("Installed" status). Default Authentication cannot be uninstalled even when the service is stopped.

- 1) Access SMS, and select [System Management] > [Enhanced System Application Management].

F-2-312

- 2) Click the [Uninstall] of the login service you want to uninstall.

F-2-313

● System Application Management

This function manages the login services for logging in to SMS.

There are two login methods: one is "password authentication" where you enter the password for SMS on the SMS login screen and log in, and the other is "RLS authentication" where you do not use the SMS login screen but enter the user ID and password on the RLS (Remote Login Service) screen for authentication.

■ Password authentication

Enter the password on the SMS login screen for authentication. Only one password can be set for SMS.

The login procedure is shown below.

- 1) Access SMS from the browser of a PC on the same network as the MEAP device. The URL is as follows.

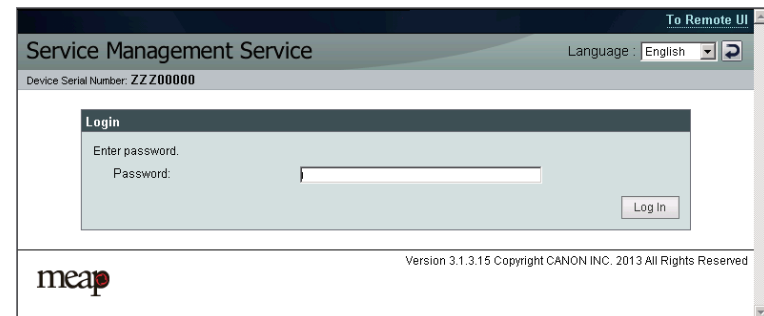

URL: <https://<IP address of MEAP device>:8443/sms/>

Ex.) <https://172.16.188.240:8443/sms/>

Note:

To encrypt the password information input when logging in, SSL of the login screen was made effective. However, it is redirected to new URL (effective SSL) even when accessing with URL (non-SSL) before.

- 2) Enter the password in the password entry field, and click the [Log In]. The default password is "MeapSmsLogin." (The password is case-sensitive.)

F-2-314

Note:

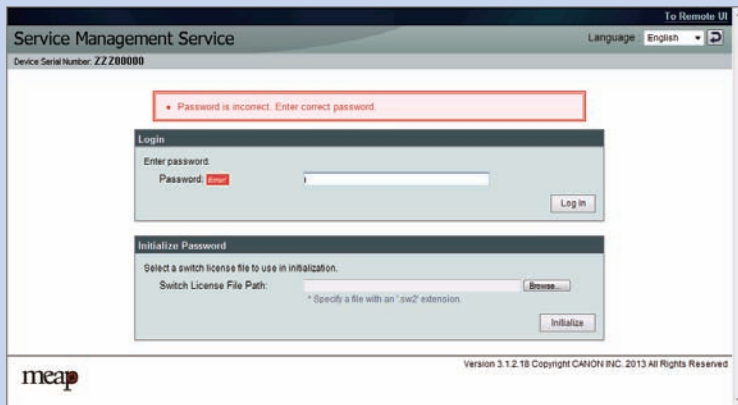

If you want to change the display language, select the language from the drop-down list of [Language] at the upper right of the login screen, and click the update.

F-2-315

Note:

If the wrong password is entered, the following window is displayed. The user's system administrator may have changed the password, so confirm the password with the system administrator. Note that there is no special password for service.

F-2-316

RLS Authentication

Login without using the SMS login window but by entering the user ID and password for authentication in the RLS (Remote Login Service) window. The user information (user name and password) used is the information for server authentication or local device authentication. The login procedures are as follows.

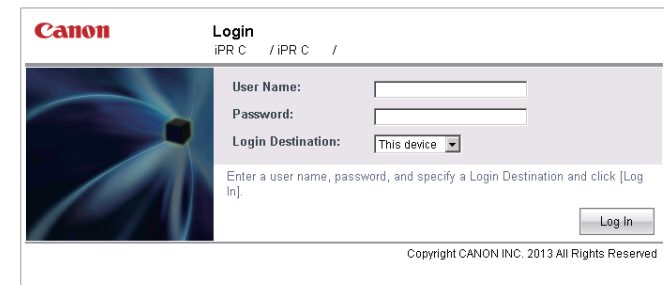

1) Access SMS by RLS Authentication from the PC browser on the same network as the MEAP device.

URL: `https://<IP address of MEAP device>:8443/sms/rls/`

Ex.) `https://172.16.188.240:8443/sms/rls/`

Note:

- To encrypt the password information input when logging in, SSL of the login screen was made effective. However, it is redirected to new URL (effective SSL) even when accessing with URL (non-SSL) before.

F-2-317

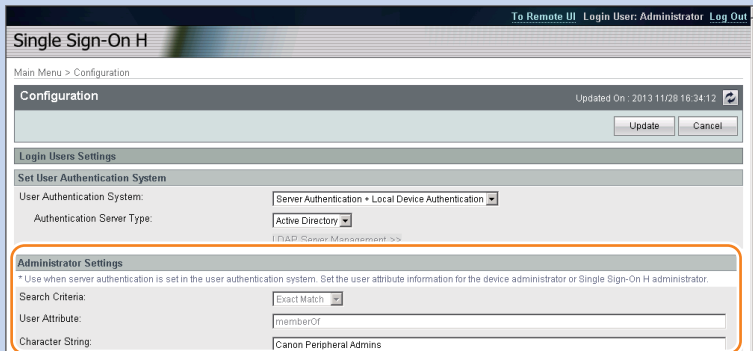

Note:

- When the device authentication method used is server authentication, enter the user name, password and login destination registered with authentication server and then click "Log In".
- If the authentication method used is local device authentication, enter the user name, password and login destination registered in the device and click "Log In". The user information is set as below for local device authentication by default. Both are case sensitive.
 - User Name: Administrator
 - Password: password

Note:

Only the following users may use SMS via RLS.

- For local device authentication, users with Administrator or Device Admin authority.
- In the case of server authentication, the users who belong to the group (default: Canon Peripheral Admins) specified as the device administrator on the SSO-H Configuration screen.

F-2-318

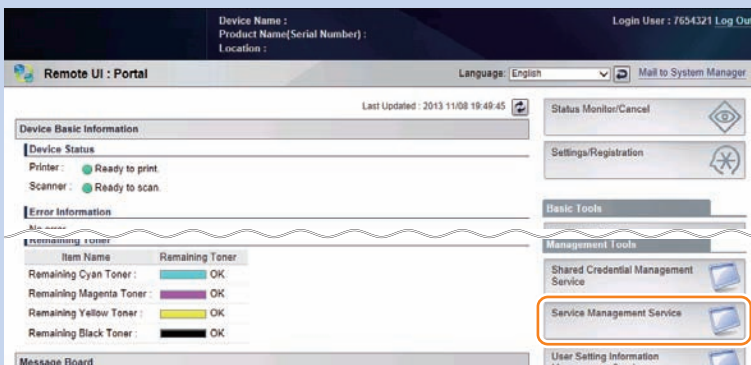

Note:

SMS Access can be gained also from Remote UI.

Access Remote UI and click on SMS shortcut shown on the lower right of the screen to gain access to SMS.

When only the password authentication is enabled, the password authentication screen is shown.

When only the RLS authentication is enabled, no further authentication is needed to access SMS. This is because users have already authorized upon accessing to Remote UI.

F-2-319

Setting the method to login to SMS

Outline

The method to log into SMS can be specified by one of the following methods.

- If you want to change the password authentication settings: Use RLS authentication to log in, and change the settings.
- If you want to change the RLS authentication settings: Use password authentication to log in, and change the settings.

The following table shows the start/stop combinations of the two login methods.

Combination of Login Methods

	Start RLS Authentication	Stop RLS Authentication
Start Password Authentication	Login available with either method	Login available only with
Stop Password Authentication	Login available only with RLS Authentication	Setting unavailable

T-2-120

CAUTION:

If only login via RLS is programmed, login may be disabled for the following reasons.

- Authentication server is down
- Network problem, no communication with authentication server

In the event of either of these cases, try the following.

1. If local device authentication is active, try logging in with local device authentication.
2. If only server authentication is active, launch in MEAP safe mode from the device service mode.

After launching in MEAP safe mode, the Default Authentication will become active, and you will be able to login to SMS with password authentication. After logging into SMS, set the password authentication login to ON (active) and restore the device from MEAP safe mode to normal mode. Until the problem blocking authentication is resolved, log into SMS with password authentication.

● Setting for login by Password Authentication

The procedures for changing the password authentication Start/ stop settings are as follows.

- 1) Access SMS login screen by RLS Authentication from the PC browser on the same network as the MEAP device.

URL: <https://<IP address of MEAP device>:8443/sms/rls/>

Ex.) <https://172.16.188.240:8443/sms/rls>

- 2) Enter the user name and the password of the user registered as an administrator, select the login destination, and then click the [Log In].

Login screen (In case authentication method is SSO-H)

F-2-320

- 3) Select [System Application Management]

Application Name	Installed on	Status	License
DSL Installer Service	3.0.5.0 11/07/2012	Started	2ca34e18-78a-4fd9-8de9-51142963b733
SMS Installer Service (Password Authentication)	3.1.2.14 11/07/2012	Starte	e7059090-c691-49af-9c23-3d9b452194db

F-2-321

- 4) Click [Start] or [Stop] shown in Status field of SMS Installer Service (Password Authentication) to check if the status is changed.

F-2-322

- 5) Logout once and login again to check to see that the setting is applied properly. When clicking [Stop] to change the status to [Start], another password authentication login screen is firstly shown. When trying to access the password authentication screen after clicking [Start] to change the status to [Stop], the user is automatically redirected to RLS authentication screen.

Password authentication started screen and Password authentication stopped screen

F-2-323

● Setting for login by RLS Authentication

The procedures for changing the RLS authentication Start/ Stop settings are as follows.

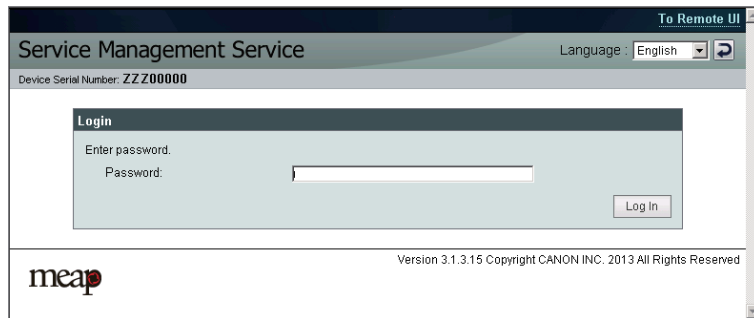

1) Access the SMS login screen using the normal method (password authentication). The URL is shown below.

URL: https://<IP address of MEAP device>:8443/sms/rls/

Ex.) https://172.16.188.240:8443/sms/rls

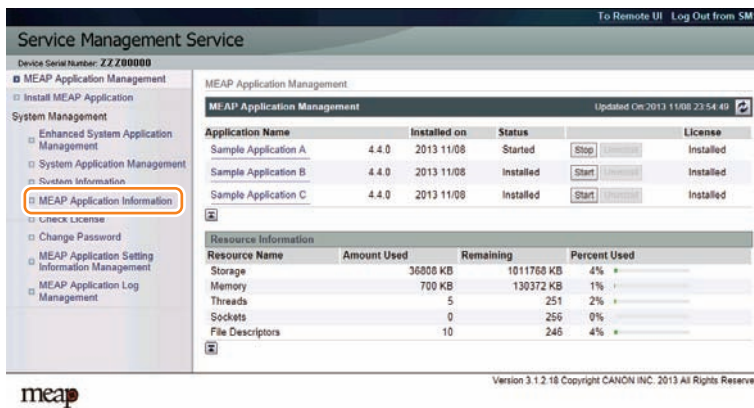

2) Enter the password in the password entry field, and click the [Log In]. The default password is "MeapSmsLogin". (Case sensitive)

Login screen by Password Authentication

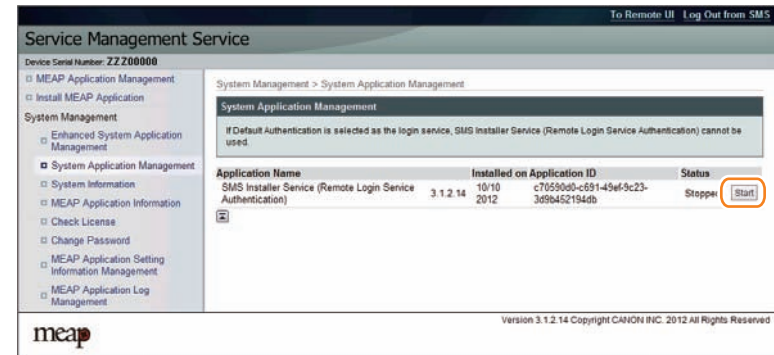

F-2-324

3) Select [System Application Management] on System Management menu.

F-2-325

4) Click on [Start] or [Stop] shown on Status field of SMS Installer Service (Remote Login Service Authentication) to check if the status is changed.

F-2-326

5) Log out and then log in again and access via the RLS authentication login window. When RLS authentication is set to [Start], another RLS login screen is firstly shown. When accessing to RLS status screen with the setting of [Stop], the user will be redirected to the password authentication screen.

RLS authentication started screen and RLS authentication stopped screen

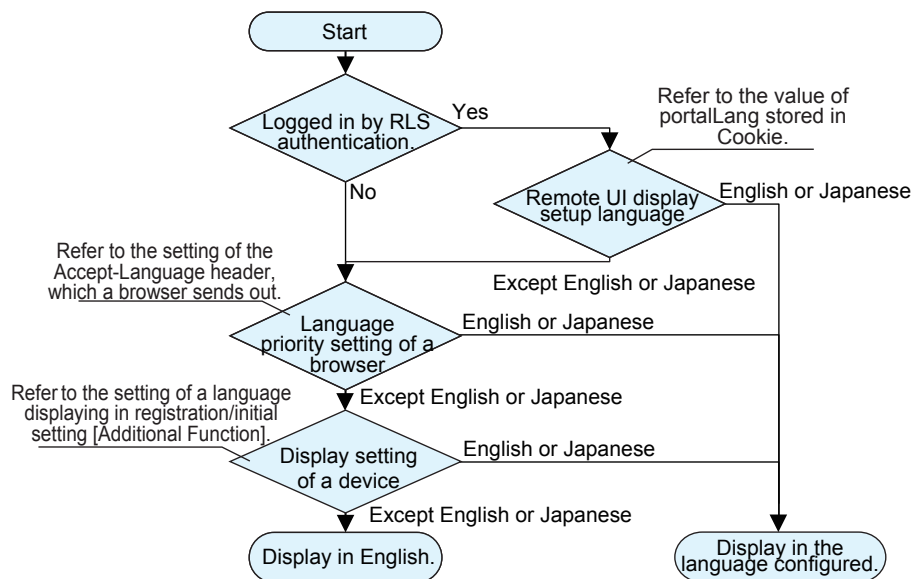

F-2-327

Initial Display Languages of SMS

SMS supports English and Japanese. Display language can be changed with selecting by the drop down list on a login page.

The initial display language at the time of accessing SMS depends on the setting.

F-2-328

When accessing by SMS Installer Service (Password Authentication)

It is referred in order of the language priority (setting of the Accept-Language header which a browser sends out) and the display-language setting in the [Settings/Registration]. When the language setup is other than English or Japanese, it is displayed in English.

When accessing by SMS Installer Service (Remote Login Service Authentication).

Initial display language is set by the language setting (value of portalLang storing in Cookie) selected by the remote UI screen. When the setting is other than English or Japanese, Selection of display language is performed in a similar way with the SMS Installer Service (Password Authentication) mentioned above.

MEAP Application System Information

Outline

You can check the device's platform information and the MEAP application's system information.

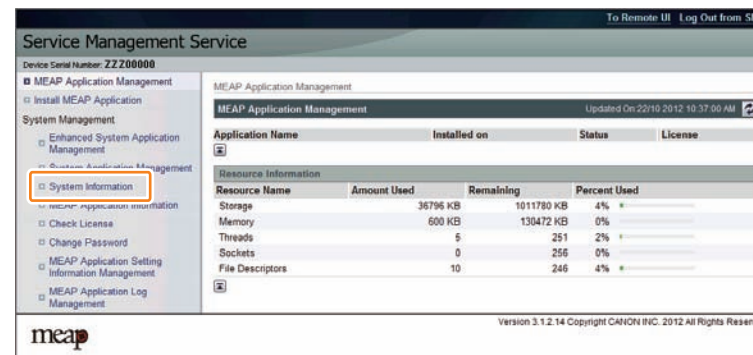

Checking the System Information

System information that can be checked from the screen

- MEAP Specifications version (MEAP Spec Ver)
 - MEAP Contents version
 - Java Virtual Machine version
 - System application information
- The name of the installed system application
 - The installation date of the installed system application
 - Application ID of the installed system application
 - The status of the installed system application

The checking procedure is shown below.

- 1) Log in to SMS.
- 2) Select [System Management] > [System Information] on System Management menu.

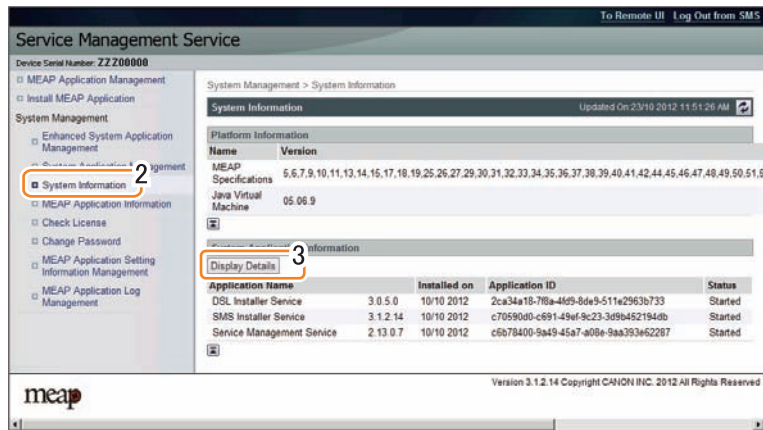

F-2-329

■ Display of System Information Details

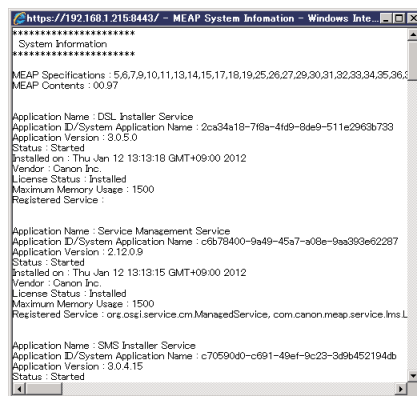

The system information details can be displayed to check more than one pieces of information all at the same time: platform information, system application information, information on the installed MEAP applications, etc.

- 1) Log in to SMS.
- 2) Select [System Info] on System Management menu.
- 3) Click [Display Details].

F-2-330

- 4) System information of each application (including system applications) is shown in an additional window. Copy and paste all the information in a file to attach to AR reports as text information. This function is useful to check status information of each application.

F-2-331

■ Printing the System Information of a MEAP Application

MEAP system information can be printed out with device for confirmation.

Note:

The system information of the MEAP application that you checked in the previous section is exactly the same as the system information of the MEAP application that is output.

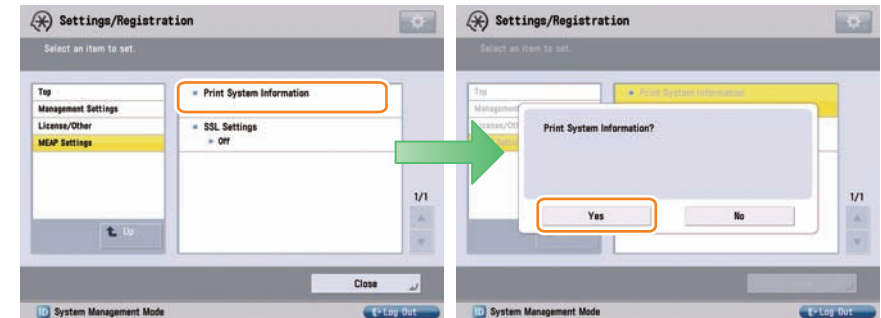

Follow the steps below when confirming information:

- 1) Select [Settings/ Registration] > [Management Settings] > [License/ Other] > [MEAP Settings] > [Print System Information].

Note:

When System Manager ID and PIN are set, go to Top screen and log in as System Manager to continue jobs.

- 2) Press [Yes].

F-2-332

Note:

MEAP system information was printed out in PDL format conventionally. However, the information has been printed out in text format instead of PDL format, enabling devices without PDL installation to print out information (iR C3220 and later).

Content of MEAP system information

Application System Information

```

Application Name: C-Cabinet Gateway for MEAP
Application ID/System Application Name: 03a46668-63e4-4636-9cbb-492b6cef05d5
Application Version: 1.0.0
Status: Resolved
Installed on: Tue Oct 21 14:00:11 GMT+09:00 2003
Vendor : Canon Inc.
License Status : Installed
Maximum Memory Usage : 1024
Registered Service :
  
```

item	content
Application Name	It is the name (bundle-name) declared in a statement within the application program. It may not necessarily be identical to the name of the program.
Application ID/System Application Name	Application ID (application-id) items which are declared on the declaration statement in the application program are printed.
Application Version	It is the version of the application (bundle-version) declared in a statement within the application program.
Status	It indicates the status of the application in question; specifically, Installed: the application has been installed. Active: the application is being in use. Resolved: the application is at rest.
Installed On	It indicates the date on which the application was installed.
Vendor	It is the name of the vendor that developed the application, and is the name (bundle-vendor) declared in a statement within the application program.
License Status	It indicates the status of the license; specifically, None: no license is needed. Not Installed: no license has been installed. Installed: the appropriate license has been installed. Invalid: the license has been invalidated. Overlimit: the license has been used beyond its permitted limit.
License Expires After	It indicates the date after which the license expires. If the status of the license is "none", this item will not be printed.
License Upper Limit	It indicates the limit imposed on individual counter readings. If the status of the license is "none", this item will not be printed.
Counter Value	It is the current counter reading of a specific counter. If the status of the license is "none", this item will not be printed.
Maximum Memory Usage	It indicates the maximum amount of memory that the application uses. It is the amount (maximum memory usage) declared in a statement within the application program, and is expressed in kilobytes.
Registered Service	It is a list of services that have been registered by the application with the MEAP framework. Some services may not have printable data.

T-2-121

MEAP Application Information

Outline

You can check the MEAP application installed on the device.

The following information can be checked on the MEAP application information screen.

Application Information

- Application Name
- Description
- Version
- Export Package
- Application ID
- Manufacturer
- Copyright
- Export Service
- Installed on
- ContactAddress
- Applet-Name
- Import Package
- Applet Number
- Category
- URL
- Import Service
- Resources Used (Storage, Memory, Threads, Sockets, File Descriptors)

License Information

- Status
- Serial Number
- Expires after

■ Procedure to Check MEAP Application Information

- 1) Log in to SMS.
- 2) Select [System Management] > [MEAP Application Information] on System Management menu.

MEAP Application Management

Application Name	Version	Installed on	Status	License
Sample Application A	4.4.0	2013 11/08	Started	Installed
Sample Application B	4.4.0	2013 11/08	Installed	Installed
Sample Application C	4.4.0	2013 11/08	Installed	Installed

Resource Name	Amount Used	Remaining	Percent Used
Storage	36008 KB	1011760 KB	4%

● Check License

■ Outline

You can check the contents of the license file.

■ Procedure to Check the License File

- 1) Log in to SMS.
- 2) Select [System Management] > [Check License] on System Management menu.

Check License

Resource Name	Amount Used	Remaining	Percent Used
Storage	36796 KB	1011780 KB	4%
Memory	600 KB	130472 KB	0%
Threads	5	251	2%
Sockets	0	256	0%
File Descriptors	10	246	4%

F-2-335

- 3) Click the [Browse..], specify a license file, and click the [Check].

License File Path:

F-2-336

Changing SMS Login Password

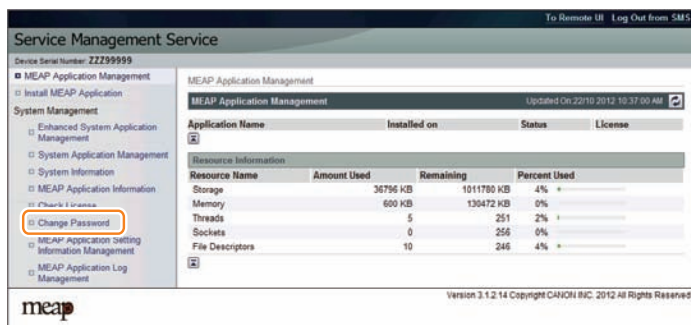

Outline

You can change the password for logging into SMS.

If you forgot the login password and you want to change the password back to the default value (MeapSmsLogin), see "If you forgot the password (SMS login password initialization)" in this chapter.

Procedure to Change the SMS Login Password

- 1) Log in to SMS.
- 2) Select [System Management] > [Change Password] on System Management menu.

F-2-337

- 3) Enter the current password and a new password, and then click the [Change].

F-2-338

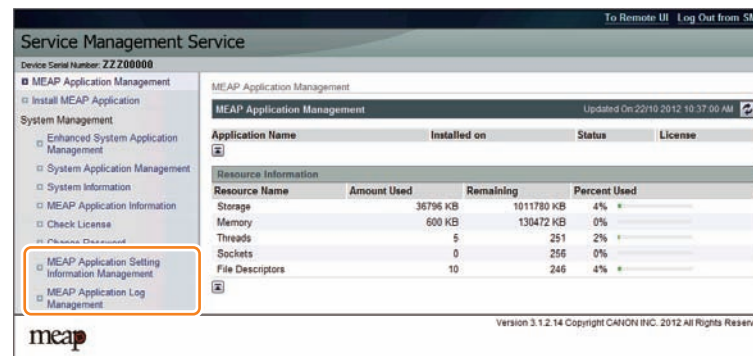

Note:

The [Reset] on the [Change Password] screen is used to clear the value entered in the text field. It is not a for changing the SMS login password back to the default value.

MEAP Application Setting Information Management and Log Management

Outline

The MEAP Application Setting Information Management page and the MEAP Application Log Management page provide menu related to "MEAP Application Configuration Service" for managing MEAP application setting information and menu related to "MEAP Application Log Service" for managing log information respectively.

F-2-339

MEAP Application Configuration Service

This service is used to manage the MEAP application setting information. It has functions such as saving setting information to the MEAP area. Ver 57 of MEAP Specifications supports this service.

MEAP Application Log Service

This service is used to collect MEAP application logs (debug logs and authentication logs).

Ver 58 of MEAP Specifications supports this service.

The collected logs can be downloaded or deleted in Remote UI.

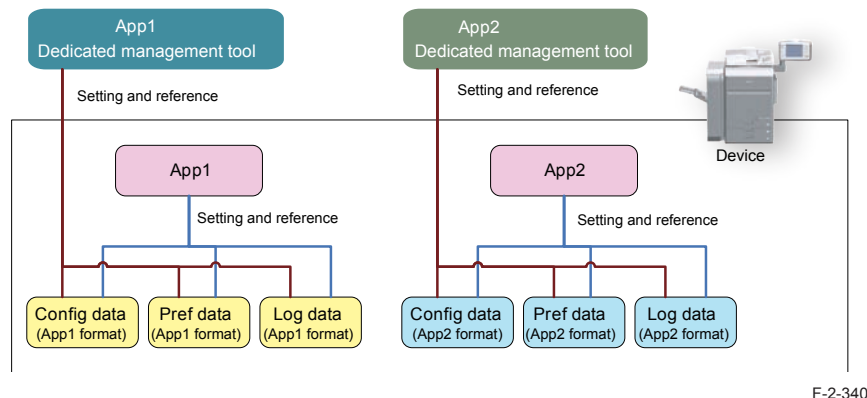

The settings such as the log level to be saved cannot be made from SMS.

These settings depend on the MEAP application. For detailed information, refer to the manual for the application.

Advantages Obtained When Using the Services

By using MEAP Application Setting Information Management and MEAP Application Log Service, as long as the MEAP application supports these services, you can collectively perform data management tasks.

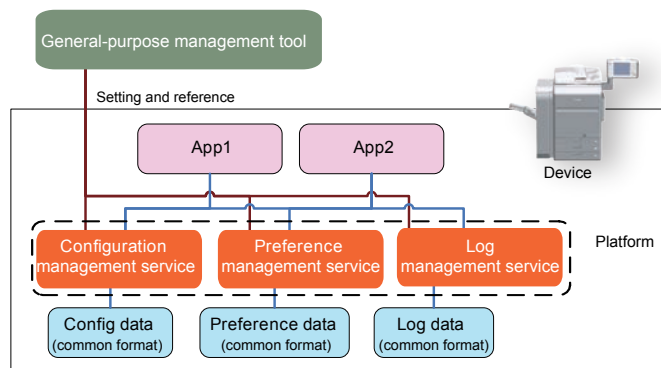

Devices and MEAP applications which do not support new functions

F-2-340

As for devices and MEAP applications that do not support the service, the setting information and log data are managed on an application-by-application basis.

Devices and MEAP applications which support new functions

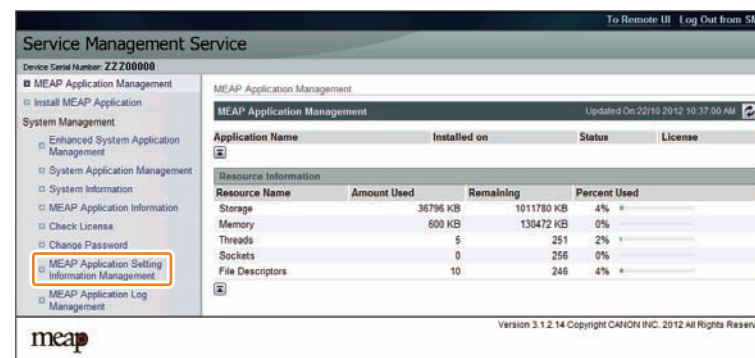

F-2-341

As for devices and MEAP applications that support the service, information can be collectively managed.

MEAP Application Setting Information Management

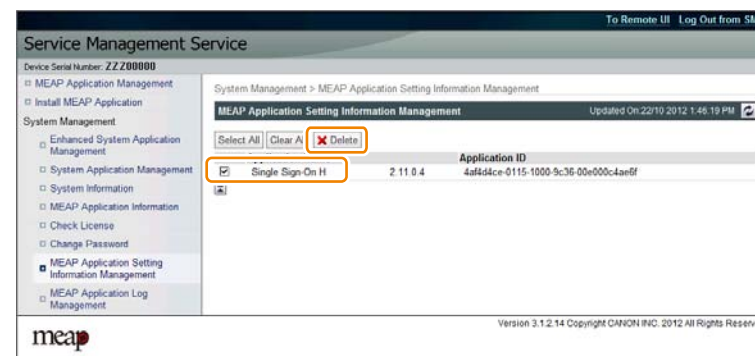

The setting data (stored on the device) of the MEAP applications which support MEAP Application Setting Information Management can be deleted. The procedure is shown below.

- 1) Log in to SMS.
- 2) Select [System Management] > [MEAP Application Setting Information Management] on System Management menu.

F-2-342

- 3) Select an application you want to delete, and click the [Delete].

F-2-343

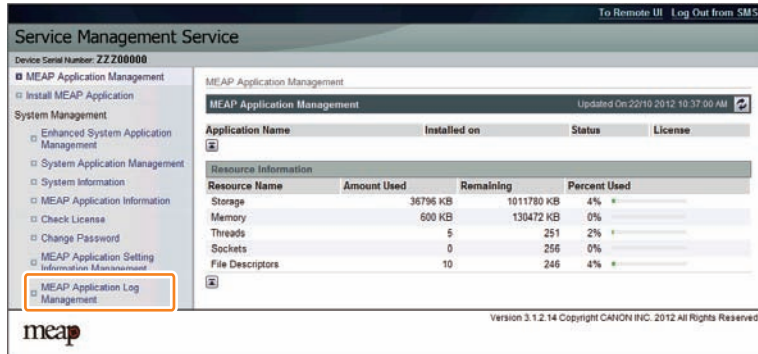

Note:

If a MEAP application that contains setting data which can be shared (not dedicated to the application) is installed, the application name [Shared Setting Information of Applications] is displayed.

MEAP Application Log Management

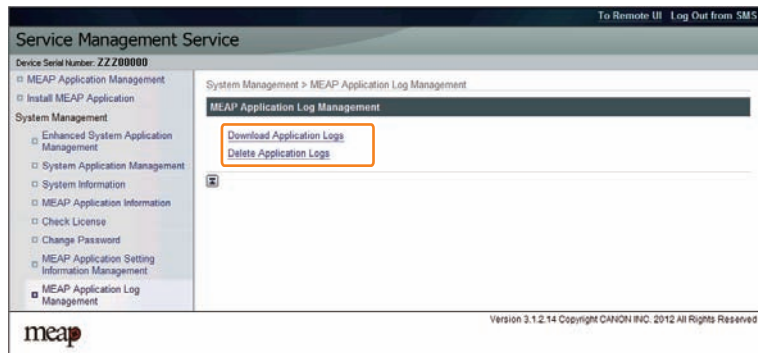

The log data (stored on the device) of the MEAP applications which support MEAP Application Log Service can be downloaded or deleted. The procedure is shown below.

- 1) Log in to SMS.
- 2) Select [System Management] > [MEAP Application Log Management] on System Management menu.

F-2-344

- 3) Select [Download Application Logs] or [Delete Application Logs].

F-2-345

- 4) To download the logs

The file save dialog for the log file will appear. Specify the destination and save the file.

F-2-346

- 5) To delete the logs

The confirmation screen will appear to prompt you to delete the logs. Click the [Yes] to delete the logs.

F-2-347

Maintenance

Backup of the MEAP Application Area and Recovery of the Backup Data Using SST

Outline

When replacing or formatting the HDD, the data in the MEAP application area needs to be temporarily saved to your PC.

This chapter describes information on backing up the data in the MEAP application area and recovering the backup data.

In the case of MEAP-installed devices, the application is license-managed, so the application needs to be reinstalled and reconfigured when replacing or formatting the HDD.

In that case, a license for reinstallation needs to be downloaded and the customer data and configuration information need to be recovered, and these procedures pose heavy burdens on the service technician.

The area used for the MEAP application can be easily saved/recovered by using the backup function of SST (Service Support Tool).

This greatly reduces the work burden on the service technician.

Please note that the application cannot be illegally copied because the backup data can be recovered only when the device has the same serial number.

CAUTION:

- You must not perform any other work (including checking operation) until the HDD has been backed up. This arrangement is to prevent a mismatch of MEAP counter readings and the HDD contents, and any fault in operation arising as the result of failure to observe this will not be covered by the guarantee of operation.
- Do not disable the license during the period from backup using SST to restoration of data.
It is not necessary to reinstall the license file when restoring the backup data.

Backup Item Automatically Copied

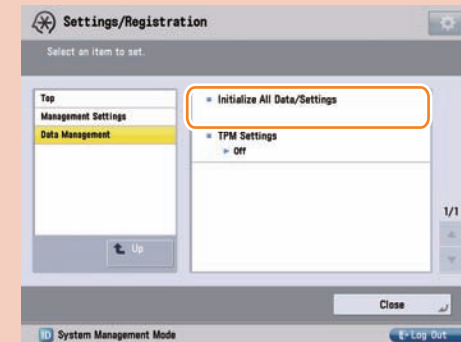

The following data are backed up using SST:

The following data are backed up (saved as Meapbackup.bin) using SST.

- MEAP applications.
- Setup data generated by MEAP applications (Note that image data stored in BOX will not be saved for MEAP applications using BOX function).
- User information data registered for local device authentication in SSO-H
- SMS password

CAUTION:

Do not execute [Initialize All Data/Settings] in [Settings/Registration] during the period from backup using SST to recovery of the data.

F-2-348

When [Initialize All Data/Settings] is executed, the key used to decrypt encrypted backup data (SMS password, etc.) is initialized, which makes it impossible to decrypt the data.

It means that SMS cannot be accessed even when the backup data has been recovered using SST.

If you inadvertently executed [Initialize All Data/Settings] and can no longer access SMS, the SMS login password needs to be initialized by following the procedure shown in "When SMS Cannot Be Accessed" in "Login to SMS" in this manual.

● Data backed up using SST

In the case of this machine, menus are implemented as MEAP application. Therefore the following items can be also backed up (stored as Meapbackup.bin).

- Setting items of each menu in the main menu (Copy, Scan and Send, Fax, Scan and Store, Access Stored Files, Fax/I-Fax Inbox,).
 - Favorite settings
 - Default settings
 - Settings of option shortcuts
 - Previous settings
- Settings of quick menu
 - Button size information
 - Wallpaper settings
 - Quick menu button information
 - Restrict quick menu use

● Requirements for Backup Using the SST

The following conditions must be met for use of the function:

1) Device Firmware Version

Device Firmware Version for SST (Ver4.2x)

	Boot ROM	System	SST
iR-ADV C2030/C2020 series iR-ADV C2230/C2220 series iR-ADV 500 series	Boot ROM is not equipped.	Already supported since the 1st version.	The version supporting the corresponding devices.
iPR / iR-ADV series other than above	Already supported since the 1st version.	Already supported since the 1st version.	The version supporting the corresponding devices.

T-2-122

2) SST Version

Version 4.2.x or later. An earlier version will not permit the use of the function. If needed, upgrade the SST.

3) Space for backup

To back up the HDD of the device, the PC must have approx 1024MB of free space at maximum. Sizes of backup files depend on actual data capacities to be backed up.

■ Procedure for backing up the MEAP application area using SST

1) Switching Login Service / Backup of Login User Information

If SSO-H is used for the login service, switch to default authentication before backing up the user information. Although SST will back up local device user information, it is recommended to export the user information just in case. For local device user information backup, go to User Management page of SSO-H site and export the data. (The SSO-H login page opens with the URL "https://<device IP address>:8443/sso/").

CAUTION:

- If a HDD of a system that uses SSO-H is formatted without changing the login service to the default authentication, the error message "The login service must be set again with SMS" appears and the system cannot start up when you attempt to restart the system after formatting.
- If this problem occurs, change the login service to SSO-H with SMS. If you cannot access to SMS since you do not have the IP address of the device, start the system with FIXIP mode -hold down the numeric keys 1 and 7 and turn the power switch on. The IP address "172.16.1.100" will be automatically assigned for the device. Then log in to SMS specifying the address.

2) Starting the device in Download Mode

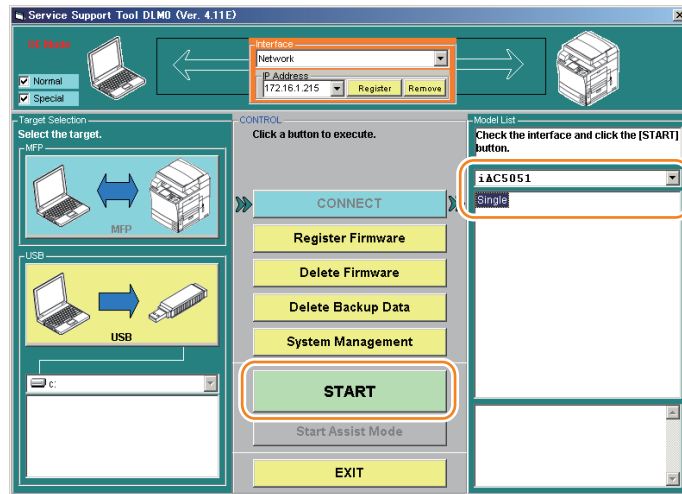

Press [2] and [8] buttons at the same time on the control panel and turn on the main power switch to start the device in Download Mode. Note that SST backup function is enabled only in Download Mode.

3) Connecting the main unit to the PC to start SST

Connect the main unit to the PC with SST installed using the crossing cable and the like to start SST on the PC.

4) Connecting the device using SST

When starting SST, select the target device type as Single and click [Start].

F-2-349

5) Generating backup data to transfer it to the PC (uploading)

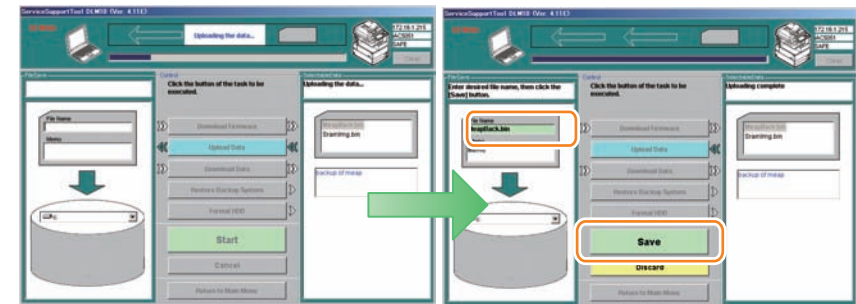

Click [Upload Data] of SST and select "Meapback.bin" as the item to be backed up to click [Start].

F-2-350

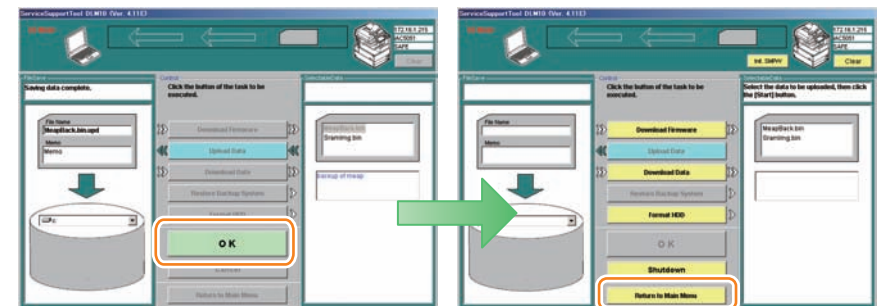

6) Saving backup data

Upon the backup data transferred to the PC, enter an appropriate file name and click [OK] to save the backup data on the PC.

F-2-351

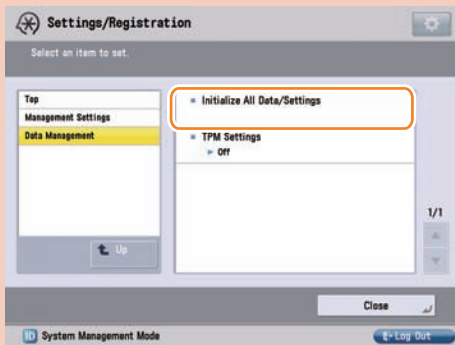

7) When the file is successfully saved, click [OK], and then click [Return to Menu].

F-2-352

CAUTION:

Do not execute [Initialize All Data/Settings] in Settings/Registration during the period from backup using SST to recovery of the data.

F-2-353

When [Initialize All Data/Settings] is executed, the key used to decrypt encrypted backup data (SMS password, etc.) is initialized, which makes it impossible to decrypt the data.

It means that SMS cannot be accessed even when the backup data has been recovered using SST.

If you inadvertently executed [Initialize All Data/Settings] and can no longer access SMS, the SMS login password needs to be initialized by following the procedure shown in "When SMS Cannot Be Accessed" in "Login to SMS" in this manual.

■ Procedures to Restore Backup Data

1) Connecting to the device

Connect the device using SST by following step 1 to step 4 of the Procedure for backing up the MEAP application area using SST.

2) Restoring backup file

Click [Download Data] and select the data backed up in the previous step (Meapback.bin) to click [Start Restoring Data]. Note that the data backed up in a different version cannot be restored.

F-2-354

3) Transferring Data

When the data is successfully transferred, click the [OK] shown on the screen. To continue other jobs, click [Return to Menu].

F-2-355

4) Turn off and on the main power switch of the device to gain access in SMS to check that MEAP applications are surely restored.

5) Restore the backup data and setting saved. Note that the user information of the local device is included in the backup data, thus does not need to be restored.

■ Formatting and Replacing the HDD

● Outline

If the HDD is broken or does not function correctly due to failure of the system (excluding the MEAP application), it needs to be formatted or replaced.

When the HDD is formatted or replaced, the files of the MEAP application stored in it will be lost, so make a backup of the MEAP application area according to "Procedure for backing up the MEAP application area using SST" if possible. If a backup cannot be made, the MEAP application and the license files need to be reinstalled.

As for the MEAP counter information, it will not be lost because it is backed up just like the conventional counter.

If a backup cannot be made, a special license file (a license file for installation with the expiration date carried over from the current counter value) is required to reinstall the MEAP application. This special license file is treated as a service tool and cannot be obtained by a general user.

In order to obtain a special license file, a service technician needs to contact a person in charge of support of a sales company.

When contacting the person in charge of support, the service technician also needs to provide the serial number of the device and the name of the MEAP application installed.

In the support departments of regional headquarters of Canon, all license files of the applications that have been issued are filed according to device serial numbers, enabling you to obtain a series of license files through a single screen as long as you can identify the serial number of the device in question.

Note:

The application that is installed with a reusable license can be reinstalled by using the same license.

● Formatting the HDD

Procedure to format the hard disk

Follow the following procedure to format the HDD.

1) Connecting to the device

Connect the device using SST by following step 1 to step 4 of "Procedure for backing up the MEAP application area using SST".

2) Formatting the HDD

Select "Format HDD" from SST menu to format the HDD.

Note:

HDD can be formatted also by starting Download mode using the USB memory and executing formatting from the displayed menu.

● HDD replacement procedure

Outline

The procedure for replacing the HDD differs according to whether the HDD functions normally or not.

If the MEAP application area cannot be backed up

If the HDD does not function correctly due to failure or for other reason, the MEAP application area cannot be backed up. It is therefore necessary to reinstall the application after replacing the HDD. The procedure is shown below.

1)Preparation for replacement

Copy a set of license files for reinstalling the MEAP application (special licenses and reusable licenses) to a laptop for service operation.

Register a set of system files of a target product to SST. Or, prepare USB thumb drive of the System file transfer settlement.

2)Replacing the drive

Prepare the necessary service parts of the HDD, and replace the drive.

3)Formatting HDD

Format the HDD referring to Procedure to format the hard disk.

4)Reinstalling the MEAP application

When the device has started normally, obtain the jar files of the MEAP applications from the user, and install them using the license files for reinstallation.

Installation method is the same as normal installation.

5)Importing user information

As necessary, make login service selections and import user information.

Note:

When you replace the HDD without uninstalling MEAP applications, make sure to reinstall the previously installed applications. Unless reinstalling them, MEAP counter will not be released and the message "The number of applications that can be installed has exceeded the limit. Try to install this application after uninstalling other applications." is displayed so that the installation of new applications may not be accepted. If you want to install new applications in this case, once reinstall the applications installed before formatting and uninstall unnecessary applications.

● If the MEAP application area can be backed up

If the MEAP application area can be backed up, it can be recovered after replacing the HDD, so it is not necessary to prepare the special licenses for reinstallation.

1)Preparation for replacement

Back up the MEAP application area of the device according to the procedure for backing up the MEAP application area using SST.

2)Replacing the drive

Prepare the necessary service parts of the HDD, and replace the drive.

3)Formatting HDD

Format the HDD referring to Procedure to format the hard disk.

4)Restoring the backup file

Restore the backup data referring to the Procedures to Restore Backup Data.

5)Importing user information

As necessary, make login service selections and import user information.

MEAP Safe Mode (level 2)

Outline

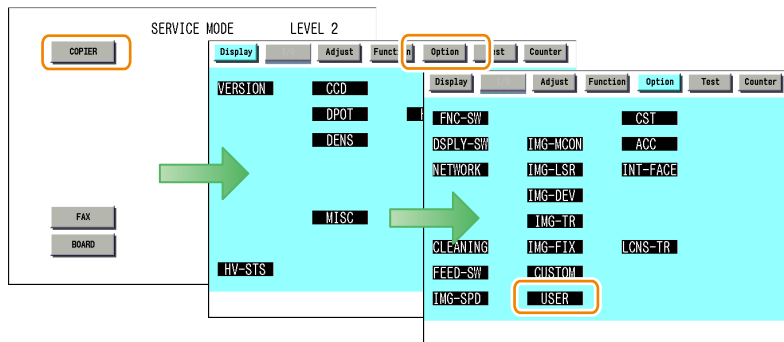

Use safe mode if you need to start up the system without worrying about extra applications. It will start up only those system software files (including SMS) that normally start up as default files while preventing MEAP applications and the like from starting up.

When you have made changes and restart the device, the control panel will indicate "MPSF" in its lower right corner. The MEAP applications that may have been active before you shut down the equipment will not start up on their own. Make use of safe mode when restoring the system software as when MEAP applications or services cause a fault as the result of a conflict or wrong sequence of registration/use. You can access to SMS in this condition so that you can take necessary measures, for example, you can stop application that may cause the trouble.

If default authentication has been selected, the mode of authentication remains valid; otherwise, the message "The login service must be set again with SMS" appears. Change the login service as necessary.

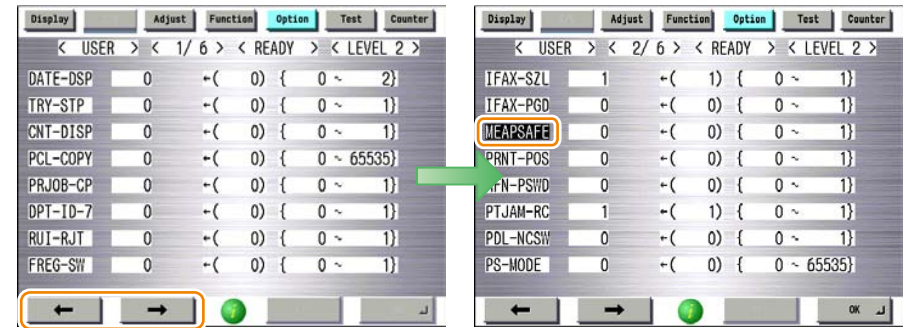

Starting in Safe Mode

- 1) Startup [SERVICE MODE] in level 2.
- 2) Press [COPIER] > [Option] > [USER].

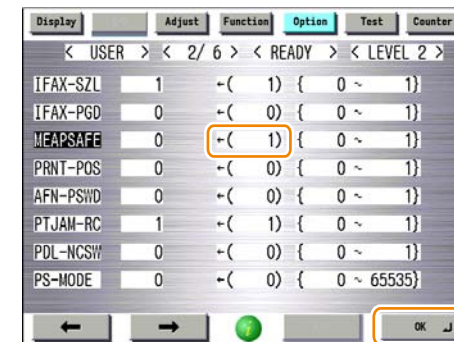

F-2-356

- 3) Press ← or → for several times until [MEAPSAFE] is shown. Click [MEAPSAFE].

- 4) Press the 1 key on the control panel keypad to change the setting to "1"; then, click [OK].

- 5) Check that the notation "MPSF" has appeared in the lower right corner of the screen; then, restart the device.

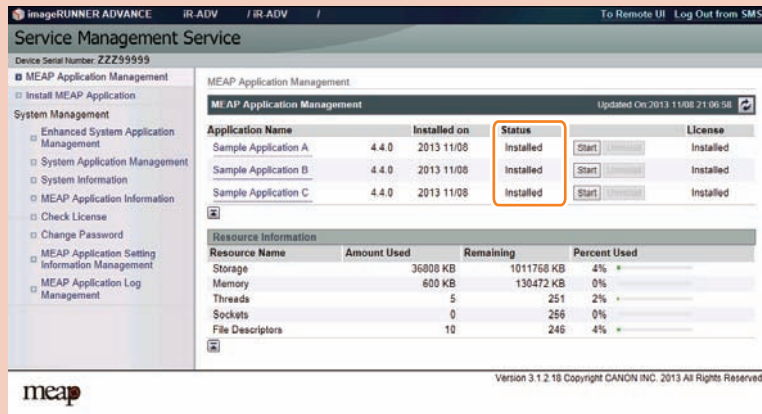

F-2-359

CAUTION:

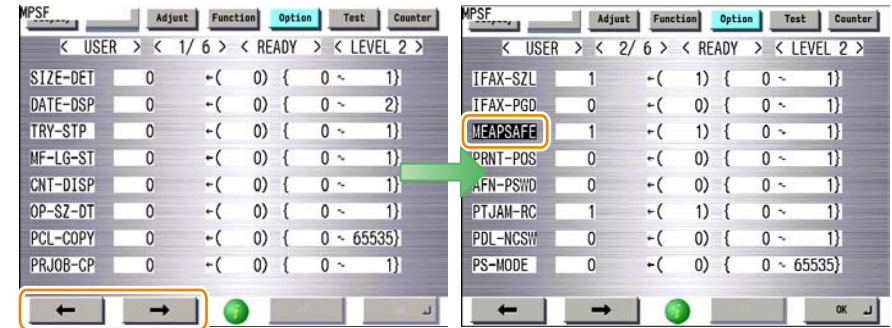

If the device has been started in MEAP SAFE mode, all the MEAP applications stop and the status becomes "Installed".

This status remains unchanged even if the MEAP SAFE mode is canceled and the device is started again in normal mode. It is therefore necessary to access SMS after normal startup and start the MEAP application.

F-2-360

3) Press **←** or **→** for several times until [MEAPSAFE] is shown. Click [MEAPSAFE].

4) Press the 0 key on the control panel keypad to change the setting to "0"; then, press **[OK]**.

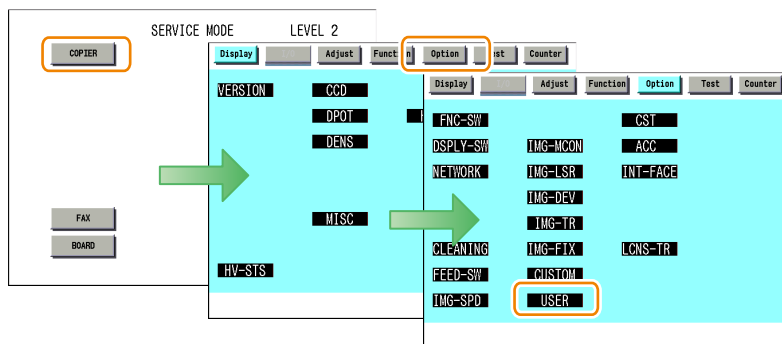

5) Start service mode again after rebooting the device, and check that the displayed setting value has changed to "0" and that [MPSF] is no longer displayed at the lower right of the screen.

F-2-364

How to cancel MEAP SAFE mode

- 1) Startup [SERVICE MODE] in level 2.
- 2) Press [COPIER] > [Option] > [USER].

F-2-361

Collection of MEAP Console Logs

Overview

When debugging a MEAP application, console logs need to be collected in some cases.

The following shows how to collect MEAP console logs using commercially available terminal software and service mode.

What to Prepare

- PC connected with the same network as the device
- Commercially available terminal software

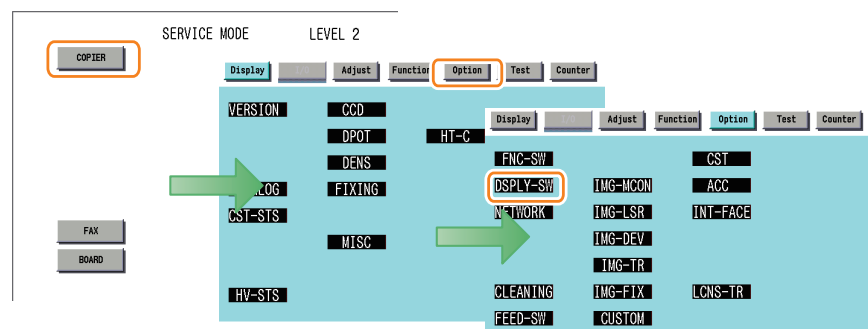

Note:

In the procedure shown in this manual, "Tera Term Pro" and "Hyper Terminal" are used as the terminal software.

Work Procedure

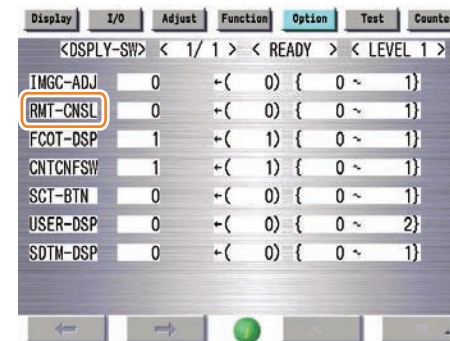

Device Setting Procedure

- 1) Start [SERVICE MODE] in Level 1.
- 2) Press [CER] > [Option] > [DSPLY-SW].

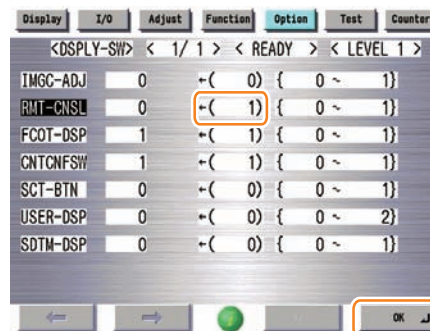

F-2-365

- 3) Press [RMT-CNSL].

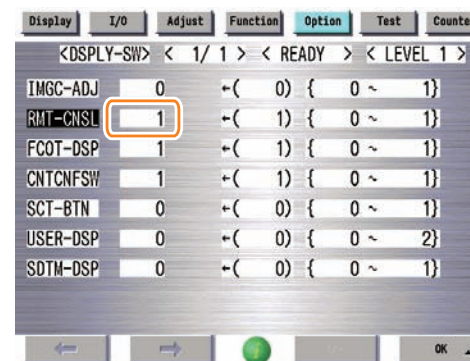

F-2-366

- 4) Press either 1 (activate remote console function) on control panel (the numerical value input in the field is displayed), and press [OK].

F-2-367

- 5) Check to see that it is reflected in setting field, and restart the device.

F-2-368

PC setting procedure (when Tera Term is used)

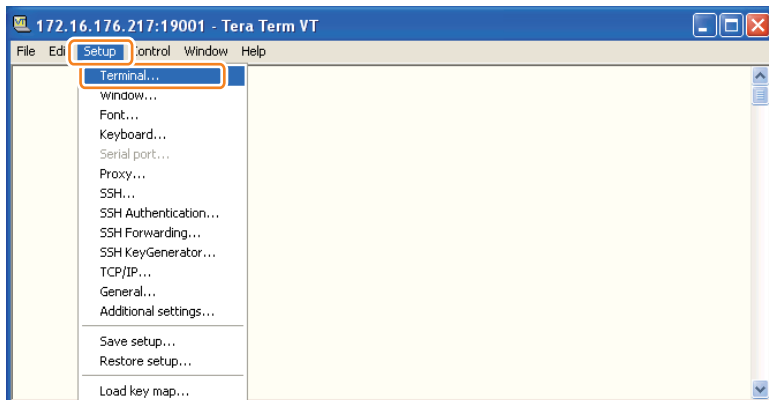

- 1) Install the terminal software on the PC.
- 2) Start the terminal software, make the following settings, and then click the [OK].

F-2-369

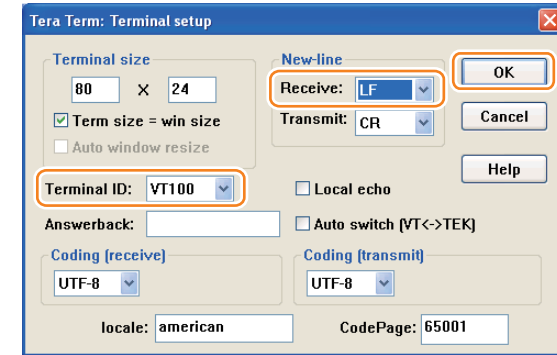

- Connection : Select [TCP/IP] (Default)
- Host : Device Host Name or IP Address
- Service : Select "Telnet"
- TCP port# : Enter 19001

- 3) The connection window will open. Select [Terminal...] from the [Setup] menu.

F-2-370

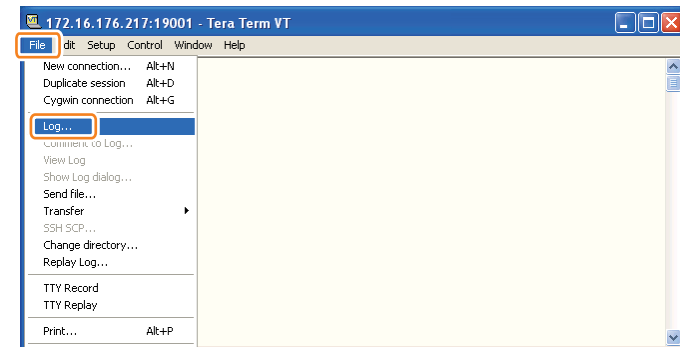

- 4) The terminal setting screen will appear. Make the following settings, and then click the [OK].

F-2-371

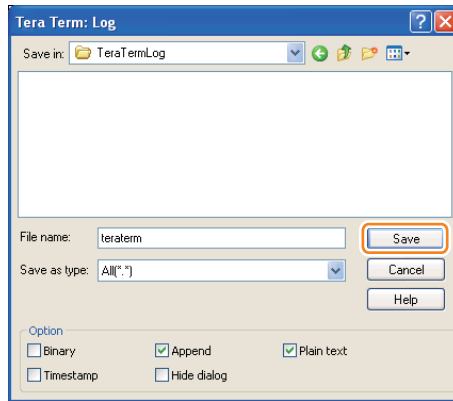

Terminal ID : VT100
New-line Receive : LF

- 5) Select [Log...] from the [File] menu.

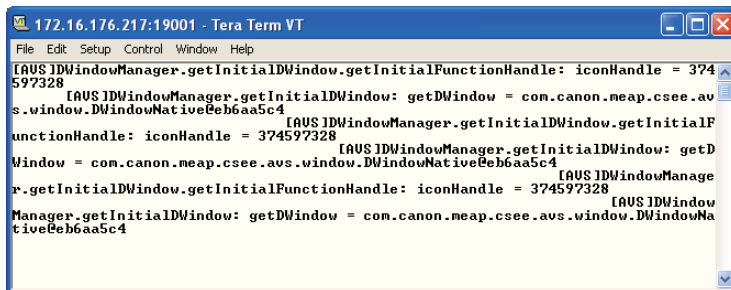

F-2-372

- 6) The dialog for specifying the save destination of the log file will appear. Set the save destination path and the file name, and then click the [Save].

F-2-373

- 7) Perform the operation whose log you want to collect.

F-2-374

- 8) Click the [Close] in the log dialog.

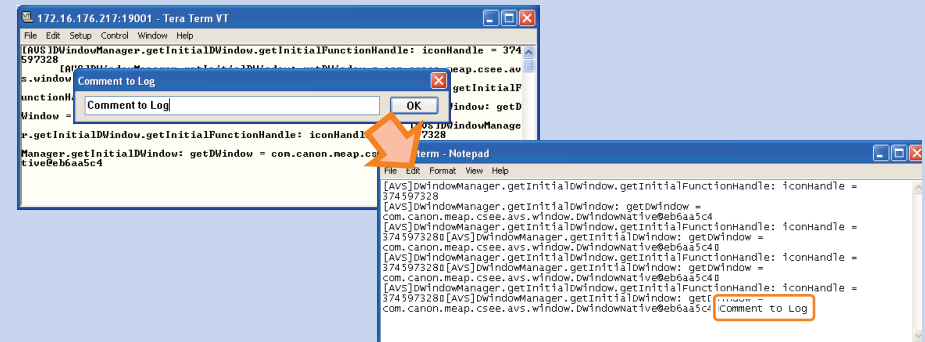

F-2-375

Note:
To suspend log collection, click the [Pause].

Note:
While collecting logs, the following operations are available from the [File] menu.

Comment to Log... :

You can add a comment to the log being collected. The added comment is reflected in the log file.

F-2-376

Show Log dialog... :

The logs that have been collected are pasted on Notepad and displayed.

F-2-377

Change directory... :

The preliminarily set save destination of the log file can be changed.

F-2-378

9) Open the file saved in the save destination, and check that the logs are stored correctly.

F-2-379

Note:

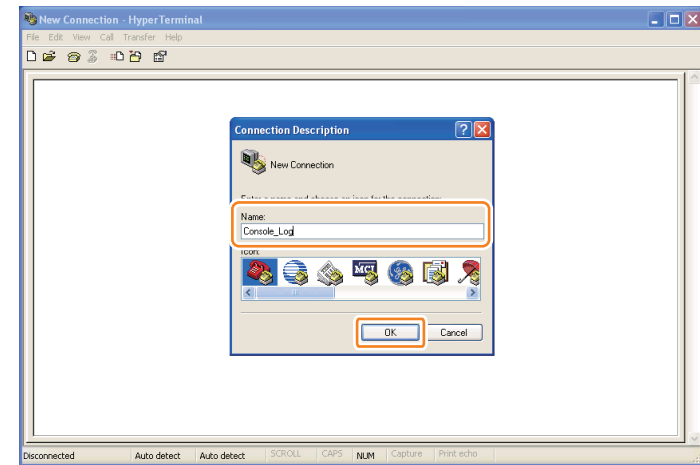

Depending on the MEAP application, the log output setting needs to be made in order to collect logs.

CAUTION:

After collecting logs, the remote console function of the device needs to be disabled (select [SERVICE MODE] LEVEL1 > [COPIER] > [Option] > [DSPLY-SW] > [RMT-CNSL] > 0, and restart the device).

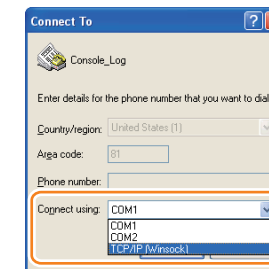

PC setting procedure (when Hyper Terminal is used)

1) Start Hyper Terminal, set the connection name in the [Connect Description] dialog that appears on the screen, and then click the [OK].

F-2-380

2) Set [TCP/IP(Winsock)] for [Connect using].

F-2-381

3) Enter the IP address of the target device in [Host address], and enter "19001" (fixed) in [Port number].

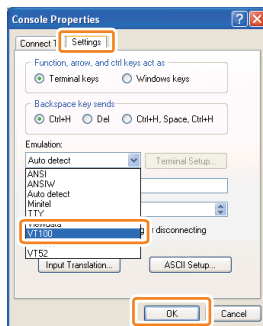

F-2-382

4) Click the "Properties" icon on the Hyper Terminal screen.

F-2-383

5) The [Console Properties] dialog will appear. Select the [Settings] tab, select [VT100] for [Emulation], and then click the [OK].

F-2-384

6) Return to the Hyper Terminal window, and select [Transfer] > [Capture Text...] from the menu.

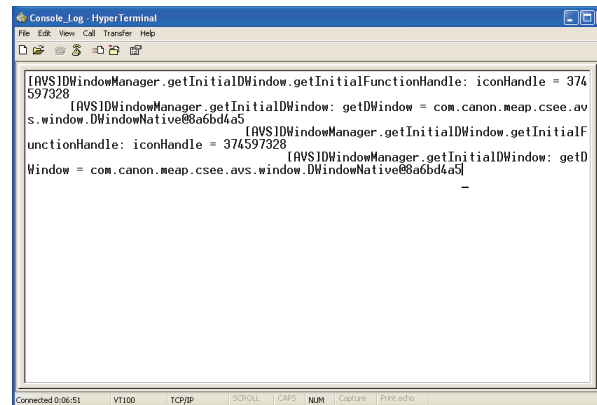

F-2-385

7) The dialog for specifying the save destination of the log file will appear. Specify the save destination.

F-2-386

8) Perform the operation whose log you want to collect.

F-2-387

9) Select [Transfer] > [Capture Text...] > [Stop] from the menu.

F-2-388

10) Open the file saved in the save destination, and check that the logs are stored correctly.

F-2-389

Note:

Depending on the MEAP application, the log output setting needs to be made in order to collect logs.

CAUTION:

After collecting logs, the remote console function of the device needs to be disabled (select [SERVICE MODE] LEVEL1 > [COPIER] > [Option] > [DSPLY-SW] > [RMT-CNSL] > 0, and restart the device).

Using USB Devices

USB Driver

Two types of USB drivers

While the USB driver that can be used in conventional devices is only the USB driver designed exclusively for MEAP application (hereinafter referred to as "MEAP driver"), not only MEAP driver but also USB system driver (hereinafter referred to as "system driver") can be used in this machine.

System driver and MEAP driver cannot be used together. When either of them is used, the other driver cannot be used.

USB driver setting

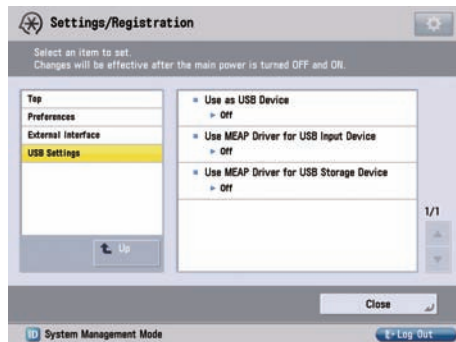

System driver is active by default in this machine.

The driver can be changed in [Settings/Registration].

Usually, It is not necessary to change the setting because it is specified in the MEAP application side.

Only in the case of a special MEAP application, it is necessary to change the USB driver setting.

For details, refer to specifications of MEAP application side.

F-2-390

Operating mode settings [Use MEAP driver as USB input device]	Conventional USB keyboard enabled MEAP application	Software keyboard application (System Driver/ MEAP Driver)	System driver supported MEAP application
OFF (*default) * Native driver	Cannot use USB keyboards. (Device cannot be detected.)	Can use USB keyboards.	Can use USB keyboards. Via software keyboards only.

T-2-123

Note:

When any settings changes are made, the device must be restarted.

Setting the USB driver for each USB device (MEAP driver preference registration)

If it is set to use the system driver, the conventional applications that support the MEAP application driver cannot use the USB input device.

Therefore, for the USB drivers used by USB devices/MEAP applications, there is setting function (MEAP driver preference registration) to give priority to the MEAP driver.

If you register the ID of the USB device by using this function, the USB device can use the MEAP driver despite the Additional Function settings.

Using this function requires the conditions below:

- Supported MEAP SpecVer: 26
- Describe the idVendor(VID) and idProduct(PID) of USB device in the manifest or activate/deactivate the VID and PID by calling API from MEAP applications.

The driver setting that is used in a manifest file is reflected in the following timing.

When registering from a manifest file.

- The registration will be enabled when an application is activated and device is restarted.
- The registration will be disabled when an application is stopped and device is restarted.

Note:

You can display/check the used driver setting at "USB device report print" described below regardless of whether it is registered from a manifest file or is registered from API.

Operating mode settings [Use MEAP driver as USB input device]	Conventional USB keyboard enabled MEAP application	Software keyboard application (System Driver/ MEAP Driver)	System driver supported MEAP application
ON * MEAP driver (conventional compatibility mode)	Can use USB keyboard. Can work only on the conventional applications that support the MEAP application driver.	Cannot use USB keyboards. (Device cannot be detected.)	Cannot use USB keyboards.

Availability for MEAP application of the USB device A (either HID keyboard or Mass Storage) plugged to device

Registration status of USB device A	When the HID keyboard is installed > USB Settings: [Use MEAP Driver for USB Input Device] When the Mass Storage is installed > USB Settings: [Use MEAP Driver for External USB Device]	Native application	MEAP application		
			System driver supported application	System driver not supported/ conventional application	Application with VID/ PID declared in Manifest for x
Not registered	OFF	YES	YES	NO	
	ON	NO	NO	YES	
Registered	OFF	NO	NO	YES	YES
	ON	NO	NO	YES	YES

T-2-124

YES: USB device available NO: USB device not available

Availability for MEAP applications of USB devices B and C (either HID keyboard or Mass Storage) plugged to device

Registration status of USB device B	Setting to use MEAP driver (Additional Functions mode)	USB device	Native application	MEAP application		
				System driver supported application	System driver not supported / conventional application	Application with VID/PID declared in Manifest for B
Registered	Not used (Native driver to be used)	B	YES	YES	NO	
		C	YES	YES	NO	
	To be used	B	NO	NO	YES	
		C	NO	NO	YES	
Not registered	Not used (Native driver to be used)	B	NO	NO	YES	YES
		C	YES	YES	NO	NO
	To be used	B	NO	NO	YES	YES
		C	NO	NO	YES	YES

T-2-125

YES: USB device available NO: USB device not available

Specifications for the use of USB keyboards

Characters that could be entered on the software keyboard displayed on the conventional control panel can be entered using a USB connected keyboard.

- When the software keyboard window is displayed, characters can be entered from the USB keyboard (in-line entry not possible).
- When the software keyboard window is not displayed, entered characters will not be remembered.
- The characters, which can be entered from a USB keyboard, is only a character, which can be entered from the software keyboard.
- Even if characters are entered from the USB keyboard, the software keyboard window will not change (the corresponding key does not invert or change color).
- Input from the USB keyboard can be accepted at the same time as input from the software keyboard or numeric keys.
- Since the device supports Plug and Play, the USB keyboard can be disconnected/ connected freely. However, do not disconnect and connect during in deep sleep (when in sleep with setting "low" at "the power consumption in sleep"). It is out of an operation guarantee to disconnect and connect the USB keyboard in deep sleep.
- When USB device is attached to device, devices do not shift to deep sleep mode.
- Keyboard layout changes according to the keyboard layout settings in the Settings/ Registration screen. In addition, function keys and ten keys which are not displayed in the software keyboard cannot be used. (Keyboard which the operation check was conducted is 84-key Keyboard, but this does not mean that the operation of all 84-key Keyboards is guaranteed.)

Note:

The factory shipment default setting is to enable the use of native (main unit functionality) USB keyboards. Therefore, in order to use MEAP application keyboards, [Use MEAP driver for USB input device] under [System management settings (initial settings/ registration)] needs to be set to ON (factory shipment setting is OFF). Operations change as described below in accordance with ON/ OFF settings.

ON: when using MEAP application keyboard

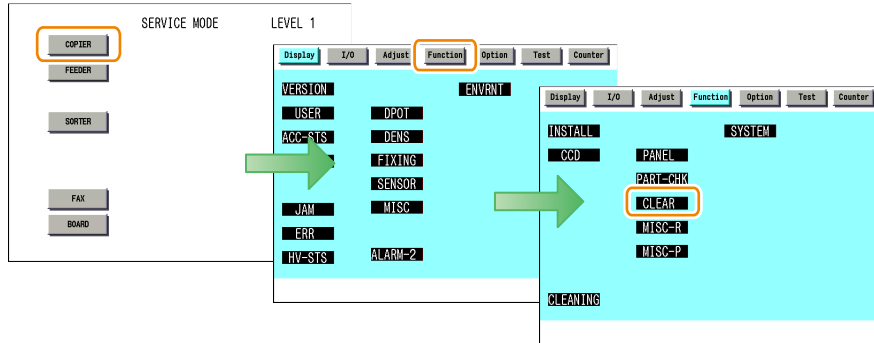

OFF: when using native (main unit functionality) keyboard (factory shipment default)

Initialization of MEAP driver priority registration

When any trouble occurs regarding USB driver settings and it is necessary to reset the setting information, you can reset the MEAP driver preference registration by using service mode.

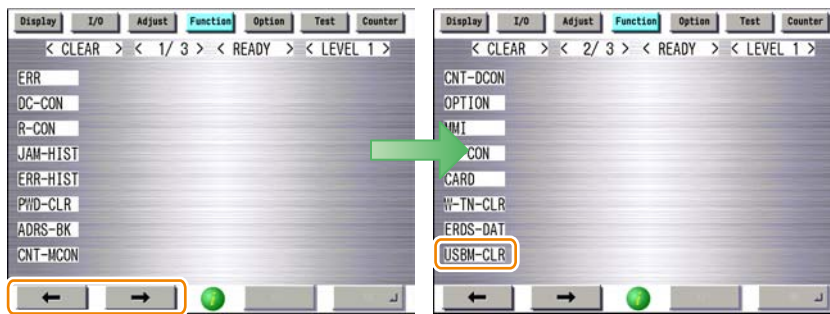

Steps to initialize preference use registration

- 1) Start [SERVICE MODE] in Level 1.
- 2) Press [COPIER] > [Function] > [CLEAR].

F-2-391

- 3) Press ← or → for several times until [USBM-CLR] is shown on the screen.
Press [USBM-CLR].

F-2-392

- 4) Press [OK] to restart this device.

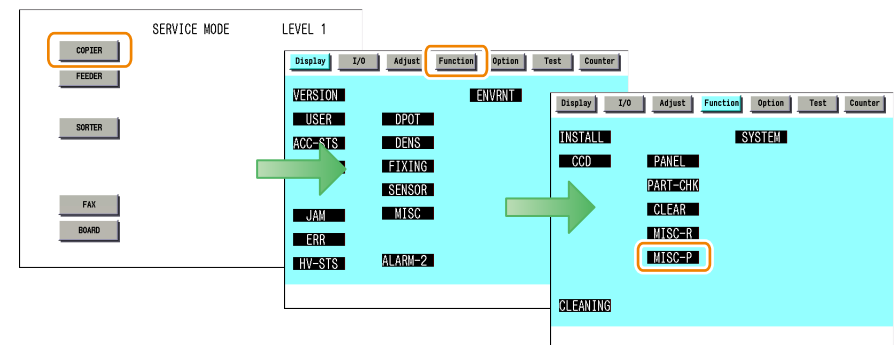

F-2-393

USB Device report print

To check the vendor IDs (idVendor) and the product IDs (idProduct) registered in this device by means of declaration in Manifest file of MEAP applications, output the USB Device report print.

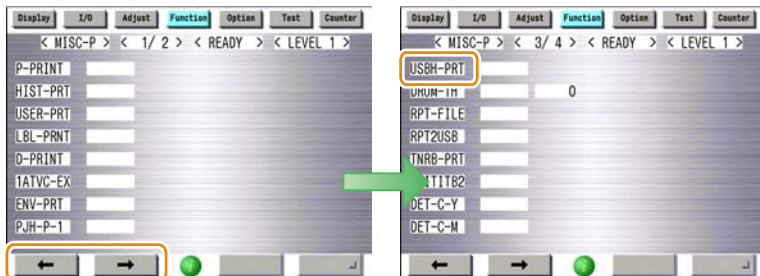

Steps to output the USB Device report print

- 1) Start [SERVICE MODE] in Level 1.
- 2) Press [COPIER] > [Function] > [MISC-P].

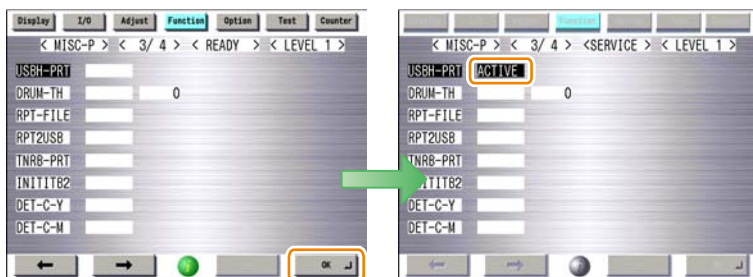

F-2-394

3) Press **←** or **→** for several times until [USBH-PRT] is shown. Press [USBH-PRT].

F-2-395

4) When pressing [OK], [ACTIVE] blinks on the status field.

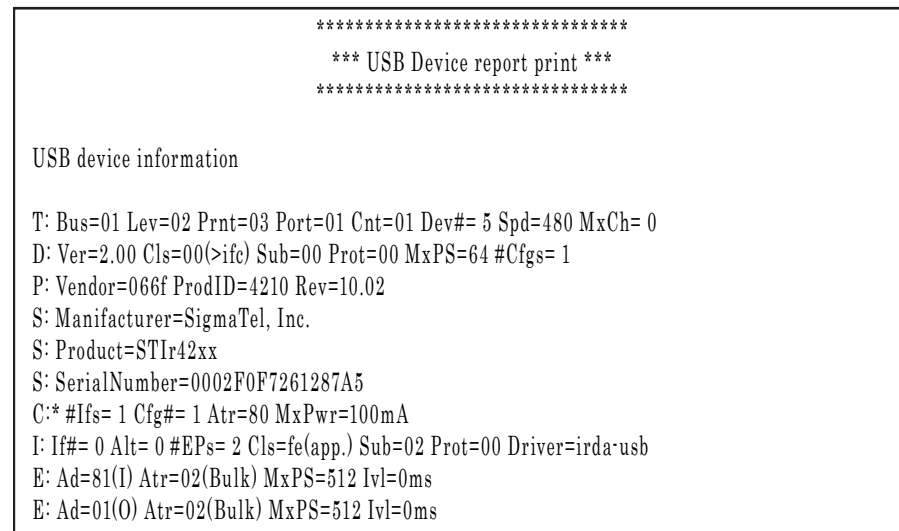

F-2-396

5) When [OK] is shown on the status field, the status print is output. Check the contents of the print.

F-2-397

Example of output result

F-2-398

USB device information Content

Display the information of the USB device, which the device recognized.

If not displayed, there may be some fault occurred.

Some of standard optional devices are not displayed on a report.

The details of each item are as follows.

T : Topology

Internal hierarchical structure, which a USB device is connected, is shown. The number of a connected bus, the hierarchical structure and connection speed can be indicated.

D : Device

Information of USB devices is shown.

P : Product

Product information of USB devices is shown. Vendor ID and Product ID can be recognized here.

S : String

The character string embedded in a USB device is shown. A manufacture name and a product name can be recognized here.

C : Configure

The configuration information of a USB device is shown. * mark is to know whether it is active.

I : Interface

The interface information of a USB device is shown. Interface class and the driver to handle can be recognized.

The value and the content of Driver are as follows.

Labeling	Content
usbhid	It is displayed when the USB system driver is assigned to the input device connected.
usb-storage	It is displayed when storage devices (USB memory storage etc.) are connected.
irda-usb IrDA	It is displayed when the dongle is connected.
hub	It is displayed when HUB is connected.
gpusb	It is displayed when the USB driver only for MEAP application is assigned to the input device connected.
gpusbex	It is displayed when a USB device, which specific vendor ID/ Product ID are preferentially registered using a manifest and MEAP API, is connected and the USB driver only for MEAP application is assigned.

T-2-126

E:Endpoint

The Endpoint information of a USB device is shown.

Right or wrong of report output

Connecting device		Report printing
HID		Yes
Storage		Yes
FAX		No
USB Device Port	IrDA	Yes
	Multimedia Card Reader	Yes
	IC Card Reader	Yes
Image Data Analyzer Board-A1		No
Hub	Internal Hub*	No
	External Hub	Yes

* USB Device Port-B1 Hub for device ports installed at the introduction

T-2-127

Note:

Some connecting devices such as the Image Data Analyzer Board and USB Device Port are not installed depending on the model.

The content of MEAP preferred device information

Display the information of the application or a USB device, which preferentially registered with MEAP application.

By seeing this information, it can check which Application ID of the MEAP application is in the status using a specific USB device.

AppID : Application ID

VID : Vendor ID

PID : Product ID

Note:

By starting, stopping or uninstalling a MEAP application, the driver settings of the USB device may be changed. If the device needs to be restarted following this setting change, a message prompting the user to restart the device is displayed.

■ Integrated Authentication Function

● Sharing the Authentication Information

Separately managing the authentication information at login and the authentication information for MEAP applications creates inconveniences such as that the authentication process is executed many times.

In order to solve this problem, the device has an integrated authentication function. This function allows authentication information to be shared between MEAP applications in a MEAP environment.

The supported version of MEAP Specifications is Ver.59, which needs to be supported by both the device and the MEAP application in order to use this function.

There are 2 types of authentication information that can be shared: Volatile Credential whose registered information is discarded at the time of logout or shutdown of the device and Persistent Credential whose registered information is not discarded at the time of logout.

● Volatile Credential

Volatile Credential is used in cases where the authentication information is shared between applications which use the same security domain for authentication.

The credential is registered mainly by the login application, therefore the applications which access the security domain that was used for authentication by the login application can use the credential.

● Persistent Credential

Persistent Credential is used to help entry of authentication information when accessing a different security domain for authentication.

The credential is registered mainly by general MEAP applications, and the authentication information can be reused when the same user logs in for the second time or later.

● Comparison of Functions

		Volatile Credential	Persistent Credential
Registered information		Character strings and arbitrary Java objects	Character strings only User ID/Password/Domain/Arbitrary character strings
Lifetime	Registration	At login (the login application), and at any timing of registration by an application	At any timing of registration by an application
	Deletion	Can be used until logout/shutdown.	Can be used until deletion by the application or management tool.
Encryption of credential data		Not supported	Data retained on the HDD is encrypted.
Store (Save) to		Memory in the device	HDD in the device

T-2-128

● Disabling the Integrated Authentication Function

If you do not want Volatile Credential to be used from a security standpoint, the function can be disabled.

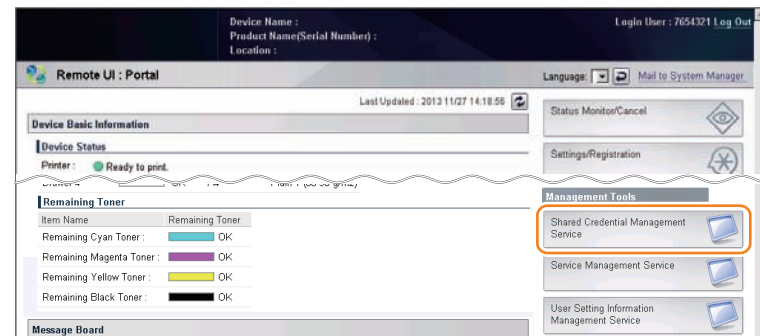

The function can be disabled from remote UI or service mode.

Persistent Credential cannot be disabled.

On the setting screen of remote UI, the function can be disabled on a protocol-by-protocol basis.

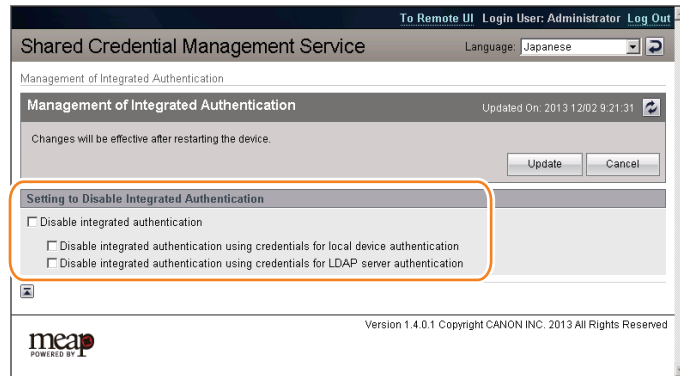

Remote UI

You can access the setting screen on remote UI for disabling integrated authentication as shown below.

F-2-399

Select the item you want to disable, and click the [Update].

F-2-400

- [Disable integrated authentication]: The integrated authentication function is disabled regardless of the authentication method.
- [Disable integrated authentication using credentials for local device authentication]: The integrated authentication function is disabled only at the time of local device authentication.
- [Disable integrated authentication using credentials for LDAP server authentication]: The integrated authentication function is disabled only at the time of LDAP server authentication.

Service mode

The location of the service mode setting for disabling integrated authentication:

Setting value: 0 = Enabled, 1 = Disabled

F-2-401

Points to Note When Enabling the [Quick Startup Settings for Main Power] Setting

If some of the MEAP applications are running on the device, the following problems will occur.

The [Quick Startup Settings for Main Power] setting cannot be enabled.

If a MEAP application that restricts the device from shifting to deep sleep mode is running, even when the setting of [Quick Startup Settings for Main Power] is enabled (On), the device starts normally instead of quick startup.

In that case, it does not affect the behavior of the MEAP application.

Changes made in the settings of a MEAP application are not reflected.

If the startup setting [Quick Startup Settings for Main Power] is enabled (On), even when the Main Power Supply Switch of the machine is turned OFF, a shutdown process is not executed internally.

Therefore, in the case of a MEAP application where changes in settings are enabled when the device is restarted, changes in settings are not reflected just by changing the settings. Follow either of the restart procedures shown below to enable the changes made in the settings.

- Execute restart from remote UI.
- Turn OFF the Main Switch, and then turn it ON within 20 seconds.

After recovery from quick startup, MEAP applications do not work properly.

MEAP applications that are scheduled to execute processes at specified times may not work properly after recovery from quick restart.

Unexpected problems such as that the application executes a task at an unexpected timing may occur.

Problems may occur in the following two cases.

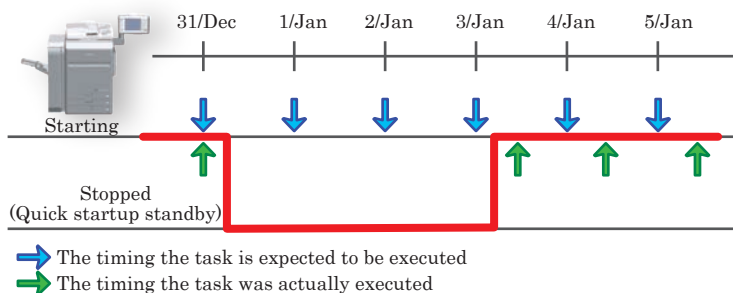

In the case of "Schedule: Execute the task every 24 hours"

A schedule is set to start the specified task at the specified time and repeat "fixed-delay execution".

If execution is delayed for some reason, the delay time is ignored.

Problem: If 24 hours have passed since the last execution of the task, the task is executed only once.

=> The task may be executed at a timing other than the time the user expects it to be executed.

F-2-402

In the case of "Schedule: Execute the task at 00:00 every day"

A schedule is set to start the specified task at the specified time and repeat "fixed-rate execution".

If execution was delayed for some reason, two or more tasks are continuously executed to "make up for the delay".

Problem: The tasks of Jan. 1, Jan. 2, and Jan. 3 are executed after quick startup.

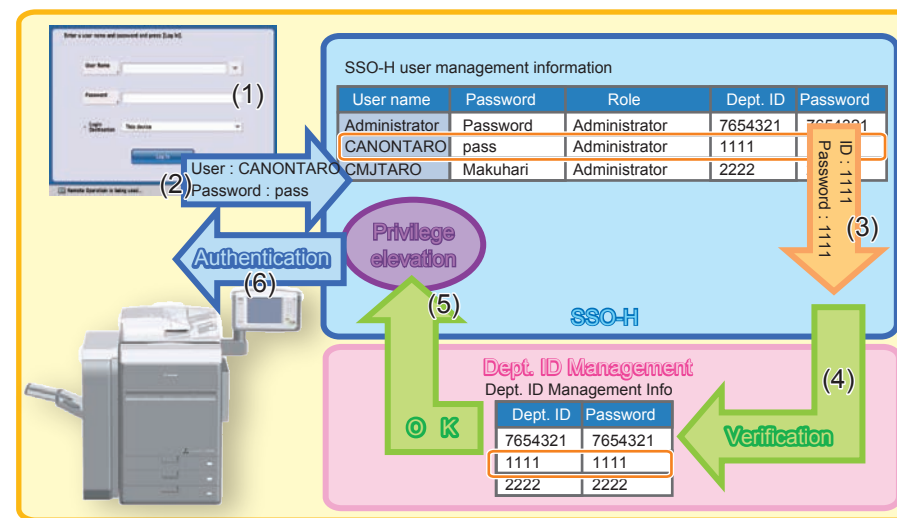

F-2-403

Remedy to Be Performed When the Device Has Become Unable to Be Logged in

Overview

Department ID Management and SSO-H (Local Device Authentication) manage user information separately. Therefore, in order to allow coexistence of Department ID Management and SSO-H, it is necessary that the information of SSO-H and the information of Department ID Management are the same.

F-2-404

- 1) The user enters the ID and password of SSO-H to a device where both SSO-H and Department ID Management are enabled.
- 2) SSO-H checks the entered ID and password with the SSO-H user information table.
- 3) SSO-H sends the department ID and password which correspond to the entered ID and password to the department ID management function.
- 4) The department ID management function checks the department ID and password sent from SSO-H with the user information table.
- 5) The user is elevated to the corresponding privilege.
- 6) The user is authenticated.

If the department ID and password registered in the user information of SSO-H do not coincide with the department ID and password registered in the Department ID Management, the authentication ends in failure and the user can no longer log in to the device.

Note :

Even if the department ID and password registered in the user information of SSO-H do not coincide with the department ID and password registered in the Department ID Management, login is possible when all of the following conditions are satisfied.

- System manager information of the device ([Settings/Registration] > [Management Settings] > [User Management] > [System Manager Information Settings]) is set.
- Login is performed as a user with the administrator right of SSO-H.

The user information of SSO-H does not coincide with the user information of Department ID Management in the following cases:

- The user information of SSO-H was different from that of Department ID Management when Department ID Management was enabled.
Department ID Management was enabled before changing the department ID and password registered in SSO-H to match with the information of Department ID Management.

SSO-H user management information

User name	Password	Role	Dept. ID	Password
Administrator	Password	Administrator	7654321	7654321
CANONTARO	pass	Administrator	1234	1234
CMJTARO	Makuhari	Administrator	5678	5678

Dept. ID Management info

Dept. ID	Password
1111	1111
2222	2222
3333	3333

F-2-405

- Only one of information was updated, resulting in mismatch.
Only the department ID and password registered in SSO-H or those in Department ID Management were changed.

SSO-H user management information

User name	Password	Role	Dept. ID	Password
Administrator	Password	Administrator	7654321	7654321
CANONTARO	pass	Administrator	1234	1234
CMJTARO	Makuhari	Administrator	5678	5678

Dept. ID Management info

Dept. ID	Password
7654321	7654321
1234	1234
5678	5678

Only the SSO-H user information was updated

SSO-H user management information

User name	Password	Role	Dept. ID	Password
Administrator	Password	Administrator	1234567	1234567
CANONTARO	pass	Administrator	9999	9999
CMJTARO	Makuhari	Administrator	8888	8888

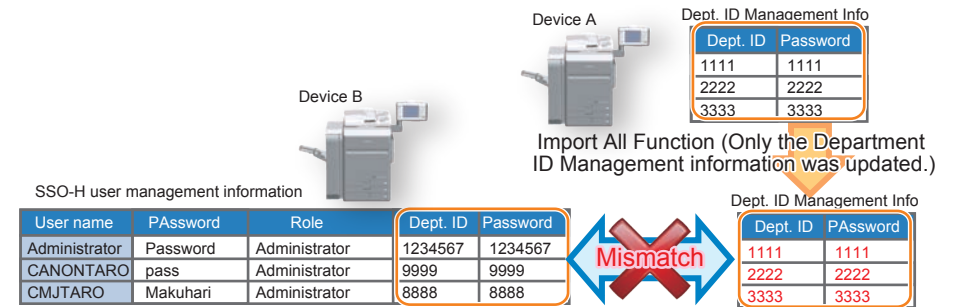

Dept. ID Management info

Dept. ID	Password
7654321	7654321
1234	1234
5678	5678

F-2-406

- Only the information of Department ID Management was updated, resulting in mismatch.
Only the Department ID Management information was changed in "Import All Function", resulting in mismatch. (The SSO-H user information cannot be changed in Import All Function.)

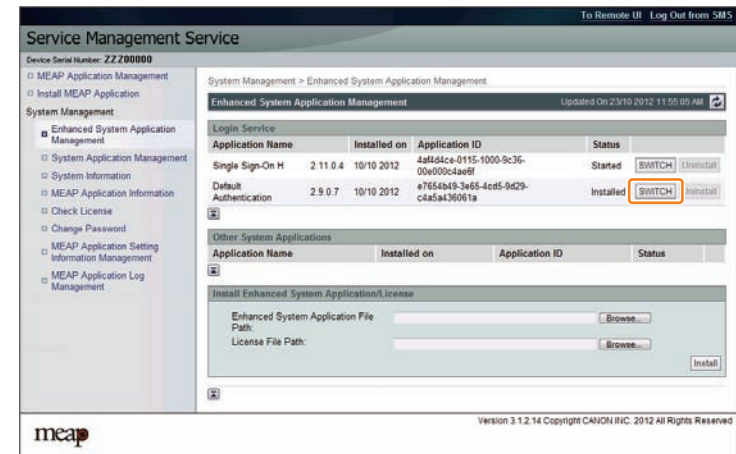

F-2-407

Remedy

If the device became unable to be logged in due to mismatch of the department ID/password, perform the following remedy.

Procedure

- 1) Change the authentication method to DA (Default Authentication).
Access SMS, and select [Default Authentication] in [Enhanced System Application Management] > [Login Service]. (How to log in to SMS can be found in "Login to SMS".)

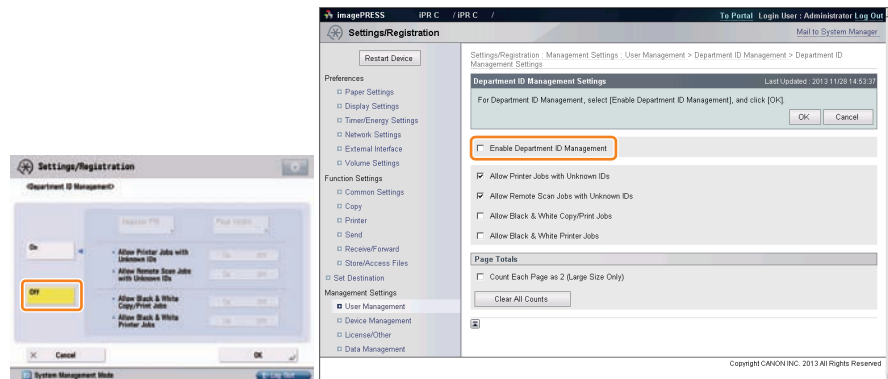

F-2-408

- 2) Restart the device.
Restart the device in order to reflect the changes in login service.

3) Disable Depart ID Management.

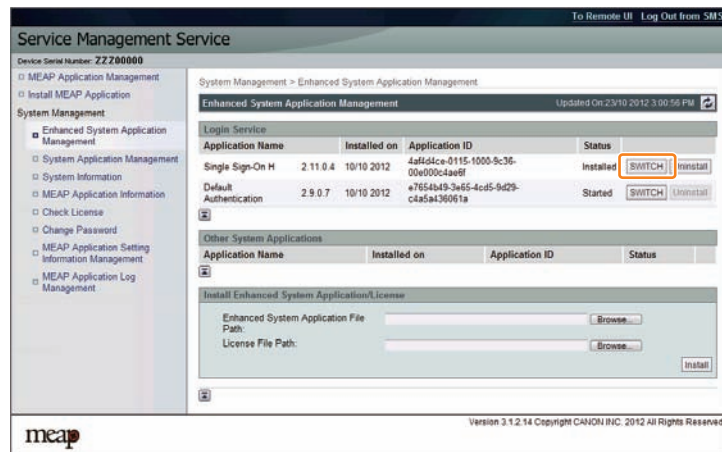

In [Settings/Registration], select [Management Settings] > [User Management] > [Department ID Management] > [OFF]. In the case of remote UI, access [Settings/Registration] > [Management Settings] > [User Management] > [Department ID Management] > [Department ID Management Settings], and deselect [Enable Department ID Management].

F-2-409

4) Change the authentication method back to SSO-H authentication.

Access SMS, and select [Single Sign-On H] in [Enhanced System Application Management] > [Login Service]. (How to log in to SMS can be found in "Login to SMS".)

F-2-410

5) Restart the device.

Restart the device in order to reflect the changes in login service.

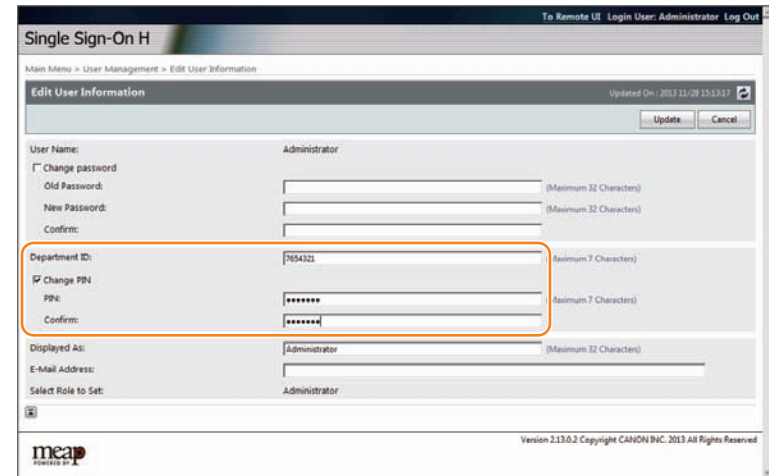

6) Change the user registration information of SSO-H.

Access the URL shown below, and change the content to the information registered in Department ID Management.

Or, import the setting file whose content you want to use.

SSO-H user registration information edition screen:

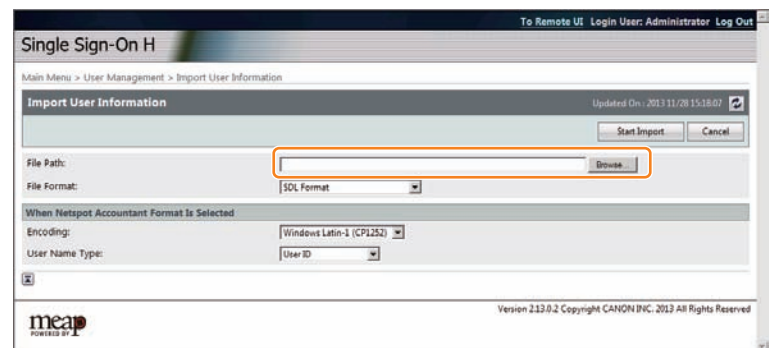

(SSO management screen [Main Menu] > [User Management] > [Edit User Information] or <https://<IP address>:8443/sso/Edit>).

F-2-411

SSO-H user registration information import screen:

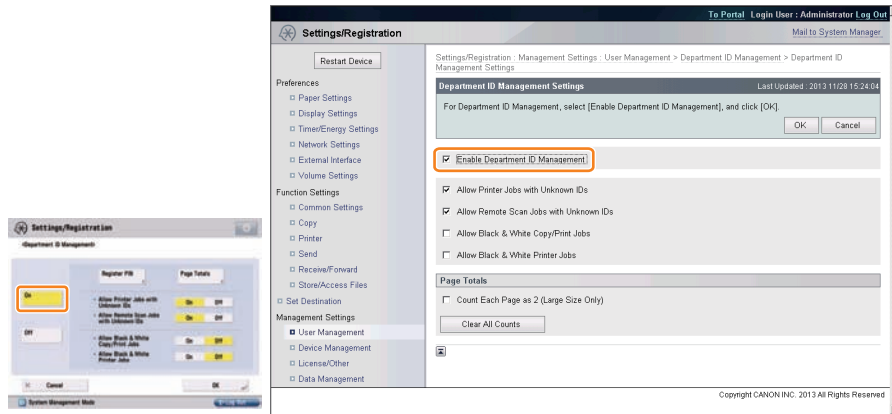

(SSO management screen [Main Menu] > [User Management] > [Import User Information] or (<https://<IP address>:8443/sso/Import>).

F-2-412

7) Enable Depart ID Management.

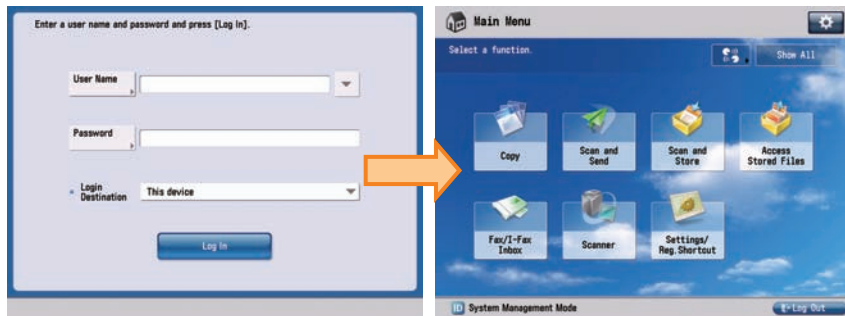

In [Settings/Registration], select [Management Settings] > [User Management] > [Department ID Management] > [ON]. In the case of remote UI, access [Settings/Registration] > [Management Settings] > [User Management] > [Department ID Management] > [Department ID Management Settings], and select [Enable Department ID Management].

F-2-413

8) Check that the device can be logged in.

Log off and then log on to check that the device can be logged in with an environment where Local Device Authentication and Department ID Management are enabled.

F-2-414

Reference material

Glossary

Terms & Acronyms	Definitions and Explanations
Application	A program unit to provide users with solutions.
Application ID	An identifier assigned to each application. A unique ID is assigned to each MEAP application.
Applet (Applet Type Application)	A MEAP application type created in Java. This type of applications show buttons on the touch panel display.
Code Sign	Information to check if an application is genuine. An application marketed in the normal procedure has a code sign assigned by LMS. MEAP platform rejects applications without Canon code signs for being installed or executed on the device.
CPCA (Common Peripheral Controlling Architecture)	Common Peripheral Controlling Architecture. CPCA defines an object model of peripheral devices. A client can control a device by creating or modifying objects in the device.
CPCA Java CL (Class Library)	CPCA Java Class Library. A Java class library, which is used to control a device.
Default Authentication -Department ID Management	The login service used when the department ID control is used but other authentication controls are not used. When the Department ID control is turned on, the login dialog prompts the users to enter the department ID and password. The dialog appears the initial screen of both the control panel on the MEAP device and Remote UI
Device Specification ID	ID allocated to each device type. This represents CPCA API specification and the version number to use MFP generic functions or obtain information including maximum allowable copies.
Esplet (Esplet Type Application)	A MEAP application type created in Java. This type of applications do not show user interfaces either on Local UI or Web. Esplet is a coined word created by Canon, consisting of [Espresso] or Italian coffee and [let] derived from Applet/Service.
File Description	An identifier for the OS to identify the destination file requested by a program. A program descriptor includes an identifier and information such as a file name and size, which helps OS to judge the file to be edited.
HID class	HID stands for Human Interface Device, representing man-machine interfaces of PC components and peripheral devices. HID class means USB class classified as HID.
iR Native application	The functionalities that existing imageRUNNER/iR has such as Copy, Universal Send and Mailbox.
ISV (Independent Software Vendor)	Independent Software Vender. Software manufacturer who develops and/or sells applications and tools but does not entire computer systems. Refers application developer in this document.

Terms & Acronyms	Definitions and Explanations
J2ME (Java2 Platform Micro Edition)	Java 2 Platform Micro Edition. One of Java Platforms licensed by Sun Microsystems, Inc. It is applied for MEAP. Other devices such as cellular phones and PDA.
J2RE (Java 2 Runtime Environment)	A set of basic programs to run applications developed in the programming language of Java2. This set includes Java virtual machine providing runtime environment for Java applications among others. Java applets do not require J2RE since these are executed on Web browsers using Java runtime environment provided on browsers. However, standalone Java applications require Java runtime environment such as J2RE for execution. Runtime environments can be downloaded for free of charge from the Web site of Sun Microsystems, the Java developer.
Java	A programming language developed by Sun Microsystems, in the U. S. A. Low dependent on models and OSes and runs on various platforms. Taking advantage of this feature, many applications that runs on web servers uses Java. The MEAP platform uses J2ME - a type of Java.
JavaScript	A script language developed by Netscape Communications, in the U.S. A., runs on web browsers such as Netscape Navigator and Internet Explorer. Allows web designers to create interactive pages with HTML files such as animated buttons and display of timetables.
Java VM (Java Virtual Machine)	JAVA Virtual Machine. The Java byte code interpreter. The Virtual Machine acts as an interpreter for processing the byte code using the native instruction set.
License Access Number	A number issued for accessing license file. The Licensing server requires entries of application ID, expiration date/times information, and the number of access numbers, to issue license access numbers
Licensae File	A software manufacture of a MEAP application provides the users with the license files. Specifies the terms of agreement that a user concludes with the manufacturer. Required for installing a MEAP application.
LMS (License Management System)	The license is required for installing a MEAP application in a MEAPenabled device. LMS is the server issuing [License Files] as well as license access numbers.
Login Service	Manages user information of MEAP device. Authenticates users with user names and passwords. Three login services are available for MEAP device - Default Authentication, which provides department ID control, SDL (Simple Device Login) and SSO (Single Sign-On).
Mass Storage class	Mass Storage means a storage device with large capacity, generally secondary storage devices. Mass Storage class means USB class classified in the secondary storage device group.
MEAP (Multifunction Embedded Application Platform)	Multifunctional Embedded Application Platform. Provides an environment for executing application programs on a peripheral device. Uses the Java platform (J2ME - Java 2 platform Micro Edition) to run Java application for MEAP.
MEAP Contents	Required to install an MEAP application to a MEAP device.

Terms & Acronyms	Definitions and Explanations
MEAP Specifications (MEAP Spec Version)	MEAP Spec Version, the term used for the SDK. The version number that shows the APIs of the MEAP platform other than CPCA, such as network and security. The version number is not assigned for each device model. MEAP Application Runs on MEAP platform. Consists of application files (*.jar) and the license file (*.lic).
MEAP-enabled device	MFP with built-in MEAP platform.
MFP (Multi Function Peripheral)	Multi Function Peripheral. Peripheral device that supports more than one function, such as digital copier, printer, scanner, and fax.
OSGi (Open Service Gateway Initiative)	Open Service Gateway Initiative. See " http://www.osgi.org/ ".
Portal Service	The web portal to gain access to a MEAP-enabled device. This service has been integrated in Remote UI top page in this machine.
Protocol	A set of rules applied to data transmission procedures over network. Major communication protocols include: <ul style="list-style-type: none"> • FTP: File Transfer Protocol. This is a communication protocol or protocolimplemented commands to provide file transfer between a host and clients over TCP/IP network. • DHCP: An upward compatible protocol of BOOTP. This communication protocol allocates a dynamic IP address to each client machine upon communication startup on TCP/IP network and collects the allocated IP address when communication is completed. The server allocates one of multiple IP addresses and notifies the setup information to a client. • BOOTP: A communication protocol to automatically load setup information including IP address and a domain name from the server to a client on TCP/IP network. • RARP: A communication protocol to request IP address information via the network adaptor address (MAC address) of a client. • IPP: A communication protocol to execute remote printing between the print server and clients via Internet. • TCP/IP: A standard communication protocol required to access to Internet and other large-scale network.
Proxy Server	Provides functions to store data fetched from remote servers. When a user request to display a web page that has been displayed and stored in the proxy, the proxy server read the stored data but does not access the remote server where the original page is present, for efficient access services. When a proxy server receives a URL from a PC, it searches the file in the cache and sends it to the PC if the requested file is found. If the requested file is not stored in the cache, it accesses the remote server of the URL to acquire the file and, at the same time, stores the acquired file in the cache so that the proxy server can quickly send the file at the next request.
Redistribution module	A built-in module of an application created with SDK. Applications without this module cannot work on MEAP platform.

Terms & Acronyms	Definitions and Explanations
SDK (Software Development Kit)	The kit containing information and tools required for software development.
Service	A functional unit or an application program working on MEAP platform. [Applications] are generally termed [Services] in Java world.
Servlet (Servlet Type Application)	A MEAP application type created in Java. This type of applications is designed to show user interface on the Web browser.
SMS (Service Management Service)	The web-base service to provide user interfaces for application life cycle management.
Socket	A virtual interface of an application for network communication. A user only needs to specify a socket as a unit of an address and a port from an application. This establishes the network connection for data transmission, eliminating complication related to detailed communication procedures.
SSO-H (Single Sign-On H)	Login service providing features of both local device authentication and domain authentication. The former is the method that device independently authorizes users; whereas the latter is that device links to the domain controller on the network in the Active Directory environment to authorize users.
Thread	A unit for program execution. A multi-task system allowing multiple programs to run concurrently assigns a memory space and other resources independently to each program, providing users with a feel as if only a program is running. At least one thread is generated upon a program generated.
URL (Uniform Resource Locator)	The method to denote Web page locations on Internet and the like. For instance, a URL on the Web is denoted as [http://www.w3.org/default.html]. [http] at the beginning means that an address following this is in a web page on the Internet.
USB	Abbreviation of Universal Serial Bus. This is the interface standard to link between information devices.
USB system driver	The general-purpose driver that control the behavior of the device, there are HID class driver, Mass Storage class driver and so on.

T-2-129

Option for exclusive individual measure

Display Setting of Copy Icon (level2)

Make a setting as to whether to display/hide the copy screen (copy tab) on the control panel. This is the specification for users who want to customize hiding it on control panel.

Default value

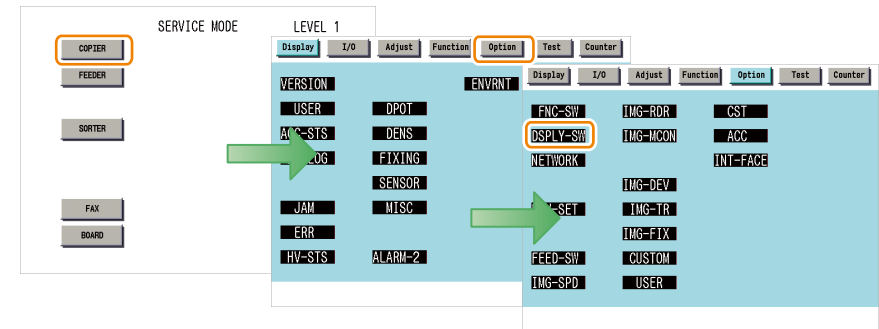

1: display

Setting range, item

0: hide 1: display

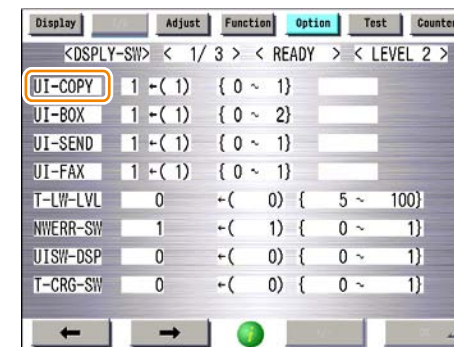

Setting Procedure

- 1) Start [SERVICE MODE] in Level 1.
- 2) Press [COPIER] > [Option] > [DSPLY-SW].

F-2-415

- 3) Press [UI-COPY].

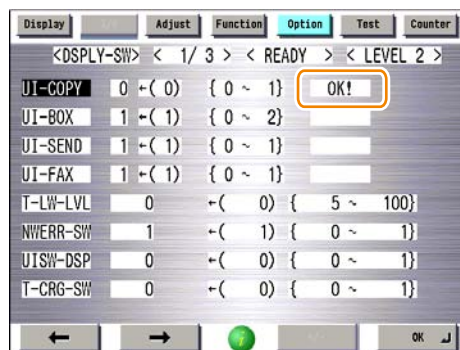

F-2-416

- 4) Press either 0 (hide) or 1 (display) on control panel (the numerical value input in the field is displayed), and press [OK].

F-2-417

- 5) Check to see that it is reflected in setting field, and restart the device.

F-2-418

Embedded RDS

Product Overview

Overview

Embedded RDS (hereinafter referred to as E-RDS) is a monitoring program that runs on the host machine. When the monitoring option is enabled by making the setting on this machine, information such as the status change of the machine, counter information, and failure information are collected. The collected device information is sent to a remote maintenance server called UGW (Universal Gateway Server) via Internet, thus allowing for e-Maintenance/ imageWARE Remote (Remote Diagnosis System).

The following device information/ status can be monitored.

- Billing counts
- Parts counter
- Firmware info
- Service call error log
- Jam log
- Alarm log
- Status changes (Toner low/ out, etc.)

Since high confidentiality is required for the information shown above, it performs communication between this machine and the UGW using HTTPS/ SOAP protocol.

The e-Maintenance/ imageWARE Remote system configuration

F-2-419

Features and benefits

E-RDS embedded with a network module in advance can realize a front-end processing of e-Maintenance/ imageWARE Remote system without attaching any extra hardware equipment.

Major Functions

Service Call Button

If a user touches service call button on the touch panel display when corrupt image, paper jams, or/ and other problem has occurred, E-RDS generates an alarm and notifies it to UGW. Moreover, E-RDS also notifies cancellation and the completion of the request

Service Browser

Service browser is a web browsing functionality only for service technicians in charge, and is used for referring to the FAQ contents which is connected to UGW.

In order to grasp on which devices the service browser is enabled, when the status of the service browser is changed from disabled (0: OFF) to enabled, E-RDS sends the browser information to the UGW.

Service mode menu Transmission

E-RDS sends the target service mode menu data to UGW in the following cases:

- When a specific alarm and service call error are detected
- When the setting is changed in service mode

The following shows the transmission timing and the target data for transmission in service mode menu:

Transmission timing	Transmitting data			Error retry
When the following alarm is detected.	COPIER	Display	ANALOG	No
Alarm codes for transmission: 0x060002, // Fixing 0x060004 - 0x069999, // Fixing 0x090005 - 0x099999, // Dram 0x100006 - 0016, 0x100022 - 0099, 0x100101 - 9900, // Development 0x300001 - 0x309999 // High voltage			HV-ST5	
			CCD	
			DPOT	
			DENS	
			FIXING	
			SENSOR	
			MISC	
			HT-C	
			HV-TR	
			P-PASCAL	

Transmission timing	Transmitting data			Error retry
When the following service call error is detected. Error codes for transmission: E000 - E00F, // Fixing E020, // Development ATR E060 - E06F // High voltage	COPIER	Display	ANALOG HV-STC CCD DPOT DENS FIXING SENSOR MISC HT-C HV-TR P-PASCAL	No
When a value is set to [COPIER - Adjust] subordinate's Service mode menu. (Transmission will be done at 60 min, later of setting)	COPIER	Adjust		Yes
When the first communication test is done. (For transmission process, 5 minutes after the execution)	COPIER	Display	ANALOG HV-STC CCD DPOT DENS FIXING SENSOR MISC HT-C HV-TR P-PASCAL	Yes
		Adjust		

T-2-130

NOTE:

Target transmission data are only the items under LEVEL1 and 2 in the service mode.

Limitations

Service Mode Menu Transmission Function

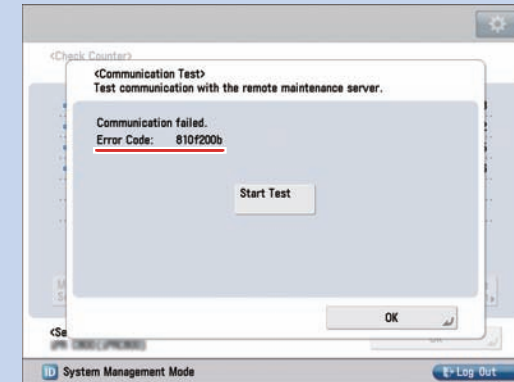

- In the following cases, service mode menu data is not transmitted.
 - When an unsent alarm log or service call log has been detected by E-RDS at power-on
 - When an alarm log or service call log to be resent due to a transmission failure is detected
 - When transmission of service mode menu executed at the time of detection of an alarm or a service call error ended in failure
 - If a new alarm or service call error occurs while service mode menu data is being obtained after detection of an alarm or a service call error, the data being obtained is not sent.
- If alarms/service call errors successively occur, and if the time of the host machine is corrected or changed while the log is being sent, service mode menu data may not be properly sent. It is because a Link No.* may be applied to the old log although it should be applied to the new log.
 - * Link No.:
A common number for linking the service mode menu data with the alarm log/service call log data to be sent
After completion of log transmission, the service mode menu data is obtained, and is sent with this number attached.
- Transmission of the data of changes made in service mode menu settings is not performed instantly, but performed when a specified period of 60 minutes elapse after the change of service mode menu settings is detected or when a communication test is performed at the time of power-on. (There is a time lag.)
- When service mode menu settings ([COPIER] > [Adjust]) are made, transmission is performed even when no change is made in the target data to be transmitted. Transmission of service mode data is also performed when changes are made in the service mode setting value not subject to transmission (items other than Level 1, 2) or when settlement of a value is performed without changing the setting value.

Service cautions

- 1) After clearing RAM of the Main Controller PCB SRAM Board, initialization of the E-RDS setting (ERDS-DAT) and a communication test (COM-TEST) need to be performed. Failure to do so will result that the counter transmitting value to the UGW may become unusual.
Also, after replacing the main controller board, all settings must be reprogrammed.
- 2) The following settings in service mode must not be change unless there are specific instructions to do so. Changing these values will cause error in communication with UGW.
 - Set port number of UGW
[SERVICE MODE] > [COPIER] > [Function] > [INSTALL] > [RGW-PORT]
Default : 443
 - URL setting of UGW
[SERVICE MODE] > [COPIER] > [Function] > [INSTALL] > [RGW-ADR]
Default : <https://a01.ugwdevice.net/ugw/agentif010>
- 3) If the e-Maintenance/imageWARE Remote contract of the device is invalid, be sure to turn OFF the E-RDS setting (E-RDS : 0).
- 4) With this machine, a communication tests can be conducted from the [Counter Check] on the control panel.* When conducting a communication test from the [Counter Check], pay attention on the following points:
 - During a communication test, do not take any actions such as pressing a key. Actions are not accepted until the communication test is completed (actions are ignored).
 - When a communication test is being conducted from service mode or the [Counter Check], do not conduct a communication test from the other. These operations are not guaranteed.

NOTE:

*The user can conduct a communication test and seen the communication test result. If the communication results in failure, an error code (a hexadecimal number, 8 digits) appears on the touch panel display.

E-RDS Setup

Confirmation and preparation in advance

To monitor this machine with e-Maintenance/ imageWARE Remote, the following settings are required.

1) Advance confirmation

Confirm with the UGW administrator that the device to be monitored with e-Maintenance/ imageWARE Remote is registered in the UGW.

2) Advance preparations

The following network-related information needs to be obtained from the user's system administrator in advance.

Information item 1

IP address settings

- Automatic setting : DHCP, RARP, BOOTP
- Manual setting : IP address, subnet mask and gateway address to be set

Information item 2

Is there a DNS server in use?

If there is a DNS server in use, find out the following.

- Primary DNS server address
- Secondary DNS server address

Information item 3

Is there a proxy server?

If there is a proxy server in use, find out the following.

- Proxy server address
- Port No. for proxy server

Information item 4

Is proxy server authentication required?

If proxy server authentication is required, find out the following.

- User name and password required for proxy authentication

3) Network settings

Based on the results of the information obtained in 2) Advance preparations, make this machine network related settings.

See Users' Guide for detailed procedures.

CAUTION:

When changes are made to the above-mentioned network settings, be sure to turn OFF and then ON the main power of this machine.

Steps to E-RDS settings

- 1) Start [Service Mode] at Level 1.
- 2) Select [COPIER] > [Function] > [CLEAR] > [ERDS-DAT] and touch the [OK] button.

NOTE:

This operation initializes the E-RDS settings to factory setting values.
For the setting values to be initialized, see the section of "Initializing E-RDS settings".

F-2-420

- 3) Perform installation or deletion of the CA certificate if necessary, and turn OFF and then ON the main power of this machine.
 - Installation of the CA certificate: Perform installation from SST or Remote UI.
 - Deletion of the CA certificate: When the following operation is performed, the CA certificate in the factory setting is automatically installed.

CAUTION:

After following procedure, the registered key and CA certificate are deleted, and only the CA certificate installed at the time of shipment is registered.

It is therefore necessary to check with the user in advance.

- (a) Start [Service Mode] at Level 2.

- (b) Select [COPIER] > [Function] > [CLEAR] > [CA-KEY] and touch the [OK] button.

F-2-421

"OK!" is displayed if the CA certificate is initialized. When "NG!" is displayed, see the section of "Troubleshooting" to execute the remedy, and then perform initialization of the CA certificate again and check to see if the CA certificate is initialized.

F-2-422

- (c) Turn OFF and then ON the main power of this machine.

CAUTION:

If a key and a CA certificate have been registered in order to use a function other than E-RDS, it is necessary to register again from SST or Remote UI.

- 4) Start [Service Mode] at Level 1.
- 5) Select [COPIER] > [Function] > [INSTALL] > [E-RDS].

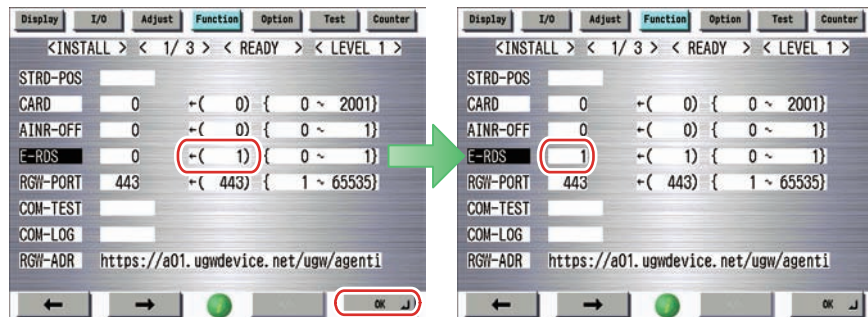

F-2-423

- 6) Press the numeric key [1] on the control panel (the setting value is changed to 1) and touch the [OK] button. (The data is reflected to the setting value field.)

NOTE:

This operation enables the communication function with UGW.

F-2-424

CAUTION:

The following settings i.e. RGW-PORT and RGW-ADR in Service mode must not be change unless there are specific instructions to do so.

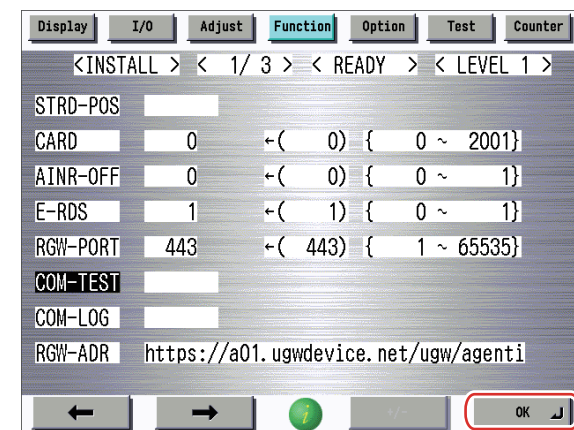

Changing these values will cause error in communication with UGW.

- 7) Select [COM-TEST] and then touch [OK].

NOTE:

This initiates the communication test between the device and the UGW.

F-2-425

If the communication is successful, "OK!" is displayed. If "NG!" (failed) appears, refer to the "Troubleshooting" and repeat until "OK!" is displayed.

F-2-426

NOTE:

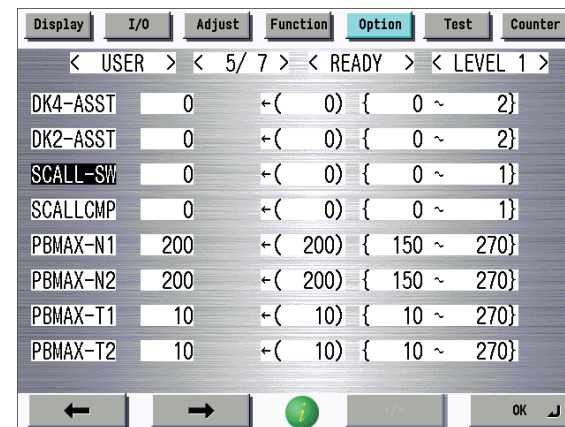

The communication results with UGW can be distinguished by referring to the COM-LOG. By performing the communication test with UGW, E-RDS acquires schedule information and starts monitoring and meter reads operation.

Steps to Service Call button settings

Steps for settings to display the service call button

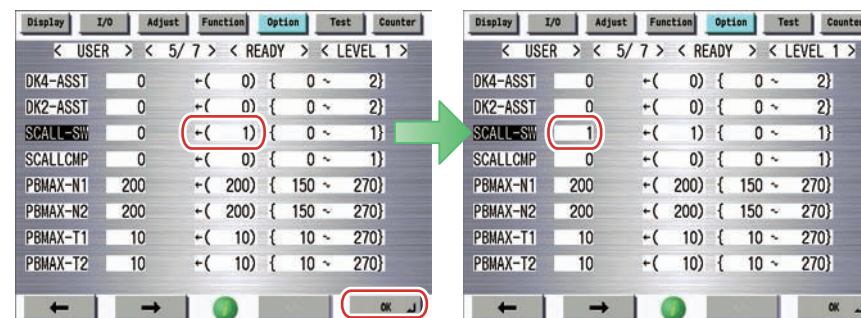

In order to use the "Service Call" button, follow the procedure shown below to display the "Service Call" button.

- 1) Start [Service Mode] at Level 1.
- 2) Select [COPIER] > [Option] > [USER] > [SCALL-SW].

F-2-427

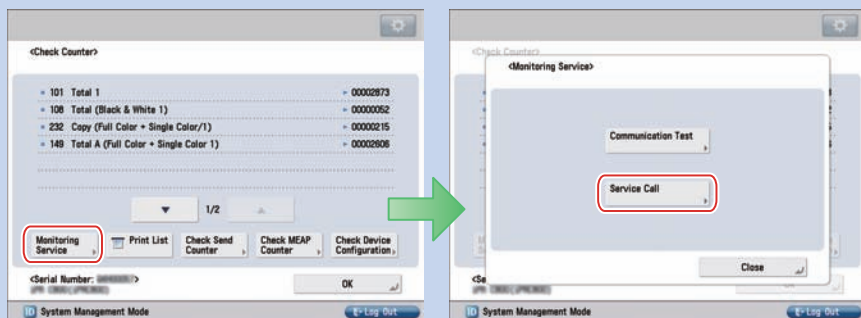

- 3) Press the numeric key [1] on the control panel (the setting value is changed to 1) and touch the [OK] button. (The data is reflected to the setting value field.)

F-2-428

NOTE:

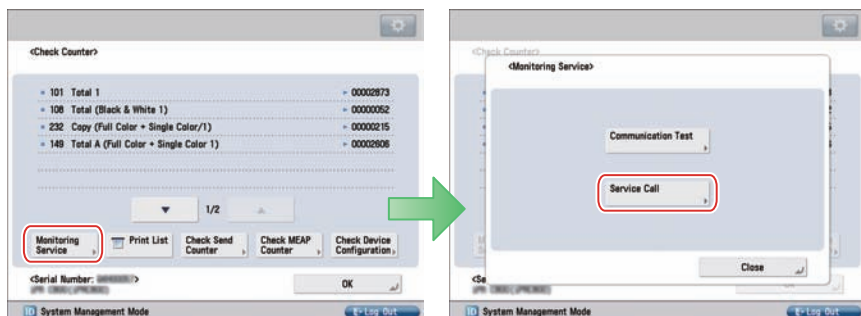

When the function is enabled, the [Service Call] button is displayed on the Monitoring Service screen by touching the [Monitoring Service] button on the Check Counter screen.

● Steps for service call request

Users should follow the instructions as described below to request a service call.

- 1) Press the [Counter Check] on the control panel to display the Check Counter screen.
- 2) Touch the [Monitoring Service] button, and touch the [Service Call] button on the Monitoring Service screen.

F-2-429

- 3) Touch the [New Request] button on the Service Call screen.

F-2-430

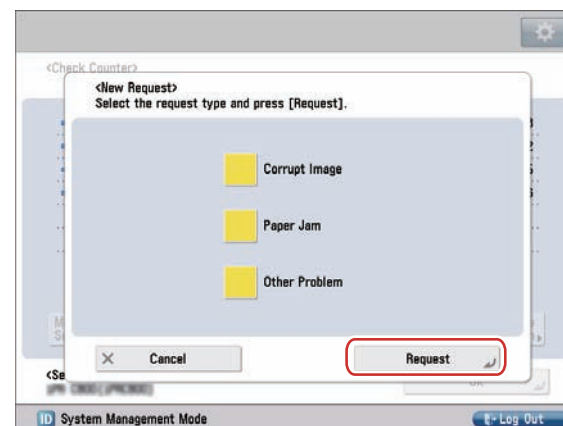

CAUTION:

When a service call has been already requested, another service call cannot be sent. The previous service call needs to be canceled, or a service technician needs to perform processing for service call completion.

- 4) Select the request details and touch the [Request] button.

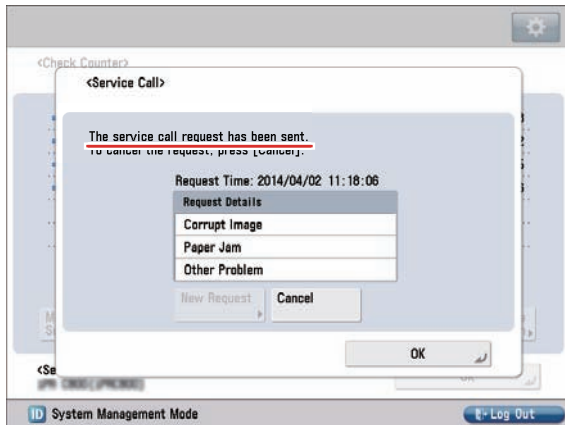

NOTE:

E-RDS generates an alarm of service call request at this timing, and sends the alarm to UGW.

F-2-431

- 5) If the service call request is successful, "The service call request has been sent." is displayed. If "Could not send the service call request." appears, refer to the "Troubleshooting" and repeat until "The service call request has been sent." is displayed.

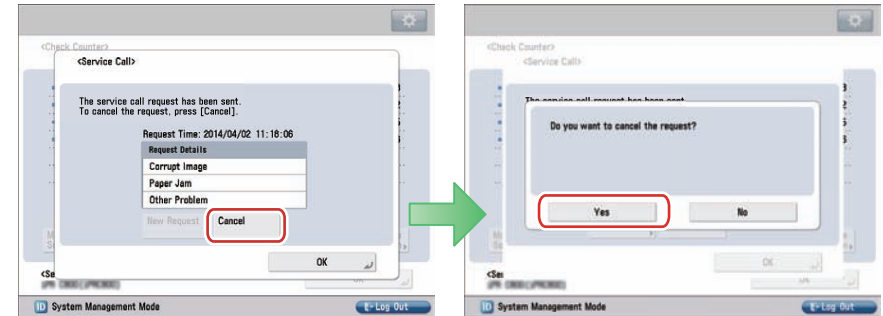

F-2-432

- 3) Touch the [Cancel] button, and touch the [Yes] button in the check screen.

NOTE:

E-RDS generates an alarm of service call cancellation at this timing, and sends the alarm to UGW.

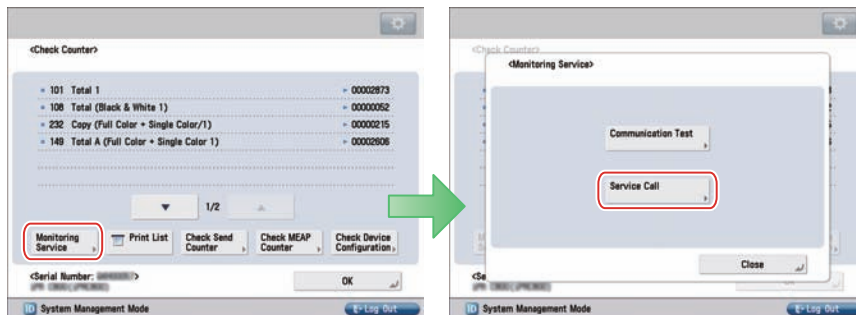

F-2-434

- 4) "The request has been canceled." is displayed.

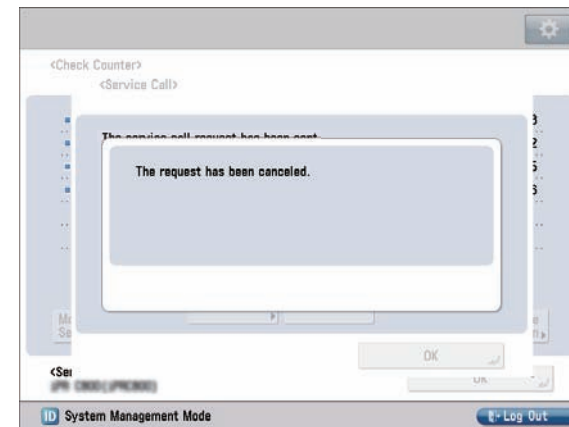

● Steps for service call cancellation

To cancel the service call, follow the instructions as described below.

- 1) Press the [Counter Check] on the control panel to display the Check Counter screen.
- 2) Touch the [Monitoring Service] button, and touch the [Service Call] button on the Monitoring Service screen.

F-2-433

F-2-435

Steps for settings of service call completion

When the service technician completes the work for the service call, follow the instruction as described below to execute the service call completion work.

- 1) Start [Service Mode] at Level 1.
- 2) Select [COPIER] > [Option] > [USER] > [SCALLCMP].

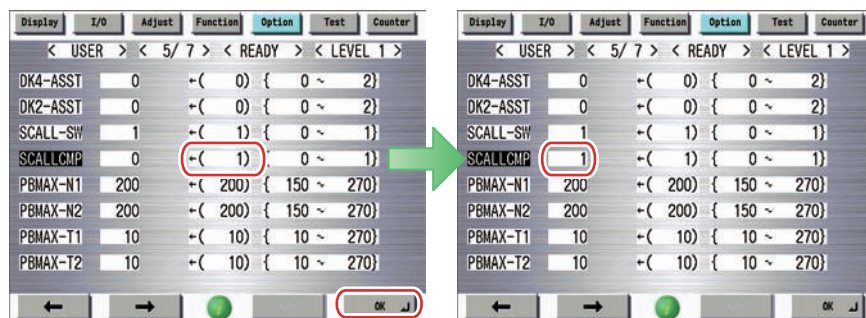

F-2-436

- 3) Press the numeric key [1] or [0] on the control panel (the setting value is changed to 1 or 0) and touch the [OK] button. (The data is reflected to the setting value field.)

NOTE:

E-RDS generates an alarm of service call completion at this timing, and sends the alarm to UGW.

F-2-437

NOTE:

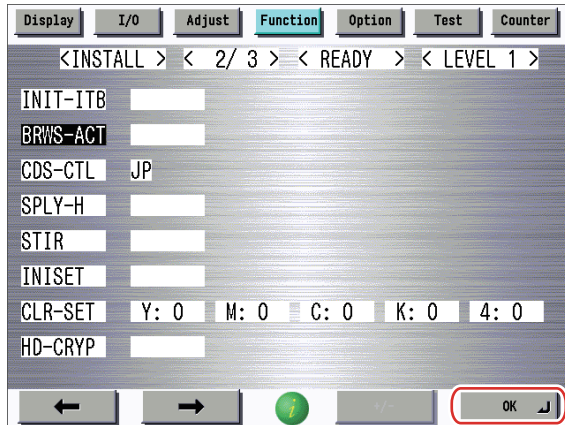

In the current condition, touching the [OK] button completes the service call regardless of whether 0 or 1 is set.

Steps to Service Browser settings

- 1) Start [Service Mode] at Level 1.
- 2) Select [COPIER] > [Function] > [INSTALL] > [BRWS-ACT] and then touch [OK].

NOTE:

When the status of the service browser is changed to enabled, E-RDS sends the browser information to the UGW at this timing.

F-2-438

If the connection is established with UGW successfully, "OK!" is displayed. When "NG!" is displayed, perform the steps referring to "Troubleshooting" until connection is established with UGW.

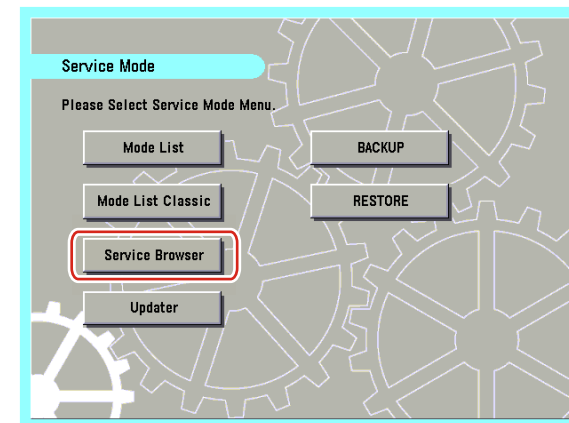

F-2-439

- 3) Turn OFF and then ON the main power of this machine.
- 4) Make sure that "1 (: ACTIVE)" is set under [COPIER] > [Display] > [USER] > [BRWS-ST].

F-2-440

- 5) When the above-shown setting values are enabled, [Service Browser] is displayed in the Service Mode screen.

F-2-441

NOTE:

Generally, once service browsing is enabled, to stop the service browsing, execute BRWS-ACT again, turn OFF and then ON the main power of this machine.

■ Initializing E-RDS settings

It is possible to clear the SRAM data of E-RDS and change the E-RDS setting back to the default value.

● Initialization procedure

- 1) Start [Service Mode] at Level 1.
- 2) Select [COPIER] > [Function] > [CLEAR] > [ERDS-DAT] and then touch [OK].

F-2-442

● Setting values and data to be initialized

The following E-RDS settings, internal data, and Alarm filtering information are initialized.

- COPIER > Function > INSTALL > E-RDS
- COPIER > Function > INSTALL > RGW-ADR
- COPIER > Function > INSTALL > RGW-PORT
- COPIER > Function > INSTALL > COM-LOG

CAUTION:

In case of replacing the CA certificate file, even if initialization of E-RDS is executed, the status is not returned to the factory default.

When installing the certificate file other than the factory default CA certificate file, it is required to delete the certificate file after E-RDS initialization and install the factory default CA certificate file.

For detailed procedures, see "Steps to E-RDS settings - step 3."

● FAQ

No.1

Q: In what case does a communication test with UGW fail?

A: The following cases can be considered in the becoming "NG!" case.

1. Name resolution was failed due to an incorrect host name or DNS server has been halted.
2. Network cable is blocked off.
3. Proxy server settings is not correct.

No.2

Q: When does E-RDS send counter information to UGW? How many data is sent?

A: The schedule of data transmitting, the start time are determined by settings in the UGW side. The send time cannot be specified on the E-RDS side. Data is sent once every 16 hours.

The data size of counter information is approx. 285 KB.

No.3

Q: Will data which failed to be sent due to an error in communication with UGW be resent?

A: Data shown below will be resent.

- Jam log
- Service call log
- Alarm log
- Service mode menu

The newest data is resent only when the settings are changed in service mode.

- Browser information

It is resent only when the web browser option is enabled.

Data is resent endlessly (after 5, 10, 15, 20, 25, and 30 minutes since the occurrence of communication error; once 30 minutes have passed, it is resent at 30-minute intervals) until it is sent successfully. Resend continues even if the power is turned OFF and then ON.

No.4

Q: What is the upper limit of the number of COM-LOGs? What is the upper limit of the number of characters of error information displayed in a COM-LOG?

A: Up to 30 log data can be saved. The data size of error information is maximum 128 characters.

No.5

Q: Although Microsoft ISA as a proxy server is introduced, the authentication check is failed.

Can E-RDS adopt with Microsoft ISA?

A: E-RDS must comply with "Basic" while "Integrated" authentication is used for Microsoft ISA (as default); therefore, authentication with E-RDS is available if you change the setting to "Basic" authentication on the server.

No.6

Q: Can I turn this machine power off during the e-Maintenance/ imageWARE Remote system operation?

A: While operating the e-Maintenance/ imageWARE Remote system, the power of the device must be ON. If power OFF is needed, do not leave the device power OFF for long time. It will become "Device is busy, try later" errors if the power supply of network equipment such as HUB is made prolonged OFF.

No.7

Q: Although a Service call error may not be notified to UGW, the reason is what?

A: If a service technician in charge turns off the power supply of this machine immediately after error occurred once, It may be unable to notify to UGW because data processing does not take a time from the controller of this machine to NIC though, the data will be saved on the RAM.

If the power supply is blocked off while starting up, the data will be inevitably deleted.

No.8

Q: How does E-RDS operate while this machine is placed in the sleep mode?

A: While being in Real Deep Sleep, and if data to be sent is in E-RDS, the system wakes up asleep, then starts to send the data to the UGW. The system also waits for completion of data transmission and let the device to shift to asleep status again.

However, transition time to the Real Deep Sleep depends on the device, and the transition to sleep won't be done if the next data transmission will be done within 10 minutes.

No.9

Q: Is E-RDS compatible with Department counter?

A: No, E-RDS does not support Department counter.

No.10

Q: Is there any setting to be made on the device side to enable the service mode menu transmission function? Moreover, what is Service mode menu set as the object of transmission?

A: No steps peculiar to Transmitting Service mode menu. As for the data that applies to transmission of the service mode, see the "Service mode menu Transmission".

No.11

Q: What service browser data is transmitted to UGW by E-RDS in what timing?

A: The service browser data to be transmitted and the transmission timing are shown below.

Transmission timing	Detailed procedure	Transmission information	Error occurs
When the service browser is enabled from the disabled state [OFF]	1) Specify the service browser setting in the service mode menu. 2) Send browser information to UGW. 3) Once obtaining OK response from UGW, enable the service browser mode [ACTIVE]. (To use the setting, it is necessary to turn OFF and then ON the main power of this machine)	Service browser mode: [Register] WEB browser option: [ON] or [OFF] according to the license status	Retransmission is not performed. ("Disabling [OFF]" continues to be set.)

T-2-131

No.12

Q: Can I make another service call request when I have already requested a service call?

A: No, you cannot make another service call request if you have already made a service call request.

Touch the [Cancel] button to cancel the service call which you'd made. Or the service technician performs a service call completion process.

No.13

Q: Is the "Requesting" status cancelled when the main power of this machine is turned OFF and then ON?

A: The requesting status is not cancelled even if the main power of this machine is turned OFF and then ON. The information of the notified service call request (the time that the request was made, the service call request description) is also retained during the "Requesting" status.

No.14

Q: Counter information could not be sent at the scheduled send time due to the power of this machine being turned OFF. Will the counter information be sent later when the power of this machine is turned ON?

A: Yes. When a scheduled send such as that for counter could not be executed due to the power of this machine being turned OFF, etc., and the scheduled send time has already passed at power-on, the send is executed immediately.

The following shows data send according to the status of this machine.

Send types	Status of this machine		
	Power ON	Power OFF	Sleep
Scheduled send	Sent	Not sent ^{*1}	Sent ^{*2}
Immediate send (Service call log / Alarm log / Jam log)	Sent	-	Sent ^{*2}

T-2-132

*1: Immediately sent if the send time has already passed at power-on.

*2: Sent after recovery from sleep mode.

No.15

Q: Some part of information seems to be suppressed as screens passes: [Settings/Registration] > [Preferences] > [Network] > [TCP/ IP Settings], when the device is connected with a PS server unit. How the authentication information such as CA certificate is dealt?

A: The certificate-related items are displayed. Even when the device is connected with a PS Server Unit, E-RDS functions.

No.16

Q: What is the number of the network port used by E-RDS?

A: The port number used by E-RDS for communication with UGW is "443".

If this setting is changed, an error occurs during communication with UGW. Therefore this setting should not be changed unless otherwise instructed.

No.17

Q: After the setting for E-RDS was made, the IP address of the host machine was changed. In that case, is it necessary to execute COM-TEST again?

A: It is not necessary to execute COM-TEST again because the IP address used by E-RDS is automatically changed. However, it is necessary to turn OFF and then ON the main power of this machine to reflect the change in the setting of the IP address

Troubleshooting

No.1

Symptom: A communication test (COM-TEST) results NG!

Cause: Initial settings or network conditions is incomplete.

Remedy 1: Check and take actions mentioned below.

1) Check network connections

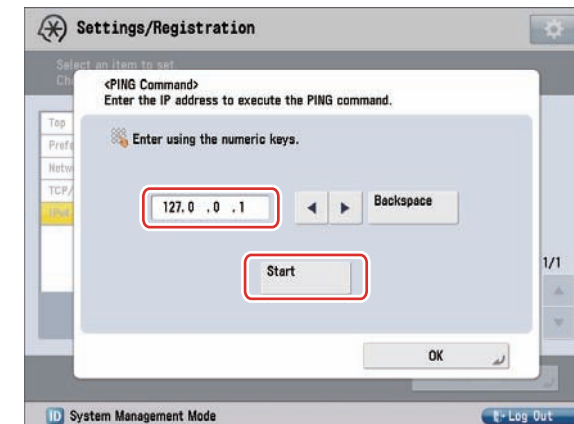

Is the status indicator LED for the HUB port to which this machine is connected ON?

YES: Proceed to Step 2).

NO: Check that the network cable is properly connected.

2) Confirm loop back address (* In case of IPv4)

Select [Settings/Registration] > [Preferences] > [Network] > [TCP/IP Settings] > [IPv4 Settings] > [PING Command], enter "127.0.0.1", and touch the [Start] button.

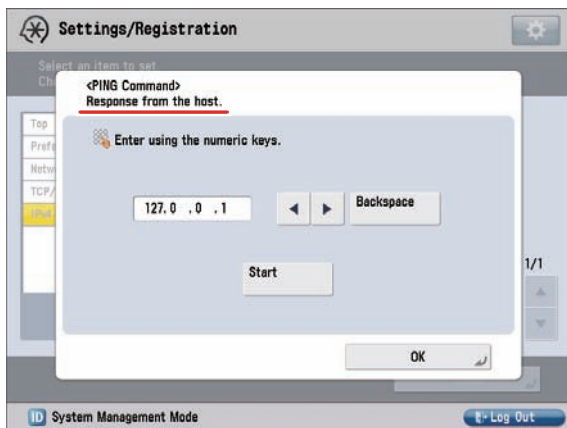

F-2-443

Does the screen display "Response from the host."? (See the next figure.)

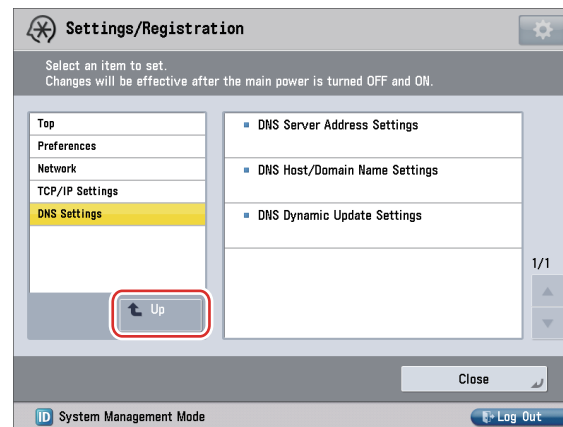

YES: Proceed to Step 3).

NO: There is a possibility that this machine's network settings are wrong. Check the details of the IPv4 settings once more.

F-2-444

(b) Touch the [Up] button.

F-2-446

3) Confirmation from another PC connected to same network.

Request the user to ping this machine from a PC connected to same network.

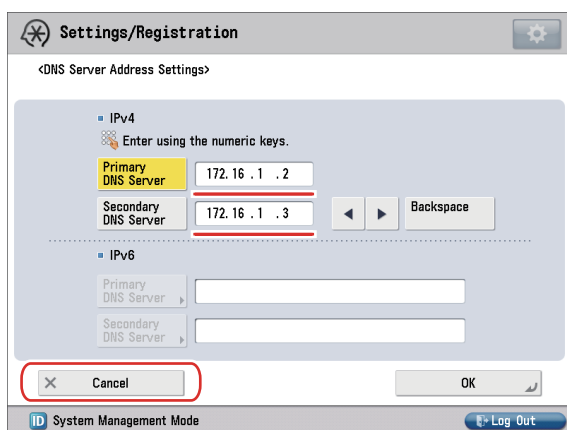

Does this machine respond?

YES: Proceed to Step 4).

NO: Confirm the details of this machine's IP address and subnet mask settings.

4) Confirm DNS connection

(a) Select [Settings/Registration] > [Preferences] > [Network] > [TCP/IP Settings] > [DNS Settings] > [DNS Server Address Settings], write down the primary and secondary addresses of the DNS server, and touch the [Cancel] button.

F-2-445

(c) Select [IPv4 Settings] > [PING Command], enter the primary DNS server noted down in step a) as the IP address, and touch the [Start] button.

Does the screen display "Response from the host."?

YES: Proceed to Remedy 2.

NO: Enter the secondary DNS server noted down in step a) as the IP address, and then touch the [Start] button.

Does the screen display "Response from the host."?

YES: Proceed to Remedy 2.

NO: There is a possibility that the DNS server address is wrong. Reconfirm the address with the user's system administrator.

Remedy 2: Troubleshooting using communication error log (COM-LOG)

- 1) Start [Service Mode] at Level 1.
- 2) Select [COPIER] > [Function] > [INSTALL] > [COM-LOG] and touch the blank field on the right side. The communication error log list screen is displayed.

F-2-447

NOTE:

- Only the initial part of error information is displayed in the communication error log list screen.
- "*" is added to the top of the error text in the case of an error in communication test (method name: getConfiguration or communicationTest) only.

- 3) When each line is selected, the communication error log detailed screen is displayed as shown in the figure below. (Example: No. 02)

F-2-448

NOTE:

- A detailed description of the error appears below 'Information'. (Max 128 characters)
- Touch the [OK] button to return to the communication error log list screen.

- 4) When a message is displayed, take an appropriate action referring to "Error code and strings".

No.2

Symptom: A communication test results NG! even if network setting is set properly.

Cause: The network environment is inappropriate, or RGW-ADR or RGW-PORT settings for E-RDS have been changed.

Remedy: The following points should be checked.

- 1) Check network conditions such as proxy server settings and so on.
- 2) Check the E-RDS setting values.
 - Check the communication error log from COM-LOG.
 - Check whether RGW-ADR or RGW-PORT settings has changed. If RGW-ADR or RGW-PORT settings has changed, restore initial values. For initial values, see "Service cautions".

No.3

Symptom: Registration information of the E-RDS machine was deleted from the device information on Web Portal, and then registered again. After that, if a communication test is left unperformed, the device setting in the UGW becomes invalid.

Cause: When the registration information of the E-RDS machine is deleted, information related to E-RDS is also deleted.

Therefore, when 7 days have passed without performing a communication test after registering the E-RDS machine again, the device setting becomes invalid.

Remedy: Perform a communication test before the device setting becomes invalid.

No.4

Symptom: There was a log, indicating "Device is not ready, try later" in error details of COM-LOG list.

Cause: A certain problem occurred in networking.

Remedy: Check and take actions mentioned below.

- 1) Check networking conditions and connections.
- 2) Turn on the power supply of this machine and perform a communication test about 60 seconds later.

No.5

Symptom: "Unknown error" is displayed though a communication test (COM-TEST) has done successfully.

Cause: It could be a problem at the UGW side or the network load is temporarily faulty.

Remedy: Try again after a period of time. If the same error persists, check the UGW status with a network and UGW administrator.

No.6

Symptom: Enabling Service Browser (BRWS-ACT) results NG!

Cause: A communication test with UGW has not been performed, or a communication test result is NG!

Remedy: Perform a communication test, and check that the test with UGW finishes successfully.

No.7

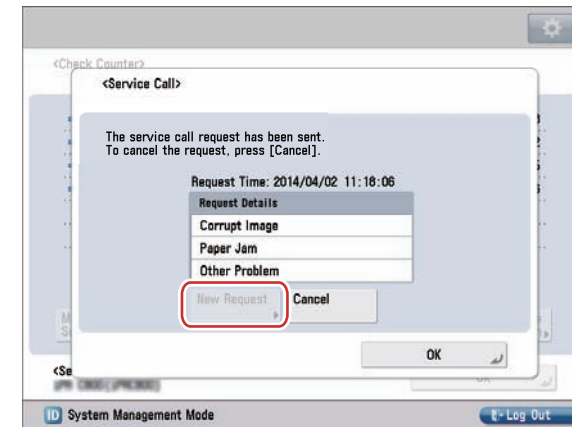

Symptom: The display indicates that the service browser is enabled (BRWS-STTS: 1), but the service browser fails to be activated.

Cause: The main power switch of this machine has not been turned OFF and then ON. ON/OFF of the service browser is enabled after reboot.

Remedy: Turn OFF and then ON the main power of this machine.

No.8

Symptom: A service call request cannot be made because the [New Request] button is grayed out.

F-2-449

Cause: There has been already a service call request.

Remedy: Perform either of the following remedy works:

- Touch the [Cancel] button to cancel the service call request that has been made.
- A service technician performs a complete processing for the service call request that has been made.

No.9

Symptom: Initializing the CA certificate (CA-KEY) results in NG!

Cause: Initialization process of the CA certificate has completed abnormally.

Remedy: Initialize the HDD.

No.10

Symptom: A service call request is failed, and a message "Could not send the service call request" is displayed.

Cause: A communication test with UGW has not been performed, or a communication test result is NG!

Remedy: Perform a communication test, and check that the test with UGW finishes successfully.

No.11

Symptom: When a communication test (COM-TEST) is repeatedly executed, an error occurs.

Cause: During communication conducted after execution of a COM-TEST, another COM-TEST was executed again.

Remedy: When repeatedly executing COM-TEST, execute COM-TEST at intervals of 5 minutes or more.

Error code and strings

The following error information is displayed on the communication error log details screen. (Here, "server" means UGW.)

- The error information are displayed in the following form.
[*] [Character strings] : [Functional classification (Method names)] [Error details provided by UGW]

NOTE:

"*" is added to the top of the error text in the case of an error in communication test (method name: getConfiguration or communicationTest) only.

No.	Code	Character strings	Cause	Remedy
1	0000 0000	SUSPEND: mode changed.	Unmatched Operation Mode	Initialize the E-RDS setting (ERDS-DAT).
2	0500 0003	SUSPEND: Communication test is not performed.	Turning OFF and then ON the main power of this machine while the communication test had not been performed although E-RDS is enabled.	Perform a communication test (COM-TEST).
3	0xxx 0003	Server schedule is not exist	Blank schedule data have been received from UGW.	Perform and complete a communication test (COM-TEST).
4	0xxx 0003	Communication test is not performed	Communication test has not completed.	Perform and complete a communication test (COM-TEST).
5	84xx 0003	E-RDS switch is setted OFF	A communication test has been attempted with the E-RDS switch being OFF.	Set E-RDS switch (E-RDS) to 1, and then perform a communication test (COM-TEST).
6	8600 0002 8600 0003 8600 0101 8600 0201 8600 0305 8600 0306 8600 0401 8600 0403 8600 0414 8600 0415	Event Registration is Failed	Processing (event processing) within the device has failed.	Turn the device OFF/ ON. If the error persists, replace the device system software. (Upgrade)
7	8700 0306	SRAM version unmatch!	Improper value is written in at the head of the NVMEM domain (nonvolatile memory domain) of E-RDS.	Turn the device OFF/ ON.

No.	Code	Character strings	Cause	Remedy
8	8700 0306	SRAM AeRDS version unmatched!	Improper value is written in at the head of the NVMEM domain (nonvolatile memory domain) of Ae-RDS.	Turn the device OFF/ ON.
9	8xxx 0004	Operation is not supported	Method which E-RDS is not supporting attempted.	Contact help desk
10	8xxx 0101	Server response error (NULL)	Communication with UGW has been successful, but an error of some sort has prevented UGW from responding. When (Null) is displayed at the end of the message, this indicates that there has been an error in the HTTPS communication method.	Perform and complete a communication test (COM-TEST).
11	8xxx 0201 8xxx 0202 8xxx 0203 8xxx 0204 8xxx 0206	Server schedule is invalid	During the communication test, there has been some kind of error in the schedule values passed from UGW.	When the error occurs, report the details to the support section. After the UGW side has responded, try the communication test again.
12	8xxx 0207 8xxx 0208	Internal Schedule is broken	The schedule data in the inside of E-RDS is not right.	Perform a communication test (COM-TEST).
13	8xxx 0221	Server specified list is too big	Alarm/Alert filtering error: The number of elements of the list specified by the server is over restriction value.	Alert filtering is not supported by UGW.
14	8xxx 0222	Server specified list is wrong	Alarm filtering error: Unjust value is included in the element of the list specified by the server.	Alert filtering is not supported by UGW.
15	8xxx 0304	Device is busy, try later	The semaphore consumption error at the time of a communication test.	Try again a communication test after a period of time.
16	8xxx 0709	Tracking ID is not match	When upgrading firmware, the TrackingID notified by Updater differs from the thing of UGW designates.	Obtain the sublog, and contact the support department of the sales company.
17	8xxx 2000	Unknown error	Some other kind of communication error has occurred.	Perform and complete a communication test (COM-TEST).
18	8xxx 2001	URL Scheme error(not https)	The header of the URL of the registered UGW is not in https format.	Check that the value of URL of UGW (RGW-ADR) is https://a01.ugwdevice.net/ugw/agentif010.

No.	Code	Character strings	Cause	Remedy
19	8xxx 2002	URL server specified is illegal	A URL different to that specified by the UGW has been set.	Check that the value of URL of UGW (RGW-ADR) is https://a01.ugwdevice.net/ugw/agentif010.
20	8xxx 2003	Network is not ready, try later	Communication attempted without confirming network connection, just after turning OFF and then ON the main power of this machine in which the network preparations are not ready.	Check the network connection, as per the initial procedures described in the troubleshooting. Perform a communication test (COM-TEST) about 60 seconds later, after turn on the device.
21	8xxx 2004	Server response error ([Hexadecimal]) [Error detailed in UGW] ¹	Communication with UGW has been successful, but an error of some sort has prevented UGW from responding.	Try again after a period of time. Check detailed error code (Hexadecimal) and [Error details in UGW] from UGW displayed after the message.
22	8xxx 200A	Server connection error	<ul style="list-style-type: none"> TCP/IP communication fault The IP address of device is not set. 	<ul style="list-style-type: none"> Check the network connection, as per the initial procedures described in the troubleshooting. When proxy is used, make the settings for proxy, and check the status of the proxy server.
23	8xxx 200B	Server address resolution error	Server address name resolution has failed.	<ul style="list-style-type: none"> Check that the value of URL of UGW (RGW-ADR) is https://a01.ugwdevice.net/ugw/agentif010. Check that Internet connection is available in the environment.
24	8xxx 2014	Proxy connection error	Could not connect to proxy server due to improper address.	Check proxy server address / port and re-enter as needed.
25	8xxx 2015	Proxy address resolution error	Could not connect to proxy server due to name resolution error of proxy address.	<ul style="list-style-type: none"> Check that the proxy server name is correct. If the proxy server name is correct, check the DNS connection, as per the initial procedures described in the troubleshooting. Specify the IP address as the proxy server name.
26	8xxx 201E	Proxy authentication error	Proxy authentication is failed.	Check the user name and password required in order to login to the proxy, and re-enter as needed.

No.	Code	Character strings	Cause	Remedy
27	8xxx 2028	Server certificate error	<ul style="list-style-type: none"> No route certificate installed in device. Certificate other than that initially registered in the user's operating environment is being used, but has not been registered with the device. The date and time of the device is not correct. 	<ul style="list-style-type: none"> Install the latest device system software. (Upgrade) Correctly set the date and time of the device. Execute CLEAR > CA-KEY, and turn OFF and then ON the device. (The CA certificate at the time of shipment is automatically installed.)
28	8xxx 2029	Server certificate verify error	The server certificate verification error occurred.	Check that the value of URL of UGW (RGW-ADR) is https://a01.ugwdevice.net/ugw/agentif010.
29	8xxx 2046	Server certificate expired	<ul style="list-style-type: none"> The route certificate registered with the device has expired. Certificate other than that initially registered in the user's operating environment is being used, but has not been registered with the device. The device time and date is outside of the certificated period. 	Check that the device time and date are correctly set. If the device time and date are correct, upgrade to the latest system software.
30	8xxx 2047	Server response time out	Due to network congestion, etc., the response from UGW does not come within the specified time. (HTTPS level time out)	If this error occurs when the communication test is being run or Service Browser is being set, try again after a period of time.
31	8xxx 2048	Service not found	There is a mistake in the UGW URL, and UGW cannot be accessed. (Path is wrong)	Check that the value of URL of UGW (RGW-ADR) is https://a01.ugwdevice.net/ugw/agentif010.
32	8xxx 2052	URL error	The data which is not URL is inputted into URL field.	Check that the value of URL of UGW (RGW-ADR) is https://a01.ugwdevice.net/ugw/agentif010.
33	8xxx 2058	Unknown error	SOAP Client fails to obtain SOAP Response. Possibility of a problem in UGW or of a temporary problem in the network load.	Perform and complete a communication test (COM-TEST).
34	8xxx 2063	SOAP Fault	SOAP communication error has occurred.	Check that the value of port number of UGW (RGW-PORT) is 443.

No.	Code	Character strings	Cause	Remedy
35	xxxx xxxx	Device internal error	An internal error, such as memory unavailable, etc., has occurred during a device internal error phase.	Turn the device OFF/ ON. Or replace the device system software. (Upgrade)
36	xxxx xxxx	SUSPEND: Initialize Failure!	Internal error occurred at the initiating E-RDS.	Turn the device OFF/ ON.

T-2-133

*1: [Hexadecimal]: indicates an error code returned from UGW.

[Error details in UGW]: indicates error details returned from UGW.

Updater

Functional Overview

Overview

Updater provides functions that enable network communication with Content Delivery System (hereinafter CDS) to install firmware, MEAP applications and system options.

- Firmware Installation**
 Updater function enables users to distribute firmware through CDS via Internet. Particularly on e-Maintenance/UGW (called NETEYE in Japan)-enabled devices, firmware can be updated remotely, which effectively slashes costs incurred in field services.
- MEAP Application/System Option Installation**
 By linking devices to CDS and License Management System (providing the function to manage licenses; hereinafter LMS), applications can be installed in devices via Updater, regardless of those not embedded (MEAP application) or embedded (system options) in devices.

Installing Firmware

With link to Updater, service technicians provide firmware install services in the following 3 methods.

Distribution Method	Download Commanded by:	Update Timing	Downloadable Firmware Versions		
			Previous Ver	Current Ver	Newer Ver
a. UGW-linked Download / Update (Full-remote update)	UGW	Auto	No	Yes	Yes*1
b. UGW-linked Download (Remote Distribution / Update)	UGW	Manual	Yes	Yes	Yes
c. Manual Download / Update (On-site Update via Service mode)	Local UI	Auto	No	Yes	Yes*1
		Manual	Yes	Yes	Yes

*1: You can select the version allowed Remote Update.

T-2-134

a. UGW-linked Download and Update (Full-Remote Update)

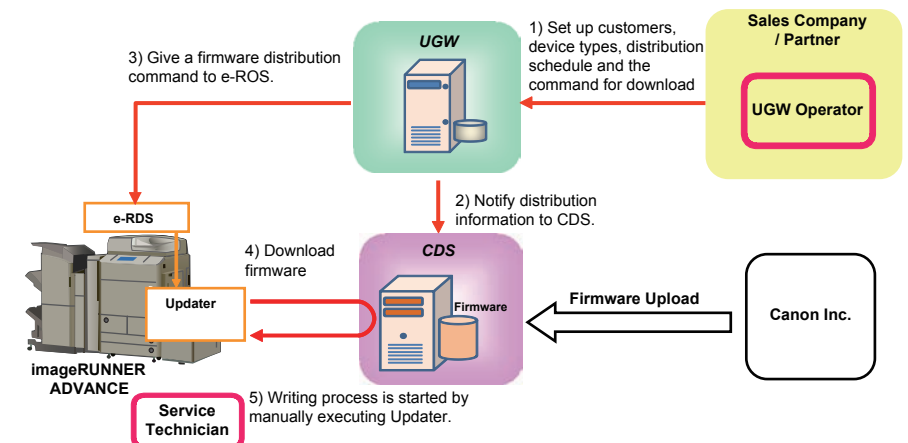

If the device is linked to UGW and the distribution schedule and update setting are registered on UGW in advance, full remote firmware update is available on an imageRUNNER ADVANCE-series device. Upon downloaded from CDS, the firmware is updated on the device.

F-2-450

b. UGW-linked Download (Remote Distribution / Update)

If the device is linked to UGW and the distribution schedule is registered on UGW in advance, firmware can be distributed to an imageRUNNER ADVANCE-series device before a service technician actually visits the customer site. This allows the service technician to update the firmware manually immediately after completing device inspection.

F-2-451

c. Manual Download and Update (On-site Update via Service Mode)

If an imageRUNNER ADVANCE-series device has connection with the external network, a service technician can gain access to CDS via Service mode to download and update firmware. This allows service technicians to update the firmware as needed on the customer site even without PCs.

F-2-452

NOTE:

“External network” here means the network connecting the device to CDS via Internet.

NOTE:

Users are able to gain firmware distribution in the following 3 methods by introducing CDS. See User Manual for detailed information.

Distribution Method	Download Commanded by	Update Timing	Downloadable Firmware Versions		
			Previous Ver	Current Ver	Newer Ver
Manual download/update via Local UI	Local UI	Auto	No	No	Yes *1
		Manual	No	No	Yes *1
Manual download/upload via Remote UI	Remote UI	Auto	No	No	Yes *1
		Manual	No	No	Yes *1
Special download/upload via Remote UI	Remote UI	-	Specific version only (Obtain it separately)		

*1: Only the latest version of Remote update-enabled version is downloadable.

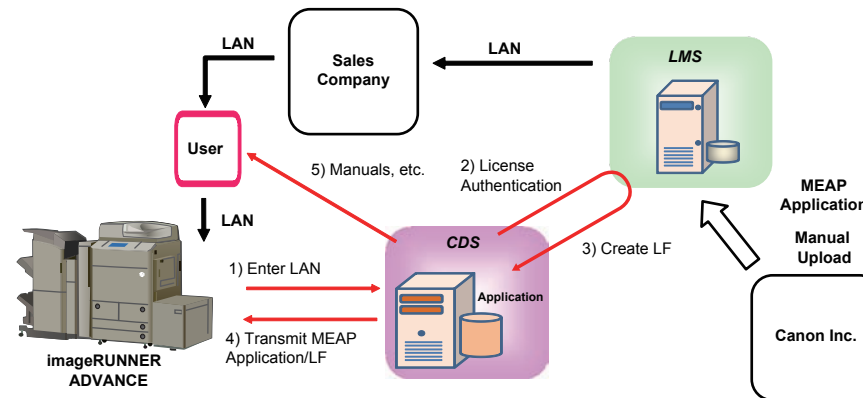

● Installing MEAP Application/System Option

The following is the installation method of MEAP application/system option which is enabled by applying CDS.

a. LMS-linked MEAP Application/System Option Installation

If an imageRUNNER ADVANCE-series device is connected to the external network, user or service technician can gain access to CDS from [Settings/Registration] to install a MEAP application or a system option.

Installing MEAP Application

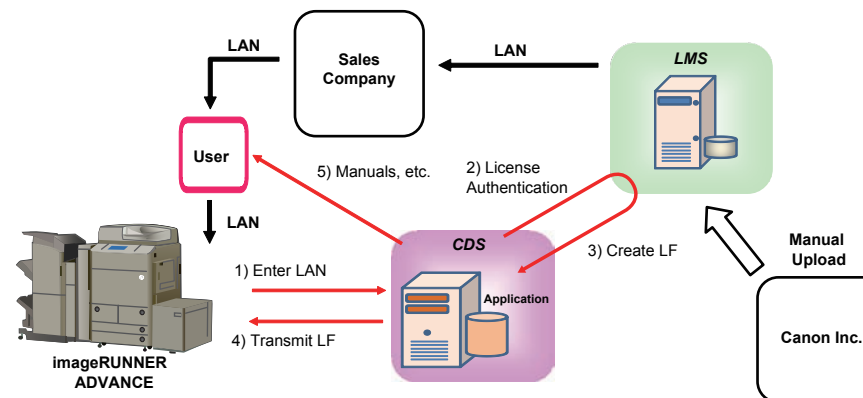

If a customer enters LAN purchased from the sales company to an imageRUNNERADVANCE-series device, MEAP application/LF can be installed.

LAN: License Access Number
LF: License File
(DSN: Device Serial Number, automatically sent to CDS upon LAN entered.)

F-2-453

Installing System Option

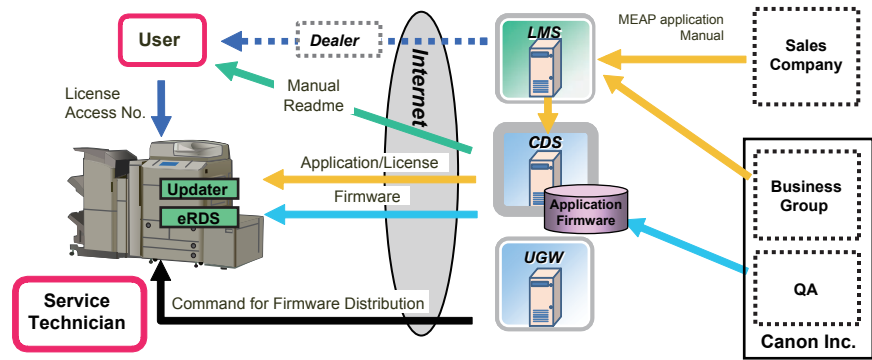

If a customer enters LAN purchased from the sales company to an imageRUNNERADVANCE-series device, a LF can be installed.

LAN: License Access Number
LF: License File
(DSN: Device Serial Number, automatically sent to CDS upon LAN entered.)

F-2-454

System Configuration

The figure below schematically shows the system configuration.

F-2-455

List of Functions

The matrix below shows the list of functions provided by Updater.

Category	Function	Service Mode	[Settings/Registration]	Remote UI	UGW-linked
Firmware	Checking firmware compatibility	Yes	-	-	-
	Checking special firmware	Yes	-	-	-
	Checking latest firmware version	-	Yes	Yes	-
	Registering/deleting firmware distribution schedule	Yes	Yes	Yes	-
	Confirming and downloading firmware	Yes	Yes	Yes	Yes
	Updating downloaded firmware	Yes	Yes	Yes	-
	Cancelling downloaded firmware	Yes	Yes	Yes	-
	Acquiring firmware distribution information registered from UGW	-	-	-	Yes
	Notifying firmware version information	-	-	-	Yes
MEAP application/system option	Inquiring license for MEAP application/system option	-	Yes	Yes	-
	Installing MEAP application / system option	-	Yes	Yes	-
System Management	Settings	Yes	-	-	-
	Testing communications	Yes	Yes	Yes	-
	Displaying update logs	Yes	Yes	Yes	-
Internal system error notification	Displaying system logs	Yes	Yes	Yes	-
	Notifying internal system error occurrence to distribution server	Yes	Yes	Yes	Yes

T-2-135

Distribution Flow

Firmware Installation Flow

Service technicians provide firmware install services in the following 3 methods.

- a: UGW-linked download and update
- b: UGW-linked download
- c: Manual download and update

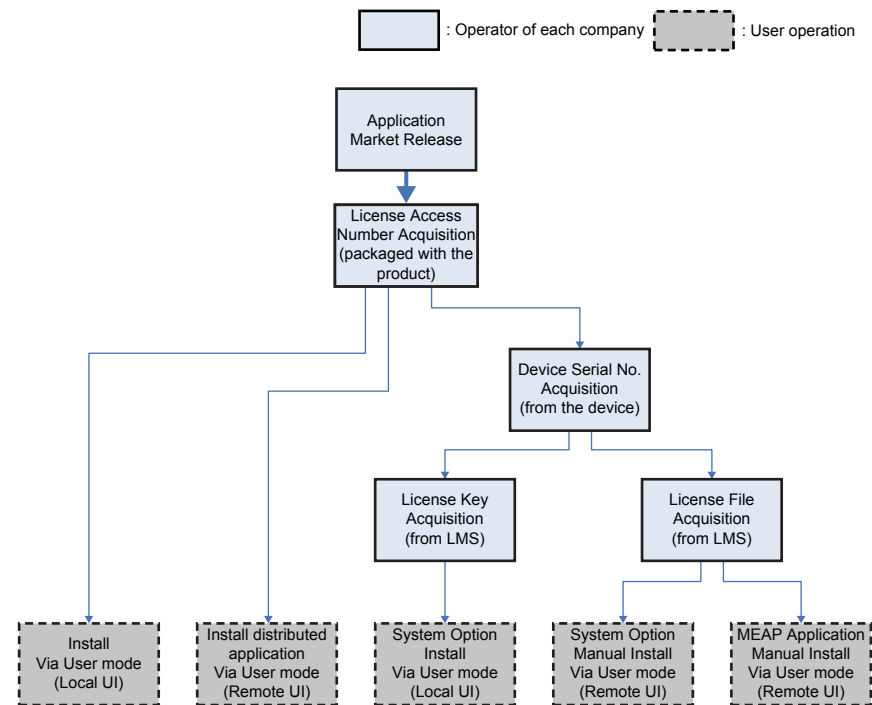

F-2-456

*1: Schedules for UGW-linked distribution are maintained on CDS.

MEAP Application/System Option Installation Flow

MEAP application/system option installation method using service mode is not provided. Be sure to use the [Settings/Registration] to install.

F-2-457

Limitations and Cautions

Limitations

Changing Date/Time on Device

When a user changes the date/time setting on the device (including change of the setting according to daylight saving time), the firmware distribution may not be performed as scheduled.

But there is not the problem if it is time adjustment of several minutes with NTP servers.

Change of Setting from Service mode

Any settings from Service mode will be enabled after restarting the device.

Cautions

Concurrent use of Updater functions

Multiple users cannot use Updater functions on a device concurrently by using it together with Remote UI.

Coexistence of Remote UI and other tools

Users logged in SMS (Service Management Service) are unable to use Update functions from Remote UI.

Using Updater function from Remote UI

Upon the following operations done, Updater functions are suspended from Remote UI for certain duration.

- When a user exits Web browser without clicking [Portal] or [Log Out] button in the setting of Remote Login Service via SMS
- When a user exits Web browser without clicking [Portal] button in the setting of not to use Remote Login Service via SMS.
- When a user exits Web browser without clicking [Log out from SMS] or [To Remote UI] button.

Wait for EOJ (end of job) Function

Firmware update will be triggered only after the following jobs are completed.

This is the Updater-specific specification.

Job/Function type	Receiving	Printing	Queued print jobs	Sending	Queued send jobs
COPY	-	Wait for EOJ	Wait for EOJ	-	-
PRINT	Wait for EOJ (end of job)	Wait for EOJ Wait for EOJ	-	-	
FAX	Wait for EOJ	Wait for EOJ	Wait for EOJ	Wait for EOJ	Wait for EOJ
I-FAX Receipt	Cancel processing to trigger update *	Wait for EOJ	Wait for EOJ	Wait for EOJ	Wait for EOJ
Report Print	-	Wait for EOJ	Wait for EOJ	-	-
SEND	-	-	-	Cancel processing to trigger update *	Cancel processing to trigger update *

T-2-136

*The data are guaranteed even if cut off in the middle of a job. It becomes the recovery object after the device reboot and carry out send / reception again.

Even during transfer, Pull SCAN job processing is cancelled soon after scanning is completed.

Firmware update is cancelled if the jobs are not completed within 10 minutes. If this occurs, the error code, 8x001106, will be returned (different numbers will be shown for x depending on the execution modes).

Firmware update is executed if the jobs stated above are not in the queue.

Follow the shutdown sequence to reboot the device after the firmware is updated.

Preparation

Overview of Preparation

The following should be prepared before using Updater.

- For updating of firmware

Installation Method	Setting Sales Company's HQ	Network Settings	Enabling UGW Link	Enabling [Update Firmware] Button	Enabling [Manual Update] Button of Remote UI
UGW-linked Download and Update	Yes	Yes	Yes	-	-
UGW-linked Download	Yes	Yes	Yes	-	-
Manual Download and Update	Yes	Yes	-	-	-
Manual Download and Update via Local UI	Yes	Yes	-	Yes	-
Manual Download and Update via Remote UI	Yes	Yes	-	Yes	-
Special Download and Update via Remote UI	Yes	-	-	-	Yes

T-2-137

- For Install of Application

Installation Method	Network Settings	Enabling [Install Application/Options] Button
LMS-linked Installation	Yes	-
LMA-linked installation via Local UI	Yes	Yes
LMS-linked installation via Remote UI	Yes	Yes

T-2-138

Setting Sales Company's HQ

When using devices input in the markets listed below, the default setting of Sales Company's HQ should be changed before obtaining firmware distributed from CDS. Unless the setting is changed properly, the desired firmware may not be able to be selected.

Market	Default Setting of Sales Company's HQ	Setting of Sales Company's HQ after Change
Canada	US	CA
Latin America	US/SG	LA
Hong Kong	SG	HK

T-2-139

Go to the following screen to change the setting of Sales Company's HQ.

Service Technician	Setting of Device Service Mode (Level 1)	COPIER > FUNCTION > INSTALL > CDS-CTL
--------------------	--	---------------------------------------

NOTE:

The list below shows the setting of Sales Company's HQ for CDS-CTS by market. Check and adhere to the appropriate setting for your market.

<List of Sales Company's HQ and the settings for CDS-CTL>

- | | |
|----------------|--------------------|
| Japan = JP | China = CN |
| USA = US | Hong Kong = HK |
| Singapore = SG | Australia = AU |
| Europe = NL | Canada = CA |
| Korea = KR | Latin America = LA |

Network Settings

Connecting to External Network

The method of connecting to external network is similar to a normal network connection method. Refer to user manual of the device for details.

NOTE:

- See User Manual for how to connect the device to the external network.
- Before using UGW link or [Settings/Registration] screen, see the sections below to prepare as required.
 - "Enabling UGW Link"
 - Enabling [Update Firmware] Button
 - Enabling [Install Application/Options] Button

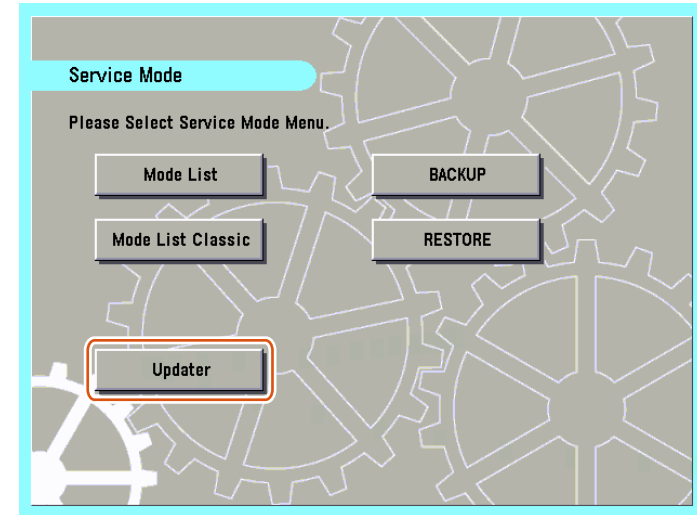

NOTE:

"External Network" here means the network connecting the device to CDS via Internet.

Confirming URL Setting of Distribution Server

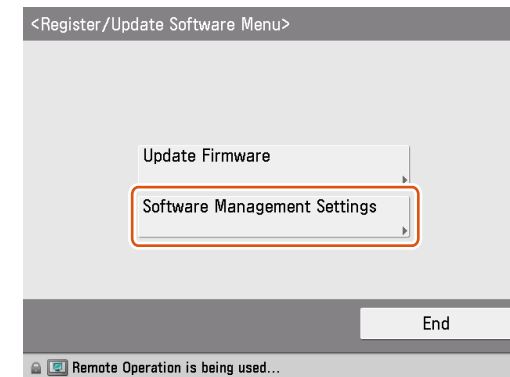

This section describes how to confirm the URL setting of the distribution server.

1. Start [Service Mode] at Level 1.
2. Press [Updater] button.

F-2-458

3. Press [Software Management Settings] button.

F-2-459

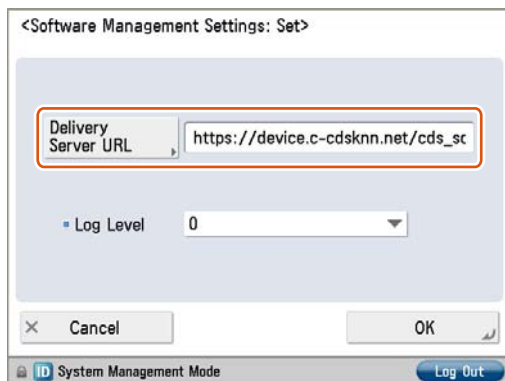

4. Press [Settings] button.

F-2-460

5. Ensure to enter “https://device.c-cdsknn.net/cds_soap/updaterif” in the field beside the [Delivery Server URL] button.

If the URL is not entered or a wrong URL is entered in the field, click [Delivery Server URL] button to show the virtual keypad. Check the URL and enter the correct one.

F-2-461

6. Press [OK] to set the entered items. Now the URL of the distribution server is successfully set.

● Communication Test

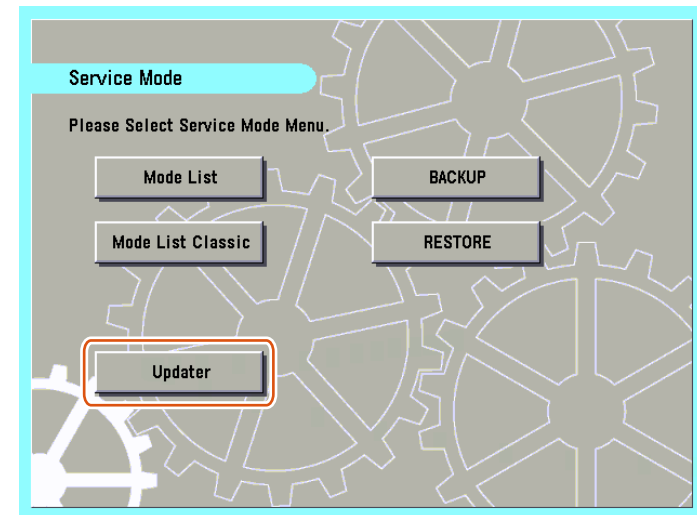

This section describes how to check if the communication is normally done to the distribution server and/or the file server.

NOTE:

Carry out the communication test with both Embedded RDS and CDS.

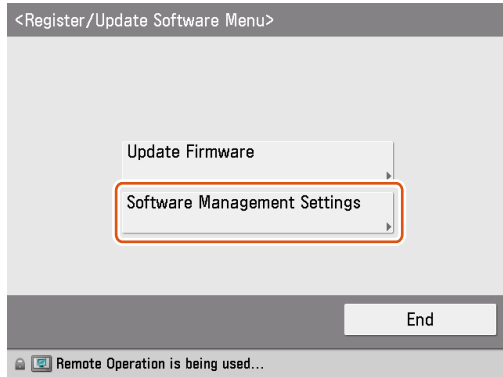

1. Start [Service Mode] at Level 1.

2. Press [Updater] button.

F-2-462

3. Press [Software Management Settings] button.

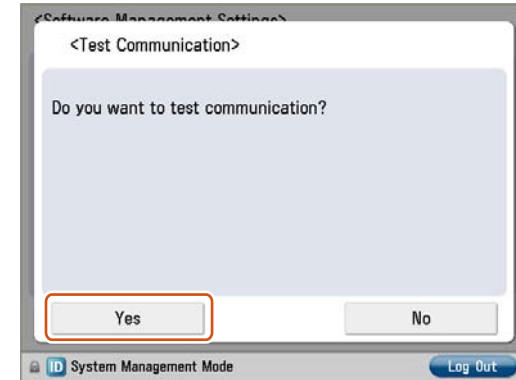

F-2-463

4. Press [Test Communication] button.

F-2-464

5. Press [Yes] button.

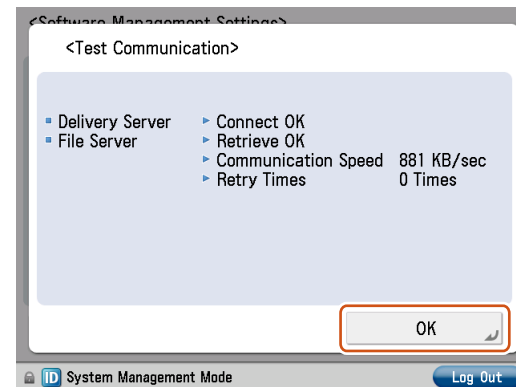

F-2-465

Obtain the download file information for communication test from the distribution server (to execute the communication test to the distribution server).

Using the download file information for communication test, the contents for test are downloaded from the file server (for the communication test to the file server).

6. Upon the communication test completed, the communication test result screen is shown. Press [OK] button to exit this operation.

F-2-466

■ Enabling UGW Link

When installing the firmware in the method of “UGW-linked Download and Update” or “UGW-linked Download”, the following should be set before actually using UGW link.

Service Technician	Setting of Device Service Mode (Level 1)	COPIER >OPTION >FNC-SW >CDS-UGW (0 -> 1)
	Setting of UGW WebPortal	In [Customer Management] screen, set [Do not distribute firmware] to [Distribute firmware].
Sales Company's HQ	Setting of Authorities on UGW WebPortal	See "Analysis>Firmware Distribution Information" to grant the appropriate authorities to each account.

NOTE:

- See “imageWARE Remote Operator's Manual / e-Maintenance Business Operation Manual” for how to operate UGW WebPortal.
- [Distribute Firmware] should be set on [Customer Management] screen for staff in charge of setting for [Enter customer information] or [Command for firmware distribution] in order to allow them to select the desired device on [Firmware Distribution Information] screen.
- If [Distribute Firmware] is not shown on [Customer Management] screen of UGW WebPortal, appropriate authorities may not be set to each account in Firmware Distribution Information. Contact the Sales Company HQ concerned for confirmation.

■ Enabling [Update Firmware] Button

To allow users to install firmware using Updater, the setting of firmware installation should be set to ON for users in advance.

Service Technician	Setting of Device Service Mode (Level 1)	COPIER >OPTION >FNC-SW >CDS-FIRM (0 -> 1)
--------------------	--	---

- [Settings/Registration] screen for Updater when the setting is not enabled (CDS-FIRM(0)):

F-2-467

- [Settings/Registration] screen for Updater when the setting is enabled (CDS-FIRM(1)):

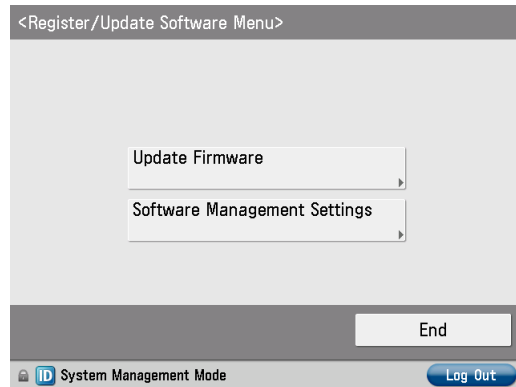

F-2-468

■ Enabling [Install Application/Options] Button

To allow users to install applications using Updater, the setting of application installation should be set to ON for users in advance.

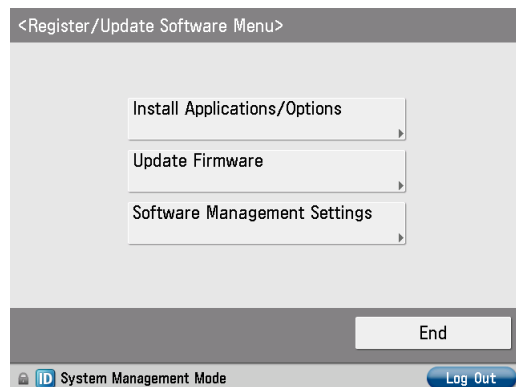

Service Technician	Setting of Device Service Mode (Level 1)	COPIER > OPTION > FNC-SW > CDS-MEAP (0 -> 1)
--------------------	--	--

- [Settings/Registration] screen of Updater when the setting is not enabled (CDS-MEAP(0)):

F-2-469

- [Settings/Registration] screen of Updater when the setting is enabled (CDS-MEAP(1)):

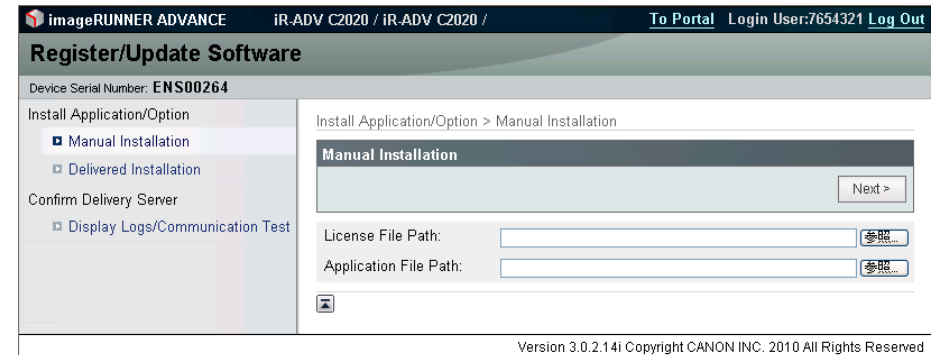

F-2-470

■ Enabling [Manual Update] Button of Remote UI

To allow users to install firmware from Updater using the file on Local PCs, the setting of firmware installation should be set to ON for users in advance.

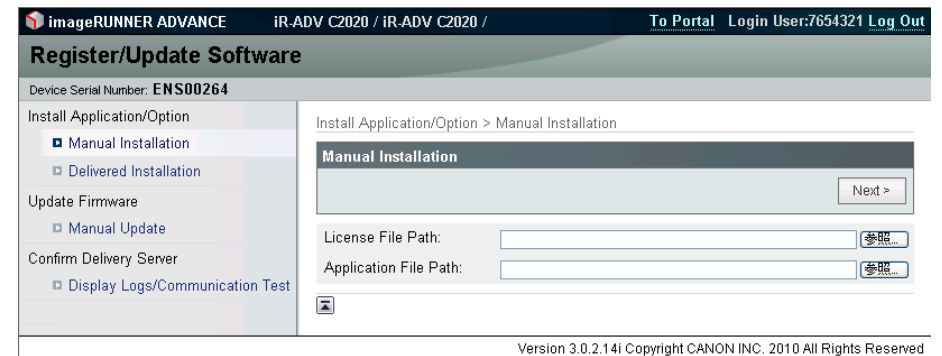

Service Technician	Setting of Device Service Mode (Level 1)	COPIER > OPTION > FNC-SW > LOCLFIRM (0 -> 1)
--------------------	--	--

- Remote UI screen of Updater when the setting is not enabled (LOCLFIRM (0)):

F-2-471

- Remote UI screen of Updater when the setting is enabled (LOCLFIRM (1)):

F-2-472

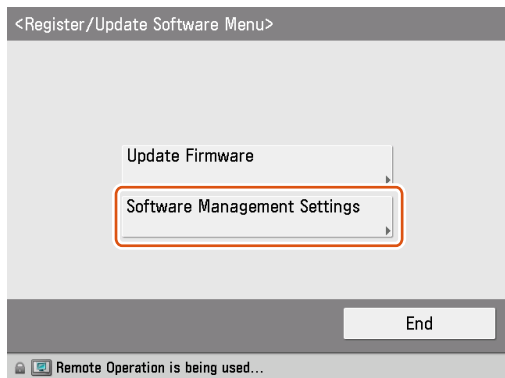

System Management Operations

Various Setting

Setting URL of Distribution Server

This section describes how to set URL of the distribution server.

1. Start [Service Mode] at Level 1.
2. Press [Updater] button.
3. Press [Software Management Settings] button.

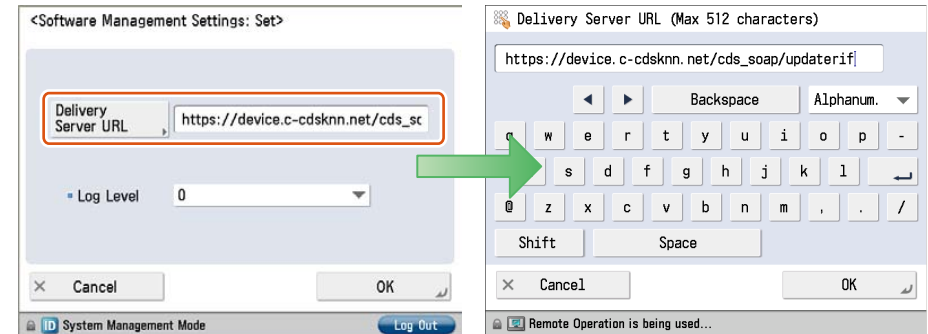

F-2-473

4. Press [Settings] button.

F-2-474

5. Press [Delivery Server URL] to show the virtual keypad. Enter the URL.

F-2-475

- [Delivery Server URL]:

Enter the "https://device.c-cdsknn.net/cds_soap/updaterif".

6. Press [OK] to set the entered items. Now the URL of the distribution server is successfully set.

Setting Log Level

This section describes how to set system log levels.

1. Start [Service Mode] at Level 1.
2. Press [Updater] button.
3. Press [Software Management Settings] button.

F-2-476

4. Press [Settings] button.

F-2-477

5. Select a log level from [Log Level] dropdown list.

F-2-478

- [Log Level]:
Select one of 5 levels ranging from [0] to [4].
See the table below for logs output in each level.

Log Level	Log Output				
	Trace	Information	Important Message	Ordinary Error	System Error
0	-	-	-	-	Yes
1	-	-	-	Yes	Yes
2	-	-	Yes	Yes	Yes
3	-	Yes	Yes	Yes	Yes
4	Yes	Yes	Yes	Yes	Yes

T-2-140

NOTE:

This list shows the contents of the Log Output.

Log Output	Description
Trace	Detailed logs for debug
Information	Logs related to operations done on the system
Important Message	Update logs output by firmware type Installation logs by MEAP application Logs related to enabled functions by system option
Ordinary Error	Logs for ordinary errors
System Error	Logs for internal system errors

T-2-141

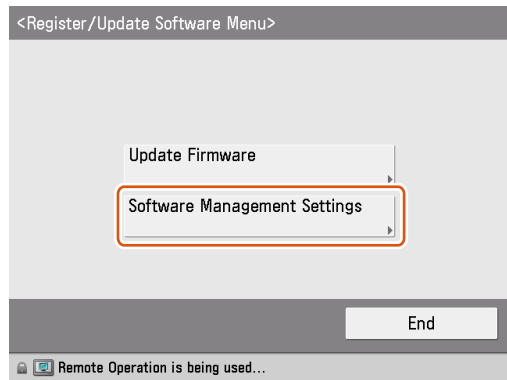

6. Press [OK] button to set the selected log level. Now the log level is successfully set.

■ Displaying Logs

● Update Logs

This section describes how to confirm System Option/MEAP Application Installation Logs and Firmware Update Logs.

1. Start [Service Mode] at Level 1.
2. Press [Updater] button.
3. Press [Software Management Settings] button.

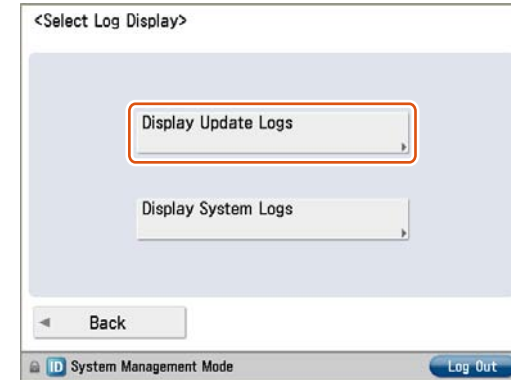

F-2-479

4. Press [Select Log Display] button.

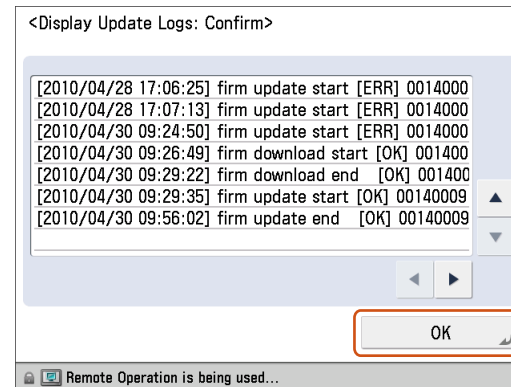

F-2-480

5. Press [Display Update Logs] button.

F-2-481

6. System Option/MEAP Application Installation Logs and Firmware Update Logs are shown. Press [OK] button to exit this operation.

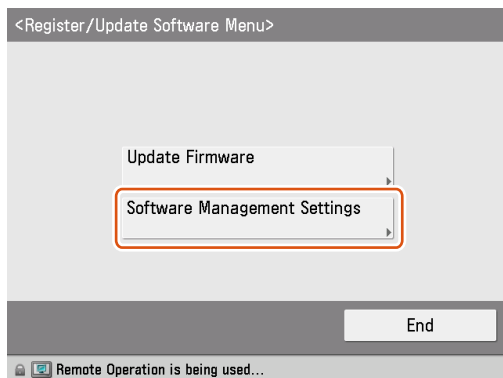

F-2-482

System Logs

This section describes how to confirm System Logs.

1. Start [Service Mode] at Level 1.
2. Press [Updater] button.
3. Press [Software Management Settings] button.

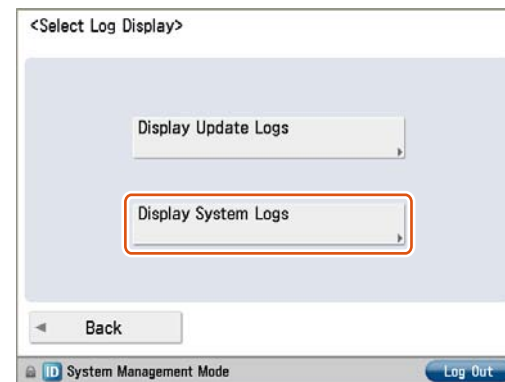

F-2-483

4. Press [Select Log Display] button.

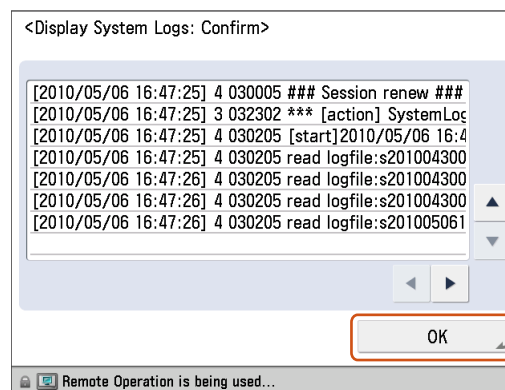

F-2-484

5. Press [Display System Logs] button.

F-2-485

6. Updater internal logs are displayed.
Press [OK] button to exit this operation

F-2-486

NOTE:

See the section of "Debug Logs" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" for more detailed information.

● Communication Test

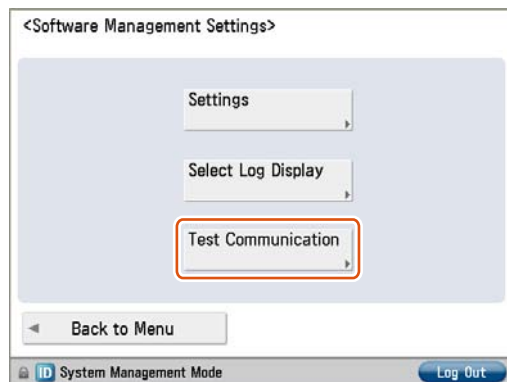

This section describes how to check if the communication is normally done to the distribution server and/or the file server.

1. Start [Service Mode] at Level 1.
2. Press [Updater] button.
3. Press [Software Management Settings] button.

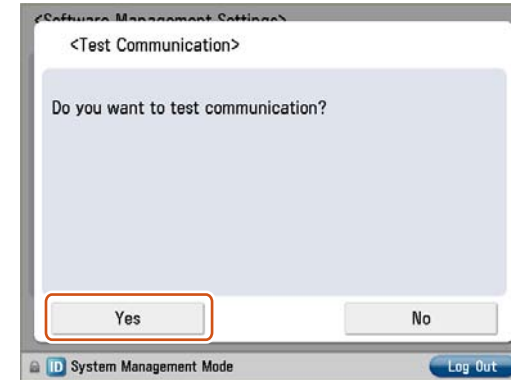

F-2-487

4. Press [Test Communication] button.

F-2-488

5. Press [Yes] button.

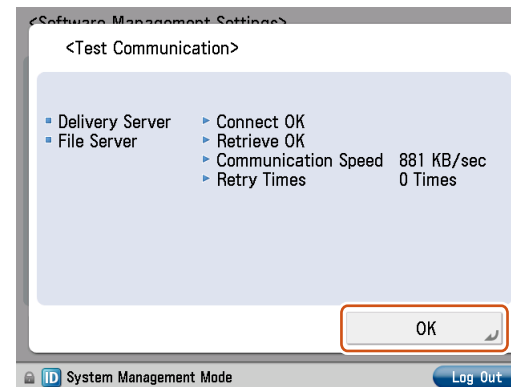

F-2-489

Obtain the download file information for communication test from the distribution server (to execute the communication test to the distribution server).

Using the download file information for communication test, the contents for test are downloaded from the file server (for the communication test to the file server).

6. Upon the communication test completed, the communication test result screen is shown. Press [OK] button to exit this operation.

F-2-490

NOTE:
Carry out the communication test with both Embedded RDS and CDS.

Maintenance

■ Upgrading Updater

The firmware installed in the device should be also upgraded when upgrading Updater. See the section of "Version Upgrade", Chapter 6 "Troubleshooting" for more detailed information.

■ Formatting Hard Disk

Since Updater is a MEAP application, its contents can be temporarily saved in the MEAP application storage area on PC via SST during formatting or replacing HDD. See "MEAP" of Chapter 2 for further information.

The settings initialized in format or replacement should be restored. See the section of "Preparation" for more detailed information.

NOTE:

When formatting or replacing HDD, distribution schedule, downloaded firmware (not updated yet) and logs (update/system logs) will be deleted.

■ How to Replace Controller Boards

- Main Controller Board PCB

The network and service mode setting should be set again after initialization. See the section of "Preparation" for more detailed information.

■ How to Replace Devices

All settings should be set again because no data are inherited. See the section of "Preparation" for more detailed information.

FAQ

FAQ on Installing Firmware

No.1

Q: Is it also possible to downgrade firmware with using CDS?

A: Firmware can be downgraded in some methods shown in the table below.

If download and update are performed consecutively, firmware can't be downgraded.

Distribution Method	Downgrade Possibility
UGW-linked Download and Update	No
UGW-linked Download	Yes
Manual Download and Update(Timing to Apply : Manual)	Yes
Manual Download and Update(Timing to Apply : Automatic)	No

T-2-142

No.2

Q: When installing firmware, does it take less time in “manual download and update” compared to “update via SST”?

A: It depends on the number of devices to update firmware.

When updating the firmware on a device, it takes more time in “manual download and update” compared to “update via SST” (It depend on network environment.).

As for the time to update firmware to multiple devices, “manual download and update” takes less time compared to “update via SST” because updating the firmware to multiple devices can be executed simultaneously.

No.3

Q: How can we confirm that the firmware is properly updated after “UGW-linked download and update” done?

A: You can confirm this in E-mail or the Device List on UGW-linked screen.

E-mail to notify firmware update will be sent from CDS server to the addresses set as destinations at the time of distribution setting to notify update completion.

On UGW-linked screen, search the device of your interest on [Select Device] screen to find the distribution status per device as shown in the search result.

No.4

Q: In the course of “UGW-linked download”, what will happen if the user downloads the firmware before the service technician update the firmware downloaded with “UGW-linked download” before?

A: The previously downloaded firmware in the method of “UGW-linked download” will be overridden by the subsequently downloaded one.

This is because only one downloaded firmware can be held on the device.

The firmware downloaded in the method of “Service mode-linked download” and “UGW-linked download” can be checked/deleted from [Settings/Registration] screen, but cannot be updated, so it cannot be updated by the user unnoticed by the service technician.

No.5

Q: What happens if the user registers another distribution schedule when the distribution schedule has been set in “manual download and update”?

A: The distribution schedule subsequently registered by the user will override the existing schedule. This is because only one distribution schedule can be held. Any existing distribution schedule is deleted and the newly registered distribution schedule is made valid.

No.6

Q: How is an individual response edition of firmware distributed?

A: Any individual response edition of firmware can be installed in all the methods provided by service technicians. Before installing the individual response edition, ensure to obtain the ID and password separately.

No.7

Q: If the device is down during firmware update, can the device be started using the older firmware version?

A: No, it is impossible to start the device using older versions. If this occurs, the service technician in charge should reinstall the firmware via SST. See the section of “Troubleshooting on Firmware Installation” under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual for more detailed information.

No.8

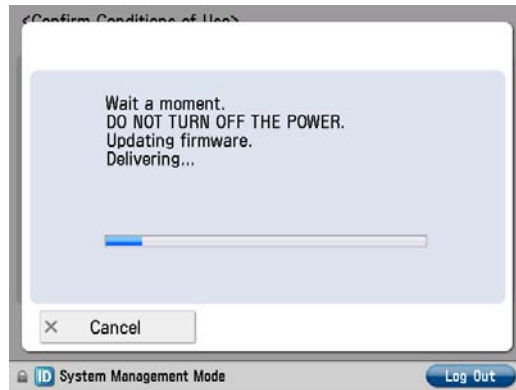

Q: If the device is down during firmware download, is it possible to download the firmware again?

A: Firmware cannot be downloaded again automatically. Instead, the error is notified in E-mail. The user should register the firmware distribution schedule again accordingly.

No.9

Q: Can we cancel the operation during firmware download?

A:Yes. [Cancel] button is shown.

F-2-491

No.10

Q: E-mail is sent to users to notify update completion. Can service technicians also receive such a notification?

A:Yes. The notification E-mail is also set for the service technician in charge if the user enters his/her E-mail address at the time of firmware distribution setting.

Multiple E-mail addresses can be entered in the field.Delimit each E-mail address with “,” (comma) or “;” (semicolon) when you enter multiple E-mail addresses in the field.

No.11

Q: How long does the firmware update take?

A:Approx. 30 min. However, this does not include the download time. Download time relies on the network environment.

FAQ on Installing MEAP Application/System Option

No.1

Q: What happens if a MEAP application is installed in the system with insufficient HDD free space?

A:An error message is shown. Upon starting installation, the MEAP application checks the required space against free space to judge installation availability.

No.2

Q: Can we cancel the operation during installation of MEAP application?

A:Yes: [Cancel] button is shown.

No.3

Q: Is the device automatically restarted after the system option is enabled?

A:The device is not automatically restarted. Users should restart the device manually.

FAQ on General Matters of Updater

No.1

Q: What preparation is needed in each installation method?

A: See the table below for preparation required in each installation method.

- For updating firmware

Installation Method	Setting Sales Company's HQ	Network Settings	Enabling UGW Link	Enabling [Update Firmware] Button of User Mode	Enabling [Manual Update] Button of User Mode (Remote UI)
UGW-linked Download and Update	Yes	Yes	Yes	-	-
UGW-linked Download	Yes	Yes	Yes	-	-
Manual Download and Update	Yes	Yes	-	-	-
Manual Download and Update via Local UI	Yes	Yes	-	Yes	-
Manual Download and Update via Remote UI	Yes	Yes	-	Yes	-
Special Download and Update via Remote UI	Yes	-	-	-	Yes

T-2-143

- For install Application

Installation Method	Network Settings	Enabling [Install Application/Options] Button of User Mode
LMS-linked Installation	Yes	-
LMA-linked installation via Local UI	Yes	Yes
LMS-linked installation via Remote UI	Yes	Yes

T-2-144

No.2

Q: How can operations using Updater be masked on the users' side?

A: Be sure to perform the following from the service mode.

- Masking Firmware Installation

Setting Device Service Mode (Level 1)	COPIER >OPTION >FNC-SW >CDS-FIRM (1 -> 0)
Setting Device Service Mode (Level 1)	COPIER >OPTION >FNC-SW >LOCLFIRM (1 -> 0)

- Masking Application Installation

Setting Device Service Mode (Level 1)	COPIER >OPTION >FNC-SW >CDS-MEAP (1 -> 0)
---------------------------------------	---

No.3

Q: Can the communication be cancelled during the communication test?

A: Yes. During the communication test, "Cancel" button is displayed.

DCM

DCM

Overview

DCM (Device Configuration Management) is a function to migrate the device settings information (e.g.: Settings/Registration Basic Information and Service Mode Settings). In terms of the description in the User's Guide, it is synonymous with "Import/Export All". Service mode setting values can be exported from the screen of service mode.

While the existing method supported only the case of backing up setting values for the same machine, DCM now supports the following 3 cases:

- The same machine (backup for the purpose of providing against emergency)
- A different machine of the same model (setting values are migrated collectively to multiple machines when replacing a host machine)
- A different model (e.g.: the setting values are copied from an old model to a new model)

Items to be Exported

The following shows the items to be exported.

Only setting values are exported. Image data such as scanned image cannot be exported.

	Export by remote UI	Export by service mode
Settings/Registration Basic Information	Yes	-
Paper Type Management Settings	Yes	-
Forwarding Settings	Yes	-
Box Settings	Yes	-
Department ID Management Settings	Yes	-
Main Menu Settings	Yes	-
Web Access Settings	Yes	-
Favorite Settings	Yes	-
Address Book	Yes	-
Quick Menu Settings	Yes	-
MEAP Application Setting Information	Yes	-
User Setting Information	Yes	-
Workflow Composer Settings	Yes	-
Service Mode Settings	Yes *	Yes

T-2-145

* Not exported by default in the case of export by remote UI

For items to be imported, refer to "List of items which can be imported".

Method of Import/Export

The following shows the methods to import/export DCM files.

- Import/Export by remote UI
- Import/Export by service mode
- Import/Export using iW Management Console DCM Plug-in

Store the backup data in the following location.

- Export by remote UI > PC
- Export by service mode > USB flash drive/internal HDD

Even if data has been exported by one method, it can be exported by another one. (E.g.: Data which was exported by remote UI can be imported by service mode)

For details of iW Management Console DCM Plug-in, refer to the e-Manual of iW Management Console DCM Plug-in.

Limitations on DCM General

- With DCM, stored data in Box, MEAP application, and system option license cannot be migrated.
- A DCM file exported to the internal HDD is not deleted even when the machine is restarted. Only 2 files at a maximum are stored in HDD. When there are more than 2 files, the oldest file are deleted.
- After importing a file, the machine must be restarted. If executing import without restart, NG is displayed and a file is not imported. This operation is not guaranteed.
- When importing DCM file including "Service Mode Settings" and "Settings/Registration Basic Information" separately, perform it in the following procedures.
 1. Perform the import of the DCM file including "Service Mode Settings" earlier
 2. Restart the host machine
 3. Import the DCM file including "Settings/Registration Basic Information"
- As include "Service Mode Settings", if the process is not completed within 5 minutes in the case of export and 15 minutes in the case of import, the item performed at that time is continued until it ends, but the final result becomes ERROR.
- DCM files to which no password is set when exporting by service mode cannot be loaded from collective import by remote UI. When assuming to perform collective import by remote UI, password must be set to data to be exported.

- Following limitations are applied to password for DCM file.
 - Character string of software keyboard: 0 to 32 characters
 - No password is set when 0 character is entered (The setting in which no password is set is allowed only export by service mode)
 - No space is allowed in the middle of a password
 - Password is case sensitive
- At the time of following setting, host machine does not recognize USB flash drive. The DCM function is not usable, too.
 - [Settings/Registration] > [Preferences] > [External Interface] > [USB Settings] > [Use MEAP Driver for External USB Device] = "On"

■ Limitations about Import/Export by Remote UI

- An import/export process ends with error while the following specific job is executed.
 - Executing/waiting any jobs (sending, forwarding, receiving i-fax, printing reports, functions specified by the Delayed Send mode)
 - During an Import/Export Individually operation
 - Viewing the address book using the Remote UI from another imagePRESS series
 - Delivering the device information
 - While error is occurring
 - Backing up inbox data
- If this function is executed with a print job simultaneously, it affects the operation such as; UI is locked, or a print job is cleared by restart after import. So it requires careful operation.
- A device rejects an import/ export request during shutdown.
- If this function is executed with device information distribution or remote UI import/ export (Individually) simultaneously, the first coming job takes priority and they are controlled exclusively.
- If this function is executed with a firmware update by a CDS (Updater) simultaneously, a firmware update process takes priority, and this function is stopped temporarily by restart.
- When error code is issued, this function ends with error.
- If the display language before import differs from that after import, a setting value of a text corrupts in some cases. The character corruption can be solved by changing the display language to the appropriate one.

■ Export All by Remote UI

Changing the value of a related service mode item can include items of "Service Mode Settings" in a DCM file that is to be exported by remote UI.

A DCM file exported by remote UI can also be imported by service mode without using remote UI.

For details of import/export by remote UI, refer to the this machine's e-Manual.

Preparation

PC and web browser

USB flash drive to store the data of reference machine

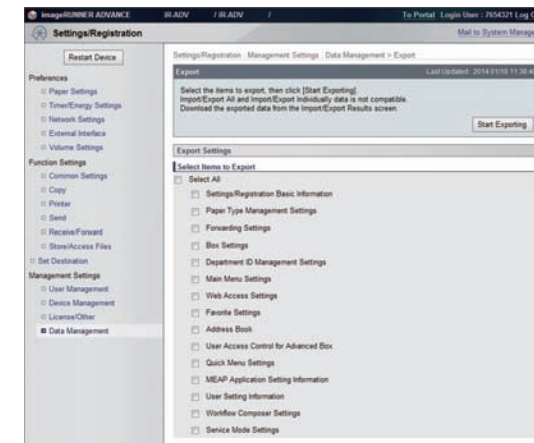

Overall flow

1. Complete the device setting as a reference machine.
2. Change the setting value of the following service mode to [1] to display "Service Mode Settings" on remote UI.

Service mode L1 > Copier > Option > USER > SMD-EXPT

- [0]: Hide the "Service Mode Settings" (Def.)
- [1]: Display the "Service Mode Settings"

3. Export including "Service Mode Settings" from remote UI.

F-2-492

4. Copy the DCM file to the root folder of the USB flash drive using a PC.
5. Connect the USB flash drive to the copy destination machine.
6. Execute import by specifying the target files from [RESTORE] in service mode. (Refer to "Import Procedure" of "Import/Export by Service Mode (External)")

■ Import/Export by Service Mode (External)

Import/export by service mode allows the selection between USB flash drive and internal HDD for the save destination of DCM files.

The procedure of import/export when USB flash drive is selected is shown below.

The DCM files to be exported contain only the items of "Service Mode Settings"

The DCM files to be imported can have been exported either by service mode or by remote UI.

● Export Procedure

Preparation

USB flash drive

* Required when exporting to USB flash drive.

It needs to have been formatted to be recognized by the device. No firmware registration is necessary.

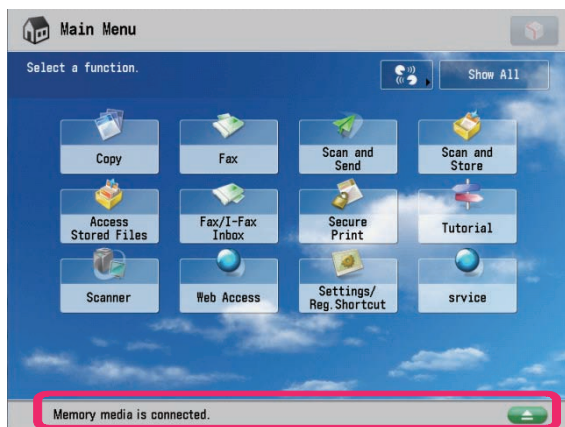

Overall flow

Here, a method to export to a USB flash drive is mentioned below.

- (1) Select USB flash drive as save destination (LIST=1)
- (2) Set the password
- (3) Export to USB flash drive
- (4) Remove USB flash drive

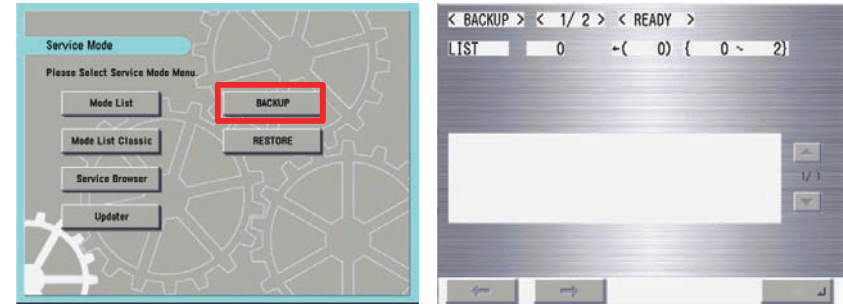

Procedure

1. Connect the USB flash drive and check that it has been mounted.

F-2-493

2. Log in to service mode and press [BACKUP].

F-2-494

3. Select [LIST] after the screen moves to <BACKUP>.

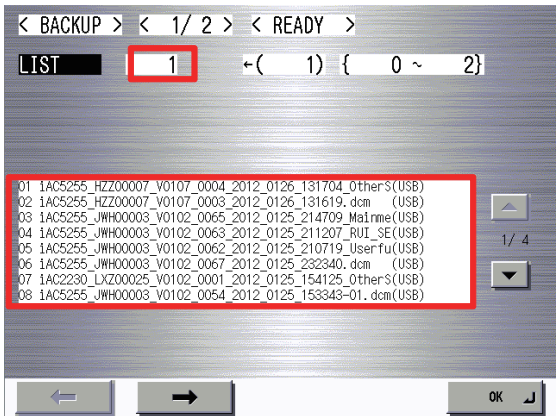

F-2-495

4. When saving to USB flash drive, enter "1" and press [OK].

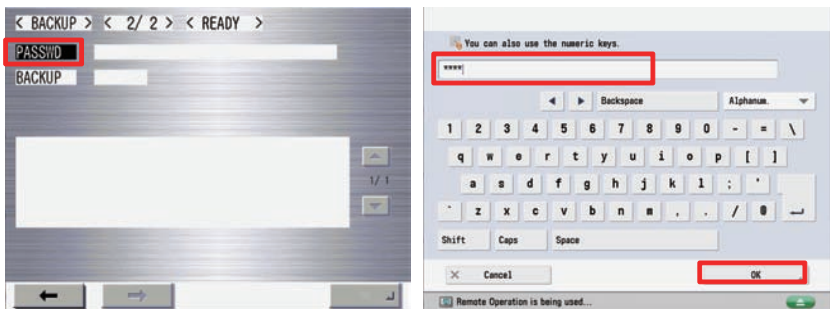

F-2-496

5. The names of DCM files saved in USB flash drive are displayed. Press [->].

F-2-497

6. Select [PASSWD], enter a password from the software keyboard, and then press [OK].

F-2-498

Note:

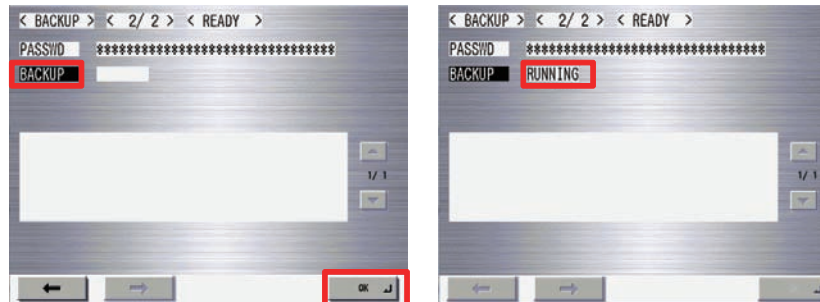

Limitations regarding the password

- Character string of software keyboard: 0 to 32 characters
- No password is set when 0 character is entered
- No space is allowed in the middle of a password
- Password is case sensitive

Limitations regarding the DCM file no password

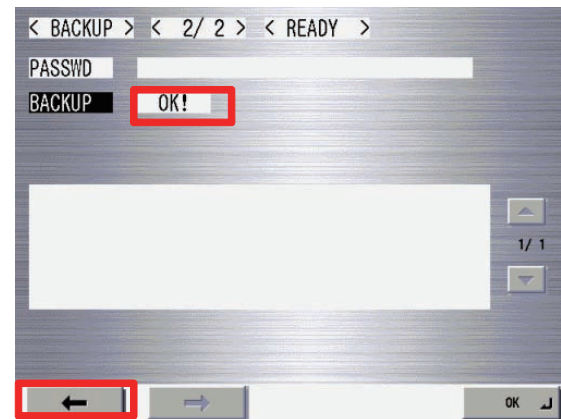

DCM files exported without password can only be imported by service mode. They cannot be imported by remote UI.

7. After entering the password, select [BACKUP]. Press [OK] to execute export.

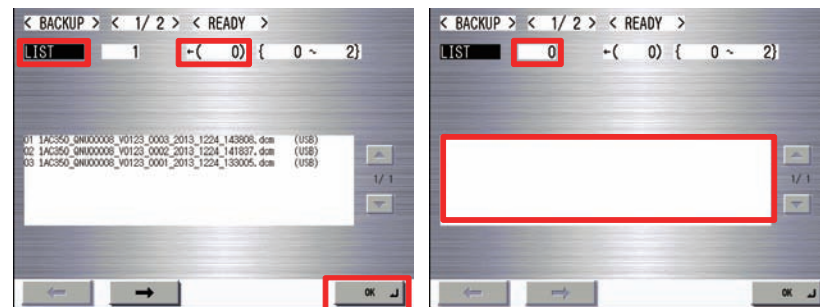

F-2-499

8. "OK!" is displayed in the status column when the processing is successfully completed. Press [->].

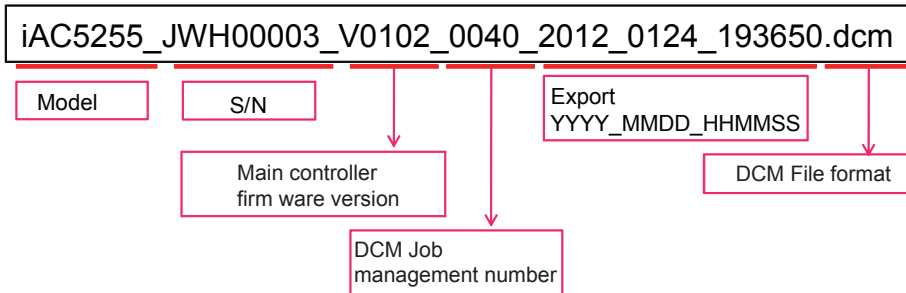

F-2-500

9. Select [LIST], enter "0" and press [OK]. Unmount the USB flash drive. It can also be removed by pressing the Remove button on the main menu.

F-2-501

F-2-502

● Import Procedure

Preparation

USB flash drive

Note:

- It needs to have been formatted to be recognized by the device. No firmware registration is necessary
- When necessary, copy the files which you want to import using a PC in advance. Be sure to store them in the root folder of the USB flash drive
- Do not change the extension from ".dcm" (only ".dcm" files can be recognized)
- It is desirable to connect the USB flash drive before entering service mode

Overall flow

Procedure for importing from USB flash drive.

- (1) Select USB flash drive as save destination (LIST=1)
- (2) Select the saved DCM file
- (3) Enter the password
- (4) Import from USB flash drive
- (5) Remove USB flash drive

Procedure

1. Connect the USB flash drive.
2. Log in to service mode and press [RESTORE].

F-2-503

3. Select [LIST] after the screen moves to <RESTORE>.

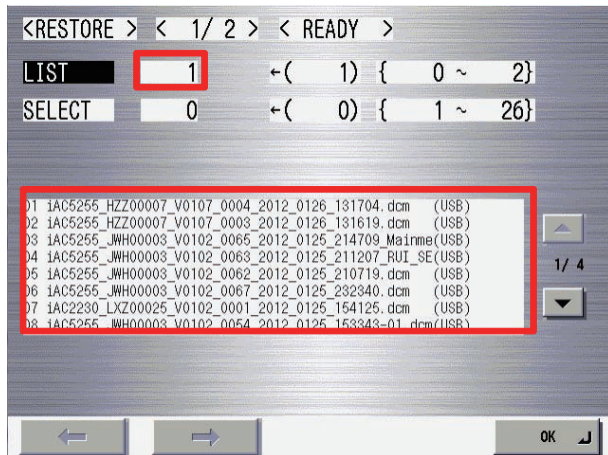

F-2-504

4. When referring to USB flash drive, enter "1" and press [OK].

F-2-505

5. The names of DCM files saved in USB flash drive are displayed.

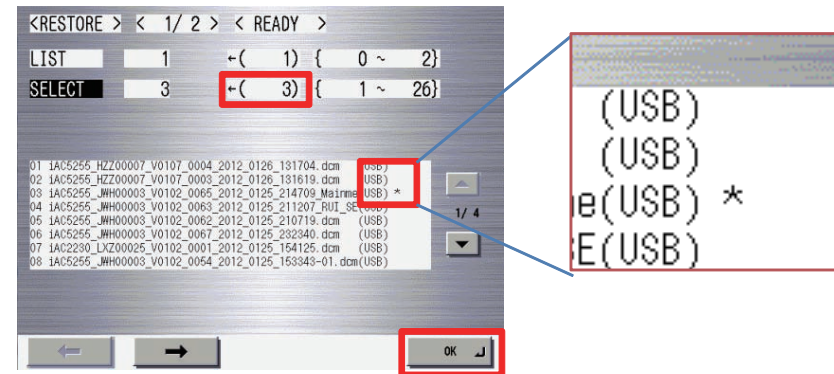

F-2-506

6. Select [SELECT].

Enter the selection number displayed on the left side of the file to be selected and press [OK].
 "*" is displayed on the right side of the file to indicate that the file has been selected.

F-2-507

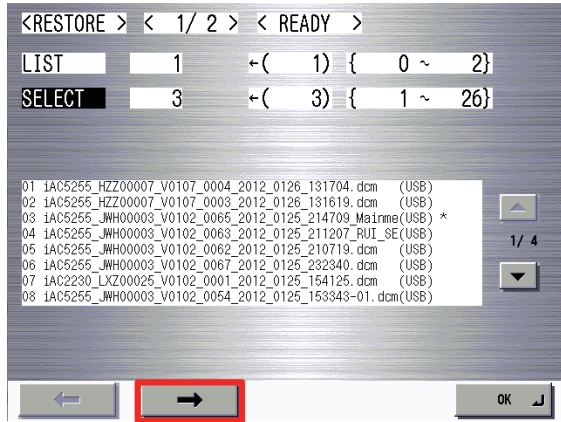

F-2-508

Note:

Up to 8 DCM files are displayed in one screen. It is necessary to switch screens when there are more than 8 files.

7. When the correct file is displayed, press [->].

F-2-509

8. Select [PASSWD], enter a password from the software keyboard, and then press [OK].

F-2-510

F-2-511

Note:

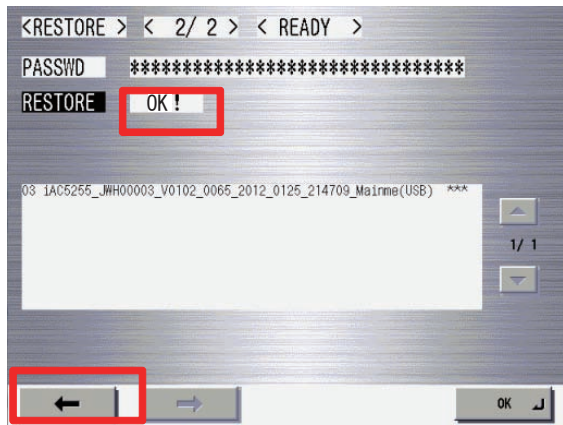

"<- " is displayed on the right side of the file to indicate that the selection of the file has been confirmed.

"****" is displayed after the password is entered.

9. After entering the password, select [RESTORE]. Press [OK] to execute import.

10. "OK!" is displayed in the status column when the processing is successfully completed. Press [-].

11. Select [LIST], enter "0" and press [OK]. Unmount the USB flash drive. It can also be removed by pressing the Remove button on the main menu.

F-2-514

Import/Export by Service Mode (Internal)

Import/export by service mode allows the selection between USB flash drive and internal HDD for the save destination of DCM files.

The procedure of import/export when internal HDD is selected is shown below.

It can be used when recovering the initial status after having tried multiple setting changes temporarily for troubleshooting, etc.

Note:

- DCM must not be used when replacing PCBs. Be sure to perform backup of DCON/ RCON in service mode
- Maximum of 2 files can be saved in the host machine's HDD

Export Procedure

Preparation

There is no need to newly prepare for saving to internal HDD.

Overall flow

Here is a procedure for exporting to internal HDD.

1. Select internal HDD as save destination (LIST=2)
2. Set the password
3. Export to internal HDD

Procedure

1. Log in to service mode and press [BACKUP].

F-2-515

2. Select [LIST] after the screen moves to <BACKUP>.

F-2-516

3. When saving to the internal HDD, enter "2" and press [OK].

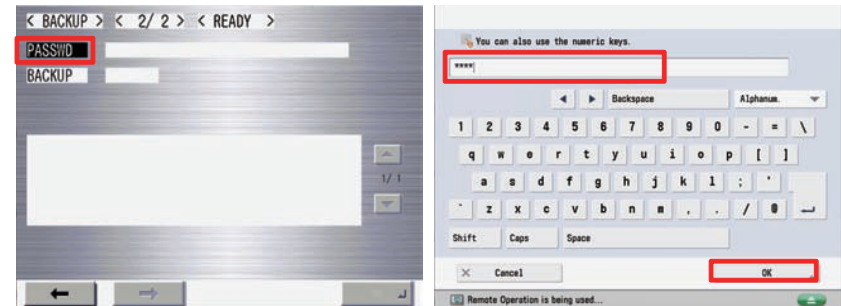

F-2-517

4. The names of DCM files saved in internal HDD are displayed. Press [->].

F-2-518

5. Select [PASSWD], enter a password from the software keyboard, and then press [OK].

F-2-519

Note:

Limitations regarding the password

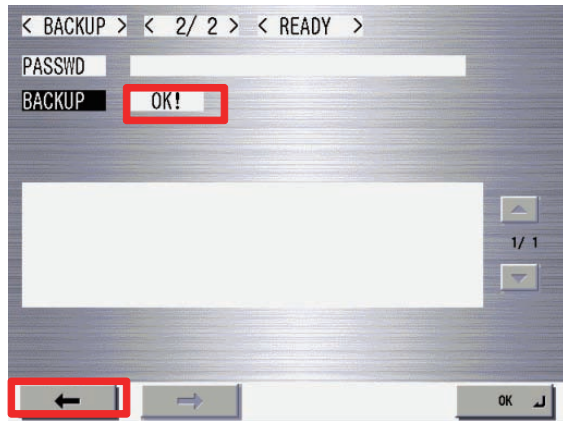

- Character string of software keyboard: 0 to 32 characters
- No password is set when 0 character is entered
- No space is allowed in the middle of a password
- Password is case sensitive

6. After entering the password, select [BACKUP]. Press [OK] to execute export.

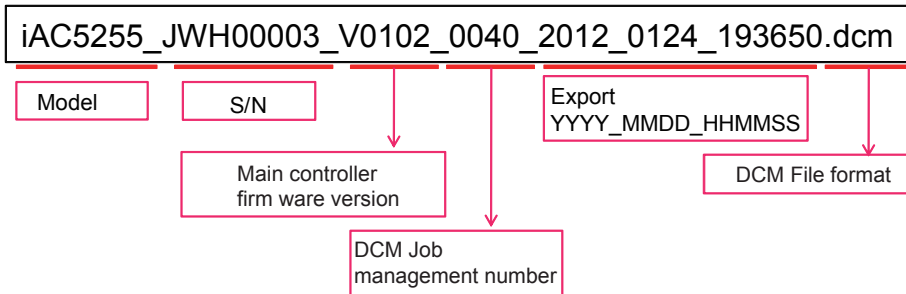

F-2-520

7. "OK!" is displayed in the status column when the processing is successfully completed. Press [-].

F-2-521

Reference:

F-2-522

● Import Procedure

Preparation

There is no need to newly prepare for saving to internal HDD.

Overall flow

Here is a procedure for Importing from internal HDD.

- (1) Select internal HDD as save destination (LIST=2)
- (2) Select the saved DCM file
- (3) Register password
- (4) Import from the internal HDD

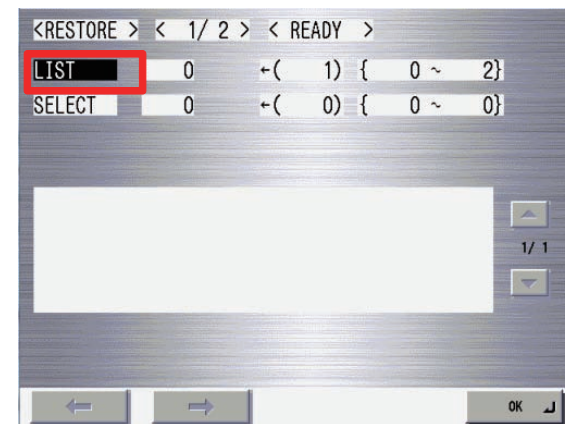

Procedure

1. Log in to service mode and press [RESTORE].

F-2-523

2. Select [LIST] after the screen moves to <RESTORE>.

F-2-524

3. When referring to internal HDD, enter "2" and press [OK].

F-2-525

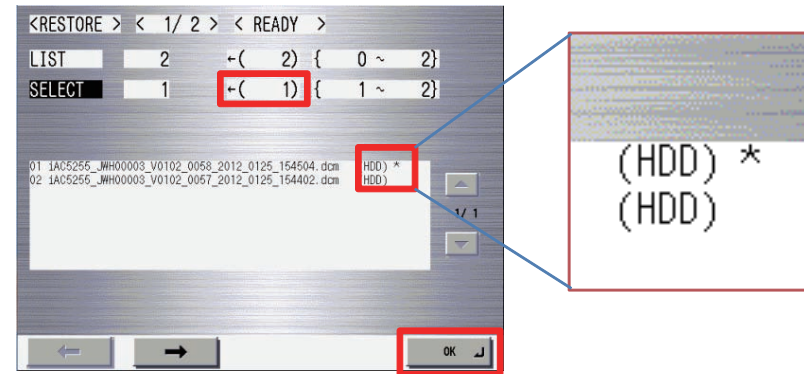

4. The names of DCM files referred to in internal HDD are displayed.

F-2-526

5. Select [SELECT].

Enter the selection number displayed on the left side of the file to be selected and press [OK].
" *" is displayed on the right side of the file to indicate that the file has been selected.

F-2-527

6. When the correct file is displayed, press [->].

F-2-528

7. Select [PASSWD], enter a password from the software keyboard, and then press [OK].

F-2-529

8. After entering the password, select [RESTORE]. Press [OK] to execute import.

F-2-531

9. "OK!" is displayed in the status column when the processing is successfully completed. Press [←].

F-2-530

F-2-532

Note:

- "<-" is displayed on the right side of the file to indicate that the selection of the file has been confirmed.
- "*****" is displayed after the password is entered.

List of items which can be imported

The following shows the items to be imported for this model.

Note that the setting values are not imported in cases such as below:

- Items which are originally not included in a DCM file (E.g.: "Settings/Registration Basic Information" of a DCM file exported by service mode)
- Items not defined in the target import range (below cases A through C)
- The options and functions related to the setting values do not exist

The following cases may be possible for the Import function.

	Target import range	Description
Case A	The same machine	Import to the same machine (on the assumption of backup and restoration)
Case B	The same model	Import to a different machine of the same model (the same series)
Case C	Different model	Import to a different machine of a different model (a different series)

T-4-53

Main Controller System

Removing the Upright Control Panel Unit

F-4-55

Procedure

1) Remove the Control Panel Rear Cover 2 [1].

- 2 Rubber Caps [2]
- 2 Screws [3]

2x

F-4-56

2) Remove the Control Panel Rear Cover 3 [1].

- 1 Hook [2]

F-4-57

3) Remove the Hinge Upper Cover [1].

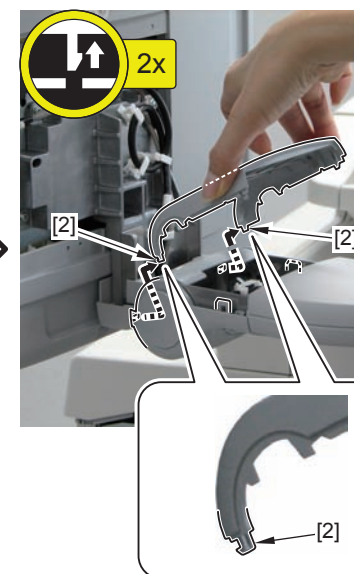

- 4 Claws [2]

2x

2x

F-4-58

NOTE: How to install the Hinge Upper Cover

The Hinge Upper Cover [1] cannot be installed if the Upright Control Panel Unit is not in an upright position. Therefore, if angle of the hinge has been changed, be sure to put the unit back in the upright position.

4) Remove the Hinge Lower Cover [1].

- 2 Screws [2]
- 2 Bosses [3]

F-4-59

5) Remove the Hinge Inner Cover [1].

- 4 Claws [2]

F-4-60

6) Disconnect the Control Panel Cable [1].

- 1 Connector [2]
- 1 Reuse Band [3]
- 3 Wire Saddles [4]

F-4-61

7) Disconnect the Power Supply Cable [1].

- 1 Connector [2]
- 1 Screw [3]
- 1 Cable Clamp [4]

F-4-62

8) Disconnect the Power Supply Cable [1] and the Control Panel Cable [2].

- 4 Wire Saddles [3]

CAUTION:

At installation, be sure to secure the part of the Power Supply Cable [1] between the 2 tie-wraps [4] with the Wire Saddle [3].

F-4-63

9) Remove the Upright Control Panel Unit [1].

- 2 Screws [2]

F-4-65

F-4-64

Removing the Upright Control Panel Arm Unit

F-4-66

Preparation

- 1) Removing the Box Left Cover (Refer to page 4-458)
- 2) Removing the Box Right Cover. (Refer to page 4-456)
- 3) Removing the Box Upper Cover. (Refer to page 4-458)

Procedure

- 1) Remove the Arm Rear Cover [1].
 - 1 Screw (TP) [2]
 - 2 Screws (Tapping) [3]
 - 2 Bosses [4]

F-4-67

- 2) Remove the Base Rear Cover [1] and the Base Front Cover [2].
 - 1 Screw (TP) [3]
 - 2 Screws (Tapping) [4]
 - 2 Claws [5]

F-4-68

CAUTION:

Be sure that the Control Panel Cable [6] and the Power Supply Cable [7] do not cover the screw hole [C] at installation.

F-4-69

NOTE: How to install the Base Rear Cover [1] and the Base Front Cover [2]

1) Put the [A] part of the Base Front Cover [2] in the [B] part which is inside the Arm Lower Cover.

2) Install the Base Rear Cover [1].

- 2 Claws [5]
- 1 Screw (TP) [3]
- 2 Screws (Tapping) [4]

F-4-70

3) Remove the Right Upper Rear Cover [1].

- 1 Screw [2]

F-4-71

4) Disconnect the Control Panel Cable [1].

- 1 Connector [2]
- 10 Wire Saddles [3]

CAUTION:

At installation, do not secure the Reuse Band [4] in place.

At installation, be sure to secure the Control Panel Cable [1] so that the Reuse Band [4] is located as shown in the figure.

F-4-72

NOTE: How to route the Control Panel Cable

Be sure to allow extra slack of the cable at the [A] part for opening and closing the Controller Box.

F-4-73

5) Disconnect the Power Supply Cable [1] of the Upright Arm.

- 1 Connector [2]
- 1 Wire Saddle [3]
- 1 Reuse Band [4]

F-4-74

6) Disconnect the Power Supply Cable [1].

- 1 Screw [2]
- 1 Cable Clamp [3]

CAUTION:

When securing the cables with the Cable Clamp [3] at installation, be sure to secure them with the Power Supply Cable [1] on the host machine side.

F-4-75

7) Disconnect the Control Panel Cable [1] and the Power Supply Cable [2].

- 1 Reuse Band [3]
- 1 Edge Saddle [4]
- 1 Wire Saddle [5]

F-4-76

NOTE: How to route the Control Panel Cable and the Power Supply Cable
Be sure to route the Control Panel Cable [1] and the Power Supply Cable [2] from the rear side of the host machine.

F-4-77

8) Remove the Upright Control Panel Arm Unit [1].

- 2 Screws [2]

F-4-78

Removing the HDD

F-4-79

Actions before Replacement(see Chapter 5, "HDD.")

Backup the Settings/Registration data.

- 1) Select the following so that the service mode setting values can be exported on remote UI.
Service mode (Lv1) > Option > USER > SMD-EXPT > [1]
- 2) Execute the collective export on remote UI.
 - 2-1) Settings/Registration > Management Settings > Data Management > Import/Export All > Export
 - 2-2) Settings/Registration > Management Settings > Data Management > Import/Export Individually
 - 2-3) Settings/Registration > Management Settings > Data Management > Back Up

CAUTION:

Collective export cannot be executed in the following cases.

- Job is being executed, or job is being waited for (various functions set by transmission, forwarding, fax reception, I-FAX reception, report print and timer)
- Individual import/export is being executed
- The address book is being remotely referenced by another imageRUNNER ADVANCE
- Device information is being distributed
- An error has occurred
- Box is being backed up

Procedure

1) Push the [A] part to open the HDD Cover [1].

F-4-80

2) Open the HDD Cap.[1].

- 1 Screw [2]

F-4-81

3) Disconnect the 2 connectors [1] of the HDD, and free the 2 harnesses [2].

- 1 Wire Saddle [3]
- 1 Edge Saddle [4]

4) Remove the screw [5].

F-4-82

CAUTION:

Be sure not to deform the [A] part of the Grounding Plate.

F-4-83

- 5) Pull out the HDD Unit [2] while avoiding contact with the gasket [1].
 6) Free the harness [3] from the [A] part, and remove the HDD Unit [2].

F-4-84

- 7) Remove the HDD [2] from the HDD Unit [1].
 • 4 Stepped Screws [3]

CAUTION:

Be sure to perform the work while supporting the HDD [2] by hand to prevent it from falling.

F-4-85

■ Actions after Replacement(see Chapter 5, "HDD.")

1)HDD format

- 1-1) Start the machine in safe mode (turn ON the main power switch while simultaneously pressing 2+8 keys).
- 1-2) Execute Formatting All Partitions using SST.

2)Download the system software (refer to Upgrade).

3)Initialize the key/certificate/CA certificate.

(Lv.2) COPIER > FUNCTION > CLEAR > CA-KEY

4)Turn OFF and then ON the power.

5)Restore the backup data.

Use the remote UI. Follow the steps below to specify the DCM file stored earlier.

- 5-1) Settings/Registration > Management Settings > Data Management > Import/Export All > Import
- 5-2) Settings/Registration > Management Settings > Data Management > Restore
- 5-3) Settings/Registration > Management Settings > Data Management > Import/Export Individually
- 5-4) Restore of MEAP: SST(Meapback)

6)When the user generates and adds the encryption key, certificate and/or CA certificate, request the user to generate them again.

7)Executing "Auto Adjust Gradation (Full Adjust)" Settings/Registration mode: Adjustment/Maintenance > Adjust Image Quality > Auto Adjust Gradation

Points to note when using an HDD with system software already installed

Use of an HDD in which the system software of another machine (a machine of a different serial number) is installed for a troubleshooting is possible if it is an HDD of a model of iR-ADV C5255 series and later. However, be sure to format it after installing it. Operation is not guaranteed if it is continued to be used as is. At installation, HDD must be formatted. Therefore, it is not recommended to use an HDD which has been used with another machine. If you use an HDD which has been used with another machine, be sure to get agreement from user in advance that user data will be deleted.

In addition, an HDD used in iR-ADV C5255 series and later cannot be accessed from a PC due to enhanced security.

"1" of the leading card.)

2)After turning OFF and ON the main power switch, perform the following operations from Settings/Registration mode.

- In Management Settings > User Management > Department ID Management > Page Totals, be sure that "ID00000001" to "ID00001000" are created.
- Set the following: Preferences > Network > TCP / IP Settings > IPv4 Settings>IP Address Settings > IP Address, Gateway Address, Subnet Mask
- In Management Settings > User Management> System Manager Information Settings> System Manager ID and System PIN, register any number for them. Then, turn OFF and ON the main power switch.

If "System Manager ID" and "System PIN" are not registered, "card registration to device" cannot be executed for the imageWARE Accounting Manager setting operation.

3)Download the card ID from imageWARE Accounting Manager to the Main Body again.

4)After downloading is completed, go to Management Settings > User Management > Department ID Management > Page Totals. Be sure that only the downloaded card ID is displayed.

5)Print using the user card registered from imageWARE Accounting Manager. Be sure that the card information used for the target devices of imageWARE Accounting Manager is collected.

● When using the Card Reader and imageWARE Accounting Manager

1)Go to COPIER > FUNCTION> INSTALL > CARD and enter the numerical value of the leading card which is used for Department ID.

Then, press "OK" button. (e.g.: If No.1 to No.1000 cards are used for Department ID, enter

Removing the Main Controller PCB 1

F-4-86

Actions before Replacement(see Chapter 5, "Main controller PCB 1.")

Backup the Settings/Registration data.

1)Execute the collective export on remote UI.

Settings/Registration > Management Settings > Data Management > Import/Export Individually

Preparation

1)Removing the Box Right Cover (Refer to page 4-456)

Disassembling Procedure

1)Disconnect the USB Cable [1] and the Control Panel Cable [2].

F-4-87

2)Remove the 2 screws [1].

F-4-88

CAUTION:

When replacing the boards installed on the Main Controller PCB 1, remove the Main Controller PCB 1 and place it on a flat surface for the work.

F-4-89

3) Remove the Main Controller PCB 1 [3] while holding the handle [1] and avoiding contact with the harness [2].

F-4-90

Assembling Procedure

CAUTION:

- When replacing the PCB, be sure to transfer any optional PCBs installed on the old Main Controller PCB 1 to the new PCB.
- When assembling, be sure to install the Main Controller PCB 1 while paying attention not to trap the cables [1].

F-4-91

- 1) While holding the handle [1] and avoiding contact with the harness [2], insert the Main Controller PCB 1 [3] halfway into the host machine.

F-4-92

- 2) Release the 2 Lock Levers [1], and uniformly push in the Main Controller PCB 1 [2] with both hands until it stops.

F-4-93

- 3) Turn over the 2 Lock Levers [1], and push in and secure the Main Controller PCB 1 [2].
- 2 Screws [3] (Removed in step 2. Install the lower one first and then the upper one.)

CAUTION:

Be sure to perform the work in the order from (1) to (4) in the figure because the Inner Connector of the Main Controller PCB 1 may not be connected.

F-4-94

■ Actions after Replacement(see Chapter 5, "Main controller PCB 1.")

- 1) Restore the backup data.
- Use the remote UI. Follow the steps below to specify the DCM file stored earlier.
- Settings/Registration > Management Settings > Data Management > Import/Export Individually

Removing the Main Controller PCB 2

F-4-95

Actions before Replacement(see Chapter 5, "Main controller PCB 2.")

Backup the Settings/Registration data.

- 1) Select the following so that the service mode setting values can be exported on remote UI.
Service mode (Lv1) > Option > USER > SMD-EXPT > [1]
- 2) Execute the collective export on remote UI.
 - 2-1) Settings/Registration > Management Settings > Data Management > Import/Export All > Export
 - 2-2) Settings/Registration > Management Settings > Data Management > Import/Export Individually
- 3) Backup of SRAM(with HDD Encryption Board): SST(Sramimg)

CAUTION:

Collective export cannot be executed in the following cases.

- Job is being executed, or job is being waited for (various functions set by transmission, forwarding, fax reception, I-FAX reception, report print and timer)
- Individual import/export is being executed
- The address book is being remotely referenced by another imageRUNNER ADVANCE
- Device information is being distributed
- An error has occurred
- Box is being backed up

Preparation

- 1) Removing the Box Left Cover (Refer to page 4-458)

Disassembling Procedure

- 1) Disconnect the Reader Communication Cable [1], and release the 2 Lock Levers [2].

F-4-96

- 2) Remove the Main Controller PCB 2 [3] while holding the handle [1] and avoiding contact with the harness [2].

- 2 Screws [4]

F-4-97

Assembling Procedure

CAUTION:

- When replacing the PCB, be sure to transfer any optional PCBs installed on the old Main Controller PCB 2 to the new PCB.
- When assembling, be sure to install the Main Controller PCB 2 while paying attention not to trap the cables [1].

F-4-98

- 1) While holding the handle [1] and avoiding contact with the harness [2], insert the Main Controller PCB 2 [3] halfway into the host machine.

F-4-99

- 2) Release the 2 Lock Levers [1] in the direction of the arrows, and uniformly push in the Main Controller PCB 2 [2] with both hands until it stops.

F-4-100

- 3) Turn over the 2 Lock Levers [1], and push in and secure the Main Controller PCB 2 [2].
 - 2 Screws [3] (Removed in step 2. Install the lower one first and then the upper one.)

CAUTION:

Be sure to perform the work in the order from (1) to (4) in the figure because the connector of the Main Controller PCB 2 may not be connected.

F-4-101

■ Actions after Replacement(see Chapter 5, "Main controller PCB 2.")

1) Restore the backup data.

Use the remote UI. Follow the steps below to specify the DCM file stored earlier.

1-1) Settings/Registration > Management Settings > Data Management > Import/Export All > Import

1-2) Settings/Registration > Management Settings > Data Management > Import/Export Individually

2) Restore of SRAM(with HDD Encryption Board): SST(Sramimg)

3) When the user generates and adds the encryption key, certificate and/or CA certificate, request the user to generate them again.

4) Executing "Auto Adjust Gradation (Full Adjust)" Settings/Registration mode: Adjustment/Maintenance > Adjust Image Quality > Auto Adjust Gradation

CAUTION:

Do not transfer the following parts to another machine (a machine of a different serial number).

The machine will not start up normally, and may become unrecoverable in some cases.

- Main Controller PCB 1
- Main Controller PCB 2 (with the Memory PCB unremoved)
- Memory PCB

● Open the Controller Box

■ Preparation

- 1) Removing the Box Left Cover (Refer to page 4-458)
- 2) Removing the Box Upper Cover (Refer to page 4-458)

■ Procedure

- 1) Push the [A] part to open the HDD Cover [1].
- 2) Remove the 4 screws [2] from the Controller Box Unit.

F-4-102

CAUTION:

Do not install/remove the Controller Cover [3] while the Controller Box Unit [2] is open. Otherwise, the Controller Box Unit may be distorted.

F-4-103

CAUTION:

Do not trap the harness [A] when opening/closing the Controller Box Unit [2].

F-4-105

CAUTION:

Do not open the Controller Box Unit [2] 90 degrees or more due to the load being applied to the harness [A].

F-4-104

2) Close the HDD Cover [1], and open the Controller Box Unit [2] while pulling the harness [A].

F-4-106

Removing the DC Controller PCB

F-4-107

Actions before Replacement(see Chapter 5, "DC controller PCB.")

Backup of DC Controller PCB SRAM

COPIER > FUNCTION > SYSTEM > DSRAMBUP (LEVEL2)

"ACTIVE" is displayed and then "OK!" is displayed about 2 minutes later.

Turn OFF the main power when the above work is complete.

Preparation

- 1) Removing the Box Left Cover (Refer to page 4-458)
- 2) Removing the Box Upper Cover (Refer to page 4-458)
- 3) Open the Controller Box (Refer to page 4-107)

Procedure

- 1) Remove the DC Controller Cover [1].
 - 4 Screws [2] (to loosen)

F-4-108

- 2) Remove the DC Controller PCB [1] while lowering the harness [A].
 - 3 Wire Saddles [2]
 - 35 Connectors [3]

F-4-109

NOTE:

The completed assembly of the DC Controller PCB is shown below.

F-4-110

■ Actions after Replacement(see Chapter 5, "DC controller PCB.")

Restoration of DC Controller PCB SRAM

COPIER > FUNCTION > SYSTEM > DSRAMRES (LEVEL2)

"ACTIVE" is displayed at execution and then "OK!" is displayed about 2 minutes later.

Restoration is complete.

CAUTION:

When replacing the DC Controller PCB, be sure to use a new one. Do not use the DC Controller PCB which was used with another machine.

After replacing the DC Controller PCB, E101-0001 may occur due to a wrong combination of versions.

After replacing the DC Controller PCB, update it to an appropriate version if necessary in accordance with the versions of other PCBs.

● Removing the Relay PCB Unit

F-4-111

■ Preparation

1) Removing the Rear Lower Cover (Refer to page 4-463)

■ Procedure

1) Disconnect the connector [1] while pressing the [A] part, and remove the Fan Duct [2].

- 2 Screws [3]

F-4-112

2) Open the 17 Wire Saddles [1], and disconnect the 25 connectors [2] of the Relay PCB Unit.

F-4-113

3) Remove the Relay PCB Unit [1].

- 2 Screws [2]
- 1 Hook [3]

F-4-114

Removing the Main Power Supply Box

F-4-115

Preparation

- 1) Removing the Rear Lower Cover (Refer to page 4-463)
- 2) Removing the Relay PCB Unit (Refer to page 4-111)

Procedure

- 1) Remove the Right Lower Rear Cover 1 [1].
 - 1 Screw [2]
 - 2 Hooks [3]

F-4-116

2) Free the harness [1] from the 2 guides [A], and disconnect the Relay Connector [2].

- 7 Wire Saddles [3]
- 3 Connectors [4]

F-4-117

3) While avoiding the harness [1], remove the Main Power Supply Box [2].

- 3 Screws [3]

F-4-118

Removing the AC Driver Box

F-4-119

Preparation

- 1) Removing the Rear Lower Cover (Refer to page 4-463)
- 2) Removing the Front Left Cover. (Refer to page 4-459)
- 3) Removing the Decurler Unit (Refer to page 4-428)
- 4) Removing the Left Lower Rear Cover (Refer to page 4-462)

Procedure

1) While avoiding the harness [1], remove the Fixing Heat Fan Unit [2].

- 1 Connector [3]
- 1 Guide [4]
- 1 Screw (black) [5]
- 2 Screws [6]

F-4-120

NOTE: How to install the Fixing Heat Fan Unit
Be sure to align the cut-off [B] of the Fixing Heat Fan Unit with the plate [A] to install the unit.

F-4-121

2) Open the 11 Wire Saddles [1] and the Edge Saddle [3], and disconnect the 15 connectors [2].

NOTE:
When disconnecting the connectors [2], flip the sheet [4] as needed.

F-4-122

CAUTION:

When removing/installing the AC Driver Box, be sure not to deform the Grounding Plate [1].

F-4-123

3) Disconnect the connector [2] while pulling out the AC Driver Box [1], and then remove the AC Driver Box [1] while lifting the harness [3].

- 4 Screws [4]

F-4-124

NOTE:
The completed assembly of the AC Driver Box is shown below.

F-4-125

Removing the IH Power Supply PCB Box

F-4-126

Preparation

1) Removing the Rear Lower Cover (Refer to page 4-463)

Procedure

1) Disconnect the connector [1] while pressing the [A] part, and remove the Fan Duct [2].
• 2 Screws [3]

F-4-127

CAUTION:

When removing/installing the IH Power Supply PCB Box, be sure not to deform the Grounding Plate [1].

F-4-128

2) Remove the IH Power Supply PCB Box [2] while lowering the harness [1].

- 3 Connectors [3]
- 3 Wire Saddles [4]
- 1 Screw [5]
- 1 Hook [6]

F-4-129

Removing the Primary Charging High Voltage PCB Box

F-4-130

Preparation

1) Removing the Rear Lower Cover (Refer to page 4-463)

Procedure

1) Remove the Right Lower Rear Cover 1 [1].

- 1 Screw [2]
- 2 Hooks [3]

F-4-131

2) Remove the Handle Cover [1].

- 1 Claw [2]
- 1 Hook [3]

F-4-132

3) Lift the handle [1], and remove the Right Lower Cover [2].

- 2 Screws [3]

F-4-133

4) Remove the Fixation Plate [1].

- 1 Screw [2]
- 1 Boss [3]

F-4-134

5) Disconnect the 2 Relay Connectors [1], and free the harness [2].

- 2 Wire Saddles [3]
- 1 Edge Saddle [4]

F-4-135

6) Disconnect the 9 connectors [1] on the Primary Charging High Voltage PCB.

- 1 Relay Connector [2]
- 11 Wire Saddles [3]
- 1 Fasten Terminal [4]

F-4-136

7) Remove the plate [A], and remove the Primary Charging High Voltage PCB Box [1].

- 4 Screws [2]
- 2 Bosses [3]

F-4-137

NOTE: How to install the Primary Charging High Voltage PCB Box
Be sure to pass the harness [4] through the plate [B] and align the 2 [C] parts of the Primary Charging High Voltage PCB Box with the 2 plates [D] to install the box.

F-4-138

NOTE:

The completed assembly of the Primary Charging High Voltage PCB Box is shown below.

F-4-139

Removing the Pickup Feed Driver PCB Unit

F-4-140

Preparation

- 1) Removing the Rear Lower Cover (Refer to page 4-463)
- 2) Removing the Primary Charging High Voltage PCB Box (Refer to page 4-118)

Procedure

- 1) Open the 13 Wire Saddles [1] and disconnect the 18 connectors [2].
 - 2 Reuse Bands [3]

F-4-141

2) Remove the Pickup Feed Driver PCB Unit [1].

- 4 Screws [2]
- 2 Bosses [3]

F-4-142

NOTE:

The completed assembly of the Pickup Feed Driver PCB Unit is shown below.

F-4-143

Removing the Finisher Power Supply Unit (Option)

F-4-144

Procedure

- 1) Remove the Right Lower Rear Cover 1 [1].
 - 1 Screw [2]
 - 2 Hooks [3]

F-4-145

2) Open the Wire Saddle [1], and disconnect the 3 connectors [2].

F-4-146

3) Remove the Finisher Power Supply Unit [1].

- 4 Screws [2]

F-4-147

Removing the Fixing Feed Driver PCB

F-4-148

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

- 1) Remove the Fixing Feed Sub Cover [1].
 - 1 Screw [2] (to loosen)
 - 2 Hooks [3]

F-4-149

NOTE: How to install the Fixing Feed Sub Cover

Put the [A] part of the Fixing Feed Sub Cover under the Fixing Feed Front Left Cover [4].

F-4-150

3) Remove the Fixing Feed Driver PCB [1].

- 14 Connectors [2]
- 7 Screws [3]

F-4-152

2) Remove the Fixing Feed Front Right Cover [1].

- 4 Screws [2]
- 2 Bosses [3]

F-4-151

Removing the CIS Driver PCB

F-4-153

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Secondary Transfer Unit (Refer to page 4-193)
- 4) Removing the Registration Unit (Refer to page 4-412)

Procedure

- 1) Remove the CIS Driver PCB Unit [1].
 - 2 Screws [2]
 - 1 Edge Saddle [3]
 - 2 Connectors [4]

F-4-154

- 2) Remove the CIS Driver PCB [1].

- 5 Screws [2]

F-4-155

Removing the Color Sensor Driver PCB Unit (Option)

F-4-156

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Secondary Transfer Unit (Refer to page 4-193)
- 4) Removing the Pre-fixing Feed Unit (Refer to page 4-421)

Procedure

- 1) Remove the Color Sensor Cover [1].
 - 6 Screws [2]

F-4-157

- 2) Remove the Color Sensor Driver PCB Unit [1].

- 3 Screws [2]
- 1 Connector [3]

F-4-158

Laser Exposure System

Removing the Laser Scanner Unit

F-4-159

Preparation

NOTE:

When pickup system options are installed, be sure to disconnect them from the host machine as needed.

- 1) Removing the Front Left Cover. (Refer to page 4-459)
- 2) Removing the Decurler Unit (Refer to page 4-428)
- 3) Removing the Box Right Cover. (Refer to page 4-456)
- 4) Removing the Box Left Cover. (Refer to page 4-458)
- 5) Removing the Left Upper Cover. (Refer to page 4-460)
- 6) Removing the Box Upper Cover. (Refer to page 4-458)

NOTE:

Be sure to refer to the correct step according to the following instruction since the step differs depending on whether the Multi-purpose Tray Pickup Unit (option) is installed.

- If the Multi-purpose Tray Pickup Unit is not installed, refer to step 7-1.
- If the Multi-purpose Tray Pickup Unit is installed, refer to step 7-2.

- 7-1) Removing the Right Middle Front Cover 1. (Refer to page 4-455)
- 7-2) Open the Multi-purpose Tray Pickup Unit.
- 8) Removing the Right Upper Front Cover. (Refer to page 4-456)
- 9) Close the Multi-purpose Tray Pickup Unit. (If the Multi-purpose Tray Pickup Unit is installed)

NOTE:

Be sure to refer to the correct step according to the following instruction since the step differs between the copier model and the printer model.

- For copier model, refer to step 10-1.
- For printer model, refer to step 10-2.

10-1) Removing the DADF Unit + Reader Unit (for copier model) (Refer to page 4-469)

10-2) Removing the Printer Upper Cover (for printer model).

11) Open the Front Cover.

12) Removing the Toner Replacement Cover (Refer to page 4-453)

13) Close the Front Cover.

14) Removing the Toner Container Replacement Cover (Refer to page 4-453)

15) Removing the Upper Front Cover (Refer to page 4-452)

Procedure

1) Free the 2 harnesses [1].

- 2 Connectors [2]
- 2 Edge Saddles [3]
- 9 Wire Saddles [4]

F-4-160

2) Remove the 3 screws [1], and loosen the 2 Stepped Screws [2].

F-4-161

3) Unhook the 2 grooves [A] of the Control Panel Plate from the 2 Stepped Screws [1].

4) Move the Control Panel Plate [3] toward the front, and hook the 2 grooves [B] of the Control Panel Plate on the 2 Stepped Screws [1].

F-4-162

5) Remove the Top Plate Cover [1].

- 5 Screws [2]
- 4 Protrusions [3]

CAUTION:

Do not deform the 9 grounding contacts [A] of the Top Plate Cover when installing/removing.

F-4-163

F-4-164

NOTE: How to install the Top Plate Cover

Be sure to install the 4 protrusions [3] of the Top Plate Cover in the holes [A] of the plate.

F-4-165

NOTE:

Be sure to refer to the correct step according to the following instruction since the step differs depending on the Laser Scanner Units (Y), (M), (C), and (Bk).

- In the cases of Laser Scanner Units (Y), (M), and (C), refer to step 5-1, 6-1, 7-1.
- In the case of Laser Scanner Unit (Bk), refer to step 5-2, 6-2, 7-2.

In the cases of Laser Scanner Units (Y), (M), and (C)

NOTE:

This procedure shows the steps to be taken in the case of Laser Scanner Unit (Y). Disassemble and assemble the Laser Scanner Units (M), and (C) in the same way.

5-1) Free the harness connected to the Laser Scanner Unit (Y) [1].

- 1 Wire Saddle [2]
- 1 Connector [3]

F-4-166

6-1) Free the harness [2] on the right side and the harness [3] on the left side which are both connected to the Laser Scanner Unit (Y) [1].

F-4-167

7-1) Remove the Laser Scanner Unit (Y) [1].

- 3 Stepped Screws [2]
- 3 Washers [3]
- 3 Springs [4]
- 2 Bosses [5]

CAUTION:

Do not touch the PCB installed to the Laser Scanner Unit when disassembling/ assembling.

F-4-168

● In the case of Laser Scanner Unit (Bk)

5-2) Free the harness connected to the Laser Scanner Unit (Bk) [1].

- 1 Wire Saddle [2]
- 1 Connector [3]

F-4-170

F-4-169

6-2) Free the harness [2] on the right side and the harness [3] on the left side which are both connected to the Laser Scanner Unit (Bk) [1].

F-4-171

7-2) Remove the Laser Scanner Unit (Bk) [1].

- 3 Stepped Screws [2]
- 3 Washers [3]
- 3 Springs [4]
- 3 Bosses [5]

CAUTION:

Do not touch the PCB installed to the Laser Scanner Unit when disassembling/ assembling.

F-4-172

F-4-173

NOTE: How to install the Flat Cable connected to the Laser Scanner Unit (Y)/(M)/(C)/(Bk)

- How to install the Flat Cable on the left side
 - 1) Insert the Flat Cable [1] in the space [A] of the Connector Holder until it stops.
 - 2) After checking that the edge [B] of the Connector Holder and the line [C] of the Flat Cable are parallel, open the Connector Lock [2].

F-4-174

- How to install the Flat Cable on the right side
 - 3) Insert the Flat Cable [1] in the space [A] of the Connector Holder until it stops.
 - 4) After checking that the edge [B] of the Connector Lock and the line [C] of the Flat Cable are parallel, open the Connector Lock [2].

F-4-175

When Replacing the Laser Scanner Unit

Procedure

- 1) Initialize the adjustment value.

Enter 0 for the service mode that corresponds to the color of the replaced Laser Scanner Unit.

(COPIER > ADJUST > LASER > M-ADJ-Y, M, C, K: 0)

- 2) Execute Auto Adjust Gradation.

Settings/Registration > Adjustment/Maintenance > Adjust Image Quality > Full Adjust

- 3) Execute color displacement correction.

Settings/Registration > Adjustment/Maintenance > Adjust Image Quality > Auto Correct Color Mismatch

The following moiré adjustment is for colors M, C and K. Since moiré is not visible in the color Y, there is no need for adjustment.

- 4) Adjust the scanner phase.

Output a PG for phase adjustment (PG 23 outputs the total three sheets of test chart of M, C, and K). *Output by color is not available.

(COPIER > TEST > PG > TYPE: 23)

(COPIER > TEST > PG > PG-PICK: Select the paper source where A3 or LDR size paper is loaded)

In the service mode that corresponds to the color, enter the median of the values of the areas where moiré has not occurred in the output chart.

(COPIER > ADJUST > LASER > LSADJ1-M, C, K)

* See below for how to check the chart.

- 5) Adjust the scanner magnification ratio.

Output a PG for magnification ratio adjustment (PG24 outputs the total three sheets of test chart of M, C, and K). *Output by color is not available.

(COPIER > TEST > PG > TYPE: 24)

(COPIER > TEST > PG > PG-PICK: Select the paper source where A3 or LDR size paper is loaded)

In the service mode that corresponds to the color, enter the median of the values of the areas where moiré has not occurred in the output chart.

(COPIER > ADJUST > LASER > LSADJ2-M, C, K)

How to see the chart for moiré adjustment

Check the following for each of the 2 columns of the chart:

- 1) Starting from +15, look for the location where moiré has disappeared.
- 2) Starting from -15, look for the location where moiré has disappeared.
- 3) Take note of the numeric value obtained by adding the two numbers and then dividing it by two.
- 4) Check the other side (column) in the same manner, and take note of the numeric value.
- 5) The value to be entered in service mode is the one obtained by adding the two numbers and then dividing it by two.

F-4-176

Cleaning the Dustproof Glass

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Removing the Toner Container Replacement Cover (Refer to page 4-453)

Procedure

- 1) Remove the Dustproof Glass cleaning tool [1] from the backside of the Toner Container Replacement Unit Inner Cover.

F-4-177

2) Insert the Dustproof Glass cleaning tool [1] into a cleaning hole [2] and clean the Dustproof Glass on the top side.

CAUTION:

- Push the Dustproof Glass cleaning tool until it stops, and then pull it out.
- Push and pull the tool at least one time.

F-4-178

3) Pull out the Dustproof Glass [1], and clean both sides of the Dustproof Glass with lint-free paper [2] moistened with alcohol.

F-4-179

CAUTION:

When installing the Dustproof Glass, insert it into the mounting hole [1] with the mark "UP" [A] upward.

F-4-180

Image Formation System

Opening the Process Unit Inner Cover

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)

Procedure

- 1) Remove the ITB Front Middle Cover [1].
 - 1 Screw [2]
 - 2 Hooks [3]

F-4-181

CAUTION:

If the pressure is released from the ITB by turning the ITB Pressure Release Lever [1], be sure to perform Actions when releasing the pressure from the ITB 4-140 .

F-4-182

CAUTION:

Be sure to turn OFF the host machine power before releasing pressure from the ITB Unit.

When the ITB Pressure Release Lever is turned at power-on, the Secondary Transfer Outer Roller is put in the engaged position, and comes in contact with the ITB whose pressure has been released. Pulling out the Fixing Feed Unit in the above state causes the Secondary Transfer Outer Roller to interfere with the ITB Unit, resulting in the risk of deformed Secondary Transfer Outer Roller and the damaged ITB.

If the ITB Pressure Release Lever was turned with the power ON, be sure to assemble the machine in the reverse order, and turn OFF and then ON the host machine power (turning OFF and then ON the host machine power puts the Secondary Transfer Outer Roller back in the disengaged state).

2) Turn the ITB Pressure Release Lever [1] to release the pressure.

F-4-183

3) Remove the Process Unit Front Cover [1].

- 2 Screws [2] (to loosen)

F-4-184

4) Turn the 2 handles [1], and open the Process Unit Inner Cover [2] by pulling it out until it stops.

F-4-185

CAUTION:

Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) and the Drum Unit (Bk) inside the machine if the Process Unit Inner Cover is kept open for 5 minutes or more.

Be sure to either install the Lightproof Sheet, or close the Process Unit Inner Cover and the Front Cover within 5 minutes.

NOTE:How to Close the Process Unit Inner Cover
Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the levers at a 90-degree angle further and close the Process Unit Inner Cover [2].

F-4-186

CAUTION:

Be sure that the 2 hooks [1] of the Process Unit Inner Cover are hooked to the 2 Hinges Shafts [2] of the machine so that the cover is locked.

F-4-187

Closing the Process Unit Inner Cover

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)

Procedure

- 1) Hold the 2 handles [1] and raise the Process Unit Inner Cover [2].
- 2) Push the Process Unit Inner Cover [2], and push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder.

F-4-188

- 3) Raise the 2 handles [1] at a 90-degree angle further and close the Process Unit Inner Cover.

F-4-189

- 4) Install the Process Unit Front Cover.
5) Turn the ITB Pressure Release Lever to apply pressure.

CAUTION:

When releasing pressure of the ITB Unit (when turning the ITB Pressure Release Lever), perform the adjustment Actions when releasing the pressure from the ITB 4-140

- 7) Install the ITB Front Middle Cover.
8) Install the Toner Replacement Cover.
9) Close the Front Cover.

CAUTION:

Be sure that the 2 hooks [1] of the Process Unit Inner Cover are hooked to the 2 Hinges Shafts [2] of the machine so that the cover is locked.

F-4-190

Actions when releasing the pressure from the ITB

Procedure

CAUTION:

If the pressure is released from the ITB by turning the ITB Pressure Release Lever [1], be sure to perform the adjustment described in this procedure.

F-4-191

- 1) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 2) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

CAUTION:

- 1) Be sure to turn OFF the host machine power before releasing pressure from the ITB Unit.
- 2) When releasing the pressure from the ITB Unit and pulling out the Fixing Feed Unit at the same time, be sure to pull out the Fixing Feed Unit for 50 mm or more in advance.

When the ITB Pressure Release Lever is turned without performing the above 1 and 2, the Secondary Transfer Outer Roller is put in the engaged position, and comes in contact with the ITB whose pressure has been released. Pulling out the Fixing Feed Unit in the above state causes the Secondary Transfer Outer Roller to interfere with the ITB Unit, resulting in the risk of deformed Secondary Transfer Outer Roller and the damaged ITB.

- If the ITB Pressure Release Lever was turned without performing the above 1, be sure to assemble the machine in the reverse order, and turn OFF and then ON the host machine power (turning OFF and then ON the power puts the Secondary Transfer Outer Roller back in the disengaged state).
- If the ITB Pressure Release Lever was turned and the Fixing Feed Unit was pulled out without performing the above 1 and 2, be sure to perform How to disengage the Secondary Transfer Outer Roller manually from the engaged position 4-140 .

How to disengage the Secondary Transfer Outer Roller manually from the engaged position

- 1) Turn OFF the power.
- 2) Turn the ITB Pressure Release Lever [1], and put the ITB Unit [2] into the engaged state.

F-4-192

- 3) Press the 2 Release Springs [1] at both sides of the rail to release the locks, and further pull out the Fixing Feed Unit [2] until it stops.

F-4-193

- 4) Put the Secondary Transfer Outer Roller [3] into the disengaged state by turning the gear [1] and changing the direction of the cam [2].

F-4-194

- 5) Put the Fixing Feed Unit back in the host machine in reverse order.
6) Assemble the host machine in the reverse order of removal, and turn OFF and then ON the host machine power (turning OFF and then ON the power puts the Secondary Transfer Outer Roller back in the disengaged state).

CAUTION:

Be sure to replace parts as needed since the Secondary Transfer Outer Roller may be deformed and the ITB may be damaged.

Pulling out the ITB Unit

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

CAUTION:

Be careful not to touch the ITB with fingers or damage it. (Otherwise failure may occur in the output image.)

- 1) Remove the ITB Front Middle Cover [1].

- 1 Screw [2]
- 2 Hooks [3]

F-4-195

CAUTION:

If the pressure is released from the ITB by turning the ITB Pressure Release Lever [1], be sure to perform Actions when releasing the pressure from the ITB 4-140 .

F-4-196

CAUTION:

- 1) Be sure to turn OFF the host machine power before releasing pressure from the ITB Unit.
- 2) When releasing the pressure from the ITB Unit and pulling out the Fixing Feed Unit at the same time, be sure to pull out the Fixing Feed Unit for 50 mm or more in advance.

When the ITB Pressure Release Lever is turned without performing the above 1 and 2, the Secondary Transfer Outer Roller is put in the engaged position, and comes in contact with the ITB whose pressure has been released. Pulling out the Fixing Feed Unit in the above state causes the Secondary Transfer Outer Roller to interfere with the ITB Unit, resulting in the risk of deformed Secondary Transfer Outer Roller and the damaged ITB.

- If the ITB Pressure Release Lever was turned without performing the above 1, be sure to assemble the machine in the reverse order, and turn OFF and then ON the host machine power (turning OFF and then ON the power puts the Secondary Transfer Outer Roller back in the disengaged state).
- If the ITB Pressure Release Lever was turned and the Fixing Feed Unit was pulled out without performing the above 1 and 2, be sure to perform How to disengage the Secondary Transfer Outer Roller manually from the engaged position 4-140 .

- 2) Turn the ITB Pressure Release Lever [1] in the direction of the arrow to release the pressure.

F-4-197

- 3) Remove the 2 screws [1] of the ITB Frame.

F-4-198

- 4) Hold the handle [1], and pull out the ITB Unit [2].

⚠ CAUTION:

Do not release the locks by pressing the 2 ITB Frame Release Springs [3] on the rails of both sides while the ITB Unit [2] is mounted. Otherwise, the ITB Unit [2] may fall.

F-4-199

F-4-200

CAUTION:

Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) and the Drum Unit (Bk) inside the machine if the ITB Unit is pulled out for 5 minutes or more.

Be sure to either install the Lightproof Sheet, or store the ITB Frame and the Fixing Feed Unit in the machine and close the Front Cover within 5 minutes.

Removing the ITB Unit

F-4-201

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)

Procedure

CAUTION:

- Be careful not to touch the ITB with fingers or damage it. (Otherwise failure may occur in the output image.)
- Be sure to place the ITB Unit on a sheet of paper. Allowing the ITB to directly contact with floor may cause adhesion of foreign matters on the ITB.
- Support the ITB Unit at the 3 locations: the lower left [A] of the ITB Unit Front Plate, the foot [B] of the ITB, and molded area [C] of the Secondary Transfer Inlet Upper Guide.

F-4-202

CAUTION:

- Do not push the Toner Collection Mouth Cap [1] of the Transfer Cleaning Unit, or toner may spill out.

F-4-203

CAUTION:

Be sure not to stand the ITB Unit with the Transfer Cleaning Unit [1] installed.

- Otherwise, waste toner [3] inside the unit may scatter.
- Operating the host machine while waste toner [3] inside is aggregated on the lower side [A] may cause abnormal noise and damage of gears.

F-4-204

If standing the ITB Unit [2] with the Transfer Cleaning Unit [1] installed, remove the Transfer Cleaning Unit [1] by referring to Removing the Transfer Cleaning Unit 4-152, and remove the aggregated waste toner [3] with a vacuum cleaner specially designed to suction toner dust [4].

F-4-205

1) Move the ITB Unit [1], and disengage the edge [A] of the ITB Pressure Arm from the hole [B] of the frame.

F-4-206

2) Hold the 2 handles [1], and remove the ITB Unit [2].

F-4-208

CAUTION:

Be careful not to hit the 2 protrusions [1] of the ITB Unit with the Front Cover [2] and the Inner Cover [3] when installing/removing the unit.

F-4-207

CAUTION:

Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) and the Drum Unit (Bk) inside the machine if the ITB Unit is removed for 5 minutes or more.

Be sure to either install the Lightproof Sheet, or store the ITB Frame and the Fixing Feed Unit in the machine and close the Front Cover within 5 minutes.

Removing the ITB Frame

F-4-209

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)

Procedure

- 1) Press the 2 Release Springs [1] at the rear of both sides of the rail to release the locks, and pull out the ITB Frame [2].

F-4-210

NOTE:

Release the 2 Rail Lock Levers [2], and store the 2 rails [2] pulled out in the machine as needed.

F-4-211

CAUTION:

Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) and the Drum Unit (Bk) inside the machine if the ITB Frame is removed for 5 minutes or more.

Be sure to either install the Lightproof Sheet, or store the 2 rails and the Fixing Feed Unit which were pulled out in the machine and close the Front Cover within 5 minutes.

Installing the ITB Unit

F-4-212

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)

Procedure

- 1) Pull out the ITB Frame [1] and the Fixing Feed Unit [2] until they stop.

F-4-213

CAUTION:

Be careful not to hit the 2 protrusions [1] of the ITB Unit with the Front Cover [2] and the Inner Cover [3] when installing/removing the unit.

F-4-214

2) Hold the 2 handles [1], align the right edge [A] and left edge [B] of the ITB Unit with the 2 marks [2] on the ITB Frame, and then place the ITB Unit [3] horizontally.

F-4-215

CAUTION:

- After placing the ITB Unit on the ITB Frame, check that the right edge [A] of the ITB Unit is located to the right of the bended part [B] of the plate of the ITB Frame.
- Check that the bended part [C] on the left edge of the ITB Unit is on top of the bended part [D] of the plate of the ITB Frame.

F-4-216

3) Fit the 2 edges [B] of the ITB Pressure Arm to the 2 grooves [A] of the ITB Frame.

NOTE:

If the 2 edges [B] of the ITB Pressure Arm are not fitted to the grooves [A] of the ITB Frame, the pressure will not be transmitted to the ITB Unit after storing.
If the machine is operated in this condition, an error due to ITB pressure failure (E074-0002) occurs.

F-4-217

4) Store the handle [1] of the ITB Unit.

F-4-218

Storing the ITB Unit

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)

Procedure

CAUTION:

- If you have operated the ITB Pressure Release Lever to install or remove the ITB Unit, execute the adjustment Actions when releasing the pressure from the ITB 4-140.
- When putting the ITB Unit [1] back in the host machine, be sure that the ITB Pressure Release Lever [2] is released (horizontal) and then push in the unit. (If the unit is pushed in while the ITB Pressure Release Lever is in the engaged state (not horizontal), pressure will not be applied to the ITB Unit even by turning the ITB Pressure Release Lever. If the machine is operated in this condition, an error due to ITB pressure failure (E074-0002) or belt displacement error (E075) occurs.)

F-4-219

- Fit the 2 edges [B] of the ITB Pressure Arm to the 2 grooves [A] of the ITB Frame.

F-4-220

- Hold the handle [1], Store the ITB Unit [2] in the machine.

F-4-221

- Secure the ITB Unit [1] with the 2 screws [2], and turn the ITB Pressure Release Lever [3] in the direction of the arrow to apply pressure.

CAUTION:

Tighten the 2 screws of the ITB Frame to secure the ITB Unit, and then turn the ITB Pressure Release Lever.

(If pressure is not applied at the proper position, the ITB Unit may be pushed up in the machine, causing damage to the ITB.)

F-4-222

- Install the ITB Inner Middle Cover [1].

- 1 Screw [2]
- 2 Hooks [3]

F-4-223

Removing the Transfer Cleaning Unit

F-4-224

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)

Procedure

CAUTION:

When replacing this part, execute the actions to be taken When Replacing the Transfer Cleaning Unit 4-156 .

CAUTION:

- Be careful not to touch the ITB with fingers or damage it. (Otherwise failure may occur in the output image.)
- Be sure to place the Static Cleaning Unit [1] on a sheet of paper [2] because toner is attached on the unit.

F-4-225

- Do not turn the Static Cleaning Unit [1] upside down to prevent toner from scattering around.

F-4-226

CAUTION:

- Do not push the Toner Collection Mouth Cap [1] of the Transfer Cleaning Unit, or toner may spill out.

F-4-227

- While lifting the ITB Unit [1], remove the Transfer Cleaning Unit [2], Contact Unit [3] and Heat Absorbing Cover [4] as a whole.

CAUTION:

When installing/removing, be careful not to hit the Transfer Cleaning Unit [2] with the ITB [5].

F-4-229

- Remove the 3 screws [1].

F-4-228

F-4-230

NOTE: How to install the Transfer Cleaning Unit [1]

- 1) Align the 2 receptacle holes for the contact points [A] of the Transfer Cleaning Unit with the 2 contact points [B] of the ITB Unit.
- 2) Align the protrusion [C] of the Transfer Cleaning Unit with the hole [D] of the ITB Unit.

F-4-231

- 3) Push the Transfer Cleaning Unit all the way in while aligning the hole [E] of the Transfer Cleaning Unit with the bearing [F] of the ITB Unit.

F-4-232

NOTE:

The ITB can be removed (Refer to page 4-156) after removing the Transfer Cleaning Unit [2], Contact Unit [3] and Heat Absorbing Cover [4] as a whole from the ITB Unit [1]. To replace the Transfer Cleaning Unit, which is a periodically replaced part, proceed to the procedure shown below.

- 3) Remove the Contact Unit [1].

- 2 Screws [2]

F-4-233

4) Remove the Heat Absorbing Cover [1].

- 1 Screw [2]
- 2 Hooks [3]
- 2 Bosses [4]

F-4-234

CAUTION:

Heat absorbing material is attached onto the inner surface of the Heat Absorbing Cover [1].

Be careful not to damage the package of the heat absorbing material [5]. In case the package is damaged, do not use it again. There is a possibility of leakage of the heat absorbing material from the inside.

Be sure not to put the Heat Absorbing Cover [1] in an environment where temperature is 50 deg C or higher while it is removed from the Transfer Cleaning Unit. The state of the heat absorbing material is changed to the liquid state when temperature is 50 deg C or higher. In contrast, the state is changed to the solid state when the material is cooled down. Once state of the material is changed to the liquid state, its shape is changed so that it may not be possible to attach it again.

F-4-235

When Replacing the Transfer Cleaning Unit

Procedure

- 1) Clear the counter.
COPIER > COUNTER > DRBL-1 > ITBCLN-U
- 2) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 3) Execute the primary transfer ATVC.
COPIER > FUNCTION > MISC-P > 1ATVC-EX
- 4) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 5) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 6) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the ITB

F-4-236

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)
- 5) Removing the Transfer Cleaning Unit (Refer to page 4-152)

Procedure

CAUTION:

- When replacing this part, execute the When Replacing the ITB 4-166 , Cleaning When Replacing the ITB 4-166 and Cleaning the Thin Paper Wraparound Prevention Guide and the Secondary Transfer Inlet Upper Guide 4-169
- Be careful not to touch any part of the ITB other than the specified part with finger or damage the ITB.
(Otherwise failure may occur in the output image.)
- Do not touch the surfaces of the ITB Drive Roller [1], Secondary Transfer Inner Roller [2], ITB Steering Roller [3], and Primary Transfer Roller (Y/M/C/Bk) [4].
(Otherwise, it may cause image failure.)
- Be sure not to damage 6 ITB Retainer Sheets [5].
- Be sure to place the ITB Unit on a sheet of paper. Allowing the ITB to directly contact with floor may cause adhesion of foreign matters on the ITB.

F-4-237

- 1) Turn the ITB Unit Front Plate [1] downward, and stand the ITB Unit [2] vertically.

F-4-238

- 2) Remove the Thin Paper Wraparound Prevention Guide [1].

- 2 Screws [2]
- 2 Bosses [3]

F-4-239

3) Remove the Secondary Transfer Inlet Upper Guide [1] in the direction of the arrow.

- 2 Screws [2]
- 2 Bosses [3]
- 2 Protrusions [4]

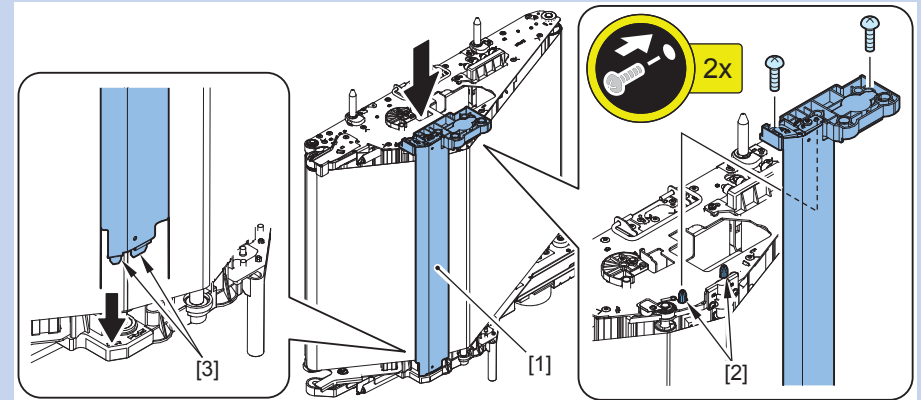

NOTE:

One of the screws [2] tightens the grounding together.

NOTE:

When installing the Secondary Transfer Inlet Upper Guide [1], align it with the 2 bosses [2], and then insert the 2 protrusions [3] of the Secondary Transfer Inlet Upper Guide in the ITB Unit to make the work easy.

4) Remove the ITB Unit Right Rear Small Plate [1].

- 1 Screw [2]
- 2 Bosses [3]
- 1 Hook [4]

5) Place the ITB Unit [1] sideways to change its orientation.

F-4-243

6) Turn the ITB Tension Lever [1] in the direction of the arrow to release the pressure applied on the ITB [2].

F-4-244

7) Place the ITB Unit [1] vertically, and turn the handle [2] toward the Rear Plate of the ITB Unit.

F-4-245

CAUTION:

- The ITB is thinner than the existing ones, so it can be easily bent. Be sure to handle it with care not to bend when working.
- Be sure to hold within 10mm from both edges of the ITB. It is for not to touch the image area of the ITB.
- Be sure to place the ITB on a sheet of paper.

F-4-246

NOTE:

- If the ITB of the service parts is available for the purpose of replacement, use the ITB Installation Auxiliary Sheet included in the package to prevent the ITB from being damaged.
If the ITB Installation Auxiliary Sheet is used: perform steps 8-1 through 8-3.
- If the ITB of the service parts is not available, use 2 sheets of A3 paper instead of the ITB Installation Auxiliary Sheet.
If 2 sheets of A3 paper are used: perform steps 9-1 through 9-3.

When removing the ITB using the ITB Installation Auxiliary Sheet

8-1) Insert the ITB Installation Auxiliary Sheet [1] included in the package between the ITB [3] and the ITB Unit, with the folded slant area [A] of the sheet coming on the upper side of the ITB Drive Roller [2].

F-4-247

8-2) Hold the edge [A] of the ITB, and remove the ITB [1] while paying attention not to damage it.

F-4-248

8-3) Remove the ITB Installation Auxiliary Sheet [1].

F-4-249

When removing the ITB using the 2 sheets of A3 paper

9-1) Insert the 2 sheets of A3 paper [1] between the ITB and the ITB Unit to wrap around the 2 ends [A] of the ITB Unit, and then use the tapes [2] to secure them to the ITB Front Plate.

F-4-250

9-2) Hold the edge [A] of the ITB, and remove the ITB [1] while paying attention not to damage it.

F-4-251

9-3) Remove the 2 sheets of A3 paper [1] and the 4 tapes [2] from the ITB Front Plate.

F-4-252

Installing the ITB

F-4-253

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)
- 5) Removing the Transfer Cleaning Unit (Refer to page 4-152)
- 6) Removing the ITB (Refer to page 4-156)

Procedure

CAUTION:

- The ITB is thinner than the existing ones, so it can be easily bent. Be sure to handle it with care not to bend when working.
- Be sure to hold within 10mm from both edges of the ITB. It is for not to touch the image area of the ITB.
- Be sure to place the ITB on a sheet of paper.

F-4-254

CAUTION:

- Do not touch the surfaces of the ITB Drive Roller [1], Secondary Transfer Inner Roller [2], ITB Steering Roller [3], and Primary Transfer Roller (Y/M/C/Bk) [4]. (Otherwise, it may cause image failure.)
- Be sure not to damage 6 ITB Retainer Sheets [5].
- Be sure to place the ITB Unit on a sheet of paper. Allowing the ITB to directly contact with floor may cause adhesion of foreign matters on the ITB.

F-4-255

CAUTION:

When installing the ITB to the ITB Unit, be sure that the pressure applied to the ITB is released.

F-4-256

- 1) Turn the ITB Unit Front Plate [1] downward, and stand the ITB Unit [2].

F-4-257

NOTE:

- If the ITB of the service parts is available for the purpose of replacement, use the ITB Installation Auxiliary Sheet included in the package to prevent the ITB from being damaged.
- If the ITB Installation Auxiliary Sheet is used: perform steps 2-1 through 2-3.
- If the ITB of the service parts is not available, use 2 sheets of A3 paper instead of the ITB Installation Auxiliary Sheet.
- If 2 sheets of A3 paper are used: perform steps 3-1 through 3-3.

When using the ITB Installation Auxiliary Sheet

2-1) Insert the ITB Installation Auxiliary Sheet [2] included in the package with the folded slant area [A] of the sheet coming on the upper side of the ITB Drive Roller [1].

F-4-258

2-2) Hold the edge [A] of the ITB to place the white sheet [1] on top of it, and install while paying attention not to damage the ITB [2].

F-4-259

2-3) Remove the ITB Installation Auxiliary Sheet [1].

F-4-260

When using the 2 sheets of A3 paper

3-1) Use the 4 tapes [2] to secure the 2 sheets of A3 paper [1] to the ITB Front Plate to wrap around the 2 ends [A] of the ITB Unit.

F-4-261

3-2) Hold the edge [A] of the ITB to place the white sheet [1] inside the ITB on the top, and install while paying attention not to damage the ITB [2].

F-4-262

3-3) Remove the 2 sheets of A3 paper [1] and the tapes [2] from the ITB Front Plate.

F-4-263

4) Place the ITB Unit [1] sideways to change its orientation.

F-4-264

5) Align the center of the ITB [2] with the center [A] of the left and right rollers [1] of the ITB Unit.

F-4-265

CAUTION

- Install the ITB [1], and place the 6 ITB Retainer Sheets [2] on top of the ITB while paying attention not to fold it.
- Be sure to place the leading edge of the 2 ITB Position Flags [3] on top of the ITB [1].

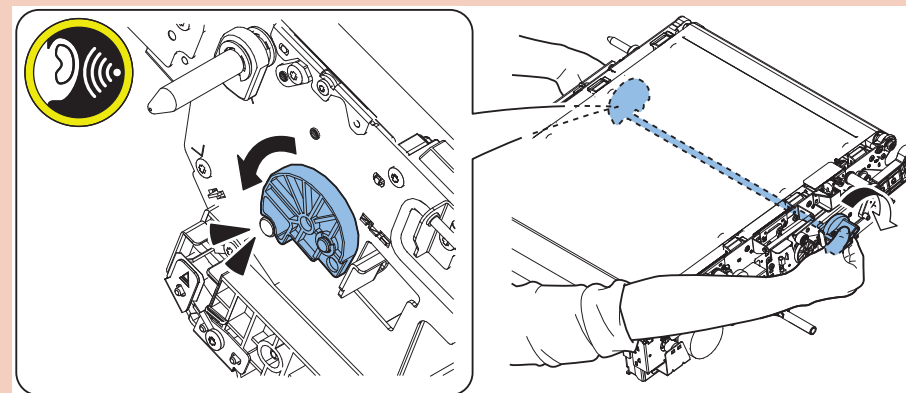

F-4-266

6) Turn the ITB Tension Lever [1] in the direction of the arrow to apply tension to the ITB [2].

CAUTION:

- To avoid applying tension quickly, hold the ITB Tension Lever and the Stopper Cam at the rear side with both hands and then turn them slowly.
- After applying tension to the ITB with the ITB Tension Lever, be sure to hook the Stopper Cam to the shaft at the rear side of the ITB Unit to lock it. At this time, be sure that a click sound is heard.

F-4-267

F-4-268

When Replacing the ITB

Procedure

- 1) Clear the counter.
COPIER > COUNTER > DRBL-1 > TR-BLT
- 2) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 3) Execute the primary transfer ATVC.
COPIER > FUNCTION > MISC-P > 1ATVC-EX
- 4) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 5) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 6) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Cleaning When Replacing the ITB

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)
- 5) Removing the Transfer Cleaning Unit (Refer to page 4-152)
- 6) Removing the ITB (Refer to page 4-156)

Procedure

- 1) While rotating the Drive Motor [2] in the direction of the arrow, clean the whole circumference [A] of the surface of the Drive Roller with lint-free paper [1] moistened with alcohol.

F-4-269

- 2) Clean the whole circumference [A] of the surface of the 3 ITB Idler Rollers with lint-free paper [1] moistened with alcohol.

F-4-270

- 3) Clean the whole circumference [A] of the surface of the ITB Steering Roller with lint-free paper [1] moistened with alcohol.

F-4-271

- 4) Clean the whole circumference [A] of the surface of the ITB Idler Roller with lint-free paper [1] moistened with alcohol.

F-4-272

- 5) Clean the soiling on the hole [A] of the HP Sensor PCB [2] with a blower [1].

F-4-273

6) Change the direction of the ITB Unit [1] so that it is turned sideways.

7) Remove the ITB Retainer Sheet [2].

- 1 Screw [3] (to loosen)
- 1 Boss [4]

F-4-274

8) Stand the ITB Unit [2] with the Front Plate side [1] of the unit down.

9) While bringing down the flag [3], clean the soiling on the ITB Displacement Sensor (Right) [5] with a blower [4].

F-4-275

10) While bringing down the flag [1], clean the soiling on the ITB Displacement Sensor (Left) [3] with a blower [2].

F-4-276

Cleaning the Thin Paper Wraparound Prevention Guide and the Secondary Transfer Inlet Upper Guide

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)
- 5) Removing the Transfer Cleaning Unit (Refer to page 4-152)
- 6) Removing the ITB (Refer to page 4-156)

Procedure

- 1) Clean the front and the back surface [A] of the Thin Paper Wraparound Prevention Guide with lint-free paper [1] moistened with alcohol.

F-4-277

- 2) Clean the front and back surface [A] of the Secondary Transfer Inlet Upper Guide with lint-free paper [1] moistened with alcohol.

F-4-278

Removing the Primary Transfer Roller

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)
- 5) Removing the Transfer Cleaning Unit (Refer to page 4-152)
- 6) Removing the ITB (Refer to page 4-156)

Procedure

CAUTION:

- When replacing this part, execute the actions to be taken Cleaning When Replacing the ITB 4-166, Cleaning the Thin Paper Wraparound Prevention Guide and the Secondary Transfer Inlet Upper Guide 4-169 and When Replacing the Primary Transfer Roller 4-172 .
- Be sure not to touch the surface of the roller when disassembling/assembling.

NOTE:

How to distinguish the Primary Transfer Roller (Bk) from the Primary Transfer Roller (Y), (M), and (C)

- The shaft on front of the Primary Transfer Roller (Bk) [1] is stepped shaft: the [A] part on the roller side is thick whereas the part on the end is thin.
- The size of the shaft [B] on front of the Primary Transfer Roller (Y), (M), or (C) [2] is constant.

F-4-280

NOTE:

This procedure indicates the location of the Primary Transfer Roller (Bk).

Be sure to perform the same procedure for the Primary Transfer Roller (Y), (M), and (C).

- 1) Place the ITB Unit [1] sideways to change its orientation.

F-4-281

2) Open the Shaft Support Cover (Front) [2] and the Shaft Support Cover (Rear) [3] by releasing them from the protrusions [1].

F-4-282

3) Release the rear shaft of the Primary Transfer Roller by holding the shaft [1] of the Primary Transfer Roller and pushing down the Shaft Support [2] at the rear side.

F-4-283

4) Remove the Primary Transfer Roller [1] in the direction of the arrow.

F-4-284

CAUTION:

Be sure to push the shafts [1] at front and rear sides of the Primary Transfer Roller into the Shaft Support [2] from above.

If no click sound is heard at this time, reinstall the roller.

F-4-285

When Replacing the Primary Transfer Roller

Procedure

- 1) Clear the counter.
COPIER > COUNTER > DRBL-1 > 1TR-RL-Y/M/C/K
- 2) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 3) Execute the primary transfer ATVC.
COPIER > FUNCTION > MISC-P > 1ATVC-EX
- 4) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 5) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 6) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Secondary Transfer Inner Roller

F-4-286

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)
- 5) Removing the Transfer Cleaning Unit (Refer to page 4-152)
- 6) Removing the ITB (Refer to page 4-156)

Procedure

CAUTION:

- When replacing this part, execute the actions to be taken When Replacing the Secondary Transfer Inner Roller 4-174 , Cleaning When Replacing the ITB 4-166, Cleaning the Thin Paper Wraparound Prevention Guide and the Secondary Transfer Inlet Upper Guide 4-169 .
- Be sure not to touch the surface of the roller when disassembling/assembling.

1) Remove the Bearing Cover [1].

- 2 Screws [2]
- 2 Bosses [3]

F-4-287

2) Remove the bearing [1] and the Secondary Transfer Roller [2] in the direction of the arrow.

CAUTION:

- Be sure not to deform the Grounding Spring [1].
- Be sure to keep the Secondary Transfer Inner Roller [2] from coming in contact with the Grounding Spring [1] to prevent it from being damaged.

F-4-288

F-4-289

NOTE:

If replacement is not required, there is no need to remove the bearing [1] at the lower side.

If it is removed, place it in the Bearing Holder [2].

F-4-290

3) Remove the bearing [2] from the Secondary Transfer Inner Roller [1].

F-4-291

When Replacing the Secondary Transfer Inner Roller

Procedure

- 1) Clear the counter.
COPIER > COUNTER > DRBL-1 > 2TR-INRL
- 2) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 3) Execute the primary transfer ATVC.
COPIER > FUNCTION > MISC-P > 1ATVC-EX
- 4) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 5) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 6) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the ITB Inner Scraper Holder

F-4-292

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)
- 5) Removing the Transfer Cleaning Unit (Refer to page 4-152)
- 6) Removing the ITB (Refer to page 4-156)

Procedure

CAUTION:

- When replacing this part, execute the actions to be taken When Replacing the ITB Inner Scraper 4-176 .
- Do not touch or bend the 2 sheets [1] in the ITB Inner Scraper Holder.

F-4-293

- 1) Place the ITB Unit [1] sideways.
 - 2) Remove the ITB Inner Scraper Holder [2].
- 2 Screws [3]
 - 2 Bosses [4]

F-4-294

When Replacing the ITB Inner Scraper

Procedure

- 1) Clear the counter.
COPIER > COUNTER > DRBL-1 > ITB-SCRIP
- 2) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 3) Execute the primary transfer ATVC.
COPIER > FUNCTION > MISC-P > 1ATVC-EX
- 4) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 5) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 6) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Cleaning the ITB Inner Scraper

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)
- 5) Removing the Transfer Cleaning Unit (Refer to page 4-152)
- 6) Removing the ITB (Refer to page 4-156)

Procedure

CAUTION:

If the ITB Inner Scraper is soiled when the ITB is removed, be sure to perform the following procedure to clean it.

- 1) Place the ITB Unit [1] sideways.

F-4-295

- 2) Clean the soiling attached to both sides (front and back) of the leading edge [A] of the ITB Inner Scraper [1] with lint-free paper [2] moistened with alcohol.

F-4-296

Removing the ITB Heater (Y)/(M) unit, ITB Heater (C)/(Bk) unit

F-4-297

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)
- 5) Removing the Transfer Cleaning Unit (Refer to page 4-152)
- 6) Removing the ITB (Refer to page 4-156)

Procedure

CAUTION:

Because the ITB Heater is hot, be sure to perform disassembly/assembly after it is cooled down.

- 1) Place the ITB Unit [1] sideways to change its orientation.

F-4-298

2) Remove ITB Heater (C)/(Bk) [1].

- 1 Wire Saddle [2]
- 1 Connector [3]
- 2 Screws [4]

F-4-299

3) Remove the ITB Heater (Y)/(M) unit [1].

- 1 Wire Saddle [2]
- 2 Connectors [3]
- 3 Spacers [4]

F-4-300

Removing the Registration Patch Sensor Unit

F-4-301

Preparation

- 1) Removing the Right Middle Front Cover 1 (Refer to page 4-455)
- 2) Open the Front Cover.
- 3) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 4) Pulling out the ITB Unit (Refer to page 4-142)
- 5) Removing the ITB Unit (Refer to page 4-144)
- 6) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-302

- 7) Removing the Toner Replacement Cover (Refer to page 4-453)
- 8) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 9) Removing the Primary Charging Assembly (Refer to page 4-202)
- 10) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 11) Removing the Drum Unit (Bk) (Refer to page 4-232)

Procedure

CAUTION:

When replacing this part, execute the actions to be taken When Replacing the Registration Patch Sensor Unit 4-181

CAUTION:

Be sure to place the Registration Patch Sensor Unit [1] on a sheet of paper [2] because toner is attached on the unit.

F-4-303

1) Disconnect the 2 connectors [1].

- 1 Edge Saddle [2]

F-4-304

CAUTION:

If the Positioning Pins at the rear side are disengaged from the 2 holes [1] when removing the Registration Patch Sensor Unit, the unit may fall off inside the machine. Therefore, be sure to firmly support the unit during the work.

F-4-305

- 2) Put the 2 connectors [1] inside the machine, and remove the Registration Patch Sensor Unit [2].
- 1 Screw [3]

F-4-306

NOTE: How to remove the Registration Patch Sensor Unit
1) Put the 2 connectors [1] through the hole [A] of the plate.

F-4-307

2) Place the plate [B] of the Registration Patch Sensor Unit on the 2 protrusions [2] of the machine and then fit the 2 Positioning Pins [3] at the rear side to the 2 holes [4] of the Rear Plate.

- 1 Screw [5]

F-4-308

When Replacing the Registration Patch Sensor Unit

Procedure

- 1) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 2) Adjust the Patch Sensor Light Intensity.
COPIER > FUNCTION > MISC-P > PT-LPADJ
- 3) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 4) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 5) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Cleaning the Registration Patch Sensor Unit

Preparation

- 1) Removing the Right Middle Front Cover 1 (Refer to page 4-455)
- 2) Open the Front Cover.
- 3) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 4) Pulling out the ITB Unit (Refer to page 4-142)
- 5) Removing the ITB Unit (Refer to page 4-144)
- 6) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-309

- 7) Removing the Toner Replacement Cover (Refer to page 4-453)
- 8) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 9) Removing the Primary Charging Assembly (Refer to page 4-202)
- 10) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 11) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 12) Removing the Registration Patch Sensor Unit (Refer to page 4-178)

Procedure

- 1) Clean the surface [A] of the shutter with lint-free paper [1] moistened with alcohol.

F-4-310

- 2) Hold the Shutter Lever [1], open the shutter [2], and clean the 6 locations of the surface [A] of the Registration Patch Sensor in the single direction with wet and tightly-wrung cotton swab [3]. After cleaning, check that there is no soiling caused by toner on the surface [A] of the sensor.

CAUTION:

- Do not use alcohol because it causes melting and clouding of the sensor window.
- Do not dry wipe the sensor window because it is charged to attract toner.
- Be sure to clean it in the single direction in order to prevent uneven wiping.

F-4-311

Removing the Primary Charging Rail

F-4-312

Preparation

- 1) Removing the Right Middle Front Cover 1 (Refer to page 4-455)
- 2) Open the Front Cover.
- 3) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 4) Pulling out the ITB Unit (Refer to page 4-142)
- 5) Removing the ITB Unit (Refer to page 4-144)
- 6) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-313

- 7) Removing the Toner Replacement Cover (Refer to page 4-453)
- 8) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 9) Removing the Primary Charging Assembly (Refer to page 4-202)
- 10) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 11) Removing the Developing Assembly (Bk) (Refer to page 4-265)
- 12) Removing the Drum Unit (Bk) (Refer to page 4-232)

Procedure

- 1) Free the 2 harnesses [1].
 - 1 Relay Connector [2]
 - 1 Connector [3]
 - 7 Wire Saddles [4]
 - 1 Edge Saddle [5]

F-4-314

- 2) Put the removed harness [1] inside the host machine.

F-4-315

3) Free the 2 harnesses [1].

- 2 Wire Saddles [2]
- Harness Guide [A]

F-4-316

4) Remove the Primary Charging Rail [1].

- 1 Screw [2]

F-4-317

CAUTION:

Install the wiring [1] of the Potential Sensor PCB Unit along the Harness Guide [A] of the Primary Charging Rail.

F-4-318

NOTE:

When installing, insert the Primary Charging Rail [1] at the angle as shown in the figure, and then insert the 2 bosses [2] in the boss holes [3] of the host machine.

F-4-319

Removing the Drum Thermopile

F-4-320

Preparation

- 1) Removing the Right Middle Front Cover 1 (Refer to page 4-455)
- 2) Open the Front Cover.
- 3) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 4) Pulling out the ITB Unit (Refer to page 4-142)
- 5) Removing the ITB Unit (Refer to page 4-144)
- 6) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-321

- 7) Removing the Toner Replacement Cover (Refer to page 4-453)
- 8) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 9) Removing the Primary Charging Assembly (Refer to page 4-202)
- 10) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 11) Removing the Developing Assembly (Bk) (Refer to page 4-265)
- 12) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 13) Removing the Primary Charging Rail (Refer to page 4-183)

Procedure

- 1) Remove the Drum Thermopile [2] from the Primary Charging Rail [1].
 - 1 Guide [3]
 - 1 Connector [4]
 - 2 Screws [5]

F-4-322

Removing the Potential Sensor PCB Unit (including Potential Sensor and Potential Control PCB)

Preparation

- 1) Removing the Right Middle Front Cover 1 (Refer to page 4-455)
- 2) Open the Front Cover.
- 3) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 4) Pulling out the ITB Unit (Refer to page 4-142)
- 5) Removing the ITB Unit (Refer to page 4-144)
- 6) Store the ITB Frame [1] and the Fixing Feed Unit [2].

- 7) Removing the Toner Replacement Cover (Refer to page 4-453)
- 8) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 9) Removing the Primary Charging Assembly (Refer to page 4-202)
- 10) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 11) Removing the Developing Assembly (Bk) (Refer to page 4-265)
- 12) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 13) Removing the Primary Charging Rail (Refer to page 4-183)

Procedure

CAUTION:

When replacing this part, execute the actions to be taken When Replacing the Potential Sensor PCB Unit 4-187 .

NOTE:

If the Potential Sensor is replaced, also replace the harness connected to the Potential Sensor and the Potential Control PCB as a Potential Sensor PCB Unit.

- 1) Remove the harness [1] connected to the Potential Sensor, Potential Sensor Protection Sheet [2], and Potential Sensor [3].
 - 2 Wire Saddles [4]
 - 2 Harness Guides [5]
 - 1 Screw [6]

CAUTION:

When installing, remove the release paper, and align the Potential Sensor Protection Sheet with the marking line [A] to affix it (be sure that the gap [B] between the marking line and the release paper is less than 0.5 mm).

F-4-327

2) Remove the Potential Control PCB [1].

- 1 Connector [2]
- 1 Screw [3]
- 5 PCB Supports [4]

F-4-328

When Replacing the Potential Sensor PCB Unit

Procedure

NOTE:

When replacing the Potential Sensor, replace the Potential Sensor PCB Unit (including the Potential Sensor, harness and Potential Control PCB).

1) Install the Primary Charging Rail [1] with the Potential Sensor removed to the host machine.

- 1 Screw [2]

F-4-329

NOTE:

When installing, insert the Primary Charging Rail [1] at the angle as shown in the figure, and then insert the 2 bosses [2] in the boss holes [3] of the host machine.

F-4-330

2) Install the ITB Unit to the host machine.

3) Connect a new cable [3] to the connector [2] of a new Potential Sensor [1].

4) Install the Potential Sensor [1] to the 2 pin electrodes [4] for checking the Potential Sensor.

- 1 Connector [2]
- 1 Screw [5]

CAUTION:

Secure the screw firmly so that the Potential Sensor is not removed.

F-4-331

5) Install a new Potential Control PCB [1].

- 1 Connector [2]
- 1 Screw [3]
- 5 PCB Supports [4]

F-4-332

6) Pass 2 harnesses [1] of the Primary Charging Rail and the electrode for checking the Potential Sensor from the Edge Saddle [2] of the Right Side Plate of the host machine, and connect the 7 Wire Saddles [3] and the 2 connectors [4].

F-4-333

7) Place the electrode [1] for checking the Potential Sensor on the Process Unit Inner Cover [2], and use the Electrode Clip [3] to pinch the plate of the hinge to ground.

CAUTION:

Be careful not to drop the electrode for checking the Potential Sensor.

F-4-334

8) Use a dedicated tool [1] to deactivate the Front Door Switch.

F-4-335

- 9) Turn ON the main power switch.
- 10) Disable (OFF) the warm-up rotation immediately after turning ON the main power switch.
COPIER > FUNCTION > INSTALL > AINR-OFF = 1
- 11) Execute the Potential Sensor adjustment.
COPIER > FUNCTION > DPC > OFST
- 12) Enable (ON) the warm-up rotation.
COPIER > FUNCTION > INSTALL > AINR-OFF = 0
- 13) Turn OFF the main power switch.

14) Install a new Potential Sensor [1] to the Primary Charging Rail.

- 1 Harness [2]
- 2 Wire Saddles [3]
- 2 Harness Guides [4]
- 1 Screw [5]

15) Install a new Potential Sensor Protection Sheet [6].

F-4-336

CAUTION:

When installing, remove the release paper, and align the Potential Sensor Protection Sheet with the marking line [A] to affix it (be sure that the gap [B] between the marking line and the release paper is less than 0.5 mm).

F-4-337

- 16) Install the Primary Charging Rail to the host machine.
- 17) Install the removed parts in reverse order.

Removing the Drum Thermistor

F-4-338

Preparation

- 1) Removing the Right Middle Front Cover 1 (Refer to page 4-455)
- 2) Open the Front Cover.
- 3) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 4) Pulling out the ITB Unit (Refer to page 4-142)
- 5) Removing the ITB Unit (Refer to page 4-144)
- 6) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-339

- 7) Removing the Toner Replacement Cover (Refer to page 4-453)
- 8) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 9) Removing the Primary Charging Assembly (Refer to page 4-202)
- 10) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 11) Removing the Developing Assembly (Bk) (Refer to page 4-265)
- 12) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 13) Removing the Primary Charging Rail (Refer to page 4-183)

Procedure

1) Remove the Drum Thermistor [1].

- 1 Connector [2]
- 1 Wire Saddle [3]
- 1 Harness Guide [4]
- 1 Screw [5]

F-4-340

Removing the Main Body Inner Temperature Detection PCB (Y)/(M) and (C)/(Bk)

F-4-341

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)
- 5) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-342

- 6) Removing the Toner Replacement Cover (Refer to page 4-453)
- 7) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 8) Remove the Process Unit (Y)/(M)/(C) (Refer to page 4-275).

Procedure

NOTE:

The 2 Main Body Inner Temperature Detection PCBs for (Y)/(M) [1] and (C)/(Bk) [2] are installed.

This procedure explains how to remove the Main Body Inner Temperature Detection PCB (C)/(Bk).

Be sure to perform the same procedure to remove the Main Body Inner Temperature Detection PCB (Y)/(M).

F-4-343

1) Remove the Thermistor Holder [1].

- 1 Claw [2]
- 1 Protrusion [3]
- 1 Wire Saddle [4]

F-4-344

2) Disconnect the connector [1].

F-4-345

3) Remove the Main Body Inner Temperature Detection PCB [1].

- 2 Claws [2]

F-4-346

Removing the Secondary Transfer Unit

F-4-347

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

CAUTION:

Be sure not to touch the surface [A] of the Secondary Transfer Outer Roller when disassembling/assembling.

F-4-348

1) Remove the Fixing Feed Sub Cover [1].

- 1 Screw [2] (to loosen)
- 2 Hooks [3]

F-4-349

2) Remove the Secondary Transfer Unit [1].

- 2 Connectors [2]
- 2 Positioning Pins [3]

F-4-351

NOTE: How to install the Fixing Feed Sub Cover
Put the [A] part of the Fixing Feed Sub Cover under the Fixing Feed Front Left Cover [4].

F-4-350

CAUTION:

When installing the Secondary Transfer Unit to the Fixing Feed Unit, be sure to do so after releasing the pressure applied on the Secondary Transfer Outer Roller.

(Otherwise, the Secondary Transfer Outer Roller may be deformed, or the ITB may be damaged.)

How to release the pressure applied on the Secondary Transfer Outer Roller

The pressure on the Secondary Transfer Outer Roller [3] can be released by turning the gear [1] and changing the direction of the cam [2]. Be sure to keep the Secondary Transfer Outer Roller lowered.

F-4-352

Cleaning the Post-secondary Transfer Guide

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

CAUTION:

Be sure not to touch the surface [A] of the Secondary Transfer Outer Roller when disassembling/assembling.

F-4-353

1) Remove the Post-secondary Transfer Guide [1].

- 1 Screw (with washer) [2]
- 1 Boss [3]
- 1 Protrusion [4]

F-4-354

2) Change the direction of the Post-secondary Transfer Guide [1], and clean it with lint-free paper [2] moistened with alcohol.

F-4-355

Removing the Secondary Transfer Static Eliminator

F-4-356

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

CAUTION:

Be sure not to touch the surface [A] of the Secondary Transfer Outer Roller when disassembling/assembling.

F-4-357

1) Remove the Post-secondary Transfer Guide [1].

- 1 Screw (with washer) [2]
- 1 Protrusion [3]

F-4-358

2) Hold the 2 [A] parts, and remove the Secondary Transfer Static Eliminator [1] while pressing the parts outward.

CAUTION:

- Do not to deform the leading edge [A] of the Secondary Transfer Static Eliminator [1].
- Be sure not to deform the Grounding Spring [2].

F-4-359

F-4-360

Cleaning the Secondary Transfer Static Eliminator

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Secondary Transfer Unit (Refer to page 4-193)
- 4) Removing the Secondary Transfer Static Eliminator (Refer to page 4-196)

Procedure

- 1) Turn over the Secondary Transfer Static Eliminator [1], and remove paper dust accumulated on the back [A] with dry lint-free paper [2].

F-4-361

Removing the Secondary Transfer Outer Roller

F-4-362

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Secondary Transfer Unit (Refer to page 4-193)
- 4) Removing the Secondary Transfer Static Eliminator (Refer to page 4-196)

Procedure

CAUTION:

- If the Secondary Transfer Outer Roller is soiled when replacing it, execute the actions to be taken Cleaning the Secondary Transfer Unit 4-201, Cleaning the Secondary Transfer Static Eliminator 4-198.
- Be sure not to touch the surface [A] of the roller when disassembling/assembling.

F-4-363

1) Remove the 2 Stop rings [1].

F-4-364

2) While pressing the Secondary Transfer Holder [1], remove the 2 arms [2] one by one.

F-4-365

3) Remove the Secondary Transfer Outer Roller [1] and the 2 Secondary Transfer Holders [2].

F-4-366

- 4) Clean soiling on the groove [A] of the Secondary Transfer Outer Unit with lint-free paper [1] moistened with alcohol.

F-4-367

- 5) Remove the 2 Secondary Transfer Holders [2] from the Secondary Transfer Outer Roller [1].

F-4-368

NOTE: How to install the Secondary Transfer Outer Roller
Be sure to install the Secondary Transfer Outer Roller so that the side with 2 grooves [1] is at the rear side of the Secondary Transfer Unit.

F-4-369

Cleaning the Secondary Transfer Unit

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

- 1) While directing the edge of the blower [1], clean the soiling on the sensor surface [A] of the Transparency Sensor and the sensor surface [B] of the Post-registration Sensor with the blower [1].

F-4-370

- 2) Clean soiling on the Upper Guide [1] with lint-free paper [2] moistened with alcohol.

F-4-371

- 3) Clean the soiling (abrasion dust of the receptacle holes) attached to the 4 Positioning Pins [1] with lint-free paper moistened with alcohol [2].

F-4-372

Removing the Primary Charging Assembly

F-4-373

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)

Procedure

CAUTION:

- When replacing this part, execute the actions to be taken When Replacing the Primary Charging Assembly 4-203.
- Do not touch the surface [1] of the Grid Plate. Otherwise functional failure may occur.
- Do not place the side with the Grid down when placing the Primary Charging Assembly.

F-4-374

- 1) Disconnect the 2 connectors [1].

F-4-375

- 2) While pressing down the claw [1], pull out the Primary Charging Assembly [2] horizontally.

F-4-376

CAUTION:

When installing, align the 2 rails [1] of the Primary Charging Assembly with the 2 protrusions [A] of the Primary Charging Assembly, and then install it horizontally.

F-4-377

When Replacing the Primary Charging Assembly

Procedure

- 1) Clear the counter.
COPIER > COUNTER > PRDC-1 > PRM-UNIT
- 2) Execution of Charging Wire cleaning COPIER > FUNCTION > CLEANING > WIRE-EX
- 3) Execution of potential control
COPIER > FUNCTION > DPC > DPC
- 4) Output pattern generator for adjustment of the wire height.
COPIER > FUNCTION > MISC-P > GRID-ADJ

NOTE:

A3+ 329.0 mm x 483.0 mm (13" x 19") is recommended.

PG can be output only under the following conditions.

- Paper type: Plain paper 1/2
- Paper size: A3+ 329.0 mm x 483.0 mm (13" x 19")/A3/SRA3/Ledger 279.4 mm x 431.8 mm (11" x 17")*A3+ 305.0 mm x 457.0 mm (12" x 18")
- Paper source: Cassette 1

Under conditions other than those mentioned above, "NG" is displayed and a blank paper is output.

* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 or later.

- 5) In the case of density difference between the front and the rear on the test print image with the dark image on the front side of the test print, go to step 6) to make adjustments. With the dark image on the rear side of the test print, go to step 7) to make adjustments. If there is no density unevenness, execute the work in step 8) and later.

6) Adjust the Primary Charging Assembly (in the case of dark image at the front side on the test print).

NOTE:

- In the case of dark image at the front side of the test print [1], execute step 6-1) through 6-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 5) and later.

F-4-378

- 6-1) Turn the plastic screw [A] clockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 6-2) If the image at the front side of test print image is still dark, turn the plastic screw [A] clockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 6-3) If the image at the front side of the test print is still dark, turn the plastic screw [A] clockwise to make a half round. Refer to the replacement procedure of the Primary

Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image

7) Adjust the Primary Charging Assembly (in the case of dark image at the rear side on the test print).

NOTE :

- In the case of dark image at the rear side of the test print [2], execute step 7-1) through 7-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 8) and later.

F-4-379

- 7-1) Turn the plastic screw [A] counterclockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 7-2) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine,

and then output the test print to check the image.

- 7-3) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make a half turn. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 8) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 9) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 10) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 11) Execute uneven density correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Primary Charging Assembly Shutter Unit

F-4-380

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)

Procedure

CAUTION:

Do not touch the surface [A] of the Grid when disassembling/assembling.

F-4-381

1) Loosen the 2 screws [3] of the Shutter Arm [1] and the Cleaning Pad Arm [2].

F-4-382

2) Move the Shutter Arm [1] and the Cleaning Pad Arm [2] until they stop.

F-4-383

3) Remove the Shutter Sheet Installation Fixtures [2] from the Shutter Slider [1].

- 2 Claws [3]

F-4-384

CAUTION:

When installing the Shutter Sheet Installation Fixture, check that the Shutter Arm is engaged with the claw properly.

(Move the Shutter Sheet installation Fixture to the right and left to check that it does not come off.)

4) Remove the Primary Charging Assembly Shutter Unit [1].

- 3 Claws [2]
- 2 Bosses [3]
- 1 Shaft [4]

F-4-385

NOTE: How to install the Primary Charging Assembly Shutter Unit

- Installing the Primary Charging Assembly Shutter Unit [1] without pulling out the Shutter Sheet Installation Fixture [2], the fixture [2] may be damaged.

F-4-386

- Be sure to pull out the Shutter Sheet Installation Fixture [2], hook it on the [A] part of the Primary Charging Assembly, and then install the Primary Charging Assembly Shutter Unit [1].

F-4-387

5) Remove the Primary Charging Wire Cleaning Motor [2] from the Primary Charging Assembly Shutter Unit [1].

- 1 Connector [3]
- 2 Claws [4]

F-4-388

Removing the Grid Plate

F-4-389

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)

Procedure

CAUTION:

- When replacing this part, execute the actions to be taken When Replacing the Grid Plate 4-211.
- Do not touch the surface [A] of the Grid when disassembling/assembling.

F-4-390

1) Loosen the 2 screws [3] of the Shutter Arm [1] and the Cleaning Pad Arm [2].

F-4-391

2) Move the Shutter Arm [1] and the Cleaning Pad Arm [2] until they stop.

F-4-392

3) Remove the Shutter Sheet Installation Fixtures [2] from the Shutter Slider [1].

• 2 Claws [3]

F-4-393

CAUTION:

When installing the Shutter Sheet Installation Fixture, check that the Shutter Arm is engaged with the claw properly.

(Move the Shutter Sheet installation Fixture to the right and left to check that it does not come off.)

4) Press the lever [1] in the direction of the arrow to remove the Grid Plate [2].

- 2 Claws [3]

F-4-394

CAUTION:

Point to Note When Installing the Grid Plate

- The Grid Plate [1] has a front side and a rear side. Therefore, install it in the correct direction.
- Be sure that the Grid Plate [1] is not placed on the protrusions [2] of the Primary Charging Assembly when installing it.
- After installing the Grid Plate [1] on the Primary Charging Assembly, check that the protrusions [2] are fitted in the holes [A] of the Grid.

F-4-395

When Replacing the Grid Plate

Procedure

- 1) Clear the counter.
COPIER > COUNTER > PRDC-1 > PRM-GRID
- 2) Execution of Charging Wire cleaning COPIER > FUNCTION > CLEANING > WIRE-EX
- 3) Execution of potential control
COPIER > FUNCTION > DPC > DPC
- 4) Output pattern generator for adjustment of the wire height.
COPIER > FUNCTION > MISC-P > GRID-ADJ

NOTE:

A3+ 329.0 mm x 483.0 mm (13" x 19") is recommended.

PG can be output only under the following conditions.

- Paper type: Plain paper 1/2
- Paper size: A3+ 329.0 mm x 483.0 mm (13" x 19")/A3/SRA3/Ledger 279.4 mm x 431.8 mm (11" x 17")*/A3+ 305.0 mm x 457.0 mm (12" x 18")
- Paper source: Cassette 1

Under conditions other than those mentioned above, "NG" is displayed and a blank paper is output.

* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 or later.

- 5) In the case of density difference between the front and the rear on the test print image with the dark image on the front side of the test print, go to step 6) to make adjustments. With the dark image on the rear side of the test print, go to step 7) to make adjustments. If there is no density unevenness, execute the work in step 8) and later.

- 6) Adjust the Primary Charging Assembly (in the case of dark image at the front side on the test print).

NOTE:

- In the case of dark image at the front side of the test print [1], execute step 6-1) through 6-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 5) and later.

F-4-396

- 6-1) Turn the plastic screw [A] clockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 6-2) If the image at the front side of test print image is still dark, turn the plastic screw [A] clockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 6-3) If the image at the front side of the test print is still dark, turn the plastic screw [A] clockwise to make a half round. Refer to the replacement procedure of the Primary

Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image

7) Adjust the Primary Charging Assembly (in the case of dark image at the rear side on the test print).

NOTE :

- In the case of dark image at the rear side of the test print [2], execute step 7-1) through 7-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 8) and later.

F-4-397

7-1) Turn the plastic screw [A] counterclockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.

7-2) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine,

and then output the test print to check the image.

7-3) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make a half turn. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.

8) Execute the ITB neutral position adjustment.

COPIER > FUNCTION > INSTALL > INIT-ITB

9) Execute auto gradation adjustment.

[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]

10) Execute color displacement correction.

[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

11) Execute uneven density correction.

[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Grid Cleaning Pad

F-4-398

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Grid Plate (Refer to page 4-208)

Procedure

CAUTION:

Do not touch the Primary Charging Wire [1] when disassembling/assembling.

F-4-399

- 1) Move the Cleaning Pad Arm [1] to the center of the Primary Charging Assembly [2].

F-4-400

NOTE:

After the work, return the Cleaning Pad Arm to the front.
This is to shorten the Cleaning Pad Arm detection time after the power is turned ON.

- 2) Remove the Primary Charging Assembly Shield Plate (L) [1] and the Primary Charging Assembly Rear Cover [2].

- 2 Screws [3]

2x

F-4-401

3) Remove the Grid Cleaning Pad [1] in the direction of the arrow.

- 2 Protrusions [2]

F-4-402

Removing the Primary Charging Wire Cleaning Pad Holder and the Primary Charging Wire Cleaning Pad Slider

F-4-403

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Grid Plate (Refer to page 4-208)
- 6) Removing the Grid Cleaning Pad (Refer to page 4-213)

CAUTION:

Do not damage the Primary Charging Wire when disassembling/assembling.

1) Use your fingers to pinch and remove the Primary Charging Wire Cleaning Pad Holder [1].

F-4-404

2) Remove the Primary Charging Wire Cleaning Pad Slider [1].

F-4-405

CAUTION:

- Push the Charging Wire [3] against the 2 pads [2] of the Primary Charging Wire Cleaning Pad Slider [1] to install.

F-4-406

- Push in the Primary Charging Wire Cleaning Pad Holder [1] until it is secured to the 2 claws [2].

F-4-407

Replacing the Primary Charging Wire Unit / Cleaning the Primary Charging Assembly

F-4-408

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Grid Plate (Refer to page 4-208)
- 6) Removing the Grid Cleaning Pad (Refer to page 4-213)
- 7) Removing the Primary Charging Wire Cleaning Pad Holder and the Primary Charging Wire Cleaning Pad Slider (Refer to page 4-214)

Disassembling Procedure

CAUTION:

When replacing this part, Cleaning the Primary Charging Assembly and execute the actions to be taken When Replacing the Primary Charging Assembly 4-203.

- 1) Use tweezers to hold the leading edge [A] of the spring [1] to remove it from the hook [2].
- 2) Remove the Primary Charging Wire [3] from the groove [B] in the direction of the arrow.

F-4-409

- 3) Remove the Charging Wire [1] from the groove [A] in the direction of the arrow.
- 4) Remove the block [2] with tweezers by pulling it upward, and then remove Primary Charging Wire Unit [3].

F-4-410

■ Cleaning Procedure

- 1) Clean the Inner Shield Plate [1] of the Primary Charging Assembly with lint-free paper [2] moistened with alcohol.

F-4-411

- 2) Clean both sides of the Shield Plate (Right) [1] removed from the Primary Charging Assembly with lint-free paper [2] moistened with alcohol.

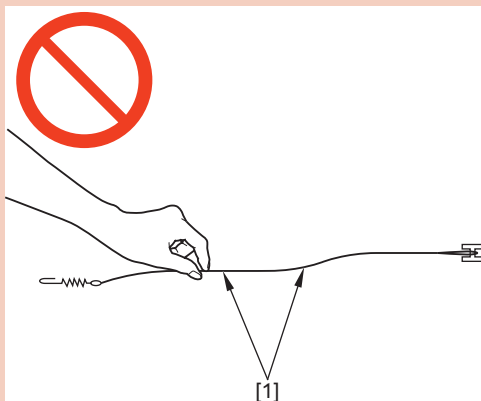

F-4-412

Assembling Procedure

CAUTION:

When replacing, do not touch the new Primary Charging Wire [1] directly with hand.

F-4-413

- 1) Insert the block [1] into the groove [A] of the Primary Charging Assembly.
- 2) Pass the Charging Wire [2] through the lower part [B] of the groove.

F-4-414

- 3) Pass the Charging Wire [1] through the lower part [A] of the groove, and then use tweezers to hold the leading edge of the spring [2] and attach it to the hook [3].

CAUTION:

The groove used for hooking the Charging Wire must be at the position shown in the figure (the side for installing the Grid).

F-4-415

CAUTION:

After hooking the Charging Wire, be sure that it is not broken or twisted.

- 4) Clean the Charging Wire with lint-free paper moistened with alcohol.

When Replacing the Primary Charging Wire Unit

Procedure

- 1) Clear the counter.
COPIER > COUNTER > PRDC-1 > PRM-WIRE
- 2) Execution of Charging Wire cleaning COPIER > FUNCTION > CLEANING > WIRE-EX
- 3) Execution of potential control
COPIER > FUNCTION > DPC > DPC
- 4) Output pattern generator for adjustment of the wire height.
COPIER > FUNCTION > MISC-P > GRID-ADJ

NOTE:

A3+ 329.0 mm x 483.0 mm (13" x 19") is recommended.

PG can be output only under the following conditions.

- Paper type: Plain paper 1/2
- Paper size: A3+ 329.0 mm x 483.0 mm (13" x 19")/A3/SRA3/Ledger 279.4 mm x 431.8 mm (11" x 17")*/A3+ 305.0 mm x 457.0 mm (12" x 18")
- Paper source: Cassette 1

Under conditions other than those mentioned above, "NG" is displayed and a blank paper is output.

* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 or later.

- 5) In the case of density difference between the front and the rear on the test print image with the dark image on the front side of the test print, go to step 6) to make adjustments. With the dark image on the rear side of the test print, go to step 7) to make adjustments. If there is no density unevenness, execute the work in step 8) and later.

- 6) Adjust the Primary Charging Assembly (in the case of dark image at the front side on the test print).

NOTE:

- In the case of dark image at the front side of the test print [1], execute step 6-1) through 6-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 5) and later.

F-4-416

- 6-1) Turn the plastic screw [A] clockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 6-2) If the image at the front side of test print image is still dark, turn the plastic screw [A] clockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 6-3) If the image at the front side of the test print is still dark, turn the plastic screw [A] clockwise to make a half round. Refer to the replacement procedure of the Primary

Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image

7) Adjust the Primary Charging Assembly (in the case of dark image at the rear side on the test print).

NOTE :

- In the case of dark image at the rear side of the test print [2], execute step 7-1) through 7-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 8) and later.

F-4-417

7-1) Turn the plastic screw [A] counterclockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.

7-2) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine,

and then output the test print to check the image.

7-3) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make a half turn. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.

8) Execute the ITB neutral position adjustment.

COPIER > FUNCTION > INSTALL > INIT-ITB

9) Execute auto gradation adjustment.

[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]

10) Execute color displacement correction.

[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

11) Execute uneven density correction.

[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Pre-transfer Charging Assembly

F-4-418

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)

Procedure

CAUTION:

When replacing this part, execute the actions to be taken When Replacing the Pre-transfer Charging Assembly 4-222.

NOTE:

When handling the Pre-transfer Charging Assembly [1], be sure to place it on a sheet of paper [2].

F-4-419

- 1) Disconnect the 2 connectors [1].

F-4-420

- 2) While pressing down the claw [1], pull out the Pre-transfer Charging Assembly [2] horizontally.

F-4-421

NOTE: How to install the Pre-transfer Charging Assembly

- 1) Fit the bottom side [A] of the Pre-transfer Charging Assembly [2] to the rail [3] and push it into the machine horizontally.
- 2) Align the 2 bosses [4] with the 2 holes [B] to install the assembly.

F-4-422

When Replacing the Pre-transfer Charging Assembly

Procedure

- 1) Clear the counter.
COPIER > COUNTER > PRDC-1 > PO-UNIT
- 2) Execution of Charging Wire cleaning
COPIER > FUNCTION > CLEANING > WIRE-EX
- 3) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 4) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 5) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 6) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Pre-transfer Charging Assembly Shutter Unit

F-4-423

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)

Procedure

CAUTION:

Do not touch the Charging Wire [1] directly with hand. Otherwise functional failure may occur.

F-4-424

- 1) Remove the Shutter Sheet Holder [2] from the Pre-transfer Charging Wire Cleaning Pad Slider [1].
 - 1 Hook [3]

CAUTION:

Because the Shutter Sheet is taken up when the Shutter Sheet Holder [2] is removed from the Pre-transfer Charging Wire Cleaning Pad Slider [1], attach the hook [3] of the removed Shutter Sheet Holder to the [A] part of the Pre-transfer Charging Assembly Shutter in advance.

F-4-425

2) Disconnect the 2 connectors [1], and free the harness [2] from the guide [A].

F-4-426

3) Remove the Pre-transfer Charging Assembly Shutter Unit [1].

- 3 Claws [2]

CAUTION:

Be sure to remove the Pre-transfer Charging Assembly Shutter Unit carefully since material that can be easily damaged is used for the 2 claws [2] for the sake of the function of Pre-transfer Charging Assembly.

F-4-427

F-4-428

4) Remove the Pre-transfer Charging Wire Cleaning Motor [2] from the Pre-transfer Charging Assembly Shutter Unit [1].

- 2 Claws [3]

F-4-429

- 5) Remove the Post Charging Wire HP Sensor [2] from the Pre-transfer Charging Assembly Shutter Unit [1].
- 2 Claws [3]
 - 2 Hooks [4]

F-4-430

NOTE: How to install the Pre-transfer Charging Assembly Shutter Unit
Be sure to check that the flag [2] moves after installing the Pre-transfer Charging Assembly Shutter Unit [1].

F-4-431

Removing the Pre-transfer Charging Wire Cleaning Pad Holder and the Pre-transfer Charging Wire Cleaning Pad Slider

F-4-432

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)

Procedure

CAUTION:

Do not touch the Charging Wire [1] directly with hand. Otherwise functional failure may occur.

F-4-433

- 1) Remove the Shutter Sheet Holder [2] from the Pre-transfer Charging Wire Cleaning Pad Slider [1].
 - 1 Hook [3]

CAUTION:

Because the Shutter Sheet is taken up when the Shutter Sheet Holder [2] is removed from the Pre-transfer Charging Wire Cleaning Pad Slider [1], attach the hook [3] of the removed Shutter Sheet Holder to the [A] part of the Pre-transfer Charging Assembly Shutter in advance.

F-4-434

- 2) Move the Pre-transfer Charging Wire Cleaning Pad Slider [1] to the cut-off [A] of the Shield Plate at the front side.

F-4-435

3) Remove the Pre-transfer Charging Assembly Cover (Front) [1] and Pre-transfer Charging Assembly Cover (Rear) [2].

F-4-436

NOTE: How to install the Pre-transfer Charging Assembly Cover
Insert the protrusion [1] of one side and bend the Pre-transfer Charging Assembly Cover, and then insert the protrusion [2] of the opposite side to install the cover.

F-4-437

4) Use tweezers to hold the leading edge [A] of the spring to remove it from the hook [1].

CAUTION:

When disassembling/assembling the Pre-transfer Charging Wire Cleaning Pad Holder and the Pre-transfer Charging Wire Cleaning Pad Slider, do not damage the Charging Wire.

F-4-438

- 5) Remove the Pre-transfer Charging Wire Cleaning Pad Holder and the Pre-transfer Charging Wire Cleaning Pad Slider [2] from the Cleaning Pad Arm [1].

F-4-439

- 6) Use your fingers to pinch and then remove the Pre-transfer Charging Wire Cleaning Pad Holder [1] and the Pre-transfer Charging Wire Cleaning Pad Slider [2].

F-4-440

CAUTION:

- When assembling, push the Charging Wire [3] against the 2 pads [2] of the Pre-transfer Charging Wire Cleaning Pad Slider [1] to install.

F-4-441

- When assembling, push in the Pre-transfer Charging Wire Cleaning Pad Holder [1] until it is secured with the 2 claws [2].

F-4-442

Replacing the Pre-transfer Charging Wire Unit/Cleaning the Pre-transfer Charging Assembly

F-4-443

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 5) Removing the Pre-transfer Charging Wire Cleaning Pad Holder and the Pre-transfer Charging Wire Cleaning Pad Slider (Refer to page 4-225)

Procedure

CAUTION:

When replacing this part, clean the Pre-transfer Charging Assembly and execute the actions to be taken When Replacing the Pre-transfer Charging Wire Unit 4-231.

- 1) Cut off and remove the old Charging Wire [1] from the Pre-transfer Charging Assembly with nippers.

F-4-444

Cleaning Procedure

- 1) Clean the Inner Shield Plate [1] of the Pre-transfer Charging Assembly with lint-free paper [2] moistened with alcohol.

F-4-445

2) Clean the Pre-transfer Upper Duct [1] with lint-free paper [2] moistened with alcohol.

F-4-446

2) Clean the Charging Wire [2] with lint-free paper [1] moistened with alcohol.

F-4-448

Assembling Procedure

1) Attach the ring [1] of the Charging Wire to the hook [2], and then pass it through the groove [A] of the rear side and the groove [B] of the sponge.

F-4-447

3) Use tweezers to hold the leading edge [A] of the spring to attach it to the hook [1].

F-4-449

4) Assemble the Pre-transfer Charging Wire Cleaning Pad Slider and the Pre-transfer Charging Wire Cleaning Pad Holder in reverse order.

When Replacing the Pre-transfer Charging Wire Unit

■ Procedure

- 1) Clear the counter.
COPIER > COUNTER > PRDC-1 > PO-WIRE
- 2) Execution of Charging Wire cleaning
COPIER > FUNCTION > CLEANING > WIRE-EX
- 3) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 4) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 5) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 6) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Drum Unit (Bk)

F-4-450

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)

Procedure

CAUTION:

When handling the Drum Unit (Bk), be sure to follow the following cautions.

- When handling the Drum Unit (Bk) [1], place it on a sheet of paper [2].
- After removing the Drum Unit (Bk), be sure to block light to the drum. Cover with the Drum Protection Sheet [3] or wrap 5 or more papers [3] around the drum to block light.

F-4-451

- Do not place the Drum Unit (Bk) in a location where is exposed to direct rays of the sun (e.g. near the window).
- Do not store in a location with high/low temperature/humidity, or in a location where temperature or humidity is dramatically changed.
- Do not store in a dusty area or in a location full of ammonia gas or organic solvent gas.

- 1) Lift the Lock Release Lever [1], and release the lock of the Black Developing Assembly Pressure Lever [2].

F-4-452

- 2) Pull out the Black Developing Assembly Pressure Lever [1] until it stops [A], and then further pull out the lever to the position [B] where pressure applied to the Developing Assembly (Bk) is released.

F-4-453

NOTE:

At installation, push the Black Developing Assembly Pressure Lever [1] to the position [A] where pressure is applied to the Developing Assembly (Bk), and then further push the lever [1] until it is locked [C].

F-4-454

3) Turn the Black Developing Assembly Pressure Lever [1].

F-4-455

5) Remove the screw [2] while holding the Drum Shaft Cap [1], and then remove the cap.

F-4-457

4) Free the harness [1].

- 1 Connector [2]
- 1 Wire Saddle [3]

F-4-456

CAUTION:

- When installing the Drum Shaft Cap [1], be sure to install it in the phase where the hole [A] of the Drum Shaft Cap is aligned with the leading edge [B] of the Drum Drive Shaft [2], and at the same time the protrusion [C] of the Drum Shaft Cap is aligned with the groove [D] of the Drum Flange.
- If the phase is displaced, hook the protrusion of the Drum Shaft Cap to the groove of the Drum Flange, and then rotate the Drum Flange [3] counterclockwise so that the phase is matched.

F-4-458

CAUTION:

- When tightening the screw of the Drum Shaft Cap, tighten the screw while pushing the Drum Shaft Cap against the rear side until it is no longer easy to turn the screwdriver so that it does not cause the drum to rotate clockwise together.
- After tightening the screw, check that the end face [A] of the Drum Shaft Cap touches the drum.
- Be sure to turn the screwdriver while holding the Drum Shaft Cap to prevent the drum from rotating together with the screwdriver.

F-4-459

CAUTION:

Do not touch the surface [A] of the Photosensitive Drum when installing/removing.

F-4-460

5) Hold the handle [A], and pull out the Drum Unit (Bk) [1] for approx. 30 cm.

F-4-461

6) Pull out the Drum Unit (Bk) by holding the upper part [A] and the left part [B], lift the right side, and then remove the unit while avoiding contact with the Rail Guide [2].

F-4-462

NOTE: How to install the Drum Unit (Bk)

- 1) Place the left lower side [C] of the Drum Unit (Bk) on the guide [D] of the Process Unit Inner Cover, and then insert it under the guide [E].

F-4-463

- 2) Place the rail [3] of the Drum Unit (Bk) on the guide [F] of the Process Unit Inner Cover, fit the left front side [G] of the Drum Unit (Bk) to the rail [4] of the machine, and then push the unit into the machine slowly and horizontally.

F-4-464

Removing the Drum Cleaning Unit

F-4-465

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 6) Removing the Drum Unit (Bk) (Refer to page 4-232)

Procedure

CAUTION:

Be sure to turn over the Drum Cleaning Unit [1] and place it on a sheet of paper [2] because toner is attached on the unit.

F-4-466

1) Remove the Drum Cleaning Unit [1].

- 6 Screws [2]
- 2 Bosses [3]
- 1 Connector [4]

F-4-467

■ When removing/installing the Drum Cleaning Blade

When installing the removed Drum Cleaning Unit again to the Drum Unit (Bk), follow the steps 1 to 3 shown below to clean the edge of the Drum Cleaning Blade and apply lubricant (Tospearl) to the edge.

CAUTION:

Installing the Drum Cleaning Blade without cleaning the edge and applying lubricant (Tospearl) will cause a cleaning error.

1) Clean the surface [A] of the Drum Cleaning Blade [2] installed to the Drum Cleaning Unit with lint-free paper [1], and apply lubricant (Tospearl) to the edge [B] contacting the Drum after cleaning.

F-4-468

CAUTION:

Be careful not to scatter lubricant (Tospearl) when cleaning the edge of the Drum Cleaning Blade and when applying lubricant.

If lubricant (Tospearl) falls onto the Pre-exposure Unit, it will cause image failure.

If lubricant (Tospearl) scatters onto the Pre-exposure Unit, clean it with a blower, etc.

2) In order to rotate the Drum, temporarily secure the Drum Cleaning Unit [1] to the Drum Unit (Bk).

- 6 Screws [2]

F-4-469

CAUTION:

Do not rotate the Drum [1] in the reverse direction (clockwise as viewed from the front side).

This may cause the Drum Cleaning Blade to be everted, resulting in image failure.

F-4-470

3) Hold both ends, and rotate the Drum [1] approx. one turn in the direction of the arrow.

F-4-471

CAUTION:

If you feel heavy load when you rotate the Drum, the Drum Cleaning Blade may be everted. Remove the Drum Cleaning Unit again, clean the edge of the Drum Cleaning Blade, and apply lubricant (Tospearl) to the edge.

4) Assemble the Drum Cleaning Unit in the reverse order of removal.

Removing the Drum Cleaning Blade (Bk) and the Side Seal (Front)/(Rear)

F-4-472

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 6) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 7) Removing the Drum Cleaning Unit (Refer to page 4-237)

Procedure

CAUTION:

Be sure to place the Drum Cleaning Blade (Bk) [1], Blade Spacer [2], and Side Seal (Front)/(Rear) [3] on a sheet of paper [4] because toner is attached on them.

F-4-473

1) Remove the Drum Cleaning Blade Cover [1].

- 2 Screws [2]

CAUTION:

Do not fold the sheet [2] when disassembling/assembling the Drum Cleaning Blade Cover [1].

F-4-474

F-4-475

2) Remove the Drum Cleaning Blade (Bk) [1], Blade Spacer [2], and Side Seal (Front)/(Rear) [3] from the Drum Cleaning Blade Unit.

- 3 Screws [4]

F-4-476

CAUTION:

When assembling the Drum Cleaning Blade Unit, be sure to pay attention to the directions of the Drum Cleaning Blade (Bk) [1], Blade Spacer [2], and Side Seal (Front)/(Rear) [3].

F-4-477

When removing/installing the Drum Cleaning Blade

When reusing the Drum Cleaning Blade, follow the steps 1 to 3 shown below to clean the edge of the Drum Cleaning Blade and apply lubricant (Tospearl) to the edge.

CAUTION:

Installing the Drum Cleaning Blade without cleaning the edge and applying lubricant (Tospearl) will cause a cleaning error.

1) Clean the surface [A] of the Drum Cleaning Blade [2] installed to the Drum Cleaning Unit with lint-free paper [1], and apply lubricant (Tospearl) to the edge [B] contacting the Drum after cleaning.

F-4-478

CAUTION:

Be careful not to scatter lubricant (Tospearl) when cleaning the edge of the Drum Cleaning Blade and when applying lubricant.

If lubricant (Tospearl) falls onto the Pre-exposure Unit, it will cause image failure.

If lubricant (Tospearl) scatters onto the Pre-exposure Unit, clean it with a blower, etc.

2) In order to rotate the Drum, temporarily secure the Drum Cleaning Unit [1] to the Drum Unit (Bk).

- 6 Screws [2]

F-4-479

CAUTION:

Do not rotate the Drum [1] in the reverse direction (clockwise as viewed from the front side).

This may cause the Drum Cleaning Blade to be everted, resulting in image failure.

F-4-480

3) Hold both ends, and rotate the Drum [1] approx. one turn in the direction of the arrow.

F-4-481

CAUTION:

If you feel heavy load when you rotate the Drum, the Drum Cleaning Blade may be everted. Remove the Drum Cleaning Unit again, clean the edge of the Drum Cleaning Blade, and apply lubricant (Tospearl) to the edge.

4) Assemble the Drum Cleaning Unit in the reverse order of removal.

Removing the Drum Patch Sensor Unit (Bk)

F-4-482

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 6) Removing the Drum Unit (Bk) (Refer to page 4-232)

Procedure

CAUTION:

Be sure to place the Drum Patch Sensor Unit (Bk) [1] on a sheet of paper [2] because toner is attached on the unit.

F-4-483

- 1) Disconnect the connector [1], and free the harness [2] from the guide [3].
- 2) Remove the screw [4] and pull the [A] part of the Drum Patch Sensor Unit (Bk) to remove the boss [5].

F-4-484

- 3) Lift the frame [1] and remove the Drum Patch Sensor Unit (Bk) [2].
 - 1 protrusion [3]

F-4-485

NOTE: How to install the Drum Patch Sensor Unit (Bk)
The following shows the installation method when the screw [1] and the frame [2] were removed before removing the Drum Patch Sensor Unit (Bk) [3].

F-4-486

Be sure that the boss hole [A] of the Drum Patch Sensor Unit (Bk) [3] is positioned correctly when installing the unit.

F-4-487

When Replacing the Drum Patch Sensor Unit (Bk)

Procedure

- Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- Enter the Patch Sensor Alpha Value.
COPIER > ADJUST > DENS > ALF-C
(Enter the 4-digit number below the barcode of the Patch Image Read Sensor Unit in the following service mode: ALF-C.)

F-4-488

- Adjust the Patch Sensor Light Intensity.
COPIER > FUNCTION > MISC-P > PT-LPADJ
- Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

- 6) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Cleaning the Drum Patch Sensor Cover (Bk) and Drum Patch Sensor (Bk)

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 6) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 7) Removing the Drum Patch Sensor Unit (Bk) (Refer to page 4-244)

Procedure

- 1) Clean the Drum Patch Sensor Cover (Bk) [1] with wet and tightly-wrung lint-free paper [2].

F-4-489

- 2) Insert the flat-blade screwdriver into the hole [A] of the Drum Patch Sensor Unit (Bk), push the Solenoid Pin [1], and then open the shutter [2].
- 3) Clean the surface [B] of the Patch Sensor (Bk) in the single direction with wet and tightly-wrung cotton swab [3]. After cleaning, check that there is no soiling caused by toner on the surface [B] of the sensor.

CAUTION:

- Do not use alcohol because it causes melting and clouding of the sensor window.
- Do not dry wipe the sensor window because it is charged to attract toner.

F-4-490

Removing the Drum (Bk)

F-4-491

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 6) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 7) Removing the Drum Cleaning Unit (Refer to page 4-237)
- 8) Removing the Drum Patch Sensor Unit (Bk) (Refer to page 4-244)

Procedure

CAUTION:

- When replacing this part, execute the actions to be taken When Replacing the Drum (Bk) 4-252.
- Do not touch the surface [A] of the Photosensitive Drum when installing/removing.

F-4-492

NOTE:

If there is abnormal noise from the drum (Bk), apply grease to the whole circumference of the 2 Sliding Assemblies [1] and 3 Slip Rings [2] of the drum.

F-4-494

CAUTION:

- Be sure to cover the drum [1] with 5 or more papers or the Lightproof Sheet [2].

F-4-493

1) Remove the Drum Shaft Bearing (Front) [1] and Drum Shaft Bearing (Rear) [2].

- 2 Screws [3] each

F-4-495

2) Remove the SD Spacer (Front) [1] and SD Spacer (Rear) [2].

F-4-496

- 3) Move the Drum (Bk) [1] in the direction of the arrow by approx. 5.0 mm, and remove the 2 Drum Sliding Assemblies [2].

F-4-497

- 4) Pull out the Drum Shaft [1] on the front side from the groove [A] of the Drum Unit Frame, and then remove the Drum (Bk) by moving it in the direction of the arrow.

F-4-498

CAUTION:

When installing a new drum (Bk), be sure to remove the Lightproof Sheet [3] after installing the drum [1] to the Drum Unit Frame [2].

F-4-499

CAUTION:

Be sure to rotate the drum [2] counterclockwise when removing the Lightproof Sheet [1].
(If the drum is rotated clockwise, the Scoop-up Sheet [3] may flip.)

F-4-500

When Replacing the Drum (Bk)

Procedure

[Before replacing Drum Unit]

1) Disable (OFF) the warm-up rotation.

COPIER > FUNCTION > INSTALL > AINR-OFF = 1

2) Turn OFF the main power switch. (Replace the Drum.)

[When Replacing the Drum (Bk)]

It is recommended to replace the Drum Cleaning Blade with a new one when replacing the Drum. (Refer to page 4-240)

When reusing the Drum Cleaning Blade, follow the steps 1 to 3 shown below to clean the edge of the Drum Cleaning Blade and apply lubricant (Tospearl) to the edge.

CAUTION:

Installing the Drum Cleaning Blade without cleaning the edge and applying lubricant (Tospearl) will cause a cleaning error.

1) Clean the surface [A] of the Drum Cleaning Blade [2] installed to the Drum Cleaning Unit with lint-free paper [1], and apply lubricant (Tospearl) to the edge [B] contacting the Drum after cleaning.

F-4-501

CAUTION:

Be careful not to scatter lubricant (Tospearl) when cleaning the edge of the Drum Cleaning Blade and when applying lubricant.

If lubricant (Tospearl) falls onto the Pre-exposure Unit, it will cause image failure.

If lubricant (Tospearl) scatters onto the Pre-exposure Unit, clean it with a blower, etc.

2) In order to rotate the Drum, temporarily secure the Drum Cleaning Unit [1] to the Drum Unit (Bk).

- 6 Screws [2]

F-4-502

CAUTION:

Do not rotate the Drum [1] in the reverse direction (clockwise as viewed from the front side).

This may cause the Drum Cleaning Blade to be everted, resulting in image failure.

F-4-503

3) Hold both ends, and rotate the Drum [1] approx. one turn in the direction of the arrow.

F-4-504

CAUTION:

If you feel heavy load when you rotate the Drum, the Drum Cleaning Blade may be everted. Remove the Drum Cleaning Unit again, clean the edge of the Drum Cleaning Blade, and apply lubricant (Tospearl) to the edge.

4) Assemble the Drum Cleaning Unit in the reverse order of removal.

5) Assemble the Drum (Bk) in the reverse order of removal, and install it to the host machine.

[After replacing Drum Unit]

1) Turn ON the main power switch.

2) Execute the ITB neutral position adjustment.

COPIER > FUNCTION > INSTALL > INIT-ITB

3) Forcibly execute the drum replacement mode.

Select COPIER > FUNCTION > INSTALL > CLR-SET, and set the target color to "1".

COPIER > FUNCTION > INSTALL > DRMRESET

4) Enable (ON) the warm-up rotation.

COPIER > FUNCTION > INSTALL > AINR-OFF = 0

5) Execute auto gradation adjustment.

[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]

6) Execute color displacement correction.

[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct

Color Mismatch]

7) Execute color displacement correction.

[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Cleaning/Lubrication of the Drum Sliding Shaft Support

■ Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 6) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 7) Removing the Drum Cleaning Unit (Refer to page 4-237)
- 8) Removing the Drum Patch Sensor Unit (Bk) (Refer to page 4-244)
- 9) Removing the Drum (Bk) (Refer to page 4-248)

■ Procedure

- 1) Clean the Drum Sliding Shaft Support [2] with lint-free paper [1] moistened with alcohol.

F-4-505

- 2) Apply grease to the whole circumference of the 3 Slip Rings [2] of the Sliding Assembly [1] of the drum.

F-4-506

Removing the Drum Cleaning Scoop-up Sheet (Bk)

F-4-507

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 6) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 7) Removing the Drum Cleaning Unit (Refer to page 4-237)
- 8) Removing the Drum Patch Sensor Unit (Bk) (Refer to page 4-244)
- 9) Removing the Drum (Bk) (Refer to page 4-248)

Procedure

CAUTION:

Be sure to place the Drum Cleaning Scoop-up Plate [1] and Drum Cleaning Scoop-up Sheet (Bk) [2] on a sheet of paper [3] because toner is attached on them.

F-4-508

CAUTION:

Since there is toner accumulated on the [A] part, be sure to perform the work while paying attention not to scatter the toner.

F-4-509

1) Move the Drum Unit (Bk) [1] in the direction of the arrow.

F-4-510

2) Remove the Drum Cleaning Scoop-up Plate [1].

- 1 Screw [2]
- 1 Protrusion [3]

F-4-511

CAUTION:

When disassembling/assembling the Drum Cleaning Scoop-up Sheet (Bk), be sure to follow the order below because the Drum Cleaning Scoop-up Sheet (Bk) [1], Front Edge Scraper (Bk) [2] and Rear Edge Scraper (Bk) [3] are layered in specific order.

- At disassembly:
Remove the Drum Cleaning Scoop-up Sheet (Bk) [1] first, before removing the Front Edge Scraper (Bk) [2] and the Rear Edge Scraper (Bk) [3].
- At assembly:
Install the Front Edge Scraper (Bk) [2] and the Rear Edge Scraper (Bk) [3] before installing the Drum Cleaning Scoop-up Sheet (Bk) [1].

3) Remove the Drum Cleaning Scoop-up Sheet (Bk) [1].

- 2 Screws [2]

F-4-513

Removing the Front Edge Scraper (Bk) and the Rear Edge Scraper (Bk)

F-4-514

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 6) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 7) Removing the Drum Cleaning Unit (Refer to page 4-237)
- 8) Removing the Drum Patch Sensor Unit (Bk) (Refer to page 4-244)
- 9) Removing the Drum (Bk) (Refer to page 4-248)
- 10) Removing the Drum Cleaning Scoop-up Sheet (Bk) (Refer to page 4-255)

Procedure

CAUTION:

Be sure to place the Drum Sliding Shaft Support [1], Front Edge Scraper (Bk) [2], and Rear Edge Scraper (Bk) [3] on a sheet of paper [4] because toner is attached on them.

F-4-515

CAUTION:

Since there is toner accumulated on the [A] part, be sure to perform the work while paying attention not to scatter the toner.

F-4-516

CAUTION:

When disassembling/assembling the Drum Cleaning Scoop-up Sheet (Bk), be sure to follow the order below because the Drum Cleaning Scoop-up Sheet (Bk) [1], Front Edge Scraper (Bk) [2] and Rear Edge Scraper (Bk) [3] are layered in specific order.

- At disassembly:
Remove the Drum Cleaning Scoop-up Sheet (Bk) [1] first, before removing the Front Edge Scraper (Bk) [2] and the Rear Edge Scraper (Bk) [3].
- At assembly:
Install the Front Edge Scraper (Bk) [2] and the Rear Edge Scraper (Bk) [3] before installing the Drum Cleaning Scoop-up Sheet (Bk) [1].

F-4-517

1) Move the Drum Unit (Bk) [1] in the direction of the arrow.

F-4-518

2) Remove the Drum Sliding Shaft Support [1] at the rear side.

• 2 Screws [2]

F-4-519

3) Remove the Front Edge Scraper (Bk) [1] and the Rear Edge Scraper (Bk) [2].

• 2 Screws [3]

F-4-520

Removing the Drum Fur Brush

F-4-521

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 6) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 7) Removing the Drum Cleaning Unit (Refer to page 4-237)
- 8) Removing the Drum Patch Sensor Unit (Bk) (Refer to page 4-244)
- 9) Removing the Drum (Bk) (Refer to page 4-248)
- 10) Removing the Drum Cleaning Scoop-up Sheet (Bk) (Refer to page 4-255)
- 11) Removing the Front Edge Scraper (Bk) and the Rear Edge Scraper (Bk) (Refer to page 4-258)

Procedure

CAUTION:

Because there is toner on the Drum Fur Brush [1] and the Felt Seal [2], place them on a sheet of paper [3], etc.

F-4-522

CAUTION:

Since there is toner accumulated on the [A] part, be sure to perform the work while paying attention not to scatter the toner.

F-4-523

1) Remove the E-ring [1] and the 2 gears [2].

F-4-524

2) Remove the Brush Plate [1].

1 Screw [2]

F-4-525

3) Remove the E-ring [1], washer [2], and Ball Bearing [3].

F-4-526

4) Remove the E-ring [1] and move the gear [2] and the bearing [3].

5) Move the Drum Fur Brush [1] and remove the gear [2] and the bearing [3].

F-4-528

F-4-527

6) Remove the Drum Fur Brush [1] and the 2 Felt Seals [2].

F-4-529

7) Remove the 2 Felt Seals [2] from the Drum Fur Brush [1].

F-4-530

NOTE:

- When installing the Drum Fur Brush [1], install it with the shaft [A] on the rear side.
- When installing the 2 Felt Seals [2], be sure to install them with the long sides [B] up and the short sides [C] down.

F-4-531

Removing the Developing Assembly (Bk)

F-4-532

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)

Procedure

CAUTION:

When replacing this part, execute the actions to be taken, When Replacement the Developing Assembly 4-273.

CAUTION:

Be sure to place the Developing Assembly (Bk) [1] on a sheet of paper [2], etc.

F-4-533

CAUTION:

Do not touch the surface [A] of the Developing Sleeve.

F-4-534

- 1) Raise the Lock Release Lever [1] to release the Black Developing Assembly Pressure Lever [2].

F-4-535

- 2) Pull out the Black Developing Assembly Pressure Lever [1] until it stops [A], and then further pull out the lever to the position [B] where pressure applied to the Developing Assembly (Bk) is released.

F-4-536

- 3) Turn the Black Developing Assembly Pressure Lever [1] in the direction of the arrow.

F-4-537

- 4) Free the harness from the guide [A], and hold the handle [B] to pull out the Developing Assembly (Bk) [1] for approx. 100 mm.

- 1 Connector [2]

F-4-538

5) Hold the front upper part and the left side of the Developing Assembly (Bk) and remove it horizontally.

CAUTION:

If the Developing Assembly is tilted inside the host machine, the Developing Assembly and the drum may come into contact causing damage to the drum. Therefore, be sure to install or remove it horizontally.

F-4-539

Installing the Developing Assembly (Bk)

Unpacking a new Developing Assembly (Bk)

CAUTION:

- Do not tilt or strongly shake the Developing Assembly, but be sure to hold it in a horizontal state (otherwise, toner scattering or image failure may occur).
- When touching the Developing Assembly, check that no foreign particle (especially metal chip) is attached on your hands before starting the work. (If foreign particle is attached on the sleeve, it can cause image failure).

- 1) Take out the Developing Assembly from the attached packing box.
- 2) Unpack the Developing Assembly and remove the packing material.

CAUTION:

- Be sure not to remove the tape [A] on the Supply Mouth until right before installing to the host machine.
- Do not remove tapes [B] and [C] before removing the SB Sleeve Seal.
- Because the tapes [B] and [C] secure the sleeve in place to prevent it from moving when the SB Sleeve Seal is removed, be sure to remove tapes [B] and [C] after the SB Sleeve Seal.

F-4-540

CAUTION:

When removing the SB Sleeve Seal [2] from the Developing Assembly [1], do not damage the Toner Blocking Sheet (Outer) [3] and the Toner Blocking Sheet (Inner) [4].

F-4-541

- 3) While holding the [D] part (top surface) of the Developing Assembly [1], carefully pull out the SB Sleeve Seal [2] parallel to the Developing Assembly [1] to remove it.

CAUTION:

Do not hold the [E] part of the Developing Assembly when removing the SB Sleeve Seal [2] (pulling the SB Sleeve Seal [2] while holding the [E] part increases the resistance, at which time the reaction force may cause damage to the Toner Blocking Sheet (Outer) [3] and the Toner Blocking Sheet (Inner) [4]).

F-4-542

F-4-543

4) Remove tape [B] and tape [C] securing the Sleeve.

F-4-544

5) Make the gear of the Sleeve rotate a full turn or 1.5 turns in the direction of the arrow (clockwise).

CAUTION:

Do not turn the Developing Sleeve in the reverse direction.
If you rotate it in the reverse direction, toner clots on the Sleeve may damage the Toner Blocking Sheet on the Sleeve.

NOTE:

Toner clots are removed by rotating the Sleeve in the direction of the arrow (clockwise).

F-4-545

6) Check that developer is not scattered on the Toner Blocking Sheet (Inner) [1]. If it is scattered, clean it [A] with dry lint-free Paper [2].

CAUTION:

Do not use alcohol when cleaning the Toner Blocking Sheet (Inner).
Be careful not to allow alcohol to attach on the Developing Sleeve.

F-4-546

7) Remove the tape [A] and the packaging material of the Supply Mouth.

CAUTION:

Be sure to remove the packaging material of the Supply Mouth.

F-4-547

Procedure

1) Align the rail [A] of the Developing Assembly (Bk) with the groove [B] of the host machine, and insert the assembly approx. 2/3 of the way while keeping it in a horizontal position.

F-4-548

2) Press the handle [A] of the Developing Assembly (Bk), align the 2 Positioning Pins [1] with the 2 boss holes [2], and then push the assembly until it stops.

F-4-549

3) Connect the connector [1], and secure the harness with the Harness Guide [2].

F-4-550

5) Apply pressure to the Developing Assembly, and lock the lever.

F-4-552

4) Turn the Black Developing Assembly Pressure Lever [1] counterclockwise.

F-4-551

When Replacement the Developing Assembly

■ Procedure

[Before replacing Developing Assembly]

- 1) Disable (OFF) the warm-up rotation.
COPIER > FUNCTION > INSTALL > AINR-OFF = 1
- 2) Turn OFF the main power switch. (Replace the Developing Assembly.)

[After replacing Developing Assembly]

- 1) Turn ON the main power switch.
- 2) Execute the initial installation mode of the Developing Assembly.
Select COPIER > FUNCTION > INSTALL > CLR-SET, and set the target color to "1".
COPIER > FUNCTION > INSTALL > INISET
- 3) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 4) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 5) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 6) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Cleaning the Developing Assembly Sleeve Cover (Bk) / Toner Blocking Sheet (Bk)

■ Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Developing Assembly (Bk) (Refer to page 4-265)

■ Procedure

CAUTION:

When cleaning, do not touch the surface [A] of the Developing Sleeve.

F-4-553

CAUTION:

Do not use alcohol when cleaning the Toner Blocking Sheet (Inner) and the Toner Blocking Sheet (Outer).

Be careful not to allow alcohol to attach on the Developing Sleeve.

- 1) Clean the Sleeve Cover (Bk) [1] of the Developing Assembly with lint-free paper [2] moistened with alcohol.

F-4-554

- 2) Clean the inner surface [A] of the Toner Blocking Sheet (Outer) [1] of the Developing Assembly with dry lint-free paper [2].

F-4-555

CAUTION:

Check that the developer [2] is not placed on the Toner Blocking Sheet [1] before returning it to the host machine.

F-4-556

- 3) Clean the surface [A] of the Toner Blocking Sheet (Inner) [1] of the Developing Assembly with dry lint-free paper [2].

F-4-557

Removing the Process Unit (Y)/(M)/(C)

F-4-558

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)

Procedure

CAUTION:

When handling the Process Unit (Y)/(M)/(C), be sure to follow the following caution.

- Do not touch the surface [A] of the Photosensitive Drum.

F-4-559

CAUTION:

- When handling the Process Unit (Y)/(M)/(C) [1], place it on a sheet of paper [2] and cover it with the Drum Protection Sheet, or wrap 5 or more papers [3] around it to block light.

F-4-560

- Do not place the Drum in a location where is exposed to direct rays of the sun (e.g. near the window).
- Do not store in a location with high/low temperature/humidity, or in a location where temperature or humidity is dramatically changed.
- Do not store in a dusty area or in a location full of ammonia gas or organic solvent gas.

NOTE:

This procedure explains the case for the Process Unit (Y) [1]. Be sure to perform the same procedure for the Process Unit (M) [2]/(C) [3].

F-4-561

- 1) Disconnect the connector [1], hook your finger to the handle [2], and then pull out the Process Unit [3] for approx. 20 cm.

F-4-562

2) Hold the front upper part and the left side of the Process Unit [1] and pull it out horizontally.

CAUTION:

If the Process Unit [1] is tilted inside the machine, it may damage the ITB. Therefore, be sure to keep the unit horizontally when installing/removing it.

F-4-563

NOTE:

The following shows the locations of the guides [1] and [2] for the Process Unit Inner Cover (Y)/(M)/(C).

The following shows the locations of the rails [3] and [4] for the Process Unit Inner Cover (Y)/(M)/(C).

F-4-565

NOTE: How to install the Process Unit

1) Align the left side [A] with the guide [1] of the Process Unit Inner Cover and the right lower side [B] with the guide [2] of the Process Unit Inner Cover, and then place the Process Unit horizontally.

2) Align the protrusion [C] on the upper left of the Process Unit with the rail [3] and the protrusion [D] on the upper right of the unit with the rail [4], and then install the unit.

F-4-564

Separating the Developing Assembly (Y)/(M)/(C) from the Drum Unit (Y)/(M)/(C)

F-4-566

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Process Unit (Y)/(M)/(C) (Refer to page 4-275)

Procedure

CAUTION:

- When replacing the Developing Assembly (Y)/(M)/(C), execute the actions to be taken, When Replacement the Developing Assembly 4-273.
- When replacing the Drum Unit (Y)/(M)/(C), Cleaning the Sleeve Cover of the Developing Assembly (Y)/(M)/(C), Toner Catch Sheet (Y)/(M)/(C), and Toner Blocking Sheet (Y)/(M)/(C) 4-285 and execute the actions to be taken When Replacing the Drum Unit (Y)/(M)/(C) 4-284.

CAUTION:

Because there is toner on the Developing Assembly [1] and the Drum Unit [2], be sure to place them on a sheet of paper [3], etc.

To prevent the sensitivity of the Photosensitive Drum from deteriorating, note the following points.

- Do not touch the surface [A] of the Photosensitive Drum.
- To prevent the Photosensitive Drum from exposure to light for a long time, cover it with 5 or more papers [4] or the Lightproof Sheet [4].

F-4-567

CAUTION:

- Do not place the Process Unit and the Drum in a location where is exposed to direct rays of the sun (e.g. near the window).
- Do not store in a location with high/low temperature/humidity, or in a location where temperature or humidity is dramatically changed.
- Do not store in a dusty area or in a location full of ammonia gas or organic solvent gas.

1) While pressing the locks [1] of the Connecting Arms, release the 2 Connecting Arms [2] to open them, and separate the Developing Assembly [3] and the Drum Unit [4].

- 2 Harness Guides [5]
- 1 Connector [6]

F-4-568

CAUTION:

When connecting the Developing Assembly and the Drum Unit, move the lock [B] of the Connecting Arm to the position where the lines [A] of the Connecting Arm can be seen, and then lock it.

F-4-569

■ Unpacking a new Developing Assembly (Y)/(M)/(C) and Drum Unit (Y)/(M)/(C)

CAUTION:

- The color is specified for the Color Developing Assembly.
- Do not tilt or strongly shake the Developing Assembly, but be sure to hold it in a horizontal state (otherwise, toner scattering or image failure may occur).
- When touching the Developing Assembly, check that no foreign particle (especially metal chip) is attached on your hands before starting the work. (If foreign particle is attached on the sleeve, it can cause image failure).

- 1) Take out the Developing Assembly from the attached packing box.
- 2) Unpack the Developing Assembly and remove the packing material.

CAUTION:

- Be sure not to remove the tape [A] on the Supply Mouth until right before installing to the host machine.
- Do not remove tapes [B] and [C] before removing the SB Sleeve Seal.
- Because the tapes [B] and [C] secure the sleeve in place to prevent it from moving when the SB Sleeve Seal is removed, be sure to remove tapes [B] and [C] after the SB Sleeve Seal.

F-4-570

CAUTION:

When removing the SB Sleeve Seal [2] from the Developing Assembly [1], do not damage the Toner Blocking Sheet (Outer) [3] and the Toner Blocking Sheet (Inner) [4].

F-4-571

3) While holding the [D] part (top surface) of the Developing Assembly [1], carefully pull out the SB Sleeve Seal [2] parallel to the Developing Assembly [1] to remove it.

CAUTION:

Do not hold the [E] part of the Developing Assembly when removing the SB Sleeve Seal [2] (pulling the SB Sleeve Seal [2] while holding the [E] part increases the resistance, at which time the reaction force may cause damage to the Toner Blocking Sheet (Outer) [3] and the Toner Blocking Sheet (Inner) [4]).

F-4-572

F-4-573

4) Remove tape [B] and tape [C] securing the Sleeve.

F-4-574

5) Make the Coupling of the Sleeve rotate a full turn or 1.5 turns in the direction of the arrow (clockwise).

CAUTION:

Do not turn the Developing Sleeve in the reverse direction.

If you rotate it in the reverse direction, toner clots on the Sleeve may damage the Toner Blocking Sheet on the Sleeve.

NOTE:

Toner clots are removed by rotating the Sleeve in the direction of the arrow (clockwise).

F-4-575

6) Check that developer is not scattered on the Toner Blocking Sheet (Inner) [1]. If it is scattered, clean it [A] with dry lint-free Paper [2].

CAUTION:

Do not use alcohol when cleaning the Toner Blocking Sheet (Inner).
Be careful not to allow alcohol to attach on the Developing Sleeve.

F-4-576

7) Take out the Drum Unit from the packaging box.

8) Unpack the Drum Unit, and remove the packaging material.

CAUTION:

- Do not touch the Photosensitive Drum.
- During work, cover it with the Protection Sheet.

F-4-577

9) Pull the 2 spacers in the direction of the arrow to remove them from the Drum Unit.

F-4-578

10) Release the lock of the Fixation Lever of the Drum Unit to lift up the Fixation Lever.

F-4-579

11) Insert the 2 protrusions of the Developing Assembly into the Drum Unit (yellow) to join the Developing Assembly and the Drum Unit, and then turn over the Fixation Lever in the direction of the arrow to assemble the Process Unit.

F-4-580

CAUTION:

Check to see whether the lock is securely in place or the grooves as shown in the figure are visible. (If the lock is not completely secure when the Process Unit is introduced into the host machine, it may not be possible to remove it from the host machine.)

F-4-581

11) Secure the harness using the Harness Guide and the Reuse Band, and connect the connector.

F-4-582

12) Remove the tape [A] and the packaging material of the Supply Mouth.

CAUTION:

Be sure to remove the packaging material of the Supply Mouth.

F-4-583

When Replacing the Drum Unit (Y)/(M)/(C)

Procedure

[Before replacing Drum Unit]

- 1) Disable (OFF) the warm-up rotation.
COPIER > FUNCTION > INSTALL > AINR-OFF = 1
- 2) Turn OFF the main power switch. (Replace the Drum.)

[After replacing Drum Unit]

- 1) Turn ON the main power switch.
- 2) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 3) Forcibly execute the drum replacement mode.
Select COPIER > FUNCTION > INSTALL > CLR-SET, and set the target color to "1".
COPIER > FUNCTION > INSTALL > DRMRESET
- 4) Enable (ON) the warm-up rotation.
COPIER > FUNCTION > INSTALL > AINR-OFF = 0
- 5) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 6) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 7) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Cleaning the Sleeve Cover of the Developing Assembly (Y)/(M)/(C), Toner Catch Sheet (Y)/(M)/(C), and Toner Blocking Sheet (Y)/(M)/(C)

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Process Unit (Y)/(M)/(C) (Refer to page 4-275)
- 5) Separating the Developing Assembly (Y)/(M)/(C) from the Drum Unit (Y)/(M)/(C) (Refer to page 4-278)

Procedure

CAUTION:

When cleaning, do not touch the surface [A] of the Developing Cylinder.

F-4-584

- 1) Remove soiling at the surface [A] of the Sleeve Cover of the Developing Assembly (Y)/(M)/(C) with lint-free paper [1] moistened with alcohol.
- 2) Remove soiling at the front side [B] and the back side [C] of the Toner Catch Sheet of the Developing Assembly (Y)/(M)/(C) with dry lint-free paper [2].

CAUTION:

Be careful not to allow alcohol to attach on the Developing Sleeve.

F-4-585

CAUTION:

Do not use alcohol when cleaning the Toner Blocking Sheet (Inner) and the Toner Blocking Sheet (Outer).

Be careful not to allow alcohol to attach on the Developing Sleeve.

3) Clean the inner surface [A] of the Toner Blocking Sheet (Outer) [1] of the Developing Assembly with dry lint-free paper [2].

F-4-586

CAUTION:

Check that the developer [2] is not placed on the Toner Blocking Sheet [1] before returning it to the host machine.

F-4-587

- 4) Clean the surface [A] of the Toner Blocking Sheet (Inner) [1] of the Developing Assembly with dry lint-free paper [2].

F-4-588

Removing the Toner Container Manually

Preparation

- 1) Removing the Box Left Cover (Refer to page 4-458)
- 2) Removing the Box Upper Cover (Refer to page 4-458)
- 3) Open the Controller Box (Refer to page 4-107)
- 4) Open the Toner Replacement Cover.

Procedure

NOTE:

This procedure explains how to remove the Toner Container (Bk).
Be sure to perform the same procedure for the Toner Container (Y)/(M)/(C).

F-4-589

1) Remove the Toner Container Removing Tool [1].

- 1 Screw [2]

F-4-590

2) Insert the Toner Container Removing Tool [2] into the Toner Container Lock Shaft [1].

F-4-591

3) Rotate the Toner Container Removing Tool [1] counterclockwise to set the Toner Container to "unlocked state".

Unlocked state refers to the following condition:

- (1) The Toner Replacement Small Door [2] at the front side opens.
- (2) A click sound is heard.
- (3) After that, the pin pops out to its maximum (approx. 1 cm).

F-4-592

NOTE: Unlocked state of the Toner Container

Normally, the Toner Container is "locked" so that it cannot be taken out.

To manually take out the Toner Container, you need to rotate the Lock Shaft counterclockwise to set it to the "unlocked state".

The Toner Container is in the "unlocked state" when the pin pops out to its maximum at this moment.

Because the Lock Shaft cannot be rotated reversely, if you miss the "unlocked state" once, wait for the next turn when the pin pops out to its maximum, which indicates the next "unlocked state".

F-4-593

4) Take out the Toner Container [1].

F-4-595

CAUTION:

Even when the Toner Container is "locked", you can install it and close the Toner Replacement Small Door.

In this case, toner is not supplied from the Toner Container and "Remaining Toner Error Message" appears.

When this happens, remove and then install the Toner Container again.

F-4-594

Removing the Hopper Tray (Bk)

F-4-596

Preparation

- 1) Remove the Toner Container (Bk).

NOTE:

Before turning OFF the power of the host machine, use the Control Panel to remove the Toner Container of the corresponding color.
If the power of the host machine is already turned OFF, see the procedure on manually removing the Toner Container (Refer to page 4-287) to remove the Toner Container of the corresponding color.

- 2) Open the Front Cover.
- 3) Removing the Toner Replacement Cover (Refer to page 4-453)
- 4) Removing the Toner Container Replacement Cover (Refer to page 4-453)
- 5) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 6) Removing the Primary Charging Assembly (Refer to page 4-202)

Procedure

- 1) Free the harness [1].
 - 1 Connector [2]
 - 1 Harness Guide [3]
 - 1 Reuse Band [4]

F-4-597

- 2) Free the 2 harnesses [1] from the 2 guides [2].
- 3) Open the Wire Saddle [3], and disconnect the connector [4] and the Relay Connector [5].

F-4-598

4) Remove the Toner Container ID Read Sensor (Bk) [1].

- 1 Screw [2]
- 1 Boss [3]

F-4-599

5) Remove the Hopper Tray (Bk) [1] while bending it.

- 2 Screws [2]

F-4-600

Removing the Hopper Tray (Y)/(M)/(C)

F-4-601

Preparation

1) Remove the Toner Container (Y)/(M)/(C).

NOTE:

Before turning OFF the power of the host machine, use the Control Panel to remove the Toner Container of the corresponding color.
If the power of the host machine is already turned OFF, see the procedure on manually removing the Toner Container (Refer to page 4-287) to remove the Toner Container of the corresponding color.

2) Open the Front Cover.

3) Removing the Toner Replacement Cover (Refer to page 4-453)

4) Removing the Toner Container Replacement Cover (Refer to page 4-453)

5) Opening the Process Unit Inner Cover (Refer to page 4-136)

Procedure

NOTE:

This procedure explains how to remove the Hopper Tray (Y).
Be sure to perform the same procedure for the Hopper Tray (M)/(C).

F-4-602

1) Free the harness [1].

- 1 Wire Saddle [2]

2) Free the harness [3].

- 1 Connector [4]
- 1 Harness Guide [5]

F-4-603

3) Remove the Hopper Tray (Y) [1] while bending it.

- 1 Screw [2]
- 2 Bosses [3]

F-4-604

Removing the Drum Drive Unit (Bk)

F-4-605

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Primary Charging Assembly (Refer to page 4-202)
- 5) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 6) Removing the Developing Assembly (Bk) (Refer to page 4-265)
- 7) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 8) Turn the Black Developing Assembly Pressure Lever [1] counterclockwise, and push it to the position [A] to lock the lever.

F-4-606

- 9) Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the levers at a 90-degree angle further and close the Process Unit Inner Cover [2].

F-4-607

- 10) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 11) Pulling out the ITB Unit (Refer to page 4-142)
- 12) Removing the ITB Unit (Refer to page 4-144)
- 13) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-608

- 14) Removing the Box Left Cover (Refer to page 4-458)
- 15) Removing the Box Upper Cover (Refer to page 4-458)
- 16) Open the Controller Box (Refer to page 4-107)

Disassembling Procedure

- 1) Turn the 2 handles [1], and open the Process Unit Inner Cover [2] by pulling it out until it stops.

F-4-609

CAUTION:

Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) inside the machine if the Process Unit Inner Cover is kept open for 5 minutes or more. Be sure to either install the Lightproof Sheet, or close the Process Unit Inner Cover within 5 minutes.

- 2) Remove the Flywheel [1].
• 3 Screws [2]

F-4-610

- 3) Remove the Drum Drive Unit (Bk) [1].

- 1 Connector [2]
- 3 Screws [3]

F-4-611

Assembling Procedure

NOTE:

Because the positioning of the Drum Drive Unit (Bk) is necessary for installation, be sure to install it in the following order.

- 1) Install the Drum Drive Unit (Bk) [1] by aligning it with the boss [2], and tighten the 3 screws [3] temporarily in the following order.
• 1 Connector [4]

F-4-612

2) Install the Drum Cap [1].

- 1 Screw [2]

F-4-613

3) Hold the 2 handles [1] and Close the Process Unit Inner Cover [2], and place it temporarily on the ITB Frame [3].

F-4-614

4) Put the Drum Drive Shaft [1] in the hole [A] of the Process Unit Inner Cover [2].

F-4-615

5) Push the Process Unit Inner Cover [2], and push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder.

F-4-616

- 6) Raise the 2 handles [1] at a 90-degree angle further and close the Process Unit Inner Cover.

F-4-617

CAUTION:

Be sure that the 2 hooks [1] of the Process Unit Inner Cover are hooked to the 2 Hinges Shafts [2] of the machine so that the cover is locked.

F-4-618

- 7) Install the Process Unit Front Cover [1].

- 2 Screws [2] (to tighten)

F-4-619

- 8) Turn the screwdriver one full turn to loosen the 3 screws [1], and make space of approx. 0.5 mm [A] between the Drum Drive Unit (Bk) [2] and the Rear Plate (the boss [3] will not come off even if the Drum Drive Unit (Bk) [2] is moved right and left).

F-4-620

9) Remove and then insert the Drum Drive Unit (Bk) [1] straight to push it against the Rear Plate, and fully tighten the 3 screws [2] in the following order.

- 1 Boss [3]

F-4-621

10) Install the Flywheel [1].

- 3 Screws [2]

F-4-622

11) Open the Process Unit Inner Cover, and remove the Drum Cap installed in step 2.

Removing the Process Drive Unit (Y)/(M)/(C)

F-4-623

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Process Unit (Y)/(M)/(C) (Refer to page 4-275)
- 5) Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the levers at a 90-degree angle further and close the Process Unit Inner Cover [2].

F-4-624

- 6) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 7) Pulling out the ITB Unit (Refer to page 4-142)
- 8) Removing the ITB Unit (Refer to page 4-144)

9) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-625

10) Removing the Box Left Cover (Refer to page 4-458)

11) Removing the Box Upper Cover (Refer to page 4-458)

12) Open the Controller Box (Refer to page 4-107)

Disassembling Procedure

NOTE:

This procedure explains how to remove the Process Drive Unit (C).
Be sure to perform the same procedure for the Process Drive Unit (M)/(Y).

F-4-626

1) Turn the 2 handles [1], and open the Process Unit Inner Cover [2] by pulling it out until it stops.

F-4-627

CAUTION:

Deterioration in sensitivity of the Photosensitive Drum may occur on the Drum Unit (Bk) inside the machine if the Process Unit Inner Cover is kept open for 5 minutes or more.
Be sure to either install the Lightproof Sheet, or close the Process Unit Inner Cover within 5 minutes.

2) Remove the Flywheel [1].

- 3 Screws [2]

NOTE:

When removing the Process Drive Unit (M)/(Y), there is no need to remove the Flywheel.

F-4-628

3) Remove the Duct [1].

- 3 Screws (RS) [2]
- 1 Screw (Tapping) [3]

NOTE:

When removing the Process Drive Unit (Y), there is no need to remove the Duct.

F-4-629

4) Tilt the PCB Mounting Base [1] forward.

- 2 Screws [2]
- 1 Connector [3]

NOTE:

When removing the Process Drive Unit (M)/(Y), there is no need to tilt the PCB Mounting Base forward.

F-4-630

5) Remove the Process Drive Unit (Y)/(M)/(C) Connecting Plate [1].

- 6 Screws [2]

F-4-631

6) Disconnect the connector [1].

NOTE:

When removing the Process Drive Unit (Y) [1], open the Wire Saddle [2], and remove the Connector [3]

F-4-632

F-4-633

7) Remove the Process Drive Unit (C) [1].

- 2 Screws [2]

F-4-634

Assembling Procedure

NOTE:

Because the positioning of the Process Drive Unit (Y)/(M)/(C) is necessary for installation, be sure to install it in the following order.

- 1) Install the Process Drive Unit (C) [1] by aligning it with the boss [2], and tighten the 2 screws [3] temporarily in the following order.

- 1 Connector [4]

F-4-635

- 2) Hold the 2 handles [1] and raise the Process Unit Inner Cover [2].
- 3) Push the Process Unit Inner Cover [2], and push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder.

F-4-636

- 4) Raise the 2 handles [1] at a 90-degree angle further and close the Process Unit Inner Cover.

F-4-637

CAUTION:

Be sure that the 2 hooks [1] of the Process Unit Inner Cover are hooked to the 2 Hinges Shafts [2] of the machine so that the cover is locked.

F-4-638

5) Install the Process Unit Front Cover [1].

- 2 Screws [2] (to tighten)

F-4-639

6) Turn the screwdriver one full turn to loosen 2 screws [1], and make space of approx. 0.5 mm [A] between the Process Drive Unit (C) [2] and the Rear Plate (the boss [3] will not come off even if the Process Drive Unit (C) [2] is moved right and left).

F-4-640

7) Remove and then insert the Process Drive Unit (C) [1] straight to push it against the Rear Plate, and fully tighten the 2 screws [2] in the following order.

- 1 Boss [3]

F-4-641

Removing the Hopper Unit (Bk)

F-4-642

Preparation

- 1) Remove the Toner Container (Bk).

NOTE:

Before turning OFF the power of the host machine, use the Control Panel to remove the Toner Container of the corresponding color.

If the power of the host machine is already turned OFF, see the procedure on manually removing the Toner Container (Refer to page 4-287) to remove the Toner Container of the corresponding color.

- 2) Open the Front Cover.
- 3) Removing the Toner Replacement Cover (Refer to page 4-453)
- 4) Removing the Toner Container Replacement Cover (Refer to page 4-453)
- 5) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 6) Removing the Primary Charging Assembly (Refer to page 4-202)
- 7) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 8) Removing the Developing Assembly (Bk) (Refer to page 4-265)
- 9) Removing the Drum Unit (Bk) (Refer to page 4-232)

- 10) Turn the Black Developing Assembly Pressure Lever [1] counterclockwise, and push it to the position [A] to lock the lever.

F-4-643

- 11) Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the levers at a 90-degree angle further and close the Process Unit Inner Cover [2].

F-4-644

- 12) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 13) Pulling out the ITB Unit (Refer to page 4-142)
- 14) Removing the ITB Unit (Refer to page 4-144)

15) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-645

16) Removing the Box Left Cover (Refer to page 4-458)

17) Removing the Box Upper Cover (Refer to page 4-458)

18) Open the Controller Box (Refer to page 4-107)

19) Removing the Drum Drive Unit (Bk) (Refer to page 4-294)

Disassembling Procedure

CAUTION:

Place the Hopper Unit (Bk) [1] on a sheet of paper [2], etc. when disassembling/ assembling.

F-4-646

1) Turn the 2 handles [1], and open the Process Unit Inner Cover [2] by pulling it out until it stops.

F-4-647

CAUTION:

Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) inside the machine if the Process Unit Inner Cover is kept open for 5 minutes or more. Be sure to either install the Lightproof Sheet, or close the Process Unit Inner Cover within 5 minutes.

2) Lift the Lock Release Lever [1], and release the lock of the Black Developing Assembly Pressure Lever [2].

F-4-648

3) Pull out the Black Developing Assembly Pressure Lever [1] until it stops.

F-4-649

4) Turn the Black Developing Assembly Pressure Lever [1].

F-4-650

5) Remove the Duct [1].

- 3 Screws (RS) [2]
- 1 Screw (Tapping) [3]

F-4-651

6) Free the harness [1].

- 3 Wire Saddles [2]
- 2 Connectors [3]
- 1 Reuse Band [4]
- 1 Edge Saddle [5]

F-4-652

7) Remove the Fan Unit [1].

- 2 Screws [2]

F-4-653

8) While opening the upper part of the Hopper Shield [1], pull it forward to remove it.

- 1 Claw [2]
- 1 Hook [3]

F-4-654

9) Remove the Rail Cover (Front) [1] and the spring [2].

- 1 Screw [3]
- 2 Hooks [4]

CAUTION:

Be sure to hold the Rail Cover (Front) [1] so as not to drop the spring [2] when removing it.

F-4-655

10) Remove the screw [1], and remove the Rail Cover (Rear) [3] while pulling the Toner Feed Pipe [2] toward the front.

CAUTION:

Do not tilt the Supply Mouth [A] of the Toner Feed Pipe [2]; otherwise toner [4] may scatter.

F-4-656

F-4-657

NOTE:

The Toner Feed Pipe [2] is pulled toward the front in order to disengage between the gear [5] of the Hopper Unit (Y)/(M)/(C) and the gear [6] of the Toner Feed Pipe.

F-4-658

11) Remove the Hopper Unit (Bk) [1].

- 1 Screw [2]
- 1 Stepped Screw [3]

CAUTION:

When removing the Hopper Unit (Bk), be sure not to spill toner [2] from the Toner Supply Mouth [1].

F-4-659

F-4-660

Assembling Procedure

NOTE:

When assembling the Hopper Unit (Bk), pull out the Small Door Open/Close Shaft [1] at the front side of the host machine by approx. 50 mm, and then install the Hopper Unit (Bk).

F-4-661

NOTE:

When assembling the Hopper Unit (Bk), use the following procedure to match the phase of the gear.

- 1) Match the phase of the tooth [A] of the Rail Cover (Rear) [1] with the tooth [B] of the gear [2], and then push in the Rail Cover (Rear) [1] until it stops.

F-4-662

2) Align the line [A] on the pipe of the Hopper Unit (Bk) with the line [B] on the Toner Supply Mouth, and then use the screw [1] to secure it.

F-4-663

CAUTION:

- Be sure that the Rail Cover (Rear) [1] touches the plate [2] on the rear side.
- Be sure to rotate the Toner Supply Mouth in the direction of the arrow until it stops so that the line [A] on the pipe of the Hopper Unit (Bk) is aligned with the line [B] on the Toner Supply Mouth.

F-4-664

Removing the Hopper Unit (Y)/(M)/(C)

F-4-665

Preparation

1) Remove the Toner Container (Y)/(M)/(C).

NOTE:

Before turning OFF the power of the host machine, use the Control Panel to remove the Toner Container (Y)/(M)/(C).

If the power of the host machine is already turned OFF, see the procedure on manually removing the Toner Container (Refer to page 4-287) to remove the Toner Container (Y)/(M)/(C).

2) Open the Front Cover.

3) Removing the Toner Replacement Cover (Refer to page 4-453)

4) Removing the Toner Container Replacement Cover (Refer to page 4-453)

5) Opening the Process Unit Inner Cover (Refer to page 4-136)

6) Removing the Process Unit (Y)/(M)/(C) (Refer to page 4-275)

7) Removing the Developing Assembly (Bk) (Refer to page 4-265)

8) Turn the Black Developing Assembly Pressure Lever [1] counterclockwise, and push it to the position [A] to lock the lever.

F-4-666

9) Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the levers at a 90-degree angle further and close the Process Unit Inner Cover [2].

F-4-667

- 10) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 11) Pulling out the ITB Unit (Refer to page 4-142)
- 12) Removing the ITB Unit (Refer to page 4-144)

13) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-668

- 14) Removing the Box Left Cover (Refer to page 4-458)
- 15) Removing the Box Upper Cover (Refer to page 4-458)
- 16) Open the Controller Box (Refer to page 4-107)
- 17) Removing the Process Drive Unit (Y)/(M)/(C) (Refer to page 4-298)
- 18) Removing the Developing Drive Unit (Y)/(M)/(C) (Refer to page 4-322)

Disassembling Procedure

CAUTION:

Place the Hopper Unit (Y)/(M)/(C) [1] on a sheet of paper [2], etc. when disassembling/assembling.

F-4-669

- 1) Turn the 2 handles [1], and open the Process Unit Inner Cover [2] by pulling it out until it stops.

F-4-670

CAUTION:

Deterioration in sensitivity of the Photosensitive Drum may occur on the Drum Unit (Bk) inside the machine if the Process Unit Inner Cover is kept open for 5 minutes or more. Be sure to either install the Lightproof Sheet, or close the Process Unit Inner Cover within 5 minutes.

- 2) Lift the Lock Release Lever [1], and release the lock of the Black Developing Assembly Pressure Lever [2].

F-4-671

- 3) Pull out the Black Developing Assembly Pressure Lever [1] until it stops.

F-4-672

- 4) Turn the Black Developing Assembly Pressure Lever [1].

F-4-673

- 5) Close the Controller Box [1].

CAUTION:

When closing the Controller Box, be careful not to trap the harness.

F-4-674

6) Remove the 2 screws [2] of the Hopper Unit (Y)/(M)/(C) [1].

F-4-675

7) Open the Controller Box [1].

8) Free the harness [2].

- 3 Wire Saddles [3]
- 2 Connectors [4]
- 1 Reuse Band [5]
- 1 Edge Saddle [6]

F-4-676

9) Remove the Fan Unit [1].

- 2 Screws [2]

F-4-677

10) While opening the upper part of the Hopper Shield [1], pull it forward to remove it.

- 1 Claw [2]
- 1 Hook [3]

F-4-678

11) Remove the Rail Cover (Front) [1] and the spring [2].

- 1 Screw [3]
- 2 Hooks [4]

CAUTION:

Be sure to hold the Rail Cover (Front) [1] so as not to drop the spring [2] when removing it.

F-4-679

12) Remove the screw [1], and remove the Rail Cover (Rear) [3] while pulling the Toner Feed Pipe [2] toward the front.

CAUTION:

Do not tilt the Supply Mouth [A] of the Toner Feed Pipe [2]; otherwise toner [4] may scatter.

F-4-680

F-4-681

NOTE:

The Toner Feed Pipe [2] is pulled toward the front in order to disengage between the gear [5] of the Hopper Unit (Y)/(M)/(C) and the gear [6] of the Toner Feed Pipe.

F-4-682

13) Remove the DC Controller Cover [1].

- 4 Screws [2] (to loosen)

F-4-683

14) Open the 4 Wire Saddles [1], and disconnect the 4 connectors [2].

F-4-684

15) Remove the 2 Grounding Wires [1].

- 1 Screw [2]
- 1 Wire Saddle [3]

16) Remove the Developing High Voltage PCB [4].

- 5 Wire Saddles [5]
- 5 Connectors [6]
- 3 Guides [A]
- 2 Screws [7]

F-4-685

NOTE:

When installing the Grounding Terminal [4], be sure that it is not placed on the boss [6].

F-4-686

CAUTION:

When disassembling/assembling the Hopper Unit (Y)/(M)/(C), pay attention to the following points.

- Do not spill toner [2] from the Toner Supply Mouth [1].

F-4-687

- When installing/removing the Hopper Unit (Y)/(M)/(C), do not hit it with the 3 ducts [2], the harness [A], and the Hopper Cooling Suction Fan [3].

F-4-688

- 17) Remove the Hopper Unit (Y)/(M)/(C) [2] while avoiding the gear [1] of the Hopper Unit (Bk).

- 2 Screws [3]
- 4 Bosses [4]
- 1 Hook [5]

F-4-689

Assembling Procedure

NOTE:

When assembling the Hopper Unit (Y)/(M)/(C), pull out the 3 Small Door Open/Close Shafts [1] at the front side of the host machine by approx. 50 mm, and then install the Hopper Unit (Y)/(M)/(C).

F-4-690

NOTE:

When assembling the Hopper Unit (Y)/(M)/(C), use the following procedure to match the phase of the gear.

- 1) Match the phase of the tooth [A] of the Rail Cover (Rear) [1] with the tooth [B] of the gear [2], and then push in the Rail Cover (Rear) [1] until it stops.

F-4-691

- 2) Align the line [A] on the pipe of the Hopper Unit (Bk) with the line [B] on the Toner Supply Mouth, and then use the screw [1] to secure it.

F-4-692

CAUTION:

- Be sure that the Rail Cover (Rear) [1] touches the plate [2] on the rear side.
- Be sure to rotate the Toner Supply Mouth in the direction of the arrow until it stops so that the line [A] on the pipe of the Hopper Unit (Bk) is aligned with the line [B] on the Toner Supply Mouth.

F-4-693

Removing the Developing Drive Unit (Bk)

F-4-694

Preparation

- 1) Remove the Toner Container (Bk).

NOTE:

Before turning OFF the power of the host machine, use the Control Panel to remove the Toner Container of the corresponding color.

If the power of the host machine is already turned OFF, see the procedure on manually removing the Toner Container (Refer to page 4-287) to remove the Toner Container of the corresponding color.

- 2) Open the Front Cover.
- 3) Removing the Toner Replacement Cover (Refer to page 4-453)
- 4) Removing the Toner Container Replacement Cover (Refer to page 4-453)
- 5) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 6) Removing the Primary Charging Assembly (Refer to page 4-202)
- 7) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 8) Removing the Developing Assembly (Bk) (Refer to page 4-265)
- 9) Removing the Drum Unit (Bk) (Refer to page 4-232)

- 10) Turn the Black Developing Assembly Pressure Lever [1] counterclockwise, and push it to the position [A] to lock the lever.

F-4-695

- 11) Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the levers at a 90-degree angle further and close the Process Unit Inner Cover [2].

F-4-696

- 12) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 13) Pulling out the ITB Unit (Refer to page 4-142)
- 14) Removing the ITB Unit (Refer to page 4-144)

15) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-697

16) Removing the Box Left Cover (Refer to page 4-458)

17) Removing the Box Upper Cover (Refer to page 4-458)

18) Open the Controller Box (Refer to page 4-107)

19) Removing the Drum Drive Unit (Bk) (Refer to page 4-294)

20) Removing the Hopper Unit (Bk) (Refer to page 4-304)

Procedure

1) Free the harness [1].

- 1 Connector [2]
- 2 Relay Connectors [3]
- 5 Wire Saddles [4]
- 1 Edge Saddle [5]
- 1 Reuse Band [6]

F-4-698

2) Remove the Developing Drive Unit (Bk) [1].

- Timing Belt [2]
- 5 Screws [3]

F-4-699

CAUTION:

When assembling the Developing Drive Unit (Bk), be sure that the leading edge [A] of the spring is hooked to the groove [B] of the Developing Drive Unit (Bk).

F-4-700

Removing the Developing Drive Unit (Y)/(M)/(C)

F-4-701

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)
- 3) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 4) Removing the Process Unit (Y)/(M)/(C) (Refer to page 4-275)
- 5) Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the levers at a 90-degree angle further and close the Process Unit Inner Cover [2].

F-4-702

- 6) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 7) Pulling out the ITB Unit (Refer to page 4-142)
- 8) Removing the ITB Unit (Refer to page 4-144)

9) Store the ITB Frame [1] and the Fixing Feed Unit [2].

F-4-703

10) Removing the Box Left Cover (Refer to page 4-458)

11) Removing the Box Upper Cover (Refer to page 4-458)

12) Open the Controller Box (Refer to page 4-107)

13) Removing the Process Drive Unit (Y)/(M)/(C) (Refer to page 4-298)

2) Remove the Developing Drive Unit (Y)/(M)/(C) [1].

- 1 Connector [2]
- 5 Screws [3]

F-4-705

Procedure

1) Pull out the 4 hooks [1] from the rail [2], and remove the duct [3].

- 3 Screws [4]

F-4-704

Removing the Waste Toner Container/Collecting Waste Toner

F-4-706

NOTE:

When disposing waste toner only, prepare the waste toner collection tools of the service parts (Waste Toner Joint, Waste Toner Bag, and Waste Toner Band).

F-4-707

F-4-708

F-4-709

Procedure

- 1) Open the Front Left Cover [1].
- 2) Pull out the Waste Toner Container Storage Tray [2].

F-4-710

NOTE:

- In the case of collecting waste toner by bringing back the Waste Toner Container, refer to steps 3 to 5.
- In the case of disposing the waste toner only, refer to the steps 6 to 17.

In the case of collecting waste toner by bringing back the Waste Toner Container

- 3) Remove the Waste Toner Container Cap [1] and attach it to the opening [A] of the Waste Toner Container [2].

F-4-711

4) Take out the Waste Toner Container [1].

F-4-712

5) Install the new Waste Toner Container and the Waste Toner Container Cap to the host machine in reverse order.

In the case of disposing the waste toner

CAUTION:

- Do not put waste toner of more than one time in one bag.
- When putting toner in the Waste Toner Bag, be sure to place it on the floor.
- Once the plastic bag is fixed with packing tape, do not remove the tape.

6) Take out the Waste Toner Container [1].

CAUTION:

Because the waste toner in the Waste Toner Container [1] may be scattered, be sure to place the Waste Toner Container on a sheet of paper [2].

F-4-713

F-4-714

7) Install the Waste Toner Joint [1] to the Waste Toner Container [2].

F-4-715

8) Put the Waste Toner Bag [1] on the Waste Toner Joint and fix it with the Waste Toner Band [2].

F-4-716

9) Move the waste toner [3] from the Waste Toner Container [1] to the Waste Toner Bag [2].

F-4-717

10) Remove the Waste Toner Band.

11) Remove the Waste Toner Bag from the Waste Toner Container and close the opening [1].

F-4-718

12) Fold the opening [1] of the Waste Toner Bag and fix it with packing tape [2].

F-4-719

13) Remove the Waste Toner Joint.

14) Remove the Prism [1].

- 1 Screw [2]
- 1 Hook [3]

F-4-720

15) Clean the toner adhered to the 2 [A] parts on the prism.

F-4-721

16) Clean the toner adhered to the [A] part of the Waste Toner Container.

F-4-722

17) Install the removed parts in reverse order.

- Prism
- Waste Toner Container

Removing the Waste Toner Vertical Pipe Unit

F-4-723

Preparation

- 1) Removing the Front Left Cover. (Refer to page 4-459)
- 2) Removing the Decurler Unit (Refer to page 4-428)

Procedure

- 1) Pull out the Waste Toner Container Storage Tray [1].

F-4-724

- 2) Place paper [2] under the First Shutter [A] of the Waste Toner Primary Feed Unit [1].

NOTE:

Be sure to place paper [2], otherwise, waste toner may drop.

F-4-725

- 3) Tap the [A] part of the Waste Toner Primary Feed Unit [1] to drop waste toner [2] inside the unit to the Waste Toner Vertical Pipe Unit [3].

F-4-726

4) Remove the Waste Toner Vertical Pipe Unit [1].

- 1 Screw [2]
- 1 Screw (RS) [3]
- 2 Hooks [4]

F-4-727

Removing the Waste Toner Primary Feed Unit

F-4-728

Preparation

- 1) Removing the Front Left Cover. (Refer to page 4-459)
- 2) Removing the Decurler Unit (Refer to page 4-428)
- 3) Removing the Delivery Unit (Refer to page 4-428)
- 4) Removing the Box Left Cover. (Refer to page 4-458)
- 5) Removing the Left Upper Cover (Refer to page 4-460)
- 6) Removing the Left Middle Cover (Refer to page 4-461)
- 7) Removing the Reverse Unit (Refer to page 4-427)
- 8) Open the Front Cover.
- 9) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 10) Pulling out the ITB Unit (Refer to page 4-142)
- 11) Removing the ITB Unit (Refer to page 4-144)
- 12) Removing the ITB Frame (Refer to page 4-147)
- 13) Put the ITB Slide Rail back in the host machine.
- 14) Put the Fixing Feed Unit back in the host machine.
- 15) Removing the Right Middle Front Cover 1 (Refer to page 4-455)
- 16) Removing the Toner Replacement Cover (Refer to page 4-453)
- 17) Opening the Process Unit Inner Cover (Refer to page 4-136)
- 18) Removing the Process Unit (Y)/(M)/(C) (Refer to page 4-275)
- 19) Removing the Primary Charging Assembly (Refer to page 4-202)
- 20) Removing the Pre-transfer Charging Assembly (Refer to page 4-221)
- 21) Removing the Drum Unit (Bk) (Refer to page 4-232)
- 22) Removing the Registration Patch Sensor Unit (Refer to page 4-178)

23) Turn the Black Developing Assembly Pressure Lever [1] counterclockwise, and push it to the position [A] to lock the lever.

F-4-729

24) Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the levers at a 90-degree angle further and close the Process Unit Inner Cover [2].

F-4-730

25) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

CAUTION:

- When disassembling/assembling the Waste Toner Primary Feed Unit [1] and the Waste Toner Vertical Pipe Unit [2], prepare a vacuum cleaner specially designed to suction toner dust because waste toner may scatter around.
- Because the waste toner may be spilled out from the 7 waste toner collection mouths [A], be sure to place them on paper [3] when disassembling/assembling.

F-4-731

1) Place paper [1] inside the host machine.

CAUTION:

Be sure to place paper [1] inside the host machine during work.

- This is to prevent the screws from being dropped and lost.
- This is because toner may be spilled out when the Waste Toner Primary Feed Unit is removed.

F-4-732

2) Remove the Fixing Upper Duct [1].

- 1 Screw [2]
- 1 Boss [3]
- 1 Protrusion [4]

F-4-733

CAUTION:

When assembling, align the positioning boss of the Fixing Upper Duct with the hole on the host machine to install.

3) Remove the ITB Pressure Plate (Rear Left) [1].

- 1 Screw [2]

F-4-734

4) Remove the ITB Drawer Base [1].

- 3 Connectors [2]
- 2 Screws [3]
- 2 Bosses [4]

F-4-735

5) Place paper [2] under the First Shutter [A] of the Waste Toner Primary Feed Unit [1].

NOTE:

Be sure to place paper [2]; otherwise, waste toner may drop.

F-4-736

6) Tap the [A] part of the Waste Toner Primary Feed Unit [1] to drop waste toner [2] inside the unit to the Waste Toner Vertical Pipe Unit [3].

F-4-737

7) Remove the Waste Toner Vertical Pipe Unit [1].

- 1 Screw [2]
- 1 Screw (RS) [3]
- 2 Hooks [4]

F-4-738

8) To prevent scattering of waste toner [1], be sure to cover the the collection mouth [A] of the Waste Toner Primary Feed Unit [2] with a plastic bag [3].

F-4-739

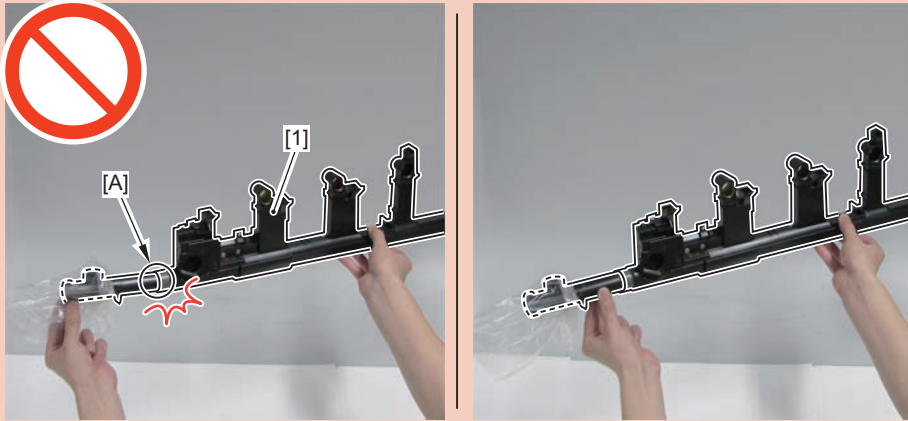

9) Remove the screw [1], and rotate the Waste Toner Primary Feed Unit [2] with the collection mouth [A] side up.

F-4-740

CAUTION:

When holding the Waste Toner Primary Feed Unit [1], be careful not to apply load on the pipe connection [A] on the left side of the unit.

F-4-741

10) Remove the Waste Toner Primary Feed Unit [1].

- 3 Screws [2]
- 2 Bosses [3]
- 2 Grooves [4]

CAUTION:

When installing/removing the Waste Toner Primary Feed Unit [1], be careful not to spill toner.

F-4-742

NOTE: How to install the Waste Toner Primary Feed Unit

1) Temporarily secure the Waste Toner Primary Feed Unit [1].

- 1 Groove [4]
- 1 Screw [2]

F-4-743

2) While paying attention to the direction of the Shaft Support [5] on the right side, insert it into the groove [4] of the U-shaped Plate, and fit the 2 Positioning Bosses [3] into the holes on the host machine to install it firmly in place.

- 2 Screws [2]

F-4-744

Fixing System

Service Note

Points to Notes at Replacing/Disposing the Fixing Unit

The heat pipe is used at the upper belt of the fixing unit to even the heat at the rear front direction. The heat pipe is a part that the small amount of liquid is vacuum-encapsulated in the airtight container. Thus, do not throw the heat pipe in the fire because it will burst. When disposing the fixing unit, be sure to shred.

Points to note when replacing the Fixing Belt Unit/Pressure Belt Unit

When replacing the Fixing/Pressure Belt Unit, be sure to clear the counter in Service Mode (COPIER > COUNTER > FIXING > FX-BLT-U / FX-BLT-L).

In the case of IRC5180 series, the displacement control of the Fixing Belt needed to be executed when replacing the Fixing Unit and the counter of the Fixing Unit has been automatically cleared by executing the displacement control; therefore, there has been no need to clear the counter when replacing the unit. In the case of this machine, however, the counter will not automatically be cleared because there is no need to execute the displacement control when replacing the Belt Unit. Therefore, the counter needs to be cleared in Service Mode when replacing the Fixing/Pressure Belt Unit.

Removing the Fixing Upper Cover

F-4-745

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

CAUTION:

Because the Fixing Assembly [1] is hot, be sure to perform disassembly/assembly after it is cooled down.

F-4-746

1) Remove the Fixing Upper Cover [1].

- 1 Screw [2]
- 2 Hooks [3]

F-4-747

CAUTION:

Be sure to check that the 2 hooks [3] are hooked when installing the Fixing Upper Cover [1].

F-4-748

If the 2 hooks [3] are not hooked, the Fixing Upper Cover [1] may hit the duct [5] when storing the Fixing Feed Unit [4].

F-4-749

Removing the Fixing IH Unit

F-4-750

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

Procedure

- 1) Free the harness [1] from the Wire Saddle [2], and remove the Drawer Connector Cover Unit [3].

- 1 Screw (with Washer) [4]

F-4-751

- 2) Free the harness [1] from the Wire Saddle [2], and remove the Fixation Pin [3].

F-4-752

CAUTION:

Do not damage the Fixing Belt [2] when installing/removing the Fixing IH Unit [1].

F-4-753

3) Remove the Fixing IH Unit [1] by opening it for approx. 30 degrees.

F-4-754

NOTE: How to install the Fixing IH Unit

Be sure to hook the hook [3] on the front side of the Fixing IH Unit to the groove [A] of the Fixing Belt Unit before hooking the hook [4] on the rear side of the unit to the groove [B].

F-4-755

Removing the Fixing Belt Displacement Control Motor Unit

F-4-756

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

Procedure

- 1) Free the 4 harnesses [1].
 - 2 Wire Saddles [2]
- 2) Disconnect the connector [3].
- 3) Remove the screw [4].

F-4-757

- 4) Free the harness [2] from the Edge Saddle [3] by lifting the Fixing Belt Displacement Control Motor Unit [1], and disconnect the connector [4].

F-4-758

5) Remove the Fixing Belt Displacement Control Motor Unit [1].

- 1 Shaft [2]

F-4-759

NOTE: How to install the Fixing Belt Displacement Control Motor Unit
When the Fixing IH Unit is installed, be sure to install the Fixing Belt Displacement Control Motor Unit in the reverse order of removal.
When the Fixing IH Unit is removed, align the hook [4] of the Fixing Belt Displacement Control Motor Unit with the pin [5] while lifting the Tension Arm Unit [3], and align the hole [A] of the Fixing Belt Displacement Control Motor Unit Plate with the shaft [6] to install the unit.

F-4-760

Procedure

1) Free the 4 harnesses [1].

- 2 Wire Saddles [2]
- 2 Connectors [3]

2) Disconnect the connector [4].

3) Remove the screw [5].

F-4-761

4) Free the harness [2] from the Edge Saddle [3] by lifting the Fixing Belt Displacement Control Motor Unit [1], and disconnect the connector [4].

F-4-762

5) Remove the Fixing Belt Displacement Control Motor Unit [1].

- 1 Shaft [2]

F-4-763

NOTE: How to install the Fixing Belt Displacement Control Motor Unit
While lifting the Tension Arm Unit [3], align the hook [4] of the Fixing Belt Displacement Control Motor Unit with the pin [5] and align the hole [A] of the Fixing Belt Displacement Control Motor Unit Plate with the shaft [6] to install the unit.

F-4-764

Opening the Fixing Belt Unit

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)

Procedure

CAUTION:

Do not touch the surface [A] of the Fixing Belt, the surface [B] of the Pressure Belt and the surface [C] of the Fixing Refresh Roller. Otherwise, it may cause fixing failure.

F-4-765

1) Remove the PCB [1] from the groove [A], and disconnect the 2 connectors [2].

F-4-766

2) Remove the Spacer Spring [1] by pinching its edge [A] using nippers.

F-4-767

NOTE: How to install the Spacer Spring
Fit the Spacer Spring [1] to the shaft [2] to install it.

F-4-768

3) Hold the handle [1], and open the Inner Delivery Unit [2].

F-4-769

- 4) Remove the screw (yellow) [1] and the 2 screws [2].
 5) Hold the handle [3], and remove the 2 bosses [5] of the Fixing Belt Unit [4].

F-4-770

- 6) While holding down the harness [1], hold the handle [2], and open the Fixing Belt Unit [3].

CAUTION:

When opening the Fixing Belt Unit, do not get the harness [1] caught by the plate [A].

F-4-771

F-4-772

Cleaning the Fixing Inlet Guide

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Opening the Fixing Belt Unit (Refer to page 4-342)

Procedure

CAUTION:

Do not touch the surface [A] of the Fixing Belt, the surface [B] of the Pressure Belt and the surface [C] of the Fixing Refresh Roller. Otherwise, it may cause fixing failure.

F-4-773

- 1) Clean the surface [A] of the Fixing Inlet Guide with lint-free paper [1] moistened with alcohol.

F-4-774

- 2) Clean the Sensor Flag's surface side [A], back side [B], and the [C] part of the Fixing Inlet Guide (which comes in contact with the Sensor Flag) with lint-free paper [1] moistened with alcohol.

F-4-775

Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit

F-4-776

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)

Procedure

CAUTION:

Do not touch the surface [A] of the Fixing Belt, the surface [B] of the Pressure Belt and the surface [C] of the Fixing Refresh Roller. Otherwise, it may cause fixing failure.

F-4-777

- 1) Remove 2 connectors [1]

F-4-778

2) Remove the Fixing Feed Sub Cover [1].

- 1 Screw [2] (to loosen)
- 2 Hooks [3]

F-4-779

3) Remove the PCB [1] from the groove [A], and disconnect the 2 connectors [2].

F-4-781

4) Remove the Spacer Spring [1] by pinching its edge [A] using nippers.

F-4-782

NOTE: How to install the Fixing Feed Sub Cover
Put the [A] part of the Fixing Feed Sub Cover under the Fixing Feed Front Left Cover [4].

F-4-780

NOTE: How to install the Spacer Spring
Fit the Spacer Spring [1] to the shaft [2] to install it.

F-4-783

5) Hold the handle [1], and open the Inner Delivery Unit [2].

F-4-784

6) Remove the screw (yellow) [1] and the 2 screws [2].

7) Hold the handle [3], and remove the 2 bosses [5] of the Fixing Belt Unit [4].

F-4-785

8) While holding down the harness [1], hold the handle [2], and open the Fixing Belt Unit [3].

CAUTION:

When opening the Fixing Belt Unit, do not get the harness [1] caught by the plate [A].

F-4-786

9) Use nippers to remove the N-ring [1].

F-4-788

F-4-787

- 10) Hold the handle [1], and remove the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit [2].
- 2 Shafts [3]

CAUTION:

Be careful not to drop the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit [2].

F-4-789

F-4-790

Removing the Fixing Belt Unit

F-4-791

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)
- 6) Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit (Refer to page 4-346)

Procedure

CAUTION:

Do not touch the surface [A] of the Fixing Belt and the surface [C] of the Fixing Refresh Roller. Otherwise, it may cause fixing failure.

F-4-792

1) Open the Wire Saddle [1] and free the harness [2].

F-4-793

2) Hold the handle [1], and separate the Fixing Refresh Roller Pressure Unit [2] and the Fixing Belt Unit [3].

- 3 Screws [4]
- 5 Bosses [5]

F-4-794

NOTE: Replacing the Fixing Belt Displacement Control Motor Unit Fixation Screw
When replacing the Fixing Belt Unit, remove the new Loose-proof Screw [6] of the Fixing Belt Unit [5] (service part), and use it to secure the Fixing Belt Displacement Control Motor Unit [7]. (Replace the Loose-proof Screw that was securing the Fixing Belt Displacement Control Motor Unit [7] with the new Loose-proof Screw [6].)

F-4-795

Cleaning and lubrication when replacing the Fixing Belt Unit

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)
- 6) Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit (Refer to page 4-346)
- 7) Removing the Fixing Belt Unit (Refer to page 4-350)

CAUTION:

Be sure to perform cleaning and lubrication when replacing the Fixing Belt Unit.

When the Pressure Belt Unit is also replaced at the same time, the application of grease to the gear of the Pressure Belt Unit mentioned in step 1 is not necessary (because grease is applied to the Fixing Belt Unit and the Pressure Belt Unit which are service parts).

Procedure

- 1) Apply grease (SE1107) to the tooth surfaces [A] of the 4 gears of the Pressure Belt Unit.
 - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface
- 2) Apply grease (SE1107) to the tooth surface [B] of the gear [2] of the Fixing Drive Unit.
 - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface

F-4-796

- 3) Clean the surface [A] of the Fixing Inlet Guide with lint-free paper [1] moistened with alcohol.

F-4-797

- 4) Clean the Sensor Flag's surface side [A], back side [B], and the [C] part of the Fixing Inlet Guide (which comes in contact with the Sensor Flag) with lint-free paper [1] moistened with alcohol.

F-4-798

- 5) Clean the Separation Plate [1] for inner delivery Unit with lint-free paper [2] moistened with alcohol.

F-4-799

- 6) Clean the 2 Inner Delivery Unit Separation Plate Rollers [1] with lint-free paper [2] moistened with alcohol.

F-4-800

CAUTION:

The cleaned Inner Delivery Unit Separation Plate Rollers should have a smooth surface with nothing attached, and should rotate without any load.

Reason: The Fixing Belt may be damaged.

- 7) Install the removed parts in reverse order.

- 8) Clear the counter.

COPIER > COUNTER > DRBL-1 > FX-BLT-U

NOTE:

The following items are cleared when the above counter is cleared.

- COPIER > DISPLAY > FIXING > FX-U-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-U-STR
- COPIER > DISPLAY > FIXING > FX-R-TM
- COPIER > COUNTER > FIXING > FX-RF-RL
- COPIER > COUNTER > CLEANING > FX1-RFRL

Cleaning the Inner Delivery Unit Separation Plate

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

- 1) Hold the handle [1], and open the Inner Delivery Unit [2].

F-4-801

- 2) Clean the Separation Plate [1] for inner delivery Unit with lint-free paper [2] moistened with alcohol.

F-4-802

Cleaning the Inner Delivery Unit Separation Plate Rollers

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

- 1) Hold the handle [1], and open the Inner Delivery Unit [2].

F-4-803

- 2) Clean the 2 Inner Delivery Unit Separation Plate Rollers [1] with lint-free paper [2] moistened with alcohol.

F-4-804

CAUTION:

The cleaned Inner Delivery Unit Separation Plate Rollers should have a smooth surface with nothing attached, and should rotate without any load.

Reason: The Fixing Belt may be damaged.

Removing the Fixing Lower Unit

F-4-805

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)
- 6) Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit (Refer to page 4-346)

Procedure

CAUTION:

Do not touch the surface [A] of the Pressure Belt. Otherwise, it may cause fixing failure.

F-4-806

CAUTION:

Be careful not to twist the Heater Cord [1] when installing/removing the unit. Otherwise, the Heater Cord [1] becomes overloaded, which may cause open circuit.

F-4-807

- 1) Disconnect the connector [1].
- 2) Disconnect the Heater Connector Front [2], free the harness from the guides [A] and [B], and then disconnect the Heater Connector Rear [3].

F-4-808

- 3) Remove the Fixation Pin Front [1] and the Fixation Pin Rear [2].
- 2 Screws [3]

F-4-809

- 4) Open the Fixing Inlet Guide [1].

F-4-810

CAUTION:

Do not touch the gear [2] of the Fixing Lower Unit since grease is applied.

F-4-811

5) Raise the 2 handles [1].

F-4-812

6) Hold the 2 handles [1], and remove the Fixing Lower Unit [2].

CAUTION:

Do not hit it against the Fixing Inlet Guide [3] and the Sensor Flag [4] when installing/removing it.

F-4-813

F-4-814

NOTE: How to install the Heater Cord on the front side

- Be sure to pass the Heater Cord [1] through the Harness Guide [A] before placing the Fixing Lower Unit on the Fixing Assembly.

F-4-815

- Be sure to connect the Heater Connector [2] to prevent the Heater Cord [1] from coming off from the Harness Guide [A] after placing the Fixing Lower Unit on the Fixing Assembly.

F-4-816

NOTE: How to install the Heater Cord on the Rear Side
 After placing the Fixing Lower Unit on the Fixing Assembly, install the Heater Connector [1], and pass the Heater Cord [2] through the Harness Guide [A], and then under the Harness Guide [B].

F-4-817

NOTE: How to install the handle of the Fixing Lower Unit
 Push the 2 handles [2] of the Fixing Lower Unit to the 2 shafts [1] located on the front and the rear sides of the Fixing Unit until you hear a click sound so that the handles are locked in place.

F-4-818

Removing the Pressure Belt Displacement Control Motor Unit

F-4-819

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)
- 6) Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit (Refer to page 4-346)
- 7) Removing the Fixing Lower Unit (Refer to page 4-356)

Procedure

CAUTION:

Do not touch the surface [A] of the Pressure Belt. Otherwise, it may cause fixing failure.

F-4-820

- 1) Remove the Pressure Belt Displacement Control Motor Unit [1].

- 1 Screw [2]

F-4-821

NOTE: How to install the Pressure Belt Displacement Control Motor Unit

1) Align the hook [3] with the shaft [4] of the Fixing Lower Unit.

F-4-822

2) Rotate the Pressure Belt Displacement Control Motor [1] to align the cut-off [A] with the hook [5] of the Fixing Lower Unit and the hole [B] with the shaft [6] of the Fixing Lower Unit.

F-4-823

3) After tightening the removed screw [2], be sure that the stepped part [C] of the shaft of the Fixing Lower Unit is fit in the hole [A] of the Support Plate of the Motor Unit.

1x

F-4-824

Separating the Pressure Belt Unit and the Pressure Heater

F-4-825

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)
- 6) Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit (Refer to page 4-346)
- 7) Removing the Fixing Lower Unit (Refer to page 4-356)
- 8) Removing the Pressure Belt Displacement Control Motor Unit (Refer to page 4-362)

Procedure

CAUTION:

Do not touch the surface [A] of the Pressure Belt. Otherwise, it may cause fixing failure.

F-4-826

- 1) Free the Heater Harness [1] on the front side from the guide [A], and remove the Heater Retainer Shaft Support Front [2].

- 1 Screw [3]

F-4-827

2) Remove the bend in the [A] part of the Heater Harness on the front side to make it straight.

F-4-828

3) Remove the Heater Retainer Shaft Support Rear [1].

- 1 Screw [2]

F-4-829

CAUTION:

Do not touch the surface [A] of the Pressure Heater.

F-4-830

4) Hold the rear side [A] of the Pressure Heater, and separate the Pressure Belt Unit [1] and the Pressure Heater [2].

F-4-831

NOTE: Checking before installing the new Pressure Belt Unit

1) Remove the 4 Fixation Members [3].

F-4-832

2) Check the positions of the 2 bearings [4] of the Pressure Roller.

- When viewed from above, the flanges [B] of the 2 bearings [4] should be located inside the 2 Support Plates [5].
- When viewed from the side, there should be no space [C] between the 2 bearings [4] and the 2 Support Plates [5].

F-4-833

NOTE: Replacing the Pressure Belt Displacement Control Motor Unit Fixation Screw

- When replacing the Pressure Belt Unit, remove the screw [6] of the Pressure Belt Unit [1] (service part), and use it to secure the Pressure Belt Displacement Control Motor Unit [7]. (Replace the Loose-proof Screw that was securing the Pressure Belt Displacement Control Motor Unit [7] with the screw [6].)

F-4-834

- After tightening the screw [6], be sure that the stepped part [D] of the shaft of the Fixing Lower Unit is fit in the hole [E] of the Support Plate of the Motor Unit.

F-4-835

Cleaning and Lubrication When Replacing the Pressure Belt Unit

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)
- 6) Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit (Refer to page 4-346)
- 7) Removing the Fixing Lower Unit (Refer to page 4-356)
- 8) Removing the Pressure Belt Displacement Control Motor Unit (Refer to page 4-362)
- 9) Separating the Pressure Belt Unit and the Pressure Heater (Refer to page 4-364)

CAUTION:

Be sure to perform cleaning and lubrication when replacing the Pressure Belt Unit.

When the Fixing Belt Unit is also replaced at the same time, the application of grease to the gear of the Fixing Belt Unit mentioned in step 1 is not necessary (because grease is applied to the Fixing Belt Unit and the Pressure Belt Unit which are service parts).

Procedure

- 1) Apply grease (SE1107) to the tooth surfaces [A] of the 6 gears of the Fixing Belt Unit.
 - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface

F-4-836

2) Apply grease (SE1107) to the tooth surface [B] of the gear [1] of the Fixing Drive Unit.

- Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface

F-4-837

3) Clean the soiling of the Contact Roller [1] on the Pressure Belt Position Sensor and the oil dripped from the Pressure Belt to the bottom side [A] of the Fixing Lower Unit with lint-free paper [2].

F-4-838

- 4) Clean the surface [A] of the Fixing Inlet Guide with lint-free paper [1] moistened with alcohol.

F-4-839

- 5) Using lint-free paper [1] moistened with alcohol, clean the Sensor Flag's surface side [A], back side [B], and the [C] part which comes in contact with the Fixing Inlet Guide.

F-4-840

- 6) Clean the Separation Plate [1] for inner delivery Unit with lint-free paper [2] moistened with alcohol.

F-4-841

- 7) Install the removed parts in reverse order.

- 8) Clear the counter.

COPIER > COUNTER > DRBL-1 > FX-BLT-L

NOTE:

The following items are cleared when the above counter is cleared.

COPIER > DISPLAY > FIXING > FX-L-TM1 to 5

COPIER > DISPLAY > FIXING > FX-MTR2 to 5

Removing the Pressure Sub Thermistor (Front)

F-4-842

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)
- 6) Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit (Refer to page 4-346)
- 7) Removing the Fixing Lower Unit (Refer to page 4-356)

Procedure

- 1) Remove the Pressure Sub Thermistor (Front) [1].

- 1 Connector [2]
- 1 Harness Guide [A]
- Screw [3]

F-4-843

CAUTION:

Do not use the Pressure Sub Thermistor (Front) [1] when it is deformed. When not properly in contact with the Pressure Belt [2], the Pressure Sub Thermistor (Front) [1] does not function normally to detect the temperature, which may cause the Fixing Assembly to be hot.

F-4-844

Removing the Pressure Sub Thermistor (Rear)

F-4-845

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)
- 6) Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit (Refer to page 4-346)
- 7) Removing the Fixing Lower Unit (Refer to page 4-356)

Procedure

- 1) Close the Inner Delivery Unit [1], and remove the Fixing Frame [2].

- 1 Connector [3]
- 1 Screw [4]
- 1 Screw [5] (to loosen)
- 2 Bosses [6]

F-4-846

2) Remove the Connector Cover [1].

- 1 Screw [2]
- 2 Hooks [3]

F-4-847

NOTE: How to install the Upper Cover

Be sure to route the harness [4] on the guide [A] of the Connector Cover [1], and align the 2 hooks [3] with the hole [B] and the cut-off [C] of the Fixing Frame.

F-4-848

3) Disconnect the connector [1], and free the harness [2] from the Harness Guide [A].

F-4-849

4) Hold the handle [1], and open the Inner Delivery Unit [2].

F-4-850

5) Remove the Pressure Sub Thermistor (Rear) [1].

- 1 Screw [2]
- 1 Edge Saddle [3]

F-4-851

⚠ CAUTION:

Do not use the Pressure Sub Thermistor (Rear) [1] when it is deformed. When not properly in contact with the Pressure Belt [2], the Pressure Sub Thermistor (Rear) [1] does not function normally to detect the temperature, which may cause the Fixing Assembly to be hot.

F-4-852

Removing the Fixing Assembly

F-4-853

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

Procedure

- 1) Disconnect the 4 connectors [1].

F-4-854

- 2) Loosen the screw [1], and remove 2 screws [2].

F-4-855

CAUTION:

- When installing/removing the Fixing Assembly [2], be careful not to hit the connector [3] with the Feed Guide [4].
- When installing/removing the Fixing Assembly [2], be careful not to hit the assembly with the Feed Guide [4] and the Feed Belt [6].

F-4-856

3) Hold the handle [1] and lift the front side of the Fixing Assembly [2], and place the connector [3] on the Feed Guide [4].

4) Lift the rear side, and remove the Fixing Assembly [2] while keeping the unit in a horizontal position.

F-4-857

NOTE: How to install the Fixing Assembly

Be sure to hold the Fixing Assembly [1] horizontally and align the 2 holes [A] with the 2 Positioning Protrusions [B] of the Fixing Feed Unit to install the assembly.

F-4-858

■ When Replacing the Fixing Assembly

1) Apply grease (SE1107) to the tooth surface [B] of the gear [1] of the Fixing Drive Unit.

- Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface

F-4-859

2) Install the removed parts in reverse order.

3) Clear the counter.

COPIER > COUNTER > FIXING > FX-CNT

COPIER > COUNTER > DRBL-1> FX-BLT-U / FX-BLT-L

NOTE:

The following items are cleared when the above counter is cleared.

- COPIER > DISPLAY > FIXING > FX-U-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-L-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-U-STR
- COPIER > DISPLAY > FIXING > FX-MTR2 to 5
- COPIER > DISPLAY > FIXING > FX-R-TM
- COPIER > COUNTER > FIXING > FX-RF-RL
- COPIER > COUNTER > CLEANING > FX1-RFRL
- COPIER > COUNTER > PRDC-1 > FXLW-TH1/2

Cleaning the Fixing Refresh Roller

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

Procedure

CAUTION:

- Do not touch the surface [A] of the Fixing Belt and the surface [B] of the Pressure Belt.

F-4-860

- Do not touch the center [A] of the surface of the Fixing Refresh Roller (any area other than the area 1 cm from the two ends of the roller [B]).

F-4-861

- By rotating the Fixing Refresh Roller while holding its edge [A] (the area 1 cm from the two ends of the roller), clean its surface [B] with lint-free paper [1] moistened with alcohol.

F-4-863

- Hold the handle [1], and open the Inner Delivery Unit [2].

F-4-862

Removing the Pressure Main Thermistor

F-4-864

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.

Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)
- 6) Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit (Refer to page 4-346)
- 7) Removing the Fixing Lower Unit (Refer to page 4-356)

Procedure

- 1) Close the Inner Delivery Unit [1], and remove the Fixing Frame [2].

- 1 Connector [3]
- 1 Screw [4]
- 1 Screw [5] (to loosen)
- 2 Bosses [6]

F-4-865

2) Remove the Connector Cover [1].

- 1 Screw [2]
- 2 Hooks [3]

F-4-866

NOTE: How to install the Upper Cover

Be sure to route the harness [4] on the guide [A] of the Connector Cover [1], and align the 2 hooks [3] with the hole [B] and the cut-off [C] of the Fixing Frame.

F-4-867

- 3) Change the direction of the Fixing Frame [1].
- 4) Replace the Pressure Main Thermistor [2].

- 1 Connector [3]
- 1 Harness Guide [4]
- 1 Edge Saddle [5]
- 1 Screw (with 2 washers) [6]

⚠ CAUTION:

Be sure to secure the Pressure Main Thermistor [2] in place when installing it. Otherwise, temperature detection by the thermistor will not function normally so that the Fixing Assembly will become hot.

F-4-868

Removing the Pressure Thermal Switch

F-4-869

NOTE:

When replacing the Pressure Thermoswitch, be sure to do so on a Pressure Stay Unit basis.

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)

NOTE:

The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit. Be sure to perform work after removing the Fixing Assembly from the Fixing Feed Unit as needed by referring to Removing the Fixing Assembly 4-375 .

- 4) Removing the Fixing IH Unit (Refer to page 4-338)
- 5) Removing the Fixing Belt Displacement Control Motor Unit (Refer to page 4-340)
- 6) Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit (Refer to page 4-346)
- 7) Removing the Fixing Lower Unit (Refer to page 4-356)

Procedure

1) Close the Inner Delivery Unit [1], and remove the Fixing Frame [2].

- 1 Connector [3]
- 1 Screw [4]
- 1 Screw [5] (to loosen)
- 2 Bosses [6]

F-4-870

2) Remove the Connector Cover [1].

- 1 Screw [2]
- 2 Hooks [3]

F-4-871

NOTE: How to install the Connector Cover

Be sure to route the harness [4] on the guide [A] of the Connector Cover [1], and align the 2 hooks [3] with the hole [B] and the cut-off [C] of the Fixing Frame.

F-4-872

3) Free the 2 AC Harnesses [1].

- 2 Screws (with 2 washers) [2]

F-4-873

4) Remove the Connector Cover [1].

- 1 Claw [2]
- 1 Harness [3]

F-4-874

NOTE: How to install the Connector Cover

Be sure to align the groove [A] of the Connector Cover [1] with the edge [B] of the plate of the Fixing Frame.

F-4-875

5) Free the harness [1].

- 2 Connectors [2]
- 1 Edge Saddle [3]

F-4-876

6) Open the Connector Cover [1].

- 1 Claw [2]

7) Disconnect the connector [3], and free the harness [4] from the guide [A].

F-4-877

8) Close the Connector Cover [1].

- 1 Claw [2]

F-4-878

9) Hold the handle [1], and open the Inner Delivery Unit [2].

F-4-879

11) Remove the Pressure Stay Unit [1].

F-4-881

10) Remove the 2 Fixation Pins [1].

- 2 Screws [2]
- 2 Shafts [3]

F-4-880

CAUTION:

- When replacing the Pressure Thermoswitch [1], be sure to do so on a Pressure Stay Unit basis.
- Since the distance with the Pressure Belt is adjusted with the Pressure Stay Unit, do not loosen the screw [2] securing the Pressure Thermoswitch [1].

F-4-882

⚠ CAUTION:

If the thermistor [1] is deformed, do not use it. If contact with the Pressure Belt [2] is insufficient, temperature detection by the thermistor [1] will not function normally so that the Fixing Assembly will become hot.

F-4-883

NOTE: How to install the Pressure Stay Unit
Be sure to fit the spring [2] to the boss [1] of the Pressure Stay Unit.

F-4-884

Pickup Feed System

Pulling out the Fixing Feed Unit

Preparation

1) Open the Front Cover.

Procedure

1) Turn over the lever [1] and pull out the Fixing Feed Unit [2].

F-4-885

NOTE:

Perform step 2 as necessary when installing/removing the units (Fixing Assembly [1], Pre-fixing Feed Belt Unit [2], Secondary Transfer Unit [3], Registration Unit [4], etc.) installed in the Fixing Feed Unit.

F-4-886

⚠ CAUTION:

Do not release the locks of the 2 Release Springs [3] at the rear on the rails of both sides.

Pulling out the Fixing Feed Unit [2] further than the trailing edge [A] of the Release Springs at the rear side may cause the unit to fall (when the red screw [4] securing the Fixing Feed Unit Rail has come off).

F-4-887

- 2) Press the 2 Release Springs [1] at both sides of the rail to release the locks, and further pull out the Fixing Feed Unit [2] until it stops.

F-4-888

Removing the Fixing Feed Unit

F-4-889

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Fixing Upper Cover (Refer to page 4-336)
- 4) Removing the Fixing Assembly (Refer to page 4-375)
- 5) Removing the Registration Unit (Refer to page 4-412)

Procedure

⚠ CAUTION:

When removing the Fixing Feed Unit by referring to this section, be sure to work with 2 or more people, and prepare 4 bases (such as paper stack 40 mm in height or higher and 100 mm by 100 mm in size or larger) to prevent deformation.

NOTE:

This machine allows the maintenance of all service parts without the removal of Fixing Feed Unit.

- 1) Remove the Open/Close Stopper [2] of the Front Cover [1].

- 1 Claw [3]

F-4-890

NOTE:

When the angle by which to open the Front Cover is limited due to pickup system options being connected, remove the Front Cover by opening the Toner Replacement Cover, removing the Hinge Shaft on the upper side, and then pulling out the Shaft Pin on the lower side.

2) Remove the Fixing Feed Front Left Cover [1].

- 3 Screws [2]

F-4-891

3) Put the 4 bases [1] at where the Fixing Feed Unit is to be placed as shown in the figure below.

F-4-892

4) Hold the [A] and [B] at the bottom of the Fixing Feed Unit.

F-4-893

5) Remove the 6 screws [1].

CAUTION:

Be sure to work with 2 or more people to prevent dropping the unit.

- Support the Fixing Feed Unit.
- Remove the screws.

F-4-894

6) Place the Fixing Feed Unit [2] on the 4 bases [1].

F-4-895

7) Adjust the positions of the 4 bases [1] to prevent the Fixing Feed Unit from being deformed.

CAUTION:

- Be sure that the Fixing Feed Unit [2] is horizontal.
- Ensure that only [A] parts at the bottom are in contact with the bases [1] after placing the Fixing Feed Unit [2].
- The sliding members [3] should not be in contact with the bases [1].

F-4-896

CAUTION:

Put the 2 rails [1] pulled out back in the host machine as needed.

F-4-897

Removing the Multi-purpose Tray Pickup Roller (Option)

F-4-898

NOTE:

The Multi-purpose Tray Pickup Roller is included in the Multi-purpose Tray Pickup Unit which is an option.

Be sure to refer to this procedure in the case the Multi-purpose Tray Pickup Unit is installed.

Procedure**CAUTION:**

Do not touch the surface [A] of the roller when disassembling/assembling.

F-4-899

- 1) Open the Multi-purpose Tray Pickup Unit [1].
- 2) Release the claw [2] to remove the gear [3].
- 3) Remove the Resin Ring [4] to remove the Shaft Support [5].

F-4-900

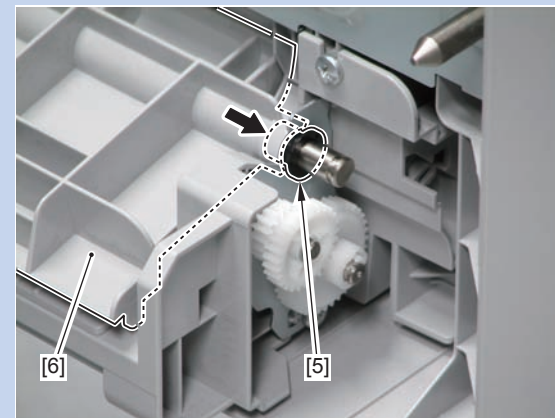

NOTE: How to Install the Shaft Support and the Resin Ring

- 1) Align the protrusion [A] with the groove [B] of the plate to install the Shaft Support [5].

F-4-901

- 2) Place the Feed Upper Cover [6] on the Shaft Support [5].

F-4-902

- 3) Install the Resin Ring [4] in the groove [C] while pulling the shaft [7].

F-4-903

4) Remove the Feed Upper Cover [1].

- 1 Shaft Support [2]

CAUTION:

Do not touch the surface [A] of the Multi-purpose Tray Pickup Roller, the surface [B] of the 2 rollers of the Feed Upper Cover and the surface [C] of the 2 rollers when disassembling/assembling.

F-4-904

F-4-905

5) Remove the Resin Ring [1] and the Multi-purpose Tray Pickup Roller [2].

F-4-906

NOTE: How to install the Multi-purpose Tray Pickup Roller
Be sure to align the groove [A] of the Multi-purpose Tray Pickup Roller [2] with the spring pin [3] to install the roller.

F-4-907

Removing the Multi-purpose Tray Separation Roller (Option)

F-4-908

NOTE:
The Multi-purpose Tray Separation Roller is included in the Multi-purpose Tray Pickup Unit which is an option.
Be sure to refer to this procedure in the case the Multi-purpose Tray Pickup Unit is installed.

Preparation

1) Removing the Multi-purpose Tray Pickup Roller (Option) (Refer to page 4-394)

Procedure

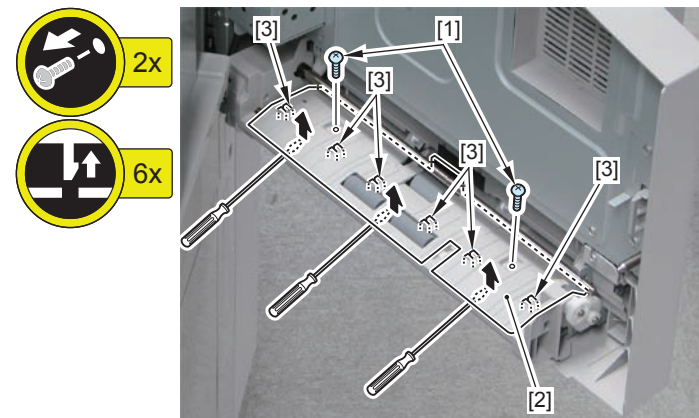

CAUTION:

Do not touch the surface [A] of the Multi-purpose Tray Separation Roller, and the surface [B] of the 2 rollers when disassembling/assembling.

F-4-909

1) Remove the 2 screws [1], and release the 6 claws [3] of the Feed Guide [2].

F-4-910

2) Push the Feed Guide [1], and unhook the 6 hooks [2].

NOTE:

The following shows the locations of the 6 hooks [2] and the 6 grooves [3] of the Feed Guide [1].

F-4-911

3) Remove the Feed Guide [2] while lifting the shaft [1].

CAUTION:

Be careful not to damage the flag [3] of the Feed Guide [2].

F-4-913

F-4-912

F-4-914

4) Remove the Multi-purpose Tray Separation Roller [2] while lifting the shaft [1].

- 1 Claw [3]

F-4-915

NOTE: How to install the Multi-purpose Tray Separation Roller

- Be sure to align the 2 grooves [A] of the Torque Limiter [4] with the 2 protrusions [B] of the shaft to install the roller.

F-4-916

- Be sure to align the groove [C] of the Multi-purpose Tray Separation Roller [2] with the 2 protrusions [D] of the Torque Limiter [4] to install the roller.

F-4-917

NOTE: How to install the Feed Guide

- 1) While lifting the shaft [1], place the Feed Guide [2] with its cut-off [A] fit to the Multi-purpose Tray Separation Roller [3].

F-4-918

2) While lifting the shaft [1], hook the 6 [B] parts of the Feed Guide [2] on the 6 hooks [4].

F-4-919

3) While lifting the shaft [1], push the Feed Guide [2] and install the 6 claws [5] to secure the Feed Guide [2].

F-4-920

Removing the Cassette 1/ Cassette 2/ Cassette 3

F-4-921

Procedure

NOTE:

In this procedure, the procedure for the Cassette 1 is described.
Be sure to perform the same procedure for the Cassette 2 and Cassette 3.

1) Pull the Open/Close Lever [1], and pull out the Cassette 1 [2].

F-4-922

2) Loosen the screw [1], and move the stopper [2] until it stops.

F-4-923

3) Pull out the [A] part on the right side of the cassette while lifting its front side, and then move it toward the right to remove the Cassette 1.

F-4-924

NOTE: How to install the Cassette 1

1) Align the triangle mark [2] of the rail on the left side with the triangle mark [3] of the cassette.

F-4-925

2) Put the [C] part in the [B] part of the rail on the right side to install the Cassette 1 [1].

F-4-926

Removing the Cassette 1, 2, 3 Pickup Roller / Cassette 1, 2, 3 Feed Roller / Cassette 1, 2, 3 Separation Roller

F-4-927

- Cassette 1 Pickup Roller / Cassette 2 Pickup Roller / Cassette 3 Pickup Roller [1]
- Cassette 1 Feed Roller / Cassette 2 Feed Roller / Cassette 3 Feed Roller [2]
- Cassette 1 Separation Roller / Cassette 2 Separation Roller / Cassette 3 Separation Roller [3]

Preparation

- 1) Removing the Cassette 1/ Cassette 2/ Cassette 3 (Remove the Cassette 1, 2, or 3 as needed.) (Refer to page 4-401)

Procedure

NOTE:

In this procedure, the procedure for the Cassette 1 Pickup Roller/Cassette 1 Feed Roller/Cassette 1 Separation Roller is described. Be sure to perform the same procedure for the Cassette 2, 3 Pickup Roller/Cassette 2, 3 Feed Roller/Cassette 2, 3 Separation Roller.

NOTE: The layout for the Cassette 1 Pickup Roller [1]/Cassette 1 Feed Roller [2]/Cassette 1 Separation Roller [3] is shown below.

F-4-928

CAUTION:

Be sure not to touch the surface [A] of the roller when disassembling/assembling.

F-4-929

1) Open the Right Cover [1].

F-4-930

● When removing the Cassette 1 Pickup Roller

2) Remove the Cassette 1 Pickup Roller [1].

- 1 Claw [2]

F-4-931

NOTE: How to install the Cassette 1 Pickup Roller

- Be sure to align the protrusion [A] of the Cassette 1 Pickup Roller [1] with the groove [B] of the gear to install the roller.
- Be sure to insert the Cassette 1 Pickup Roller [1] until the claw [2] is hooked.

F-4-932

● When removing the Cassette 1 Feed Roller

3) Remove the Cassette 1 Feed Roller [1].

- 1 Claw [2]

F-4-933

NOTE:

If both the Cassette 1 Pickup Roller and the Cassette 1 Feed Roller are removed, the Slave Gear [2] comes off easily. If it comes off, be sure to put it back in the installation position.

F-4-934

NOTE: How to install the Cassette 1 Feed Roller

- Be sure to align the groove [A] of the Cassette 1 Feed Roller [1] with the protrusion [B] of the Torque Limiter to install the roller.
- Be sure to insert the Cassette 1 Feed Roller [1] until the claw [2] is hooked.

F-4-935

● When removing the Cassette 1 Separation Roller

4) Remove the Cassette 1 Separation Roller [1].

- 1 Claw [2]

F-4-936

NOTE: How to install the Cassette 1 Separation Roller

- Be sure to align the groove [A] of the Torque Limiter with the spring pin [3] to install the roller.

F-4-937

- Be sure to align the groove [B] of the Cassette 1 Separation Roller [1] with the protrusion [C] of the Torque Limiter to install the roller.
- Be sure to insert the Cassette 1 Separation Roller [1] until the claw [2] is hooked.

F-4-938

Removing the Cassette 1 Pickup Unit / Cassette 2 Pickup Unit / Cassette 3 Pickup Unit

F-4-939

Preparation

NOTE:

When pickup system options are installed, be sure to disconnect them from the host machine as needed.

- 1) Removing the Vertical Path Unit (Refer to page 4-410)
- 2) Pull out the Cassette 1 (pull out any of the Cassette 1/2/3 as needed).

Preparation

NOTE:

This procedure explains the case for Cassette 1 Pickup Unit. Perform the same procedure also for the Cassette 2 Pickup Unit and Cassette 3 Pickup Unit.

CAUTION:

Do not touch the 3 areas on the roller surface [A] when disassembling/assembling

F-4-940

1) Remove the Connector Cover [1].

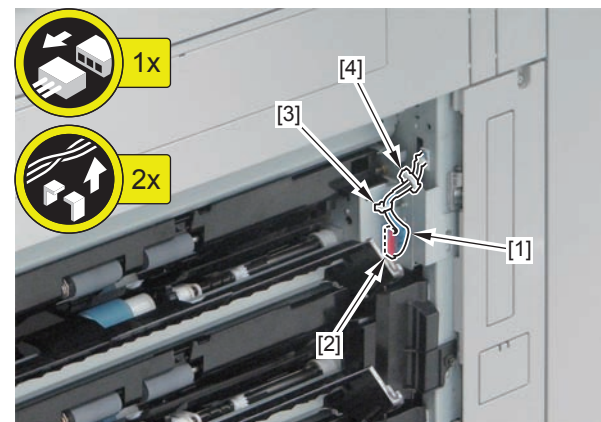

- 1 Screw [2]
- 2 Bosses [3]

F-4-941

2) Free the harness [1].

- 1 Connector [2]
- 1 Wire Saddle [3]
- 1 Edge Saddle [4]

F-4-942

3) Remove the Pickup Unit [1].

- 1 Screw [2]

F-4-943

Removing the Cassette Heater Unit

F-4-944

Preparation

1) Removing the Cassette 1/ Cassette 2/ Cassette 3 (Refer to page 4-401)

Procedure

1) Remove the Connector Cover [1].

- 1 Claw [2]
- 2 Protrusions [3]

F-4-945

2) Disconnect the connector [1].

F-4-946

3) Remove the Cassette Heater Unit [1].

- 2 Screws [2]
- 2 Bosses [3]
- 2 Protrusions [4]
- 2 Holes [5]

CAUTION:

- At assembly, align the 2 protrusions [4] with the 2 holes [5] of the Rear Plate.
- When securing the Cassette Heater Unit, secure it with the 2 screws [2] with the 2 bosses [3] in the correct positions.

F-4-947

Removing the Vertical Path Unit

F-4-948

Preparation

NOTE:

When pickup system options are installed, be sure to disconnect them from the host machine as needed.

Procedure

1) Open the Vertical Path Unit [1], and remove the strap [2].

- 1 Screw [3]

F-4-949

2) Hold the [A] part, and remove the stopper [1] from the groove [B] of the shaft.

F-4-950

3) Remove the Vertical Path Unit [1].

- 1 Shaft [2]

F-4-951

Cleaning the Vertical Path Feed Roller and the Slave Roller

Procedure

- 1) Open the Vertical Path Unit [1].
- 2) Clean the surface [A] of the 3 Vertical Path Feed Rollers and the surface [B] of the 3 Slave Rollers with lint-free paper [2] moistened with alcohol while rotating them by hand.

F-4-952

Removing the Registration Unit

F-4-953

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

CAUTION:

When removing/installing or replacing this part, be sure to perform steps described in When Removing/Installing the Registration Unit 4-414.

- 1) Remove the Fixing Feed Sub Cover [1].

- 1 Screw [2] (to loosen)
- 2 Hooks [3]

F-4-954

NOTE: How to install the Fixing Feed Sub Cover
Put the [A] part of the Fixing Feed Sub Cover under the Fixing Feed Front Left Cover [4].

F-4-955

- 2) Remove the Fixing Feed Front Right Cover [1].

- 4 Screws [2]
- 2 Bosses [3]

F-4-956

3) Open the Edge Saddle [1] and the Wire Saddle [2], and disconnect the 2 connectors [3].

F-4-957

5) Remove the Registration Unit [1].

F-4-959

4) Remove the 4 screws [1] and disconnect the round shape terminal [2].

F-4-958

CAUTION:

When removing/installing any one of the 2 Cam Gears [1] and the 2 gears [2] in the Registration Unit as shown in the figure below, the phase of the Cam Gears [1] and the gears [2] needs to be aligned.

Method: Be sure to align the leading edge of the arrow [A] of the Cam Gear with the leading edge of the arrow [B] of the gear to install the gears.

F-4-960

When Removing/Installing the Registration Unit

Procedure

- 1) Perform image position adjustment (Refer to page 5-2)

Cleaning the area from the Pre-registration Path to the Registration Path

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

CAUTION:

Do not touch the cleaned parts (the guide and rollers) after cleaning them.

NOTE:

If the feed area which can be cleaned by dry lint-free paper is dirty after cleaning it with the paper lint cleaning tool, clean it with lint-free paper moistened with alcohol.

- 1) Unhook the paper lint cleaning tool [1] from the Stepped Screw [2]

F-4-961

- 2) Remove the Open/Close Stopper [2] of the Front Cover [1].

- 1 Claw [3]

F-4-962

NOTE:

When the angle by which to open the Front Cover is limited due to pickup system options being connected, remove the Front Cover by opening the Toner Replacement Cover, removing the Hinge Shaft on the upper side, and then pulling out the Shaft Pin on the lower side.

- 3) Insert the paper lint cleaning tool [1] from the gap [A] of the Registration Guide, and clean the 2 feed areas [B].

NOTE:

Clean the area [C] which can be cleaned as there is a roller inside.

F-4-963

- 4) Open the Registration Unit Inlet Guide [1].

F-4-964

- 5) Insert the paper lint cleaning tool [1] from the gap [A] of the Pre-registration Guide Unit (Upper), and clean the 2 feed areas [B].

F-4-965

- 6) Insert the paper lint cleaning tool [1] from the gap [A], and clean the feed area [B] of the Pre-registration Guide Unit (Upper) and the feed area [C] of the Pre-registration Lower Guide.

NOTE:
Clean the area [D] which can be cleaned as there is a roller inside.

F-4-966

- 7) Clean the surface [A] of the Contact Image Sensor with lint-free paper [1] moistened with alcohol.

CAUTION:

Do not dry wipe the Contact Image Sensor as it may be charged.

- 8) Clean the surface [B] of the CIS Sheet with the paper lint cleaning tool [2].

F-4-967

9) Insert the paper lint cleaning tool [1] from the gap [A] of the Fixing Feed Unit, and clean the surface [B] of the feed area of the Pre-registration Upper Guide and the feed area [C] of the Pre-registration Lower Guide.

NOTE:
Clean the area [D] which can be cleaned as there is a roller inside.

F-4-968

10) Insert the paper lint cleaning tool [1] from the gap [A] of the Duplex Merging Guide, and clean the 2 feed areas [B].

NOTE:
Clean the area [C] which can be cleaned as there is a roller inside.

F-4-969

11) Clean each of the following rollers with lint-free paper [1] moistened with alcohol while rotating the roller by hand.

- 2 areas [2] of the Slave Roller Unit (for the Pre-registration Roller)
- 2 areas [3] of the Slave Roller Unit (for the Shift Roller)

CAUTION:

Be sure to use lint-free paper to rotate the rollers instead of directly touching them by hand.

F-4-970

Cleaning the Contact Image Sensor

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

- 1) Release the Open/Close Stopper [2] of the Front Cover [1].
 - 1 Claw [3]

F-4-971

2) Remove the paper lint cleaning tool [1] from the Stepped Screw [2].

F-4-972

3) Open the Registration Unit Inlet Guide [1].

F-4-973

4) Clean the surface [A] of the Contact Image Sensor with lint-free paper [1] moistened with alcohol.

CAUTION:

Do not dry wipe the Contact Image Sensor as it may be charged.

5) Clean the surface [B] of the CIS Sheet with the paper lint cleaning tool [2].

F-4-974

Cleaning the Registration Unit Upper Guide

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

- 1) Clean the surface [A] of the Registration Unit Upper Guide with lint-free paper [1] moistened with alcohol.

F-4-975

Removing the Pre-fixing Feed Unit

F-4-976

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Removing the Secondary Transfer Unit (Refer to page 4-193)

Procedure

- 1) Remove the Pre-fixing Feed Unit [1].
 - 1 Connector [2]
 - 2 Screws [3]

F-4-977

Cleaning the Post-secondary Transfer Sensor / Pre-fixing Feed Belt

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

- 1) Use a blower [1] to clean the soiling on the surface of the Post-secondary Transfer Sensor from the hole [A] of the guide.

F-4-978

CAUTION:

Do not move the Fixing Feed Belt [2] toward the front/rear.

F-4-979

- 2) Clean the surface [A] of the Fixing Feed Belt [2] with lint-free paper [1] moistened with alcohol.
- Move the lint-free paper in the direction of [B] to wipe it.
 - Rotate the Belt Roller [3] in the direction of [C] to clean the whole circumference of the surface [A] of the belt.

F-4-980

Cleaning the Duplex Path

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)

Procedure

CAUTION:

Do not touch the cleaned parts (the guide and rollers) after cleaning them.

- 1) Hold the handle [1], and open the Duplex Guide (Lower) [2].

F-4-981

2) While directing the edge of the blower [1] toward the 2 holes [A] of the Duplex Guide (Upper), clean the paper lint attached to the sensor surface of the Color Sensor with the blower [1].

NOTE:

Do so only when the Color Sensor (option) is installed.

F-4-982

3) Clean the feed area [A] of the Duplex Guide (Upper) with lint-free paper [1] moistened with alcohol.

4) While rotating the following rollers, clean the whole circumference of their surface with lint-free paper [1] moistened with alcohol.

- 2 areas [2] of the Duplex Feed Roller 1
- 2 areas [3] of the Duplex Feed Roller 2
- 2 areas [4] of the Duplex Feed Roller 3
- 2 areas [5] of the Duplex Feed Roller 4

CAUTION:

Be sure to use lint-free paper to rotate the rollers instead of directly touching them by hand.

F-4-983

5) Clean the feed area [A] of the Duplex Guide (Lower) with lint-free paper [1] moistened with alcohol.

CAUTION:

Be careful not to get the 3 Guide Tapes [2] peeled off or damaged. Otherwise, it may cause feed failure.

6) While rotating the following rollers, clean the whole circumference of their surface with lint-free paper [1] moistened with alcohol.

- 8 areas [3] of the Slave Rollers for the Duplex Feed Roller

CAUTION:

Be sure to use lint-free paper to rotate the rollers instead of directly touching them by hand.

F-4-984

Removing the Delivery Unit

F-4-985

Preparation

- 1) Removing the Front Left Cover (Refer to page 4-459)
- 2) Removing the Decurler Unit (Refer to page 4-428)

Procedure

- 1) Remove the Waste Toner Container [1] and store the Waste Toner Container Storage Tray [2].

CAUTION:

Be sure to install the Waste Toner Container Cap to the removed Waste Toner Container [1] so as not to scatter toner.

F-4-986

CAUTION:

- When placing the Delivery Unit [1], be sure to do so with the [A] side of the delivery side down.
- Be sure to place the unit on a place where there is a difference in level of the floor (such as an edge of a working table) for not allowing the Slave Roller [2] to contact with the floor to prevent deformation.

F-4-987

2) Pull the Lock Lever [1], and remove the Delivery Unit [2].

- 2 Shafts [3]

CAUTION:

Do not hit the Delivery Unit [2] against the Waste Toner Vertical Pipe Unit [4].

F-4-988

F-4-989

Removing the Reverse Unit

F-4-990

Preparation

- 1) Removing the Front Left Cover (Refer to page 4-459)
- 2) Removing the Decurler Unit (Refer to page 4-428)
- 3) Removing the Delivery Unit (Refer to page 4-428)
- 4) Removing the Box Left Cover (Refer to page 4-458)
- 5) Removing the Left Upper Cover (Refer to page 4-460)
- 6) Removing the Left Middle Cover (Refer to page 4-461)

Procedure

- 1) Remove the Fan Unit [1].
 - 3 Connectors [2]
 - 4 Screws [3]
 - 2 Bosses [4]

F-4-991

- 2) Free the harness [1].
 - 3 Connectors [2]
 - 1 Edge Saddle [3]
 - 4 Wire Saddles [4]

F-4-992

CAUTION:

- When placing the Reverse Unit [1], be sure to do so with the [A] side of the delivery side down.
- Be sure to place the unit on a place where there is a difference in level of the floor (such as an edge of a working table) for not allowing the Fan Duct [2] to contact with the floor to prevent deformation.

F-4-993

4) Remove the Reverse Unit [1].

- 6 Screws [2]
- 2 Hooks [3]

CAUTION:

Do not hit the Reverse Unit [1] against the Waste Toner Vertical Pipe Unit [4].

F-4-994

F-4-995

Removing the Decurler Unit

F-4-996

Preparation

NOTE:

When removing the Decurler Unit from the host machine, be sure to remove the delivery system options in advance.

1) Removing the Front Left Cover (Refer to page 4-459)

Procedure

1) Pull the Open/Close Lever [1], and open the Feed Guide [2].

F-4-997

2) Disconnect the Decurler Cable [1].

- 1 Wire Saddle [2]

F-4-998

3) Remove the Left Cover [1].

- 7 Screws [2]
- 2 Protrusions [3]

F-4-999

4) Pull out the Waste Toner Container Storage Tray [1].

F-4-1000

5) Remove the Connecting Harness Stopping Plate [1].

- 2 Screws [2]
- 3 Connectors [3]

F-4-1001

6) Store the removed Waste Toner Container Storage Tray.

7) Remove the Decurler Upper Cover [1].

- 2 Screws [2] (Loosen)
- 2 Hooks [3]

F-4-1002

CAUTION:

When installing/removing the Decurler Unit, do not hit it against the Waste Toner Pipe [2].

F-4-1003

CAUTION:

Do not place the Decurler Unit [1] on the floor while being tilted; otherwise the [A] part may be deformed.

F-4-1004

8) Remove the screw [1].

9) Release the 4 shafts [2] from the hole [A] and the 4 hooks [3], and remove the Decurler Unit [4].

F-4-1005

NOTE: How to install the Decurler Unit

- 1) Align the 4 shafts [4] of the Decurler Unit [1] with the 4 hooks [3] of the host machine.
- 2) Secure the Decurler Unit in place with the screw [2] while it is pushed against the Decurler Mounting Plate (Front) [5].

F-4-1006

Cleaning the Decurler Unit and Reverse/Delivery Unit

CAUTION:

After cleaning, do not touch the cleaned parts (the guide and rollers).

Procedure

- 1) Open the Front Left Cover [1].

F-4-1007

2) Pull the Open/Close Lever [1], and open the Rotary Frame Unit [2].

F-4-1008

3) Clean the Decurler Guide [2] with lint-free paper [1] moistened with alcohol.

F-4-1009

4) Clean each of the following rollers with lint-free paper [1] moistened with alcohol while rotating the roller by hand.

- Decurler Adjustment Roller 2 [2]
- Decurler Roller 2 [3]
- Decurler Adjustment Roller 1 [4]
- Buffer Feeding Roller 2 Slave Roller [5]
- Buffer Feeding Roller 2 [6]

F-4-1010

5) While rotating the knob [1], clean the Decurler Roller 1 [3] with lint-free paper [2] moistened with alcohol.

F-4-1011

6) Holding the Open/Close Lever [1], close the Rotary Frame Unit [2].

F-4-1012

7) Pull the Open/Close Lever [1], and open the Feed Guide [2].

F-4-1013

8) Clean each of the following rollers with lint-free paper [1] moistened with alcohol while rotating the roller by hand.

- Decurler Inlet Roller [2]
- Decurler Inlet Roller Slave Roller [3]

F-4-1014

9) Holding the Open/Close Lever [1], close the Feed Guide [2].

F-4-1015

10) Pull the Lock Lever [1] to open the Delivery Unit [2].

F-4-1016

12) Close the Delivery Unit [1] and the Front Left Cover [2].

F-4-1018

11) Clean each of the following rollers with lint-free paper [1] moistened with alcohol while rotating the roller by hand.

- 2 Feed Rollers [2]
- 2 Feed Roller Slave Rollers [3]

F-4-1017

Cleaning the Decurler Sensor 1

Procedure

1) Open the Front Left Cover [1].

F-4-1019

2) Pull the Open/Close Lever [1], and open the Feed Guide [2].

F-4-1020

3) Clean the Decurler Sensor 1 [1] with a blower [2].

F-4-1021

Cleaning the Decurler Sensor 2

Procedure

1) Open the Front Left Cover [1].

F-4-1022

2) Pull the Open/Close Lever [1], and open the Rotary Frame Unit [2].

F-4-1023

3) Clean the Decurler Sensor 2 [1] with a blower [2].

F-4-1024

Removing the Rotary Frame Unit

F-4-1025

Preparation

NOTE:

When delivery system options are installed, be sure to disconnect them from the host machine in advance.

1) Removing the Front Left Cover (Refer to page 4-459)

Procedure

CAUTION:

Do not touch the surface [A] of the Decurler Adjustment Roller 1 and the [B] part of the Static Eliminator when disassembling/assembling.

F-4-1026

1) Remove the knob [1].

- 1 Claw [2]

F-4-1027

2) Remove the Decurler Inner Cover [2] while avoiding contact with the Open/Close Lever [1].

- 4 Screws [3]

- 1 Shaft [4]

F-4-1028

3) Disconnect the connector [1].

- 1 Harness Guide [A]
- 1 Edge Saddle [2]

F-4-1029

CAUTION:

When installing/removing the Rotary Frame Unit [1], do not hit it against the 1 area on the Sponge Roller surface [B], the 2 areas on the Decurler Roller surface [C] and the 1 area on the Feed Roller surface [D] on the Decurler Unit side.

F-4-1030

4) Pull the Open/Close Lever [1], and remove the Rotary Frame Unit [3] while holding the harness [2].

- 1 Screw [4]
- 1 Fixation Pin [5]

F-4-1031

NOTE: How to install the Rotary Frame Unit
Be sure to fit the hole [A] on the Rotary Frame Unit to the Positioning Pin [6] on the host machine to install the unit.

F-4-1032

Removing the Outlet Guide Unit (Upper)

F-4-1033

Preparation

- 1) Removing the Front Left Cover (Refer to page 4-459)
- 2) Removing the Rotary Frame Unit (Refer to page 4-437)

Procedure

CAUTION:

Do not touch the surface [A] of the Decurler Adjustment Roller 1 and the [B] part of the Static Eliminator when disassembling/assembling.

F-4-1034

1) Remove the Guide Cover [1].

- 2 Screws [2]
- 2 Protrusions [3]

F-4-1035

2) Disconnect the connector [1].

F-4-1036

3) Slide the 2 bosses [1] from the groove [A], and remove the Outlet Guide Unit (Upper) [2].

- 4 Screws [3]

F-4-1037

Removing the Decurler Adjustment Roller 1 Support Plate Unit

F-4-1038

Preparation

- 1) Removing the Front Left Cover (Refer to page 4-459)
- 2) Removing the Rotary Frame Unit (Refer to page 4-437)
- 3) Removing the Outlet Guide Unit (Upper) (Refer to page 4-439)

Procedure

CAUTION:

Be sure not to touch the surface [A] of the Decurler Adjustment Roller 1 when disassembling/assembling.

F-4-1039

- 1) Remove the Open/Close Lever Shaft [1].
 - 2 E-rings [2]
 - 2 Bushings [3]
 - 1 Spring [4]

F-4-1040

NOTE: How to hook the spring [4]
Hook the 2 ends of the spring [4] to the hole [A] and the hook [B] on the Support Plate to install the spring.

F-4-1041

3) Remove the Decurler Adjustment Roller 1 Support Plate Unit [1].

- 1 Tension Spring [2]
- 1 Screw [3]
- 1 Fixation Pin [4]

F-4-1043

2) Remove the Short Guide (Upper) [1].

- 2 Screws [2]

F-4-1042

Removing the Decurler Adjustment Roller 1

F-4-1044

Preparation

- 1) Removing the Front Left Cover (Refer to page 4-459)
- 2) Removing the Rotary Frame Unit (Refer to page 4-437)
- 3) Removing the Outlet Guide Unit (Upper) (Refer to page 4-439)
- 4) Removing the Decurler Adjustment Roller 1 Support Plate Unit (Refer to page 4-441)

Procedure

- 1) Remove the Decurler Adjustment Roller 1 [1].
 - 2 E-rings [2]
 - 2 Bearings [3]

CAUTION:

Do not touch the surface of the Decurler Adjustment Roller 1 [1].

F-4-1045

Removing the Decurler Adjustment Roller 2

F-4-1046

Preparation

- 1) Removing the Front Left Cover (Refer to page 4-459)

Procedure

CAUTION:

Be sure not to touch the surface [A] of the Decurler Adjustment Roller 2 when disassembling/assembling.

F-4-1047

1) Remove the knob [1].

- 1 Claw [2]

F-4-1048

2) Remove the Decurler Inner Cover [2] while avoiding contact with the Open/Close Lever [1].

- 4 Screws [3]
- 1 Shaft [4]

F-4-1049

3) Remove the Decurler Rear Cover [1].

- 1 Screw [2] (to loosen)
- 1 Screw [3] (to remove)

F-4-1050

4) Remove the Decurler Compression Distance Adjustment Motor 1 [1].

- 1 Connector [2]
- 1 Screw [3] (to loosen)
- 2 Screws [4] (to be removed)

F-4-1051

5) Remove the Fixation Pin [1].

- 1 Screw [2]

F-4-1052

6) Remove the Finisher Guide (Lower) [1].

- 1 Screw [2]
- 2 Hooks [3]

F-4-1053

7) Remove the Left Upper Cover [1].

- 6 Screws [2]
- 3 Protrusions [3]
- 2 Bosses [4]
- 1 Hook [5]

F-4-1054

CAUTION:

When installing the Left Upper Cover [1], be sure to install the 2 out of 6 screws [2] in the following order. (There is not installation order for other 4 screws.) Otherwise, there is a possibility that the cover is installed while the 2 bosses [4] of the cover are not fit in the holes on the Decurler Unit.

F-4-1055

8) Pull the Open/Close Lever [1], and open the Rotary Frame Unit [2].

F-4-1056

9) Remove the Sensor Support Plate [2] while avoiding contact with the Sensor Flag [1].

- 1 Screw [3]

F-4-1057

10) While supporting the stay [1], remove the Fixation Pin [2] and then remove the Stay [1].

- 1 Screw [3]

F-4-1058

11) While supporting the Decurler Adjustment Roller 2 Support Plate Unit [1], remove the Fixation Pin [2] and then remove the unit [1].

- 1 Screw [3]

F-4-1059

NOTE: How to install the Decurler Adjustment Roller 2 Support Plate Unit

- Install the Decurler Adjustment Roller 2 Support Plate Unit [1] by inserting it into the pin on the rear side of the Decurler Unit.
- When installing the Decurler Adjustment Roller 2 Support Plate Unit [1], be sure to place the unit at the upper side of the 2 cams [5] of the Decurler Unit.

F-4-1060

12) Remove the Decurler Adjustment Roller 2 [1].

- 2 E-rings [2]
- 2 Shaft Supports [3]

F-4-1061

Removing the Decurler Inlet Roller

F-4-1062

Preparation

- 1) Removing the Front Left Cover (Refer to page 4-459)
- 2) Removing the Rotary Frame Unit (Refer to page 4-437)

Procedure

CAUTION:

Be sure not to touch the surface [A] of the Decurler Inlet Roller when disassembling/ assembling.

F-4-1063

1) Remove the Decurler Rear Cover [1].

- 1 Screw [2] (to loosen)
- 1 Screw [3] (to remove)

F-4-1064

2) Remove the Decurler Feed Motor [1].

- 1 Connector [2]
- 1 Wire Saddle [3]
- 3 Screws [4]
- 1 Edge Saddle [5]
- 1 Reuse Band [6]

F-4-1065

3) Free the harness [1], and remove the Door Sensor Support Plate [2].

- 1 Screw [3]
- 3 Connectors [4]
- 1 Edge Saddle [5]
- 3 Wire Saddles [6]

F-4-1066

4) Remove the Decurler Inlet Roller [1].

- 3 E-rings [2]
- 2 Washers [3]
- 1 Gear [4]
- 1 Parallel Pin [5]
- 2 Shaft Supports [6]

F-4-1067

Removing the Buffer Feeding Roller 2

F-4-1068

Preparation

1) Removing the Front Left Cover (Refer to page 4-459)

Procedure

CAUTION:

Be sure not to touch the surface [A] of the Buffer Feeding Roller 2 when disassembling/assembling.

F-4-1069

1) Remove the knob [1].

- 1 Claw [2]

F-4-1070

2) Remove the Decurler Inner Cover [2] while avoiding contact with the Open/Close Lever [1].

- 4 Screws [3]
- 1 Shaft [4]

F-4-1071

3) Remove the Decurler Rear Cover [1].

- 1 Screw [2] (to loosen)
- 1 Screw [3] (to remove)

F-4-1072

5) Remove the Finisher Guide (Lower) [1].

- 1 Screw [2]
- 2 Hooks [3]

F-4-1074

4) Remove the Decurler Compression Distance Adjustment Motor 2 [1].

- 1 Connector [2]
- 2 Wire Saddles [3]
- 3 Screws [4]

F-4-1073

6) Remove the Left Upper Cover [1].

- 6 Screws [2]
- 3 Protrusions [3]
- 2 Bosses [4]
- 1 Hook [5]

F-4-1075

CAUTION:

When installing the Left Upper Cover [1], be sure to install the 2 out of 7 screws [2] in the following order. (There is not installation order for other 5 screws.) Otherwise, there is a possibility that the cover is installed while the 2 bosses [4] of the cover are not fit in the holes on the Decurler Unit.

F-4-1076

7) Pull the Open/Close Lever [1], and open the Rotary Frame Unit [2].

F-4-1077

8) Remove the Buffer Feeding Roller 2 [1].

- 3 E-rings [2]
- 2 Washers [3]
- 1 Gear [4]
- 1 Parallel Pin [5]
- 2 Shaft Supports [6]

CAUTION:

Be careful not to drop and lose the Parallel Pin [5] in the gear [4].

F-4-1078

External/Auxiliary System

Removing the Upper Front Cover

F-4-1079

Procedure

- 1) Open the Toner Replacement Cover [1].
 - 2) Remove the Upper Front Cover [2].
- 3 Rubber Caps [3]
 - 3 Screws [4]
 - 3 Hook Holes [A]

F-4-1080

NOTE: How to install the Upper Front Cover
Be sure to fit the 3 hook holes [A] of the Upper Front Cover to the 3 protrusions [5] of the host machine to install the cover.

F-4-1081

Removing the Toner Replacement Cover

F-4-1082

Preparation

1) Open the Front Cover.

Procedure

- 1) Open the Toner Replacement Cover [1].
 - 2) Remove the Hinge Pin [2], and then remove the Toner Replacement Cover [1].
- 1 Shaft [3]

F-4-1083

Removing the Toner Container Replacement Cover

F-4-1084

Preparation

- 1) Open the Front Cover.
- 2) Removing the Toner Replacement Cover (Refer to page 4-453)

Procedure

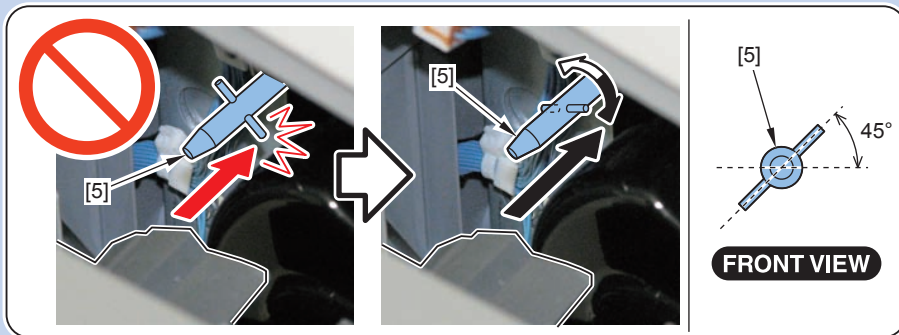

- 1) Remove the Toner Container Replacement Cover [1].
- 4 Screws [2]
 - 2 Claws [3]
 - 4 Protrusions [4]

F-4-1085

NOTE: How to install the Toner Container Replacement Cover

- Be sure to install the Toner Container Replacement Cover [1] after tilting the 4 Parallel Pins [5] of the Inner Door Link Shaft at an angle of approx. 45 degrees.

F-4-1086

- If the Toner Container (Bk) is not installed, be sure to install the Toner Container Replacement Cover [1] while opening the Lock Lever [6] of the Toner Container (Bk).

F-4-1087

CAUTION:

When installing the Toner Container Replacement Cover [1], be sure to prevent the cover from interfering with and damaging the 4 Toner Insertion Inlet Cover Open/Close Sensors [7] and the 4 groundings [8] on the upper side of the sensors.

F-4-1088

● Removing the Right Middle Front Cover 1

F-4-1089

■ Procedure

- 1) Remove the Right Middle Front Cover 1 [1].
 - 3 Screws [2]
 - 1 Hook [3]

F-4-1090

Removing the Right Upper Front Cover

F-4-1091

Preparation

1) Removing the Right Middle Front Cover 1 (Refer to page 4-455)

Procedure

1) Remove the Right Upper Front Cover [1].

- 1 Rubber Cap [2]
- 2 Screws [3]
- 4 Hooks [4]

F-4-1092

Removing the Box Right Cover

F-4-1093

Procedure

1) Push the [A] part to open the HDD Cover [1].

F-4-1094

2) Remove 3 Screws [1].

F-4-1095

3) Remove the Box Right Cover [1].

- 1 Hook [2]
- 1 Protrusion [3]

F-4-1096

NOTE: How to install the Box Right Cover
Install the Box Right Cover to the host machine by inserting its protrusion [3] and hooking its hook [2].

F-4-1097

Removing the Box Left Cover

F-4-1098

Procedure

- 1) Remove the Network Cable [1], and Remove the Box Left Cover [2].
- 4 Screws [3]

F-4-1099

Removing the Box Upper Cover

F-4-1100

Preparation

- 1) Removing the Box Left Cover (Refer to page 4-458)

Procedure

- 1) Remove the screw [1] of the Box Right Cover.
 - 2) Remove the Box Upper Cover [2].
- 2 Screws [3]
 - 1 Protrusion [4]

F-4-1101

NOTE: How to install the Box Upper Cover

Be sure to put the [A] part of the Box Upper Cover [2] and the protrusion [4] inside the Box Right Cover [5] to install the cover.

F-4-1102

Removing the Front Left Cover

F-4-1103

Procedure

1) Open the Front Left Cover [1], remove the Stepped Screw [2], and then store the link [3].

F-4-1104

2) Remove the 2 Hinge Shafts [1] and the Front Left Cover [2].

F-4-1105

Removing the Left Upper Cover

F-4-1106

Preparation

- 1) Removing the Front Left Cover (Refer to page 4-459)
- 2) Removing the Decurler Unit (Refer to page 4-428)
- 3) Removing the Box Left Cover (Refer to page 4-458)

Procedure

- 1) Remove the Left Upper Cover [1].
 - 2 Stepped Screws [2]
 - 2 Screws (Binding) [3]
 - 3 Hooks [4]

F-4-1107

NOTE: How to install the Left Upper Cover
Install the Left Upper Cover [1] so that its [A] part comes on the upper side of the Reader Cover [2].

F-4-1108

Removing the Left Middle Cover

F-4-1109

Preparation

- 1) Removing the Front Left Cover (Refer to page 4-459)
- 2) Removing the Decurler Unit (Refer to page 4-428)
- 3) Removing the Box Left Cover (Refer to page 4-458)
- 4) Removing the Left Upper Cover (Refer to page 4-460)

Procedure

- 1) Remove the Decurler Mounting Plate (Rear) [1].
 - 2 Screws [2]
 - 2 Bosses [3]

F-4-1110

2) Remove the Left Middle Cover [1].

- 2 Screws [2]
- 4 Stepped Screws [3]

F-4-1111

Removing the Left Lower Rear Cover

F-4-1112

Preparation

- 1) Removing the Front Left Cover (Refer to page 4-459)
- 2) Removing the Decurler Unit (Refer to page 4-428)

Procedure

- 1) Remove the Left Lower Rear Cover [1].
 - 4 Screws [2]
 - 2 Bosses [3]

F-4-1113

Removing the Rear Lower Cover

F-4-1114

Procedure

1) Disconnect the Power Supply Connector [1].

- 2 Screws [2]
- Power Supply Connector Cover [3]

F-4-1115

2) Remove the Rear Curtain Unit [1].

- 2 Screws [2]

F-4-1116

CAUTION:

Do not move the machine over a long distance while the Rear Curtain Unit [1] is installed. Otherwise, the Rear Curtain Unit [1] may be damaged.

3) Remove the 2 screws [1] of the Left Lower Rear Cover.

F-4-1117

CAUTION:

When disassembling/assembling, do not deform the Grounding Plate [1].

F-4-1118

4) While opening the Left Lower Rear Cover [1], remove the Rear Lower Cover [2].

- 4 Screws [3]

F-4-1119

NOTE:

- When assembling, be sure to insert the edge [A] of the Left Lower Rear Cover in the groove [B] of the Rear Lower Cover.
- When assembling, be sure to put the [C] part of the Rear Lower Cover inside the [D] part of the Rear Upper Cover.

F-4-1120

Removing the Fixing Dustproof Filter and the Ozone Filter

F-4-1122

Procedure

CAUTION:

Be sure to place the Noise Reduction Duct Filter Unit [1] on a sheet of paper [2] because toner is attached on the unit.

F-4-1123

1) Remove the Noise Reduction Duct Filter Unit [1].

- 2 Claws [2]

F-4-1124

2) Remove the Fixing Dustproof Filter [1].

F-4-1125

NOTE: How to install the Fixing Dustproof Filter
Be sure to align the rib [2] of the Fixing Dustproof Filter with the guide [A] when installing the filter.

F-4-1126

3) Remove the 2 Ozone Filters [2] from the Filter Case [1].

F-4-1127

NOTE: How to install the Ozone Filter
Be sure to install the Ozone Filter with its sponge [3] on the upper side.

F-4-1128

Removing the Primary Charging Dustproof Filter

F-4-1129

Procedure

- 1) Remove the Right Middle Front Cover 2 [1].
 - 2 Claws [2]
 - 3 Hooks [3]

F-4-1130

2) Open the Filter Cover [1].

- 1 Screw [2]

F-4-1131

3) Hold the tab [A] to remove the Primary Charging Dustproof Filter [1].

F-4-1132

Options

Removing the DADF Unit + Reader Unit

F-4-1133

Preparation

NOTE:

When pickup system options are installed, be sure to disconnect them from the host machine as needed..

- 1) Removing the Front Left Cover (Refer to page 4-459)
- 2) Removing the Decurler Unit (Refer to page 4-428)
- 3) Removing the Box Right Cover (Refer to page 4-456)
- 4) Removing the Box Left Cover (Refer to page 4-458)
- 5) Removing the Left Upper Cover (Refer to page 4-460)
- 6) Removing the Box Upper Cover (Refer to page 4-458)

NOTE:

Be sure to refer to the correct step according to the following instruction since the step differs depending on whether the Multi-purpose Tray Pickup Unit (option) is installed.

- If the Multi-purpose Tray Pickup Unit is not installed, refer to step 7-1.
- If the Multi-purpose Tray Pickup Unit is installed, refer to step 7-2.

- 7-1) Removing the Right Middle Front Cover 1 (Refer to page 4-455)
- 7-2) Open the Multi-purpose Tray Pickup Unit.
- 8) Removing the Right Upper Front Cover (Refer to page 4-456)
- 9) Close the Multi-purpose Tray Pickup Unit. (If the Multi-purpose Tray Pickup Unit is installed)

Procedure

CAUTION:

- Because the weight of the equipment is approx. 40 kg, be sure to work with 2 or more people when lifting it up/down. Also, be sure to lift the equipment horizontally.
- To prevent deformation of the bottom of the Reader Unit, be sure that the Reader Support Plate [B] is installed when placing it on the floor.

F-4-1134

- 1) Move the Reader Scanner Unit to the fixing position by executing the following service mode.

Service Mode (Level 2) > COPIER > FNCTION > MISC-R > RD-SHPOS

CAUTION:

Be sure to move the Scanner Unit to the fixing position and secure it in place when moving the Reader after installation. Otherwise, the Scanner Unit may get damage

2) Disconnect the Reader Power Supply Cable [1].

- 2 Connectors [2]
- 1 Wire Saddle [3]

F-4-1135

3) Disconnect the Reader Communication Cable [1].

- 3 Wire Saddles [2]
- 2 Connectors [3]

F-4-1136

4) Free the Control Panel Cable [1] from the 3 Wire Saddles [2].

5) Remove the Wire Saddle [3].

F-4-1137

6) Disconnect the round shape terminal [1] of the Grounding Wire.

- 1 Screw [2]
- 1 Toothed Washer [3]

F-4-1138

NOTE:

Be sure to allow extra slack of the cables at the [A] part for opening and closing the Controller Box.

F-4-1139

8) Remove the Base Rear Cover [1] and the Base Front Cover [2].

- 1 Screw (TP) [3]
- 2 Screws (Tapping) [4]
- 2 Claws [5]

F-4-1141

7) Remove the Arm Rear Cover [1].

- 1 Screw (TP) [2]
- 2 Screws (Tapping) [3]
- 2 Bosses [4]

F-4-1140

CAUTION:

Be sure that the Control Panel Cable [1] and the Power Supply Cable [2] do not cover the screw hole [A].

F-4-1142

NOTE: How to install the Base Rear Cover [1] and the Base Front Cover [2]

1) Put the [A] part of the Base Front Cover [2] in the [B] part which is inside the Arm Lower Cover.

2) Install the Base Rear Cover [1].

- 2 Claws [5]
- 1 Screw (TP) [3]
- 2 Screws (Tapping) [4]

F-4-1143

9) Remove the Arm Lower Cover [1].

- 1 Screw (TP) [2]
- 2 Screws (Tapping) [3]

F-4-1144

10) Remove the Arm Upper Cover [1].

- 2 Screws (Tapping) [2]

F-4-1145

11) Remove the Stopper Stepped Screw [1].

F-4-1146

12) Rotate the Upright Control Panel [1].

F-4-1148

CAUTION:

When rotating the Upright Control Panel [1], do not break the 2 Control Panel Cables [2].

F-4-1147

13) Remove the Right Upper Rear Cover [1].

- 1 Screw [2]

F-4-1149

14) Remove the Reader Fixation Plate (R) [1].

- 1 Screw [2]
- 2 Bosses [3]

F-4-1150

16) Open the DADF, and remove the Left Upper Small Cover [1].

- 1 Claw [2]
- 1 Hook [3]

F-4-1152

15) Remove the Reader Fixation Plate (L) [1].

- 1 Screw [2]
- 2 Bosses [3]

F-4-1151

17) Install the Scanner Fixation Tool [1] that has been kept in a safe place since installation.

F-4-1153

CAUTION:

Fixation by the Scanner Fixation Tool assumes shipping of the reader placed on the host machine.

When shipping only the DADF + Reader Unit, be sure to use the 2 Scanner Fixation Screws [1].

F-4-1154

18) Close the DADF

19) Remove the Reader Support Plate [1].

- 1 Screw [2]

F-4-1155

20) Remove the Reader Support Plate A [2] from the Reader Support Plate B [1].

- 2 Screws [3]

F-4-1156

21) Install the Reader Support Plate A [1].

- 2 Screws [2]

F-4-1157

22) Lift up the DADF + Reader Unit slightly with a screwdriver by applying the principle of leverage, and remove the 4 Rubber Plates [1] from the host machine (printer).

⚠ CAUTION:

- When attempting to lift up the DADF + Reader Unit fully without first removing the 4 Rubber Plates, force is generated when the Rubber Plates are removed, which may cause the DADF + Reader Unit to fall.
- To make the work easier, remove the Rubber Plates in the front side first.
- Do not use a long screwdriver. Otherwise, it may be bent.
- When removing the Rubber Plate [A] on the front side, do not insert a screwdriver between the front side of the plate and the host machine because harnesses [2] are routed there.
- When removing the Rubber Plate [A] on the rear side, do not insert a screwdriver between the rear side of the plate and the host machine because harnesses [3] are routed there.

F-4-1158

F-4-1159

CAUTION:

Points to note when installing/removing the DADF + Reader Unit

- Do not trap the Reader Power Supply Cable [2] and the Reader Communication Cable [3].
- Be careful not to break the 2 Dust Collection Cups [4].
- Be careful not to break the Wire Saddle [5].

F-4-1160

⚠ CAUTION:

- Because the weight of the equipment is approx. 40 kg, be sure to work with 2 or more people when lifting it up/down. Also, be sure to lift the equipment horizontally.
- When lifting up/down the DADF + Reader Unit, be careful not to get the cables and fingers caught.

NOTE:

When lifting up/down the DADF + Reader Unit, be sure to hold the Reader Support Plate A [1] and the 2 positions on the right side of the reader [A].

F-4-1161

23) Remove the DADF + Reader Unit [1] from the 2 pins [2] of the host machine, and place it temporarily while being shifted for approx. 45mm toward left side of the host machine.

F-4-1162

24) Install the Reader Support Plate [B].

- 1 Screw [1]

CAUTION:

When lifting down the DADF + Reader Unit from the host machine, be sure to install the Reader Support Plate [B] to the DADF + Reader Unit before lifting it down. This is to prevent deformation of the bottom of the Reader Unit.

F-4-1163

CAUTION:

When lifting up/down the DADF + Reader Unit, be sure to hold the position [A] shown in the figure.

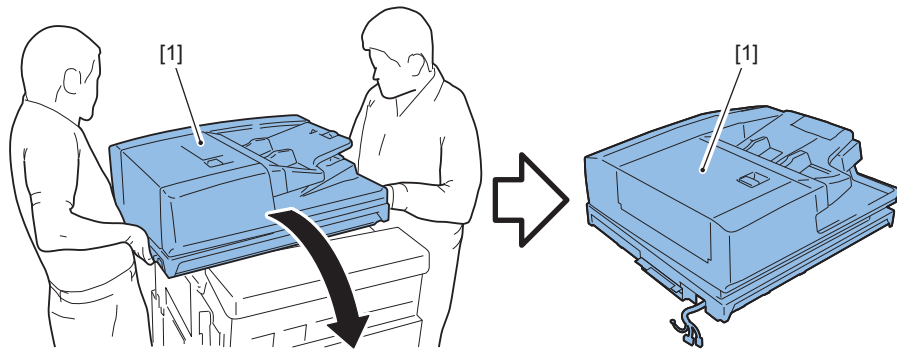

F-4-1164

25) Lift the DADF + Reader Unit [1] with 2 or more people, and remove it by passing over the front side of the host machine.

CAUTION:

Because the center of gravity of the equipment is at the rear, be careful not to drop it when lifting it.

F-4-1165

NOTE: Installation to the host machine
Place the DADF + Reader Unit temporarily on the floor in such a way that the 2 pins [1] of the host machine and the 2 holes of the DADF + Reader Unit are facing the same direction. Then, place the DADF + Reader Unit on the host machine from the front side of the machine.

- The triangle mark [A] are shown to indicate the positions of the 2 holes [2] located on the side of the Reader Unit.

F-4-1166

Data to be handled by SRAM(with HDD Encryption Board

The kind of data to handle

Data to operate this machine is largely divided into 2 categories.

System software	Common data among the same model
Data in SRAM and HDD on the boards	Factory settings value for the target machine and the values in Address Book and Settings/Registration, etc. entered by the user.

T-4-54

Upgrading and installation is used as the terms to handle the system software.

Backup and restoration is used as the terms to handle data in SRAM and HDD on the boards.

F-4-1167

Be sure to use the latest possible backup data for the SRAM data of each board.

If restoring the SRAM data backed up long time ago, image failure, etc., may occur due to mismatch between the backup data and the parameter for host machine adjustment changed after backup.

Handling SRAM data of this machine

With the normal service, the contents of SRAM of the Main Controller PCB 2 can be backed up to HDD in service mode and restored after replacing the board.

If there is an HDD Encryption Board, the encryption key of the HDD Encryption Board recorded on SRAM is lost when replacing the Main Controller PCB 2, and the contents of HDD cannot to be read. Therefore, restoration cannot be done although backup is performed.

When replacing the Main Controller PCB 2, user data needs to be reentered in the same way as when replacing the HDD with a new one.

Part to be replaced	Description	Procedure	When TPM is enabled (ON)
Main Controller 2	SRAM of the Main Controller PCB 2 includes user data and MEAP-related data. If there are any files backed up from RUI by the user, restore them after recovery. Explain the user that the reinstallation of everything related to MEAP is necessary. Reference: If Meapback.bin is saved using SST, it can be restored after replacing the Main Controller PCB 2. This makes the reinstallation of everything related to MEAP unnecessary.	1. Use SST to backup the "sramimg.bin." 2. Replace the Main Controller PCB. 3. Use SST to restore the "sramimg.bin."	After the system is properly installed, enable TPM to execute a backup of TPM.
New HDD	Install the system software on the new HDD after formatting it by SST. If there are any files backed up from RUI by the user, restore them after recovery. Explain the user that the reinstallation of everything related to MEAP is necessary. Reference: If Meapback.bin is saved using SST, it can be restored after replacing the Main Controller PCB 2. This makes the reinstallation of everything related to MEAP unnecessary.	1. Hold down 2 and 8 to start the machine. 2. Use SST to Format ALL. 3. Install the system.	After the system is properly installed, enable TPM to execute a backup of TPM.
System installation when the HDD is properly working.	To upgrade the system version, the Assist Mode of SST is recommended.	1. Enter service mode and select the following: COPIER > FUNCTION > SYSTEM > DOWNLOAD > OK 2. Use SST to install the system software in Assist mode.	No additional work
Backup of Reader Controller PCB	Enter service mode to make a backup of SRAM data into the HDD.	1. Select the following to execute system backup: COPIER > FUNCTION > SYSTEM RSRAMBUP 2. Replace the Reader Controller PCB 3. Select the following to restore the system: COPIER > FUNCTION > SYSTEM RSRAMRES	No additional work
Backup of DC Controller PCB	Enter service mode to make a backup of SRAM data into the HDD.	1. Select the following to execute system backup: COPIER > FUNCTION > SYSTEM DSRAMBUP 2. Replace the DC Controller PCB 3. Select the following to restore the system: COPIER > FUNCTION > SYSTEM DSRAMRES	No additional work

Part to be replaced	Description	Procedure	When TPM is enabled (ON)
HDD Encryption Board	An encryption key of the HDD Encryption Board is newly made. Install the system software on the HDD after formatting it by SST. If there are any files backed up from RUI by the user, restore them after recovery.	1. Hold down 2 and 8 to start the machine. 2. Use SST to Format ALL. 3. Install the system.	After the system is properly installed, enable TPM to execute a backup of TPM.
TPM Board	When there is a backup of TPM, restore TPM.	1. Use RUI to make a restore.	Follow the description on the left.
	When there is no backup of TPM, select the following: Settings/Registration > Management Settings	1. Use RUI to make a backup. 2. Settings/Registration > Management Settings > Data Management > Initialize All Data/Settings 3. Use RUI to make a restore. 4. Enable TPM to make a backup.	Follow the description on the left.

T-4-55

● Items which needs to be backed up when replacing the Main Controller PCB 2

When replacing the Main Controller PCB 2, the encryption key of the HDD Encryption Board on SRAM is lost and HDD cannot be accessed. For recovery, perform "Items which needs to be backed up by the user when replacing the HDD" as well in addition to the table below to format the HDD.

*1: Detailed parameters cannot be imported by default. Only basic parameters can be imported.

When OFF is set for "Restrict Receiving for Each Function" in "Device Information Delivery Settings" in "Settings/Registration", the detailed parameters can also be imported.

However, import of detailed parameters between different models is not recommended.

The data can be import/export only from/to another host machine of the same model.

*2: "Copy" and "Scan and Store" are not supported.

*3: It is possible only when logging in as an administrator user.

*4: Only "favorites of web browser" can be backed up.

*5: Only when the MEAP applications have a backup function

*6: Data retained independently by the MEAP application is excluded. This includes only data registered as management information data of the MEAP application.

*7: Backup only against TPM PCB failure is possible.

In addition, restoration cannot be done to other machines whose TPM setting is set to

"ON".

*8: Backup is possible in Sramimg, DSRAMBUP, and RSRAMBUP.

*9: When You set it in COPIER > OPTION > USER > SMD-EXPT > ON, a backup/restore is possible in Service Mode Settings from the Remote UI.

There is a backup button on the TOP page of the service mode. HDD and USB memory can back up Service Mode Settings by backup button.

*10: Audit log that was exported cannot be put back to the device from which the log was exported

● Items with no backup method when replacing the HDD

Regarding the items in the table below, there is no method for the user to back them up. Ask the user to make settings again. Part of the items can be recovered from Meapbac.bin.

Items	User	Service	DCM
Preferences (Except for Paper Type Management Settings)	-	SST (Sramimg)	Remote UI (Import/Export All)

T-4-57

● Using SST enables the following:

SST has the following functions that are necessary for service work:

- To download system software
- To copy the system software into a USB memory device.
- To backup and restore information of SRAM and MEAP in Main Controller.
- To format HDD
- To collect device log
- To clear the encryption key of HDD Encryption Board

● Upgrading using a USB memory device

Using a USB memory device, the following functions are available to upgrade the system:

- To download system software
- To clear download file
- To format HDD
- To collect device log

5

Adjustment

- Basic Adjustment
- When replacing parts
- When clearing RAM

Basic Adjustment

Image Position Adjustment <Overview>

Checking the paper size

- The image position adjustment is executed based on the following premises: paper sizes of A3 and LDR are 297mm X 420mm and 279mm X 432mm, respectively. Therefore, if the trailing edge margin and right edge margin do not become the reference value 2.5mm after the adjustment, the paper size may not be the regular size so check the paper size being used.
- In leading edge right angle adjustment, it is assumed that the four corners of paper are at a right angle.

Paper type

Following papers are recommended for the image margin adjustment:

- GF-C081 81.4gsm)
- OK Top Coated + (128gsm)
- Hammermill Color Copy Digital 28lb (105gsm)
- CANON-OCE TOP COLOUR 100gsm

Because the foregoing papers are recommended as the general papers, so it is acceptable to use papers which a user frequently uses for the image position adjustment. Be sure not to use recycled paper, textured paper, and vellum paper because variation in feeding performance is more likely to occur with them.

Checking method

The test print used for adjustment must be magenta halftone image.

Check that each image position is within the specified range in accordance with "Checking/ Adjusting Image Position". If it is out of the specified range, make an adjustment in accordance with "<Adjustment method>" of each item.

- Standard value of left edge margin (Mechanical Adjustment for Cassette, Execute with all paper sources)
 - $L4 = 2.5 \pm 1.0$ mm or less

- Standard value of leading edge skew
 - $-0.3\text{mm} \leq L1 - L2 \leq +0.3$ mm
 - * In case of $L1 - L2 \leq -0.5$ mm or $L1 - L2 \geq +0.5$ mm, execute mechanical adjustment for registration alignment.

- Standard value of leading edge right angle (based on an assumption that right angle accuracy of paper is correct)
 - $(L4 - L5) \times 280/400 \geq -0.5$ mm or $(L4 - L5) \times 280/400 \leq +0.5$ mm

- Standard value of trapezoid
 - $Lx1 - Lx2 \geq -0.5$ mm or $Lx1 - Lx2 \leq +0.5$ mm

- Magnification ratio in horizontal scanning direction
 - A3 paper: $Ly = 292 \pm 0.6$ mm or less
 - LDR paper: $Ly = 274.4 \pm 0.5$ mm or less

- Magnification ratio in vertical scanning direction
 - A3 paper: $Lx = 412 \pm 0.8$ mm or less
 - LDR paper: $Lx = 423.8 \pm 0.8$ mm or less

- Standard value of left edge margin/leading edge margin (1st side/2nd side: Software Adjustment)
 - left edge margin $L4$: 2.5 ± 0.5 mm or less
 - leading edge margin $L3$: 4.0 ± 0.5 mm or less

F-5-1

Image Position Adjustment <Checking/Adjusting>

Go through the following procedure for image adjustment.

1. Left Edge Margin Adjustment (Mechanical Adjustment for Cassette Execute with all paper sources)

- 1) Set service mode (level1) > COPIER > OPTION > FEED-SW > CIS-OFF to "1" (Disabling side registration shift).
- 2) After setting the service mode (level 1) as follow, press the Start key and output a test print from each cassette.
 - COPIER > TEST > PG > TYPE = 5
 - COPIER > TEST > PG > COLOR-M = 1
 - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
 - COPIER > TEST > PG > PG-PICK = 1/2/3
- 3) Check that the left edge margin L4 of the image is within 2.5 +/- 1.0 mm.

F-5-2

- 4) If the margin is within the range, proceed to "Adjustment Method step 7".
If it is not within the range, execute adjustment by following the procedure below.

<Adjustment Method>

- 1) Pull out the Cassette.
- 2) Check the position of the scale of the Cassette Lock Unit.

F-5-3

- 3) Loosen the 2 screws of the Cassette Lock Unit.

F-5-4

4) According to the scale in which the position was checked in step 2, adjust the position of the Cassette Lock Unit.

- If the left edge margin is big, move the Cassette Lock Unit to the front.
- If the left edge margin is small, move the Cassette Lock Unit to the rear.

CAUTION:

Be careful not to move a cassette too much; otherwise, it may not be able to be installed in the host machine.

F-5-5

5) Tighten the 2 screws loosened in step 3.

6) Perform printing again from the paper source where adjustment has been made, and check that the value is within the specified range. When the result is out of the specified range, repeat steps 1 to 5.

NOTE:

If you are concerned with alignment of the Cassette Cover, adjust the right and left sides of the cover as necessary.

7) Loosen the 2 screws and adjust the position of the Cassette Cover by referring to the scale.

When moving the Cassette Lock Unit, adjust the left side of the Cassette Cover by shifting it with the same shifting amount of the unit.

8) Tighten the 2 screws that were loosened.

F-5-6

9) Change the setting of Service Mode (Level 1) > COPIER > OPTION > FEED-SW > CIS-OFF back to "0" (to enable side registration shift).

10) Exit service mode.

CAUTION:

When "Mechanical Adjustment for Cassette Execute" has been performed, be sure to perform the following "Cassette pull-in Check".

<Cassette pull-in Check>

- 1) Open the Left Cover.
- 2) Open the cassette 200 mm or more.

NOTE:

The pull-in mechanism is activated by opening the cassette 200 mm or more.

- 3) Push back the cassette until it is 15 mm [A] from the Front Cover of the host machine, and let go of the cassette.

F-5-7

<Appropriate>

The latch is locked, and the level difference between the Cassette Front Cover and other external covers is within the appropriate range when viewed from the left side. Adjustment is not necessary.

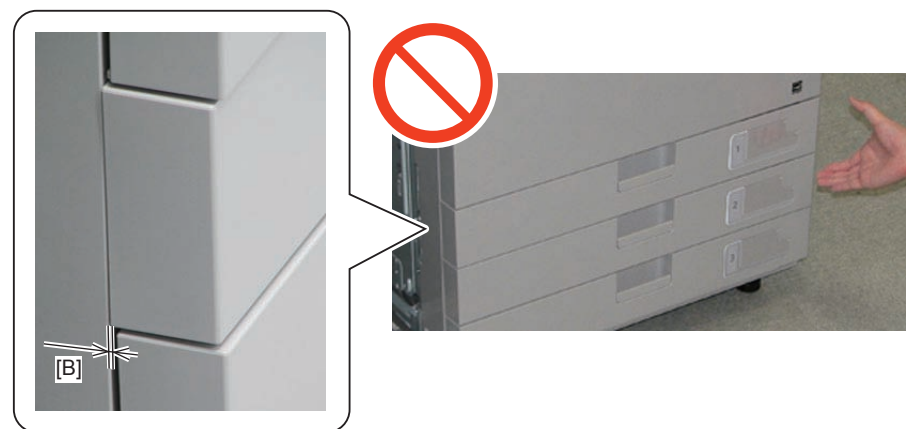

- The level difference [A] between the cassette and other covers (the Front Cover and other Cassette Front Covers) on the front side should be 2 mm or less.
- The gap [B] from the cover on the rear side should be 3 +/- 1 mm.

F-5-8

<Semi-closed>

The cassette has been excessively pulled in. The gap from other external covers is eliminated by further pushing the cassette in this situation, but adjustment is needed from a functional point of view.

F-5-9

By further pushing the cassette in this situation, a gap [B] is generated between the cassette and the cover on the rear side. Measure and write down the gap [B].

F-5-10

Perform "Adjusting the Cassette Front Cover", and then perform "Adjusting the Pull-in Guide" as needed.

<Latch not locking>

The cassette has not been pulled in enough. The cassette is not latched and comes out.

Perform "Adjust the Pull-in Guide".

F-5-11

<Adjusting the Cassette Front Cover>

- 1) Pull out the cassette.
- 2) Loosen the 2 adjustment screws on the left side, and move the Cassette Front Cover as needed using the 2 scales as reference until the gap [B] from the cover on the rear side you wrote down in "Checking Method" changes to a value within the appropriate range.

NOTE:

While the appropriate range of the gap is 3 +/- 1 mm in normal circumstances, in the case of a semi-closed cassette, adjust the gap to a value within 3 to 4 mm.

F-5-12

- 3) Tighten the 2 adjustment screws you loosened in step 2.
- 4) Perform the procedure of "Checking Method" again. If the gap is still out of the appropriate range, perform "Adjusting the Pull-in Guide".

<Adjusting the Pull-in Guide>

- 1) Remove the cassette.
- 2) Loosen the 3 adjustment screws on the rear side of the cassette. Using the scale and the boss line as reference, move the position of the Pull-in Guide for 1 division of the scale.

NOTE:

Check the initial position on the scale (because the position at the time of shipment is not always at the center).

- In the case of a semi-closed cassette: Move the Pull-in Guide for 1 division of the scale upward (toward the rear side [A] of the host machine) so that the amount the cassette is pulled in is reduced.
- In the case of latch not locking: Move the Pull-in Guide for 1 division of the scale downward (toward the front side [B] of the host machine) so that the amount the cassette is pulled in is increased.

F-5-13

- 3) Tighten the 3 adjustment screws you loosened in step 2.
- 4) Perform the procedure of "Checking Method" again, and adjust the gap until it becomes an appropriate value.

CAUTION:

The value of Service Mode (Level 1) > COPIER > OPTION > FEED-SW > CIS-OFF must be back to "0" (to enable side registration shift) when performing the following adjustments.

NOTE:

By executing the leading edge margin adjustment for the Cassette 1, the adjustment is applied to all source of paper.

2. Leading Edge Skew Adjustment

- 1) After setting the service mode (level 1) as follow, press the Start key and output a test print from each cassette.

- COPIER > TEST > PG > TYPE = 5
- COPIER > TEST > PG > COLOR-M = 1
- COPIER > TEST > PG > COLOR-Y/C/Bk = 0
- COPIER > TEST > PG > PG-PICK = 1

- 2) Check that the leading edge skew on the image is as follow. When the result is out of the specified range, perform adjustment by following the following procedure.

- If the result is $L1 - L2 \leq -0.5\text{mm}$ or $L1 - L2 \geq +0.5\text{mm}$: Go to mechanical adjustment for registration alignment
- If the result is as follow: $-0.5\text{mm} < L1 - L2 < -0.3\text{mm}$ or $0.3\text{mm} < L1 - L2 < 0.5\text{mm}$: Go to software adjustment

F-5-14

<Adjustment method (mechanical adjustment for registration alignment)>

- 1) Open the Front Cover and pull out the Fixing Feed Unit.
- 2) Push the 2 Lock Springs of the Rails (both sides) to release the lock and further pull out the Fixing Feed Unit until it stops.

CAUTION:

Do not release the Lock Springs at the rear side of the Rails (both sides); otherwise the Frame of the Fixing Feed Unit can be off.

F-5-15

- 3) Remove the Fixing Feed Inner Cover.

- 1 Screw
- 2 Hooks

F-5-16

- 4) Remove the Secondary Transfer Outer Unit.

- 2 Connectors
- 2 Protrusions

F-5-17

CAUTION:

Do not touch the surface of the Secondary Transfer Outer Roller.

F-5-18

5) Loosen the 4 screws.

F-5-19

6) Adjust the Registration Adjustment Shaft by turning it with a screwdriver.

- In case of $L1 - L2 > 0.5 \text{ mm}$: Turn to - direction
 - In case of $L1 - L2 > -0.5 \text{ mm}$: Turn to + direction
- e.g.: In case of $L1 - L2 = 0.6$, turn the shaft to - direction by 6 scales.
1 scale mark of the dial: 0.1mm

F-5-20

7) Install the Secondary Transfer Outer Unit (2 Connectors).

CAUTION:

When installing the Secondary Transfer Outer Unit to the Fixing Feed Unit, be sure to do so after releasing the pressure applied on the Secondary Transfer Outer Roller. (Otherwise, the Secondary Transfer Outer Roller may be deformed, or the ITB may be damaged.)

<How to release the pressure applied on the Secondary Transfer Outer Roller>

The pressure on the Secondary Transfer Outer Roller can be released by turning the gear and changing the direction of the cam. Be sure to keep the Secondary Transfer Outer Roller lowered.

F-5-21

8) Tighten the 4 screws loosened in step 5.

CAUTION:

When tightening the screws, be sure to tighten them in the order from (1) to (2).

F-5-22

9) Perform printing again from the Cassette 1, and check that the value is within the specified range.

- If $-0.5 \text{ mm} < L1 - L2 < -0.3 \text{ mm}$ or $0.3 \text{ mm} < L1 - L2 < 0.5 \text{ mm}$: Go to software adjustment
- If $-0.3 \text{ mm} \leq L1 - L2 \leq +0.3 \text{ mm}$ or less: Go to leading edge right angle adjustment

<Adjustment method (software adjustment)>

1) Adjust the value of the following service mode (Level 1): COPIER > ADJUST > IMG-REG > SLP-1.

- Setting range: -10 to 10 (0.1 mm per increment)
- When the value is increased by "1", the leading edge skew (L1 - L2) is increased by 0.1 mm.

2) Perform printing again from the Cassette 1, and check that the value is within the specified range.

3) Write down the new adjustment value in the service label.

- SLP-1

NOTE:

From "3. Leading Edge Right Angle Adjustment" through "6. Vertical Scanning Magnification Ratio Adjustment", adjustment can be made with the same test print image.

3. Leading Edge Right Angle Adjustment

1) After setting the service mode (level 1) as follow, press the Start key and output a test print from each cassette.

- COPIER > TEST > PG > TYPE = 5
- COPIER > TEST > PG > COLOR-M = 1
- COPIER > TEST > PG > COLOR-Y/C/Bk = 0
- COPIER > TEST > PG > PG-PICK = 1

2) Check that the leading edge right angle on the image is $(L4 - L5) \times 280/400 \geq -0.5$ mm or $(L4 - L5) \times 280/400 \leq +0.5$ mm. When the result is out of the specified range, perform adjustment by following the following procedure.

F-5-23

<Adjustment method>

- 1) Measure the leading edge right angle $((L4 - L5) \times 280/400)$ on the 1st side.
- 2) Adjust the value of the following service mode (Level 1): COPIER > ADJUST > IMG-REG > ANGLE-1
 - Setting range: -10 to 10 (0.1 mm per increment)
 - When the value is increased by "1", the leading edge right angle $((L4 - L5) \times 280/400)$ is increased by 0.1 mm.
E.g. (in the case of A3 paper): When $L4 = 2.5$ and $L5 = 1.5$, $(2.5 - 1.5) \times 280/400 = 0.7$; therefore, the value to enter is "-7".
- 3) Perform printing again from the Cassette 1, and check that the value is within the specified range.
- 4) Write down the new adjustment value in the service label.
 - ANGLE-1

4. Trapezoid Adjustment

- 1) After setting the service mode (level 1) as follow, press the Start key and output a test print from each cassette.
 - COPIER > TEST > PG > TYPE = 5
 - COPIER > TEST > PG > COLOR-M = 1
 - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
 - COPIER > TEST > PG > PG-PICK = 1
- 2) Check that trapezoid of the image is $Lx1 - Lx2 \geq -0.5$ mm or $Lx1 - Lx2 \leq +0.5$ mm.
When the result is out of the specified range, perform adjustment by following the following procedure.

F-5-24

<Adjustment method>

- 1) Measure trapezoid $(Lx1 - Lx2)$ on the 1st side.
- 2) Adjust the value of the following service mode (Level 1): COPIER > ADJUST > IMG-REG > TRPZ-1
 - Setting range: -10 to 10 (0.1 mm per increment)
 - When the value is increased by "1", the trapezoid $(Lx1 - Lx2)$ is increased by 0.1 mm.
E.g. (in the case of A3 paper): When $Lx1=412$ and $Lx2 = 411.4$, $412-411.4 = 0.6$; therefore, the value to enter is "-6".
- 3) Perform printing again from the Cassette 1, and check that the value is within the specified range.
- 4) Write down the new adjustment value in the service label.
 - TRPZ-1

5. Horizontal Scanning Magnification Ratio Adjustment

1) After setting the service mode (level 1) as follow, press the Start key and output a test print from each cassette.

- COPIER > TEST > PG > TYPE = 5
- COPIER > TEST > PG > COLOR-M = 1
- COPIER > TEST > PG > COLOR-Y/C/Bk = 0
- COPIER > TEST > PG > PG-PICK = 1

2) Check that the horizontal scanning magnification ratio is within the specified range. When the result is out of the specified range, perform adjustment by following the following procedure.

- A3 paper: $Ly = Ly = 292 \pm 0.6$ mm
- LDR paper: $Ly = Ly = 274.4 \pm 0.5$ mm

F-5-25

<Adjustment method>

1) Measure the horizontal scanning magnification ratio on the 1st side.

- In case of A3 paper: $(Ly/292 - 1) \times 100$ (%)
- In case of LDR paper: $(Ly/274.4 - 1) \times 100$ (%)

2) Adjust the value of the following service mode (Level 1): COPIER > ADJUST > IMG-REG > MAG-H

NOTE:

If the version of the Main Controller is older than 10.2x, it is displayed under Level 2.

- Setting range: -100 to 100 (0.01% per increment)
- When the value is increased by "1", the horizontal scanning magnification ratio is increased by 0.01%

E.g. (in the case of A3 paper): When $Ly = 291$, $(291/292-1) \times 100 = -0.342...$ (The value is rounded off to two decimal places)

When the actually measured value is smaller than the nominal value (292 mm), the value of the ratio becomes "-" (negative)"; therefore, the value to enter is "+34".

- 3) Perform printing again from the Cassette 1, and check that the value is within the specified range.
- 4) Write down the new adjustment value in the service label.
 - MAG-H

6. Vertical Scanning Magnification Ratio Adjustment

1) After setting the service mode (level 1) as follow, press the Start key and output a test print from each cassette.

- COPIER > TEST > PG > TYPE = 5
- COPIER > TEST > PG > COLOR-M = 1
- COPIER > TEST > PG > COLOR-Y/C/Bk = 0
- COPIER > TEST > PG > PG-PICK = 1

2) Check that the vertical scanning magnification ratio is within the specified range. When the result is out of the specified range, perform adjustment by following the following procedure.

- A3 paper: $Lx = 412 \pm 0.8$ mm
- LDR paper: $Lx = 423.8 \pm 0.8$ mm

F-5-26

<Adjustment method>

1) Measure the vertical scanning magnification ratio on the 1st side.

- A3 paper: $(Lx/412 - 1) \times 100$ (%)
- LDR paper: $(Lx/423.8 - 1) \times 100$ (%)

2) Adjust the value of the following service mode (Level 1): COPIER > ADJUST > IMG-REG > MAG-V

- Setting range: -100 to 100 (0.01% per increment)
- When the value is increased by "1", the vertical scanning magnification ratio is increased by 0.01%.

E.g. (in the case of A3 paper): When $Lx = 411$, $(411/412 - 1) \times 100 = -0.242\%$ (The value is rounded off to two decimal places)

When the actually measured value is smaller than the nominal value (412 mm), the value of the ratio becomes "-" (negative)"; therefore, the value to enter is "+24".

3) Perform printing again from the Cassette 1, and check that the value is within the specified range.

4) Write down the new adjustment value in the service label.

- MAG-V

7. Left Edge/Leading Edge Margin Adjustment (1st side/2nd side: Software Adjustment)

CAUTION:

By making an adjustment for the 1st side, the absolute value of the margin on the 2nd side is also changed. Therefore, the margin adjustment for the 2nd side is adjustment of the difference from the margin on the 1st side. If the difference between 1st and 2nd sides is ± 0.5 mm or less, do not perform adjustment for the 2nd side.

1) After setting the service mode (level 1) as follow, press the Start key and output a test print (2-sided print) from the Cassette 1.

- COPIER > TEST > PG > TYPE = 5
- COPIER > TEST > PG > COLOR-M = 1
- COPIER > TEST > PG > COLOR-Y/C/Bk = 0
- COPIER > TEST > PG > 2-SIDE = 1
- COPIER > TEST > PG > PG-PICK = 1

CAUTION:

At 2-sided printing, paper is output with the 1st side down and 2nd side up.

Therefore, when checking the leading edge margin on the 1st side, check the margin at the side opposite to the feeding direction on the face-down side.

2) Check that the left edge margin L4 and the leading edge margin L3 for the 1st and 2nd sides are within the range indicated below.

- left edge margin L4: 2.5 ± 0.5 mm
- leading edge margin L3: 4.0 ± 0.5 mm

F-5-27

<Left Edge Margin Adjustment Method>

1) Change the left edge margin adjustment value for the 1st side.

- Service Mode (Level 1) > COPIER > ADJUST > FEED-ADJ > REG-L

Setting range: -100 to 100 (0.1 mm per increment)

As the value is incremented by "1", the left edge margin is increased by 0.1 mm.

2) Change the left edge margin adjustment value for the 2nd side.

- Service Mode (Level 1) > COPIER > ADJUST > FEED-ADJ > ADJ-REFE

When the value is increased by "1", the left edge margin on the 2nd side is increased by 0.1 mm.

<Leading Edge Margin Adjustment Method>

1) Change the leading edge margin adjustment value for the 1st side.

- Service Mode (Level 1) > COPIER > ADJUST > FEED-ADJ > REGIST

Setting range: -100 to 100 (0.1 mm per increment)

When the setting value is increased by "1", the leading edge margin is decreased by 0.1 mm.

2) Change the leading edge margin adjustment value for the 2nd side.

CAUTION:

It is necessary to change the setting value individually according to the process speed.

- Service Mode (Level 1) > COPIER > ADJUST > FEED-ADJ

- REG-DUP1 (2nd side at 1/1 speed)
- REG-DUP2 (2nd side at 2/3 speed)
- REG-DUP3 (2nd side at 1/2 speed)

When the setting value is increased by "1", the leading edge margin on the 2nd side is decreased by 0.1 mm.

<Checking after Adjustment >

1) Perform 2-sided printing from the Cassette 1.

2) Check that the left edge margin L4 and the leading edge margin L3 for the 1st and 2nd sides are within the range indicated below.

- left edge margin L4: 2.5 +/- 0.5mm
- leading edge margin L3: 4.0 +/- 0.5 mm

3) If the values of the following service modes have been changed, write down the new adjustment value in the service label.

- REG-L
 - ADJ-REFE
 - REGIST
 - REG-DUP1/2/3
- 4) Exit service mode.

When replacing parts

Overview

In this chapter, measures of adjustment when replacing parts in servicing operation are mentioned. Parts to be replaced are categorized into 5 blocks based on their related technology as shown below.

Main Controller System	HDD	(Refer to page 5-16)
	Main Controller PCB 1	(Refer to page 5-18)
	Main Controller PCB 2	(Refer to page 5-18)
	DC Controller PCB	(Refer to page 5-19)
	TPM PCB	(Refer to page 5-19)
Laser Exposure System	Laser Scanner Unit	(Refer to page 5-20)
Image Formation System	Primary Charging Wire	(Refer to page 5-21)
	Grid Plate	(Refer to page 5-23)
	Primary Charging Assembly	(Refer to page 5-26)
	Pre-Primary Transfer Charging Wire	(Refer to page 5-28)
	Pre-Primary Transfer Charging Assembly	(Refer to page 5-28)
	Drum Unit	(Refer to page 5-29)
	Drum Patch Sensor Unit (Bk)	(Refer to page 5-29)
	Developing Assembly	(Refer to page 5-30)
	Potential Sensor	(Refer to page 5-30)
	ITB	(Refer to page 5-31)
	ITB Inner Scraper	(Refer to page 5-31)
	Secondary Transfer Inner Roller	(Refer to page 5-31)
	Transfer Cleaning Unit	(Refer to page 5-31)
	Actions when releasing the pressure from the ITB	(Refer to page 5-32)
	Primary Transfer Roller	(Refer to page 5-32)
	Patch Sensor Unit	(Refer to page 5-32)
Fixing System	Fixing assembly	(Refer to page 5-35)
	Fixing Belt Unit	(Refer to page 5-36)
	Pressure Belt Unit	(Refer to page 5-37)
Pickup Feed System	Registration Unit	(Refer to page 5-39)

T-5-1

Main Controller

HDD

How to Replace the Parts	
	see Chapter 4, "Removing the HDD."
Before Replacing	
1	Backup of data Remote UI Settings/Registration > Management Settings > Data Management > Back Up Target data: <ul style="list-style-type: none"> • Mail Box • Memory RX Inbox • Confidential Fax Inbox • Form for Composition *When the optional HDD (1TB) is used, the backup is possible only with an USB connected HDD.
2	Export of settings Remote UI Settings/Registration > Management Settings > Data Management > Export Target data: <ul style="list-style-type: none"> • Settings/Registration Basic Information • Paper Type Management Settings • Forwarding Settings • Box Settings • Department ID Management Settings • Main Menu Settings • Web Access Settings • Favorite Settings • Address Book • Quick Menu Settings • MEAP Application Setting Information • User Setting Information (A substitution is possible in the USER-PRT) • iW Function Flow Settings • Service Mode Settings (A substitution is possible in the P-PRINT) *When exporting "Service Mode Settings", select Copier > Option > USER > SMD-EXPT > 1. SMD-EXPT cannot be exported, therefore the settings need to be made every time the HDD is replaced.
3	Export of settings Remote UI Settings/Registration > Management Settings > Data Management > Import/Export Individually Target data: <ul style="list-style-type: none"> • Address Lists • Device Settings (Forwarding Settings, Address Book, Send Function Favorite Settings) • Printer Settings • Paper Information

4	Export Audit Logs* Remote UI Settings/Registration > Device Management > Export/Clear Audit Log * After obtaining the audit logs, give the data to the user.
5	Backup of MEAP SST(Meapback) Target data: <ul style="list-style-type: none"> MEAP application(SMS) User authentication information registered in the Local Device Authentication user authentication system of SSO-H (Single Sign-On H) *Meapback.bin can be restored after replacement or initialization of the HDD. [CAUTION] When the following service mode is executed, Meapback.bin cannot be restored. COPIER > FUNCTION > SYSTEM > CHK-TYPE > 7 COPIER > FUNCTION > SYSTEM > HD-CLEAR
6	TPM Check User TMP back up.
After Replacement	
1	Format the HDD. 1-1) Start the machine in safe mode (turn ON the main power switch while simultaneously pressing 2+8 keys). 1-2) Execute Formatting All Partitions using SST.
2	Download the system software 2-1) Download the system software (system/LANG/RUI, etc.) using SST.
3	Initialize the key/certificate/CA certificate. (Lv.2) COPIER > FUNCTION > CLEAR > CA-KEY
4	Turn OFF and then ON the power
5	Restore the backup data. 5-A) A hand inputs the value of the report. Input the value of the report. 5-B) Restoration by remote UI. 5-1) Restore of data Remote UI Settings/Registration > Management Settings > Data Management > Restore 5-2) Import of settings Remote UI Settings/Registration > Management Settings > Data Management > Import 5-3) Resetting/registering the data Remote UI Settings/Registration > Management Settings > Data Management > Import/Export Individually
5	5-4) Restore of MEAP SST(Meapback)
6	When an encryption key/certificate/CA certificate has been generated or added by the user, ask the user to execute regeneration.
7	Execute auto gradation adjustment (full adjust). Settings/Registration mode: Adjustment/ Maintenance > Adjust Image Quality > Auto Adjust Gradation
When using the Card Reader and imageWARE Accounting Manager	

1	Go to COPIER > FUNCTION> INSTALL > CARD and enter the numerical value of the leading card which is used for Department ID. Then, press "OK" button. (e.g.: If No.1 to No.1000 cards are used for Department ID, enter "1" of the leading card.)
2	After turning OFF and ON the main power switch, perform the following operations from Settings/Registration mode. <ul style="list-style-type: none"> In Management Settings > User Management > Department ID Management > Page Totals, be sure that "ID00000001" to "ID00001000" are created. Set the following: Preferences > Network > TCP / IP Settings > IPv4 Settings>IP Address Settings > IP Address, Gateway Address, Subnet Mask In Management Settings > User Management> System Manager Information Settings> System Manager ID and System PIN, register any number for them. Then, turn OFF and ON the main power switch. If "System Manager ID" and "System PIN" are not registered, "card registration to device" cannot be executed for the imageWARE Accounting Manager setting operation.
3	Download the card ID from imageWARE Accounting Manager to the Main Body again.
4	After downloading is completed, go to Management Settings > User Management > Department ID Management > Page Totals. Be sure that only the downloaded card ID is displayed.
5	Print using the user card registered from imageWARE Accounting Manager. Be sure that the card information used for the target devices of imageWARE Accounting Manager is collected. Points to Note when Using the System Software-installed HDD When using the HDD which was installed the system software of the other machine (different serial number), be sure to format the HDD after the installation. If the HDD is not formatted, the operation cannot be guaranteed.
Points to note when using an HDD with system software already installed	
Use of an HDD in which the system software of another machine (a machine of a different serial number) is installed for a troubleshooting is possible if it is an HDD of a model of iR-ADV C5255 series and later. However, be sure to format it after installing it. Operation is not guaranteed if it is continued to be used as is. In addition, an HDD used in iR-ADV C5255 series and later cannot be accessed from a PC due to enhanced security.	

T-5-2

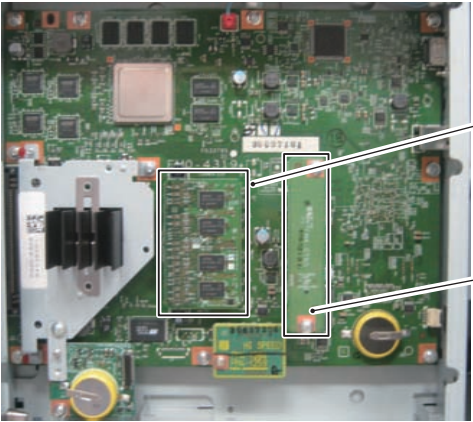

Main controller PCB 1

How to Replace the Parts	
see Chapter 4, "Removing the Main Controller PCB 1."	
Before Replacing	
1	Export of settings Remote UI Settings/Registration > Management Settings > Data Management > Import/Export Individually Target data: <ul style="list-style-type: none"> • Address Lists • Device Settings (Forwarding Settings, Address Book, Send Function Favorite Settings)
At replacement	
1	Transferring the parts from old PCB to new PCB <ul style="list-style-type: none"> • Flash PCB • TPM PCB <div style="text-align: center;">  </div>
Resetting/registering the data is not necessary after Main Controller PCB 1 is replaced.	
After Replacement	
1	Resetting/registering the data Remote UI Settings/Registration > Management Settings > Data Management > Import/Export Individually

T-5-3

Main controller PCB 2

How to Replace the Parts	
see Chapter 4, "Removing the Main Controller PCB 2."	
Before Replacement	
1	Export of settings Remote UI Settings/Registration > Management Settings > Data Management > Export Target data: <ul style="list-style-type: none"> • Settings/Registration Basic Information • Paper Type Management Settings • Forwarding Settings • Box Settings • Department ID Management Settings • Main Menu Settings • Web Access Settings • Favorite Settings • Address Book • Quick Menu Settings • MEAP Application Setting Information • User Setting Information (A substitution is possible in the USER-PRT) • iW Function Flow Settings • Service Mode Settings (A substitution is possible in the P-PRINT) *When exporting "Service Mode Settings", select Copier > Option > USER > SMD-EXPT > 1. SMD-EXPT cannot be exported, therefore the settings need to be made every time the HDD is replaced.
2	Export of settings Remote UI Settings/Registration > Management Settings > Data Management > Import/Export Individually Target data: <ul style="list-style-type: none"> • Address Lists • Device Settings (Forwarding Settings, Address Book, Send Function Favorite Settings) • Printer Settings • Paper Information
3	Backup of SRAM(with HDD Encryption Board) SST(Sramimg) Target data: <ul style="list-style-type: none"> • The encryption key of the HDD Encryption Board recorded [Memo] If there is an HDD Encryption Board, the encryption key of the HDD Encryption Board recorded on SRAM is lost when replacing the Main Controller PCB 2, and the contents of HDD cannot to be read. Therefore, restoration cannot be done although backup is performed.

At replacement	
1	<p>Replace the part from the old PCB to the new PCB.</p> <ul style="list-style-type: none"> Option SDRAMs Bypass PCB Memory PCB 
After Replacement	
1	<p>Resetting/registering the data</p> <p>Remote UI</p> <ul style="list-style-type: none"> Settings/Registration > Management Settings > Data Management > Import Settings/Registration > Management Settings > Data Management > Import/Export Individually
2	<p>Restore of SRAM(with HDD Encryption Board)</p> <p>SST(Sramimg)</p>
3	<p>When an encryption key/certificate/CA certificate has been generated or added by the user, ask the user to execute regeneration.</p>
4	<p>Execute auto gradation adjustment (full adjust).</p> <p>Settings/Registration mode:</p> <p>Adjustment/Maintenance > Adjust Image Quality > Auto Adjust Gradation</p>
Points to Note	
	<p>If mismatch between the box management information included in the SRAM data and box data on the HDD occurs, which is caused by starting the machine normally without restoring SRAM data after replacing the Main Controller 2 PCB, the box management information is initialized. As a result, box documents on the HDD are deleted.</p> <p>Therefore, be sure to back up the box documents on remote UI.</p>
Restrictions	
	<p>Do not transfer the following parts to another machine (a machine of a different serial number). The machine will not start up normally, and may become unrecoverable in some cases.</p> <ul style="list-style-type: none"> Main Controller PCB 1 Main Controller PCB 2 (with the Memory PCB unremoved) Memory PCB

T-5-4

DC controller PCB

How to Replace the Parts	
	see Chapter 4, "Removing the DC Controller PCB."
Before Replacing	
	<p>Backup of DC Controller PCB SRAM</p> <p>COPIER > FUNCTION > SYSTEM > DSRAMBUP (LEVEL2)</p> <p>"ACTIVE" is displayed and then "OK!" is displayed about 2 minutes later.</p> <p>Turn OFF the main power when the above work is complete.</p> <p>* If necessary, output the service mode setting values by P-PRINT before execution.</p> <p>COPIER > FUNCTION > MISC-P > P-PRINT</p>
After Replacing	
	<p>Restoration of DC Controller PCB SRAM</p> <p>COPIER > FUNCTION > SYSTEM > DSRAMRES (LEVEL2)</p> <p>"ACTIVE" is displayed at execution and then "OK!" is displayed about 2 minutes later. Restoration is complete.</p> <p>* If uploading of backup data fails before replacement due to the damage to the DC Controller PCB, enter the values of service mode items recorded on the service label or P-PRINT.</p>
Prohibited Operation	
	<ul style="list-style-type: none"> When replacing the DC Controller PCB, be sure to use a new one. Do not use the DC Controller PCB which was used with another machine.

T-5-5

CAUTION:

After replacing the DC Controller PCB, E101-0001 may occur due to a wrong combination of versions.

After replacing the DC Controller PCB, update it to an appropriate version if necessary in accordance with the versions of other PCBs.

TPM PCB

How to Replace the Parts	see Chapter 2, "TPM PCB."
--------------------------	---------------------------

* Be sure to perform the installation work by referring to the procedure above.

T-5-6

Laser Exposure System

Laser Scanner Unit

Procedure of parts replacement	see Chapter 4, "Removing the Laser Scanner Unit."
Procedure of adjustment	<p>1) Initialize the adjustment value. Enter 0 for the service mode that corresponds to the color of the replaced Laser Scanner Unit. (COPIER > ADJUST > LASER > M-ADJ-Y, M, C, K: 0)</p> <p>2) Execute Auto Adjust Gradation. Settings/Registration > Adjustment/Maintenance > Adjust Image Quality > Full Adjust</p> <p>3) Execute color displacement correction. Settings/Registration > Adjustment/Maintenance > Adjust Image Quality > Auto Correct Color Mismatch</p> <p>The following moiré adjustment is for colors M, C and K. Since moiré is not visible in the color Y, there is no need for adjustment.</p> <p>4) Adjust the scanner phase. Output a PG for phase adjustment (PG 23 outputs the total three sheets of test chart of M, C, and K). *Output by color is not available. (COPIER > TEST> PG > TYPE: 23) (COPIER > TEST> PG > PG-PICK: Select the paper source where A3 or LDR size paper is loaded) In the service mode that corresponds to the color, enter the median of the values of the areas where moiré has not occurred in the output chart. (COPIER > ADJUST > LASER > LSADJ1-M, C, K) * See below for how to check the chart.</p> <p>5) Adjust the scanner magnification ratio. Output a PG for magnification ratio adjustment (PG24 outputs the total three sheets of test chart of M, C, and K). *Output by color is not available. (COPIER > TEST> PG > TYPE: 24) (COPIER > TEST> PG > PG-PICK: Select the paper source where A3 or LDR size paper is loaded) In the service mode that corresponds to the color, enter the median of the values of the areas where moiré has not occurred in the output chart. (COPIER > ADJUST > LASER > LSADJ2-M, C, K)</p>

Procedure of adjustment

How to see the chart for moiré adjustment

Check the following for each of the 2 columns of the chart:

- 1) Starting from +15, look for the location where moiré has disappeared.
- 2) Starting from -15, look for the location where moiré has disappeared.
- 3) Take note of the numeric value obtained by adding the two numbers and then dividing it by two.
- 4) Check the other side (column) in the same manner, and take note of the numeric value.
- 5) The value to be entered in service mode is the one obtained by adding the two numbers and then dividing it by two.

T-5-7

Image Formation System

Primary Charging Wire

Procedure of parts replacement	see Chapter 4, "Replacing the Primary Charging Wire Unit / Cleaning the Primary Charging Assembly."
Procedure of adjustment	<p>1) Clear the counter. COPIER > COUNTER > PRDC-1 > PRM-WIRE</p> <p>2) Execution of Charging Wire cleaning COPIER > FUNCTION > CLEANING > WIRE-EX</p> <p>3) Execution of potential control COPIER > FUNCTION > DPC > DPC</p> <p>4) Output pattern generator for adjustment of the wire height. COPIER > FUNCTION > MISC-P > GRID-ADJ</p> <div style="border: 1px solid black; padding: 5px; margin: 10px 0;"> <p>NOTE: A3+ 329.0 mm x 483.0 mm (13" x 19") is recommended. PG can be output only under the following conditions.</p> <ul style="list-style-type: none"> - Paper type: Plain paper 1/2 - Paper size: A3+ 329.0 mm x 483.0 mm (13" x 19")/A3/SRA3/ Ledger 279.4 mm x 431.8 mm (11" x 17")*/A3+ 305.0 mm x 457.0 mm (12" x 18") - Paper source: Cassette 1 <p>Under conditions other than those mentioned above, "NG" is displayed and a blank paper is output.</p> <p>* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 or later.</p> </div> <p>5) In the case of density difference between the front and the rear on the test print image with the dark image on the front side of the test print, go to step 6) to make adjustments. With the dark image on the rear side of the test print, go to step 7) to make adjustments. If there is no density unevenness, execute the work in step 8) and later.</p>

Procedure of adjustment

6) Adjust the Primary Charging Assembly (in the case of dark image at the front side on the test print).

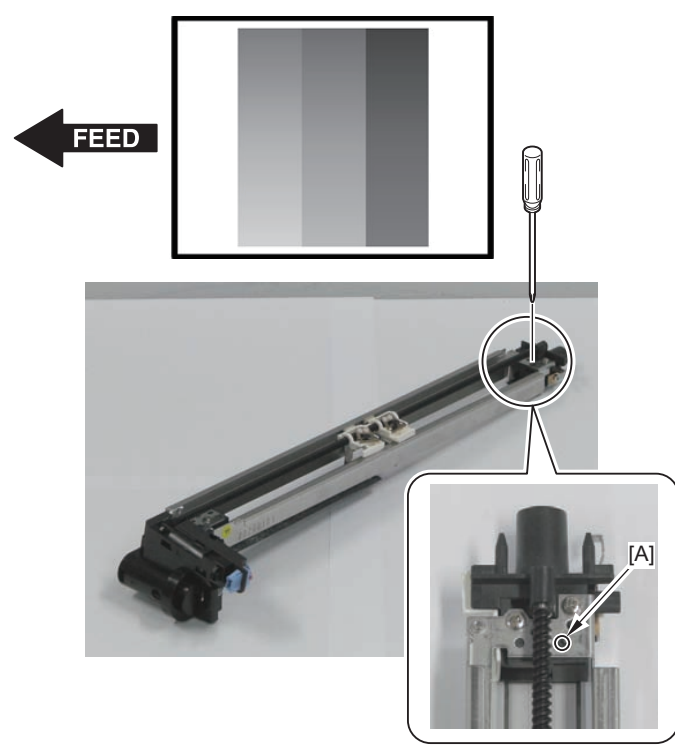

NOTE:

- In the case of dark image at the front side of the test print [1], execute step 6-1) through 6-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 5) and later.

F-5-29

Procedure of adjustment	<p>6-1) Turn the plastic screw [A] clockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.</p> <p>6-2) If the image at the front side of test print image is still dark, turn the plastic screw [A] clockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.</p> <p>6-3) If the image at the front side of the test print is still dark, turn the plastic screw [A] clockwise to make a half round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.</p>
-------------------------	---

Procedure of adjustment	<p>7) Adjust the Primary Charging Assembly (in the case of dark image at the rear side on the test print).</p> <p>NOTE :</p> <ul style="list-style-type: none"> In the case of dark image at the rear side of the test print [2], execute step 7-1) through 7-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 8) and later.  <p style="text-align: right;">F-5-30</p>
-------------------------	---

Procedure of adjustment	7-1) Turn the plastic screw [A] counterclockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
	7-2) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
	7-3) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make a half turn. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
	8) Execute the ITB neutral position adjustment. COPIER > FUNCTION > INSTALL > INIT-ITB
	9) Execute auto gradation adjustment. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
	10) Execute color displacement correction. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
	11) Execute uneven density correction. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

T-5-8

■ Grid Plate

Procedure of parts replacement	see Chapter 4, "Removing the Grid Plate."
Procedure of adjustment	<ol style="list-style-type: none"> 1) Clear the counter. COPIER > COUNTER > PRDC-1 > PRM-GRID 2) Execution of Charging Wire cleaning COPIER > FUNCTION > CLEANING > WIRE-EX 3) Execution of potential control COPIER > FUNCTION > DPC > DPC 4) Output pattern generator for adjustment of the wire height. COPIER > FUNCTION > MISC-P > GRID-ADJ <div style="border: 1px solid black; background-color: #e6f2ff; padding: 10px; margin: 10px 0;"> <p>NOTE: A3+ 329.0 mm x 483.0 mm (13" x 19") is recommended. PG can be output only under the following conditions.</p> <ul style="list-style-type: none"> - Paper type: Plain paper 1/2 - Paper size: A3+ 329.0 mm x 483.0 mm (13" x 19")/A3/SRA3/ Ledger 279.4 mm x 431.8 mm (11" x 17")*/A3+ 305.0 mm x 457.0 mm (12" x 18") - Paper source: Cassette 1 <p>Under conditions other than those mentioned above, "NG" is displayed and a blank paper is output.</p> <p>* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 or later.</p> </div> <ol style="list-style-type: none"> 5) In the case of density difference between the front and the rear on the test print image with the dark image on the front side of the test print, go to step 6) to make adjustments. With the dark image on the rear side of the test print, go to step 7) to make adjustments. If there is no density unevenness, execute the work in step 8) and later.

6) Adjust the Primary Charging Assembly (in the case of dark image at the front side on the test print).

NOTE:

- In the case of dark image at the front side of the test print [1], execute step 6-1) through 6-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 5) and later.

F-5-31

- 6-1) Turn the plastic screw [A] clockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 6-2) If the image at the front side of test print image is still dark, turn the plastic screw [A] clockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 6-3) If the image at the front side of the test print is still dark, turn the plastic screw [A] clockwise to make a half round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.

7) Adjust the Primary Charging Assembly (in the case of dark image at the rear side on the test print).

NOTE :

- In the case of dark image at the rear side of the test print [2], execute step 7-1) through 7-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 8) and later.

F-5-32

Procedure of adjustment

- 7-1) Turn the plastic screw [A] counterclockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 7-2) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 7-3) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make a half turn. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.

- 8) Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB
- 9) Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
- 10) Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
- 11) Execute uneven density correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

T-5-9

Primary Charging Assembly

Procedure of parts replacement	see Chapter 4, "Removing the Primary Charging Assembly."
Procedure of adjustment	<ol style="list-style-type: none"> 1) Clear the counter. COPIER > COUNTER > PRDC-1 > PRM-UNIT 2) Execution of Charging Wire cleaning COPIER > FUNCTION > CLEANING > WIRE-EX 3) Execution of potential control COPIER > FUNCTION > DPC > DPC 4) Output pattern generator for adjustment of the wire height. COPIER > FUNCTION > MISC-P > GRID-ADJ <div style="border: 1px solid black; padding: 5px; margin: 10px 0;"> <p>NOTE: A3+ 329.0 mm x 483.0 mm (13" x 19") is recommended. PG can be output only under the following conditions.</p> <ul style="list-style-type: none"> - Paper type: Plain paper 1/2 - Paper size: A3+ 329.0 mm x 483.0 mm (13" x 19")/A3/SRA3/ Ledger 279.4 mm x 431.8 mm (11" x 17")*/A3+ 305.0 mm x 457.0 mm (12" x 18") - Paper source: Cassette 1 <p>Under conditions other than those mentioned above, "NG" is displayed and a blank paper is output.</p> <p>* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 or later.</p> </div> <ol style="list-style-type: none"> 5) In the case of density difference between the front and the rear on the test print image with the dark image on the front side of the test print, go to step 6) to make adjustments. With the dark image on the rear side of the test print, go to step 7) to make adjustments. If there is no density unevenness, execute the work in step 8) and later.

Procedure of adjustment

6) Adjust the Primary Charging Assembly (in the case of dark image at the front side on the test print).

NOTE:

- In the case of dark image at the front side of the test print [1], execute step 6-1) through 6-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 5) and later.

F-5-33

- 6-1) Turn the plastic screw [A] clockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 6-2) If the image at the front side of test print image is still dark, turn the plastic screw [A] clockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
- 6-3) If the image at the front side of the test print is still dark, turn the plastic screw [A] clockwise to make a half round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.

Procedure of adjustment

7) Adjust the Primary Charging Assembly (in the case of dark image at the rear side on the test print).

NOTE :

- In the case of dark image at the rear side of the test print [2], execute step 7-1) through 7-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 8) and later.

F-5-34

Procedure of adjustment	<p>7-1) Turn the plastic screw [A] counterclockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.</p> <p>7-2) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.</p> <p>7-3) If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make a half turn. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

T-5-18

Transfer Cleaning Unit

Procedure of parts replacement	see Chapter 4, "Removing the Transfer Cleaning Unit."
Procedure of adjustment	<ol style="list-style-type: none"> 1) Clear the counter. COPIER > COUNTER > DRBL-1 > ITBCLN-U 2) Execute the ITB neutral position adjustment. COPIER > FUNCTION > INSTALL > INIT-ITB 3) Execute the primary transfer ATVC. COPIER > FUNCTION > MISC-P > 1ATVC-EX 4) Execute auto gradation adjustment. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust] 5) Execute color displacement correction. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch] 6) Execute color displacement correction. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

T-5-20

■ Actions when releasing the pressure from the ITB

Procedure of parts replacement	see Chapter 4, "Actions when releasing the pressure from the ITB."
Procedure of adjustment	Be sure to perform "Actions when releasing the pressure from the ITB" when removing/installing the ITB Unit (when turning the ITB Pressure Release Lever). 1) Execute the ITB neutral position adjustment. COPIER > FUNCTION > INSTALL > INIT-ITB 2) Execute color displacement correction. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

T-5-21

■ Primary Transfer Roller

Procedure of parts replacement	see Chapter 4, "Removing the Primary Transfer Roller."
Procedure of adjustment	1) Clear the counter. COPIER > COUNTER > DRBL-1 > 1TR-RL-Y/M/C/K 2) Execute the ITB neutral position adjustment. COPIER > FUNCTION > INSTALL > INIT-ITB 3) Execute the primary transfer ATVC. COPIER > FUNCTION > MISC-P > 1ATVC-EX 4) Execute auto gradation adjustment. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust] 5) Execute color displacement correction. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch] 6) Execute color displacement correction. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

T-5-22

■ Registration Patch Sensor Unit

Procedure of parts replacement	see Chapter 4, "When Replacing the Registration Patch Sensor Unit."
Procedure of adjustment	1) Execute the ITB neutral position adjustment. COPIER > FUNCTION > INSTALL > INIT-ITB 2) Adjust the Patch Sensor Light Intensity. COPIER > FUNCTION > MISC-P > PT-LPADJ 3) Execute auto gradation adjustment. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust] 4) Execute color displacement correction. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch] 5) Execute color displacement correction. [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

T-5-23

List of Work Items and Order of Works for Simultaneous Replacement of Periodically Replaced/Consumable Service Parts of Image Formation System

When replacing the Developing Assembly simultaneously with "Drum" or "Transfer system" in the table above or simultaneously with both of them

Category	Periodically replaced/ consumable parts	Work description													Adjustment				
		Disable (OFF) the warm-up rotation.	Turn OFF the main power switch.	Replacing parts	Turn ON the main power switch	When the host machine is "Ready", reset parts counters.	Charging Wire cleaning	Execute the ITB neutral position adjustment.	Forcibly execute the drum replacement mode.	Execute Developing Assembly initial installation mode.	Enable (ON) the warm-up rotation.	Execution of potential control	Output pattern generator for adjustment of the wire height.	Adjust the height of the Primary Charging Assembly Wire.	Execute the primary transfer ATVC.	Execute the ITB neutral position adjustment.	Execute auto gradation adjustment.	Execute color displacement correction.	Execute uneven density correction.
		COPIER > FUNCTION > INSTALL > AINR-OFF =1					COPIER > FUNCTION > INSTALL > INIT-ITB	COPIER > FUNCTION > INSTALL > CLR-SET	COPIER > FUNCTION > INSTALL > INISET	COPIER > FUNCTION > INSTALL > CLR-SET	COPIER > FUNCTION > INSTALL > AINR-OFF > DPC	COPIER > FUNCTION > MISC-P > GRID-ADJ	COPIER > FUNCTION > MISC-P > 1ATVC-EX	COPIER > FUNCTION > INSTALL > INIT-ITB	[Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]	[Adjustment/Maintenance] > [Adjust Image Quality]	[Adjustment/Maintenance] > [Adjust Image Quality]	[Settings/Registration] > [Correct Shading]	[Settings/Registration] > [Adjust Image Quality]

* "*" indicates work items to be performed when replacing the part, and the figure next to "*" indicates the order of work.

T-5-25

1. Simultaneously replace all the parts including the Developing Assembly.
2. Perform adjustment from the start to "Execute the primary transfer ATVC." (In the order from left to right in the table.)
3. Perform "Execute auto gradation adjustment.", "Execute color displacement correction.", and "Execute uneven density correction." in this order.

Fixing System

Fixing assembly

Procedure of parts replacement	see Chapter 4, "Removing the Fixing Assembly."
Procedure of adjustment	<p>1) Apply grease (SE1107) to the tooth surface [B] of the gear [1] of the Fixing Drive Unit.</p> <p>Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface</p> 

F-5-36

- 2) Install the removed parts in reverse order.
- 3) Clear the counter.
 COPIER > COUNTER > FIXING > FX-CNT
 COPIER > COUNTER > DRBL-1> FX-BLT-U / FX-BLT-L

NOTE:

The following items are cleared when the above counter is cleared.

- COPIER > DISPLAY > FIXING > FX-U-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-L-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-U-STR
- COPIER > DISPLAY > FIXING > FX-MTR2 to 5
- COPIER > DISPLAY > FIXING > FX-R-TM
- COPIER > COUNTER > FIXING > FX-RF-RL
- COPIER > COUNTER > CLEANING > FX1-RFRL
- COPIER > COUNTER > PRDC-1 > FXLW-TH1/2

- 4) Clear the error. (In the case of error occurrence)
 COPIER > FUNCTION > CLEAR > ERR

T-5-26

Fixing Belt Unit

Procedure of parts replacement	see Chapter 4, "Removing the Fixing Belt Unit."
Procedure of adjustment	<p>1) Apply grease (SE1107) to the tooth surfaces [A] of the 4 gears of the Pressure Belt Unit. Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface</p> <p>2) Apply grease (SE1107) to the tooth surface [B] of the gear [2] of the Fixing Drive Unit. Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface</p>

F-5-37

Procedure of adjustment

3) Clean the surface [A] of the Fixing Inlet Guide with lint-free paper [1] moistened with alcohol.

F-5-38

4) Clean the Sensor Flag's surface side [A], back side [B], and the [C] part of the Fixing Inlet Guide (which comes in contact with the Sensor Flag) with lint-free paper [1] moistened with alcohol.

F-5-39

Procedure of adjustment

5) Clean the Separation Plate [1] for inner delivery Unit with lint-free paper [2] moistened with alcohol.

F-5-40

6) Install the removed parts in reverse order.

7) Clear the counter.

COPIER > COUNTER > DRBL-1 > FX-BLT-U

NOTE:

The following items are cleared when the above counter is cleared.

COPIER > DISPLAY > FIXING > FX-U-TM1 to 5

COPIER > DISPLAY > FIXING > FX-U-STR

8) Clear the error. (In the case of error occurrence)

COPIER > FUNCTION > CLEAR > ERR

T-5-27

■ Pressure Belt Unit

Procedure of parts replacement

see Chapter 4, "Separating the Pressure Belt Unit and the Pressure Heater."

Procedure of adjustment

1) Apply grease (SE1107) to the tooth surfaces [A] of the 6 gears of the Fixing Belt Unit.

- Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface

F-5-41

Procedure of adjustment

- 2) Apply grease (SE1107) to the tooth surface [B] of the gear [1] of the Fixing Drive Unit.
- Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface

F-5-42

Procedure of adjustment

- 3) Clean the soiling of the Contact Roller [1] on the Pressure Belt Position Sensor and the oil dripped from the Pressure Belt to the bottom side [A] of the Fixing Lower Unit with lint-free paper [2].

F-5-43

- 4) Clean the surface [A] of the Fixing Inlet Guide with lint-free paper [1] moistened with alcohol.

Procedure of adjustment

5) Using lint-free paper [1] moistened with alcohol, clean the Sensor Flag's surface side [A], back side [B], and the [C] part which comes in contact with the Fixing Inlet Guide.

F-5-45

6) Clean the Separation Plate [1] for inner delivery Unit with lint-free paper [2] moistened with alcohol.

F-5-46

7) Install the removed parts in reverse order.

8) Clear the counter.
COPIER > COUNTER > DRBL-1 > FX-BLT-L

NOTE:

The following items are cleared when the above counter is cleared.
COPIER > DISPLAY > FIXING > FX-L-TM1 to 5
COPIER > DISPLAY > FIXING > FX-MTR2 to 5

9) Clear the error. (In the case of error occurrence)
COPIER > FUNCTION > CLEAR > ERR

T-5-28

Pickup Feed System

Registration Unit

Procedure of parts replacement

see Chapter 4, "Removing the Registration Unit."

Procedure of adjustment

NOTE:

Perform this adjustment also when removing/installing the unit only.

1) Perform image position adjustment (refer to page 5-1).

T-5-29

When clearing RAM

DC controller PCB

How to Replace the Parts	see Chapter 4, "Removing the DC Controller PCB."
Before Replacing	Backup of DC Controller PCB SRAM COPIER > FUNCTION > SYSTEM > DSRAMBUP (LEVEL2) "ACTIVE" is displayed and then "OK!" is displayed about 2 minutes later. Turn OFF the main power when the above work is complete.
After Replacing	Restoration of DC Controller PCB SRAM COPIER > FUNCTION > SYSTEM > DSRAMRES (LEVEL2) "ACTIVE" is displayed at execution and then "OK!" is displayed about 2 minutes later. Restoration is complete.
Prohibited Operation	<ul style="list-style-type: none"> When replacing the DC Controller PCB, be sure to use a new one. Do not use the DC Controller PCB which was used with another machine.

Making Initial Checks

List of Initial Check Items

Item	No.	Detail	Check
Site Environment	1	The voltage of the power supply is as rated ($\pm 10\%$).	
	2	The site is not a high temperature / humidity environment (near a water faucet, water boiler, humidifier), and it is not in a cold place. The machine is not near a source of fire or dust.	
	3	The site is not subject to ammonium gas.	
	4	The site is not exposed to direct rays of the sun. (Otherwise, provide curtains.)	
	5	The site is well ventilated, and the floor keeps the machine level.	
	6	The machine's power plug remains connected to the power outlet.	
Checking the Paper	7	The paper is of a recommended type.	
	8	The paper is not moist or dry. Try paper fresh out of package.	
Checking the Placement of Paper	9	Check the cassette, the deck and the manual feed tray to see if the paper is not in excess of a specific level.	
	10	If a transparency is used, check to make sure that it is placed in the correct orientation.	
Checking the Durables	11	Check the table of durables to see if any has reached the end of its life.	
Checking the Periodically Replaced Parts	12	Check the scheduled servicing table and the periodically replaced parts table, and replace any part that has reached the time of replacement.	

T-6-1

Test Print

Overview

This machine has several test print types shown in the table below. A circle in each image check item shows the availability to check the different type of image faults. If the faulty image shown in the output does not appear in the appropriate test print type, the cause may lie in PDL input or the reader

PG TYPE	TYPE Pattern	Items										Originator
		Gradation	Fogging	Transfer Fault	Black line	White line	Uneven Density	Uneven Density at the Front / Rear	Color displacement	Right Angle	Straight Lines	
0	Normal copy / print											----
1 to 3	(For R&D)											----
4	16-Gradation	Yes	Yes			Yes		Yes				Main controller PCB
5	Full Area Half Tone			Yes	Yes	Yes	Yes					Main controller PCB
6	Grid									Yes	Yes	Main controller PCB
10	MCYBk Horizontal Line					Yes		Yes				Main controller PCB
12	64-Gradation	Yes										Main controller PCB
14	Full Color 16-gradation	Yes	Yes									Main controller PCB

T-6-2

Selecting Test Print TYPE

- 1) Set the copy count, paper size, and pickup mode (single-sided or double-sided).
- 2) Make the following selections in service mode: COPIER > TEST > PG.
- 3) Enter the appropriate TYPE No. using the keypad, and press the OK key.
- 4) Set the density using DENS-Y/M/C/K (valid only if TYPE=5).
- 5) Set the image mode by TXPH
- 6) Press the start key.

How to check test print

16-Gradation (TYPE=4)

This test print can mainly check gradation performance, image fogging, white line, and density unevenness at the rear/front.

F-6-1

(1) Gradation

If there is no 16-step density gradation, it may be caused by fault of drum unit or laser scanning system.

(2) Foggy image

If there is foggy image only at the white area as shown in the figure below, it may be caused by fault of drum unit or laser scanning system.

(3) Vertical white/black line

If white or black lines occur with a particular color, the possible cause is an error in the Drum Unit of the color, an error in the Developing Assembly, or soiling on the laser light path.

If white or black lines occur at the same position with all the colors, the possible cause is deterioration of the Intermediate Transfer Unit or Fixing Assembly.

(4) Density unevenness at the rear/front

If there is density unevenness at the rear/front, it may be caused by fault of drum unit, laser scanning system or transfer unit.

Full Area Half Tone (TYPE=5)

This test print can mainly check transfer failure, black line, white line, and pitch unevenness.

COLOR-M=1, COLOR-Y/C/K=0

F-6-2

NOTE:

- Output by every developing color is available by specifying the developing color COLOR-Y/M/C/K in the following service mode: COPIER > TEST > PG
- In the case of changing density of the test print, execute followings in service mode for density setting: TEST > PG > DENS-Y/M/C/K

(1) Transfer failure

If there is transfer failure, it may be caused by fault of transfer (intermediate transfer/secondary transfer) unit.

(2) Horizontal unevenness

If there is horizontal unevenness, it may be caused by fault of photosensitive drum drive unit, drum ITB motor, or drum unit.

(3) Vertical unevenness

If there is vertical unevenness, it may be caused by soiled LDE lens, fault of drum unit, or deterioration of intermediate transfer belt.

■ Grid (TYPE=6)

This test print can mainly check color displacement, right angle accuracy and linearity.

F-6-3

(1) Color displacement

If there is color displacement, it may be caused by fault of each laser scanning system, transfer (intermediate transfer/secondary transfer) unit or photosensitive drum drive unit.

(2) Right angle accuracy and linearity

If there is fault of right angle accuracy or linearity, it may be caused by fault of laser scanning system, or defective shape of registration (upper/lower) roller or the secondary transfer outer roller.

■ MCYBk Horizontal Line (TYPE=10)

This test print can mainly check the dark area density of each color, balance among each color and white line by developing.

F-6-4

(1) Solid density of each color and balance among each color.

- Density is not extremely light.
- In the case of light density with a certain color, it may be caused by the developer of the color in question, or fault of primary transfer roller, laser scanning system or high voltage system.

(2) White/black line

If white or black lines occur with a particular color, the possible cause is an error in the Drum Unit of the color, an error in the Developing Assembly, or soiling on the laser light path.

If white or black lines occur at the same position with all the colors, the possible cause is deterioration of the Intermediate Transfer Unit or Fixing Assembly.

(3) Density unevenness at the rear/front

If there is density unevenness with a certain color, it may be caused by fault of drum unit, laser scanning system or transfer (intermediate transfer/secondary transfer) unit.

If there is density unevenness with all colors, it may be caused by deterioration of intermediate transfer unit.

■ 64-Gradation (TYPE=12)

YMCBk64 gradation test print can mainly check gradation performance of each color (YMBCk) at one time.

F-6-5

■ Full Color 16-gradation (TYPE=14)

Full color 16-gradation test print can mainly check gray balance, gradation performance of each color (YMBCk) and foggy image.

F-6-6

- (1) Gray balance
Check to see if the output comes with even density of each color at gray scale area.
- (2) Gradation performance
Check gradation performance and density difference of each color (YMBCk)
- (3) Foggy image
If there is foggy image at the white area, it may be caused by fault of developing system or photosensitive drum, or correction fault of laser scanning system.

Image Faults

Development stain

[Location]

Developing Sleeve

[Cause]

When the toner charging amount (tribo-charging) shifts at relatively low levels, toner scatters inside the Developing Assembly and in the space between the lid of the Developing Assembly and the sleeve, and the accumulated toner turns into development stain.

[Condition]

Near the end of the developer life. In a high humidity environment.

It is likely to occur with Bk or M.

[Field Remedy]

In service mode reduce T/D ratio in Developing Assembly to remedy this phenomenon.

1) Set the upper limit value of Toner Density Sensor concentration correction for the affected color.

Set COPIER > ADJUST > DENS > HLMT-PT* (affected color) (Level 2) to "+1".

(Default: 0)

2) Print 50 sheets of the image in 10% coverage (Ex.: COPIER > TEST > PG > TYPE: "16", COPIER > TEST > PG > COLOR-* (the affected color): "1") for four times.

3) Print the document on which the phenomenon appeared to check if the problem is remedied.

If the phenomenon is remedied,

4) Execute Settings / Registration > Adjustment / Maintenance > Adjust Image Quality > auto gradation adjustment > full adjust.

If the phenomenon is not remedied,

4) Set "+2" in COPIER > ADJUST > DENS > HLMT-PT* (affected color) (Level 2) and execute Steps 2) through 3). If the problem is not remedied, execute Step 5).

5) Set the default value "0" in COPIER > ADJUST > DENS > HLMT-PT* (affected color) (Level 2) to clean Developing Assembly and Drum Unit.

NOTE:

To set T/D ratio in the desired value in Developing Assembly, Step 2) is required to consume toner.

CAUTION:

The larger value set in COPIER > ADJUST > DENS > HLMT-PT* is not favorable in terms of carrier attachment (the phenomenon developing carriers may occur).

[Sample Image]

F-6-7

Transfer failure on the trailing edge of coated paper

[Location]

Secondary Transfer Unit

[Cause]

The trailing edge curled upward, causing gap voltage between the ITB and paper at Secondary Transfer Nip.

[Condition]

At printing on the coated paper.

[Field Remedy]

1. Ask the user to use the "curl straightened" paper (Bend the paper in the opposite direction to straighten the curl).
Curled paper shall be straightened before use (10mm or less in plain paper, 5mm or less in thick paper).
Curled paper may not be fed depending on paper types.
If the problem is not remedied, follow steps below for correction.
2. In User Mode > Tail End White Patch Correction. adjust the secondary transfer bias.
 - 1) Set "1" in COPIER > OPTION > DSPLY-SW > IMG-ADJ.
 - 2) Select Settings/Registration > Preferences > Paper Settings > Paper Type Management Settings > the affected paper (with the phenomenon appeared).

NOTE:

To select "Paper Type Management Settings", log in to "System Management Mode."

- 3) Select Details / Edit > Tail End White Patch Correction. > 1st or 2nd side.
 - Correction level : Increment the value until blanking is not appeared.
 - Correction amount : Enter the blanking range (distance from the trailing edge: mm).

NOTE:

1. "Tail End White Patch Correction." can be changed in only copied and registered paper.
2. "Tail End White Patch Correction." adjusts the secondary transfer bias.
Increment the correction level value: the secondary transfer bias is decreased.
Decrement the correction level value: the secondary transfer bias is increased.

[Sample Image]

F-6-8

Calibration for color difference on front and back sides

Calibration is needed when significant color difference is appeared in images scanned with 1st side Scanning Optical Unit and 2nd side Scanning Optical Unit.

NOTE:

This calibration is usable only in machines with two optical units (in the reader and DADF).

- 1) Check that A4 (LTR) paper (plain) is set in the deck or cassette.
- 2) (Lv.1) From COPIER > TEST > PG, output the chart calibration.
<Setting>
TXPH=1 (low screen ruling), THRU=0 (Pascaly applied), TYPE=58

NOTE:

When the power has just been turned ON, it is recommended to stabilize engine operation by printing out about 30 blank sheets of paper before outputting the calibration chart.

- 3) (Lv.1) Display the screen of COPIER > FUNCTION > MISC-R to set the reference side as follows.

- 1PCLBSET (setting the reference side for calibration of DADF color difference on 1st and 2nd sides)
<Setting value>
0: None (default), 1: Adjust 2nd side in reference to 1st side, 2: Adjust 1st side in reference to 2nd side.
 - Color difference cannot be calibrated when this item is set to 0.
 - This item shall be set to "0" whenever calibration is not needed.
 - The calibration chart shall be set in the direction as shown in the figure in Steps 4) and 5).
 - If the chart is set in the wrong direction, "NG!" is shown in each service mode. In such a case, correct the direction and retry.

NOTE:

"NG!" may be shown even when the calibration chart is set in the right direction in Steps 4) and 5). In this case, it can be assumed that the original is placed askew, or the printed chart itself is skew-fed. Place the original again, and if "NG" still appears, print out the chart again.

- 4) Place the output calibration chart in face up and select the following item to press OK.
 - 1PSCLB_A (Execution of DADF color difference calibration on 1st and 2nd sides (1st side))
 The output calibration chart shall be set in face up and the blue patch in the corner to the front on the left.

F-6-9

NOTE:

The values are cleared if exiting from the MISC-R screen during scanning.

- 5) Place the output calibration chart in face down and select the following item to press OK.
- 1PSCLB_B (Execution of DADF color difference calibration for 1st and 2nd sides (2nd side))
- The output chart calibration shall be set in face down with the blue patch in the corner to the rear on the left.

F-6-10

NOTE:

The values are cleared and the processing is cancelled if exiting MISC-R screen during scanning.

- 6) Check that "OK!" is shown in 1PSCLB_A and 1PSCLB_B and turn OFF/ON the power switch.

- 7) Execute Steps a through c below to adjust calibration when needed.

- a. When resetting the calibrated result:

Set the item below to "0" and turn OFF/ON the power switch.

- 1PCLBSET (setting for the reference side of DADF color difference calibration on 1st and 2nd side)

- b. When the color not affected before calibration is mismatched:

Set "1" in the following item and repeat Step 3) and the following.

- 1PCLBUDR (setting of the lower limit of DADF color difference calibration on 1st and 2nd sides)

<Setting value>

0: OFF (default), 1: ON

- c. When significant color mismatch occurred after calibration:

Set "1" or "2" in the following item and repeat Step 3) and the following.

- 1PCLBOVR (setting of the upper limit of DADF color difference calibration on 1st and 2nd sides)

<Setting value>

0: no control (default), 1: low control, 2: high control

Paper edge dirt

[Location]

Fixing Belt

[Cause]

When paper in the same size is continuously fed, Fixing Belt surface is worn at the position of the paper edge. This causes gloss lines in the printed image on the large paper.

[Condition]

To mitigate this phenomenon (as it is unable to remedy completely), the refresh sequence is inserted in a certain interval. However, it is not effective if the interval is not frequent enough or Refresh Roller surface is contaminated due to aging.

[Field Remedy]

Identify which of infrequent interval or Refresh Roller contamination causes the problem to take remedy.

1) Check the image before remedy.

Recommended image (Cy gradation image): COPIER > TEST > PG > TYPE "4"
(COLOR-Y=0 M=0 C=1 K=0)

2) Execute the manual refresh mode either in the following methods.

User mode > Adjustment / Maintenance > Maintenance > Fixing Roller Refresh
Service Mode > COPIER > FUNCTION > CLEANING > FX-CLN

3) Check the image again to confirm the effect (if the phenomenon is reduced).

Recommended image (Cy gradation image): COPIER > TEST > PG > TYPE "16"
(COLOR-Y=0 M=0 C=1 K=0)

4)-1 If gloss lines are reduced by executing the manual refresh mode, frequency of the fixing refresh sequence may not be sufficient.

Increase the frequency as below and observe the situation for a while.

User mode > Adjustment / Maintenance > Maintenance > Fixing Roller Auto Refresh level

4)-2 When the manual refresh mode does not improve gloss lines at the paper edge, Refresh Roller surface may be contaminated. In such a case, clean Refresh Roller surface in reference to the service manual.

When Fixing Belt Unit is aging (based on the reading of the paper feed counter), replacing Fixing Belt Unit will remedy gloss lines in images.

Check the reading of the paper feed counter of Fixing Belt Unit, judge the appropriate remedy between cleaning and unit replacement.

The paper feed counter of Fixing Belt Unit: COPIER > COUNTER > DRBL-1 > FX-BLT-U

5) After the refresh roller is cleaned according to the judgment in 4)-2, check the image again.

Recommended image (Cy gradation image): COPIER > TEST > PG > TYPE "16"(COLOR
Y=0 M=0 C=1 K=0)

If gloss lines are not mitigated, replace Fixing Belt Unit.

[Sample Image]

F-6-11

Malfunction

Operation Failure of the ITB Pressure Release Lever

If any of the symptoms shown below occurs when the ITB Pressure Release Lever is turned, perform the cleaning described in this section.

- The ITB Pressure Release Lever is hard to turn.
- The ITB Pressure Release Lever is hard to raise, and the ITB Front Middle Cover (to be secured with a screw) cannot be installed.

Preparation

- 1) Open the Front Cover.
- 2) Pulling out the Fixing Feed Unit (Refer to page 4-389)
- 3) Pulling out the ITB Unit (Refer to page 4-142)
- 4) Removing the ITB Unit (Refer to page 4-144)

Procedure

- 1) Clean the following areas on the front side of the ITB Unit with lint-free paper [1] moistened with alcohol.
 - The whole circumference of the surface [A] of the 2 cams
 - The whole circumference of the surface [B] of the shaft of the 2 ITB Pressure Arms

CAUTION:

When cleaning, do not rotate the shaft [2] by moving the cam and the ITB Pressure Arm. Doing so may change the direction of the cam and cause ITB pressure failure.

F-6-12

- 2) Clean the following areas on the rear side of the ITB Unit with lint-free paper [1] moistened with alcohol.
 - The whole circumference of the surface [A] of the 2 cams

CAUTION:

When cleaning, do not rotate the shaft [2] by moving the cam. Doing so may change the direction of the cam and cause ITB pressure failure.

F-6-13

- 3) Clean the surface [A] of the 2 Cam Guide Plates and the groove [B] of the 2 ITB Pressure Arm Guides in the ITB Frame with lint-free paper [1] moistened with alcohol.

F-6-14

4) Remove the ITB Engagement/Disengagement Lever [1].

- 1 E-ring [2]

F-6-15

5) Clean the groove [A] on the back of the ITB Engagement/Disengagement Lever roller lint-free paper [1] moistened with alcohol.

F-6-16

Cassette pull-in adjustment

If any of the symptoms shown below occurs when the cassette is closed, perform the adjustment described in this section.

- The cassette bounces back and comes out.
- The cassette is excessively pulled into the host machine.
- The Cassette Front Cover is not aligned with other external covers.

NOTE:

The adjusted position of the Pull-in Guide is related with the position of the cassette adjusted by side registration adjustment (when the position of the Cassette Lock Unit has been adjusted and the position of the Cassette Front Cover has been changed). The position of the cassette in the host machine is determined by side registration adjustment of the cassette. Since the appropriate position to which the Pull-in Guide should be adjusted is determined by the position of the cassette, cassette pull-in adjustment is required when the position of the cassette has been changed.

Side registration adjustment of the cassette:

Refer to in Chapter 9 "Installation > Installing the Host Machine > Image Position Adjustment <Checking/Adjusting>"

"1. Left Edge Margin Adjustment (Mechanical Adjustment for Cassette Execute with all paper sources)"

"the side registration adjustment of the cassette (mechanical adjustment for the cassette)"

Checking Method

- 1) Open the Left Cover.
- 2) Open the cassette 200 mm or more.

NOTE: The pull-in mechanism is activated by opening the cassette 200 mm or more.

- 3) Push back the cassette [2] until it is 15 mm [A] from the Front Cover [1] of the host machine, and let go of the cassette.

F-6-17

Appropriate

The latch is locked, and the level difference between the Cassette Front Cover [1] and other external covers is within the appropriate range when viewed from the left side. Adjustment is not necessary.

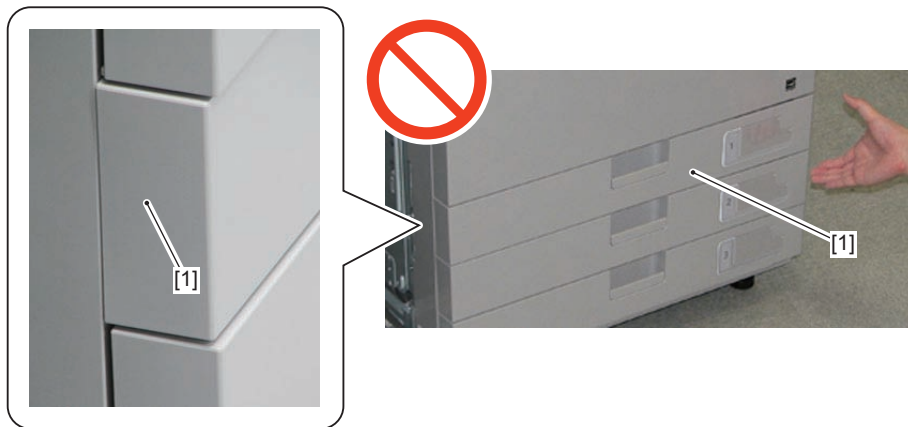

- The level difference [A] between the cassette and other covers (the Front Cover and other Cassette Front Covers) on the front side should be 2 mm or less.
- The gap [B] from the cover [2] on the rear side should be 3 +/- 1 mm.

F-6-18

Semi-closed

The cassette [1] has been excessively pulled in. The gap from other external covers is eliminated by further pushing the cassette in this situation, but adjustment is needed from a functional point of view.

F-6-19

- By further pushing the cassette [1] in this situation, a gap [B] is generated between the cassette [1] and the cover [2] on the rear side. Measure and write down the gap [B].

F-6-20

- Perform "1. Adjusting the Cassette Front Cover", and then perform "2. Adjusting the Pull-in Guide" as needed.

Latch not locking

The cassette has not been pulled in enough. The cassette (1) is not latched and comes out. Adjustment is needed.

- 2. Adjust the Pull-in Guide.

F-6-21

Adjustment Method

1. Adjusting the Cassette Front Cover

- 1) Pull out the cassette [1].
- 2) Loosen the 2 adjustment screws [2] on the left side, and move the Cassette Front Cover [4] as needed using the 2 scales [3] as reference until the gap [B] from the cover on the rear side you wrote down in "Checking Method" changes to a value within the appropriate range.

NOTE:

While the appropriate range of the gap is 3 +/- 1 mm in normal circumstances, in the case of a semi-closed cassette, adjust the gap to a value within 3 to 4 mm.

F-6-22

- 3) Tighten the 2 adjustment screws you loosened in step 2.
- 4) Perform the procedure of "Checking Method" again. If the gap is still out of the appropriate range, perform "2. Adjusting the Pull-in Guide".

2. Adjusting the Pull-in Guide

- 1) Remove the cassette.
- 2) Loosen the 3 adjustment screws [1] on the rear side of the cassette. Using the scale [2] and the boss line [3] as reference, move the position of the Pull-in Guide [4] for 1 division of the scale.

NOTE: Check the initial position on the scale (because the position at the time of shipment is not always at the center).

- In the case of a semi-closed cassette: Move the Pull-in Guide [4] for 1 division of the scale upward (toward the rear side [A] of the host machine) so that the amount the cassette is pulled in is reduced.
- In the case of latch not locking: Move the Pull-in Guide [4] for 1 division of the scale downward (toward the front side [B] of the host machine) so that the amount the cassette is pulled in is increased.

F-6-23

- 3) Tighten the 3 adjustment screws you loosened in step 2.

4) Perform the procedure of "Checking Method" again, and adjust the gap until it becomes an appropriate value.

Double feed or pickup failure when paper is picked up from the cassette

In the event of double feed or pickup failure when paper is picked up from the cassette, perform the adjustment in this section to adjust the separation pressure of the cassette pickup.

Procedure

- 1) Open the Vertical Path Cover.
- 2) Pull out the cassette.
- 3) Remove the Paper Guide [1] while bending the side [A].
 - 2 Bosses [2]

F-6-24

4) Rotate the Separation Pressure Adjustment Gear [1] so that the protrusion [A] can be seen.

NOTE:

Be sure to rotate it clockwise when viewed from the front side of the machine.

F-6-25

5) Lift the Positioning Boss [1] to release it from the initial positioning groove [A], and align it with either of the 3 grooves [B], [C], and [D] to adjust the position of the Separation Pressure Adjustment Gear [2].

- When pickup failure occurs: Move the Positioning Boss [1] toward the groove [B] on the front side of the machine (to increase the separation pressure).
- When double feed occurs: Move the Positioning Boss [1] toward the groove [C] on the rear side of the machine (to reduce the separation pressure). If double feed still occurs, move it further to [D].

F-6-26

Other

● Checking of nip width

If the paper wrinkle or fixing failure occurs, check whether the fixing nip width is within the reference range.

However, fixing nip width of this machine cannot be checked in the field.

1) Output a PG for checking the nip.

Plain 1, A4 or LTR, PG5, Y: 0/M: 0/C: 0/BK: 255 (solid black)

2) Load the output PG in the cassette.

3) Execute the fixing nip paper output in service mode.

4) Measure the nip width of output paper and check whether it is within the reference range.

< Reference value >

- Center: 15.5 +/- 1.0 mm
- Edge: 17.5 +/- 1.0 mm (at 15 mm from the edge)

If the nip width is not within the range, replace the Fixing Assembly.

F-6-27

Startup System Failure Diagnosis

The viewpoint of this Startup System Failure Diagnosis

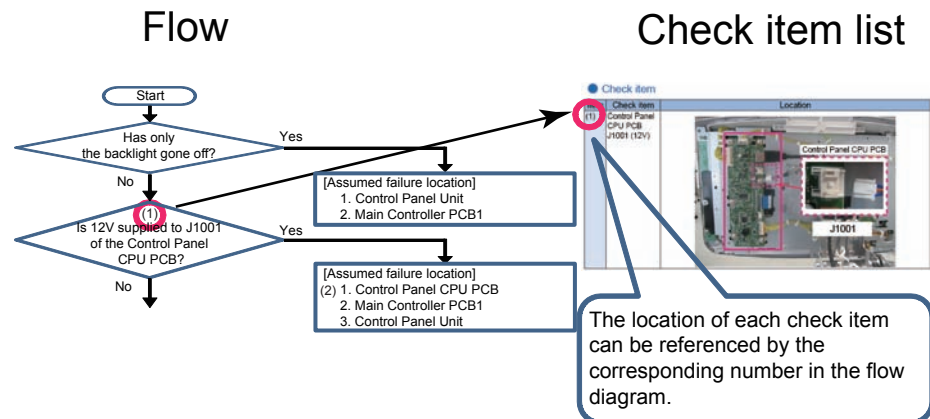

The goal of the startup system failure diagnosis is to be able to solve troubles associated with a Control Panel display failure by performing the following steps.

It is assumed that the users have already learned the following items:

- How to use a tester
- Roles of the All-night Power Supply (3.3V) and Non-all-night Power Supply (12V)
- How to back up data (HDD and Main Controller)

Useful Operations

The items of detailed procedure explanation start with a description of the flow diagram. The items and procedures checked in the flow diagram are described separately in a check item table. The flow diagram contains numbers (e.g. (1)) corresponding to the check items so that the readers can grasp the relevant parts of the check item table.

F-6-28

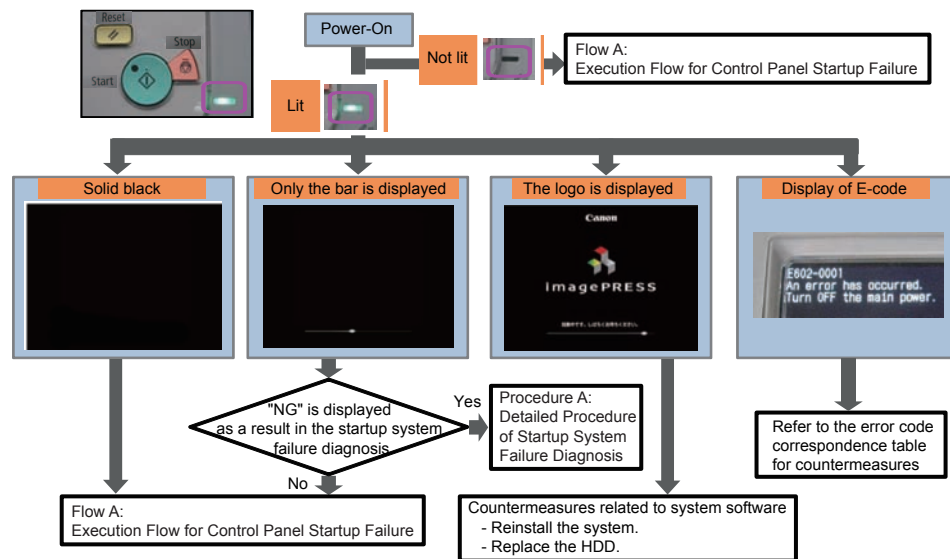

Startup Failure Analysis Policy

Startup Failure Analysis Policy describes troubleshooting related to "Execution Flow for Control Panel Startup Failure" for the All-night Power Supply (3.3V) and 12V Power Supply. If the host machine does not start successfully even when its Power Switch is turned ON, identify the location of the failure by referencing the following diagram. Select the appropriate failure location identification procedure based on the display status of the Control Panel.

Preconditions

If the following two parts are not operating with the main power turned ON, it is likely that a failure has occurred.

- Control Panel Main Power LED (All-night Power Supply 3.3V system)
- Rotation noise of the motor at warm-up rotation and activation of the Control Panel Backlight (12V system)

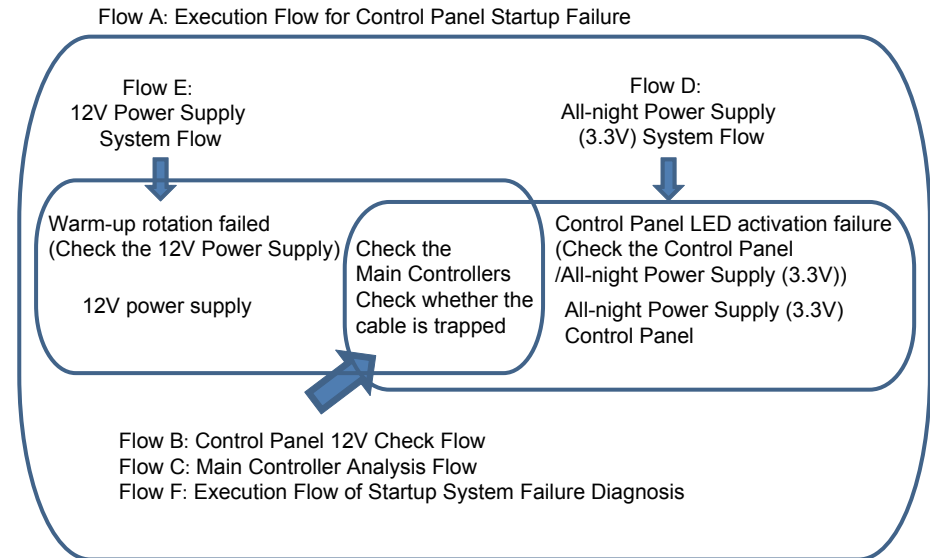

F-6-29

Memo:

- It may take about 5 minutes or more to display E 602-0001.

Structure overview of each flow

F-6-30

Flow A: Execution Flow for Control Panel Startup Failure

Status Check

If nothing is displayed on the Control Panel when the power of the host machine is turned ON, identify the location of the failure according to the flow.

Flow for narrowing down troubles

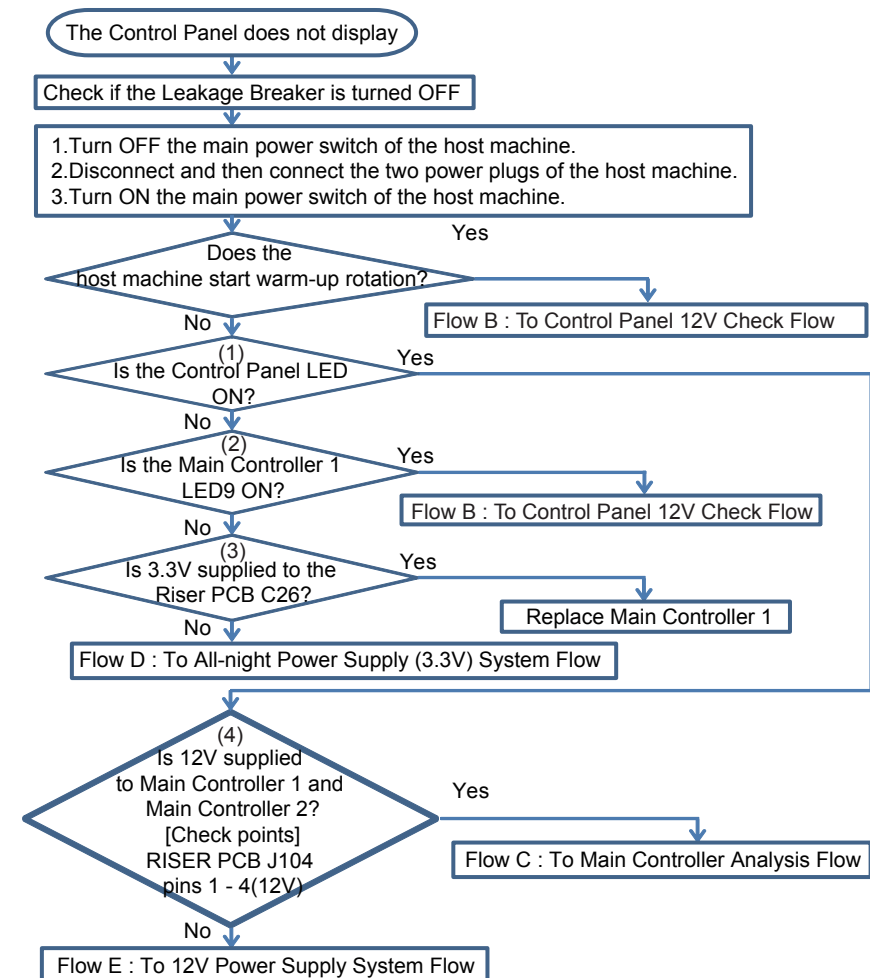

If the Main Power LED is ON, the All-night Power Supply (3.3V) is being supplied.

If the 12V Power Supply is activated, the Control Panel Backlight can be activated.

If the power-on signal (3.3V) is supplied to the 12V Power Supply, the 12V can still activate the Control Panel Backlight.

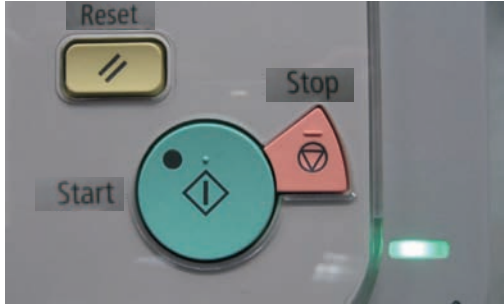

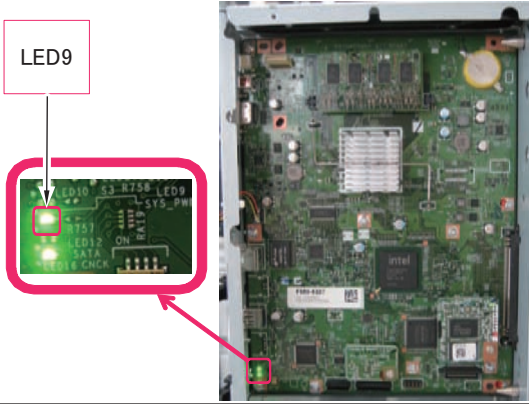

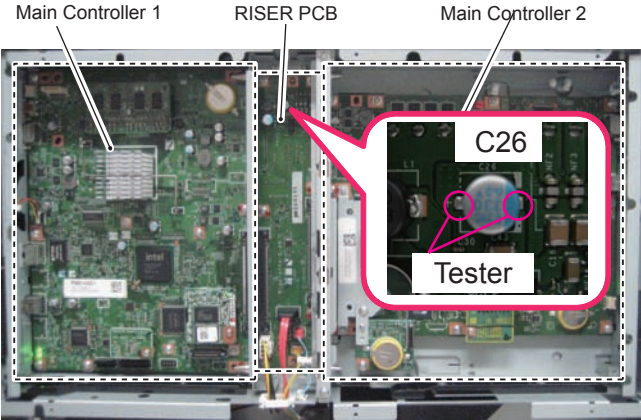

If the power-on signal is blocked, the 12V Power Supply stops supplying power.

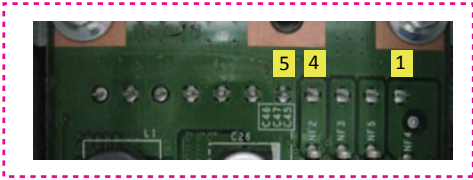

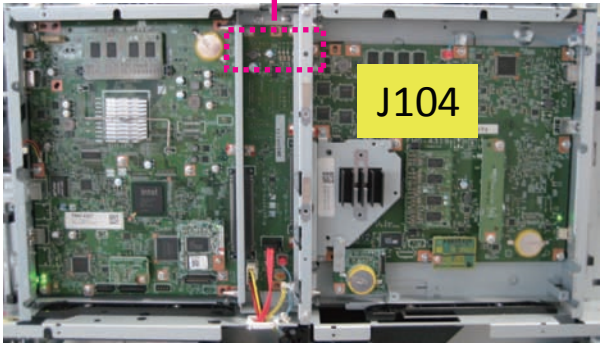

Consult this flow when checking the 3.3V and 12V power supplies and identifying the location of the failure in "Execution Flow for Control Panel Startup Failure" described below.

Check if power is distributed between J1001 connector(pin 2, pin 3) and all the corresponding pins of J8103 connector.(pin 2, pin 3) Normal value: 0 ohm 3. Check if power is distributed between J1811 connector(pin 11, pin 12) and all the corresponding pins of J8121 connector.(pin 2, pin 3) Normal value: 0 ohm 4. Check if power is distributed between J8103 connector(pin 2, pin 3) and all the corresponding pins of J8121 connector.(pin 2, pin 3) Normal value: 0 ohm 5. Replace all the cables to which power is not distributed if there are any.

Item	Check item	Location
(5)	Disconnect J1811 of the Relay PCB and check the following resistance: Relay PCB FU2 Normal value: 0 ohm	
(6)	Check the following resistances of the cables connected to J1811 of the Relay PCB - Between pins 11,14 and pins 12,13(GND) - Between pin 11 and the chassis	

T-6-4

Flow C: Main Controller Analysis Flow

Status Check

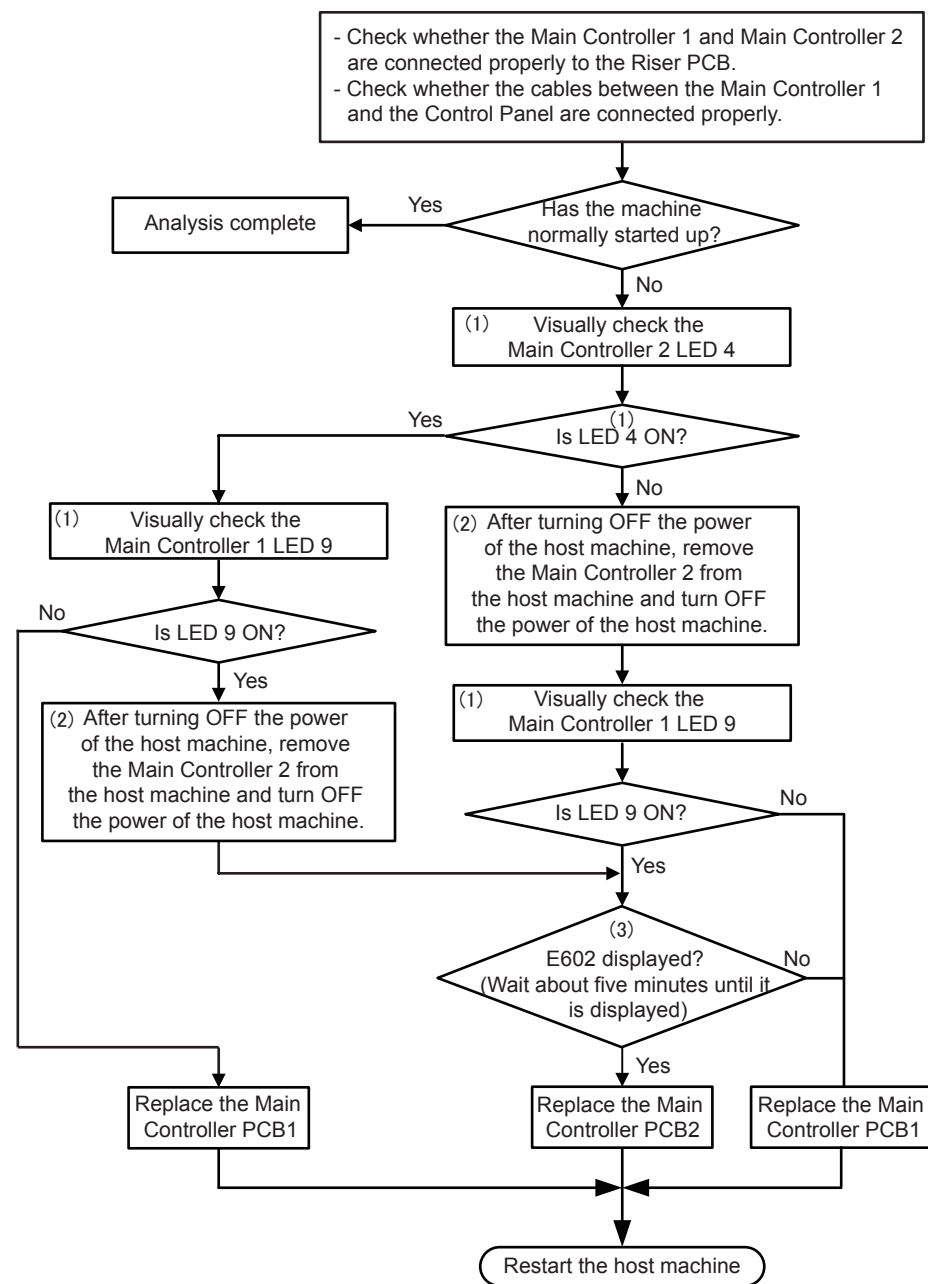

If the Main Controller 1 LED 9 and Main Controller 2 LED 4 cannot be turned ON, identify the location of the failure according to the flow.

Flow for narrowing down troubles

Pre-check items

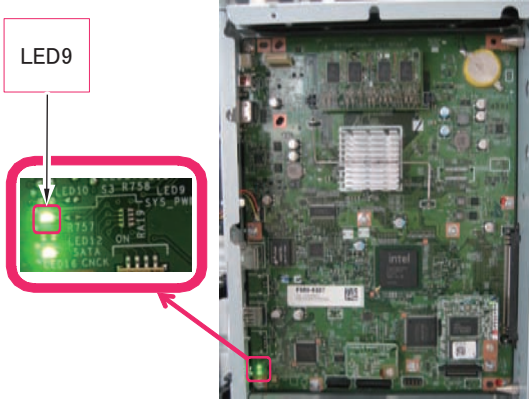

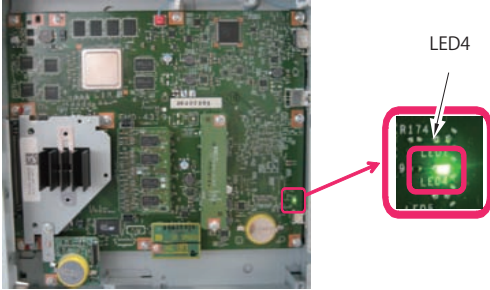

- Check whether the Main Controller 1 and Main Controller 2 are connected properly to the Riser PCB.
- Check whether the cables between the Main Controller 1 and the Control Panel are connected properly.

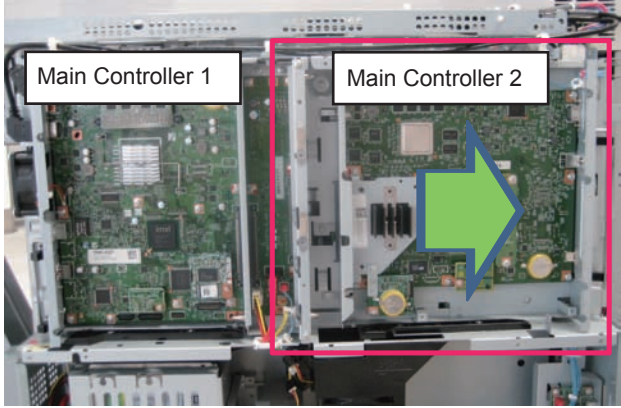

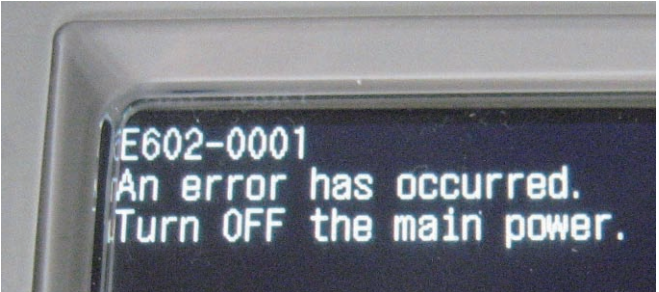

If the Control Panel is not turned ON even after these checks, try identifying the location of the failure through the following procedure.

F-6-33

● Check item

Item	Check item	Location
(1)	Check the Main Controller 1 LED 9 activation	 <p>LED9</p>
	Check the Main Controller 2 LED 4 activation	 <p>LED4</p>

Item	Check item	Location
(2)	Remove the Main Controller 2	 
(3)	Display of E-code	

Flow D: All-night Power Supply (3.3V) System Flow

Status Check

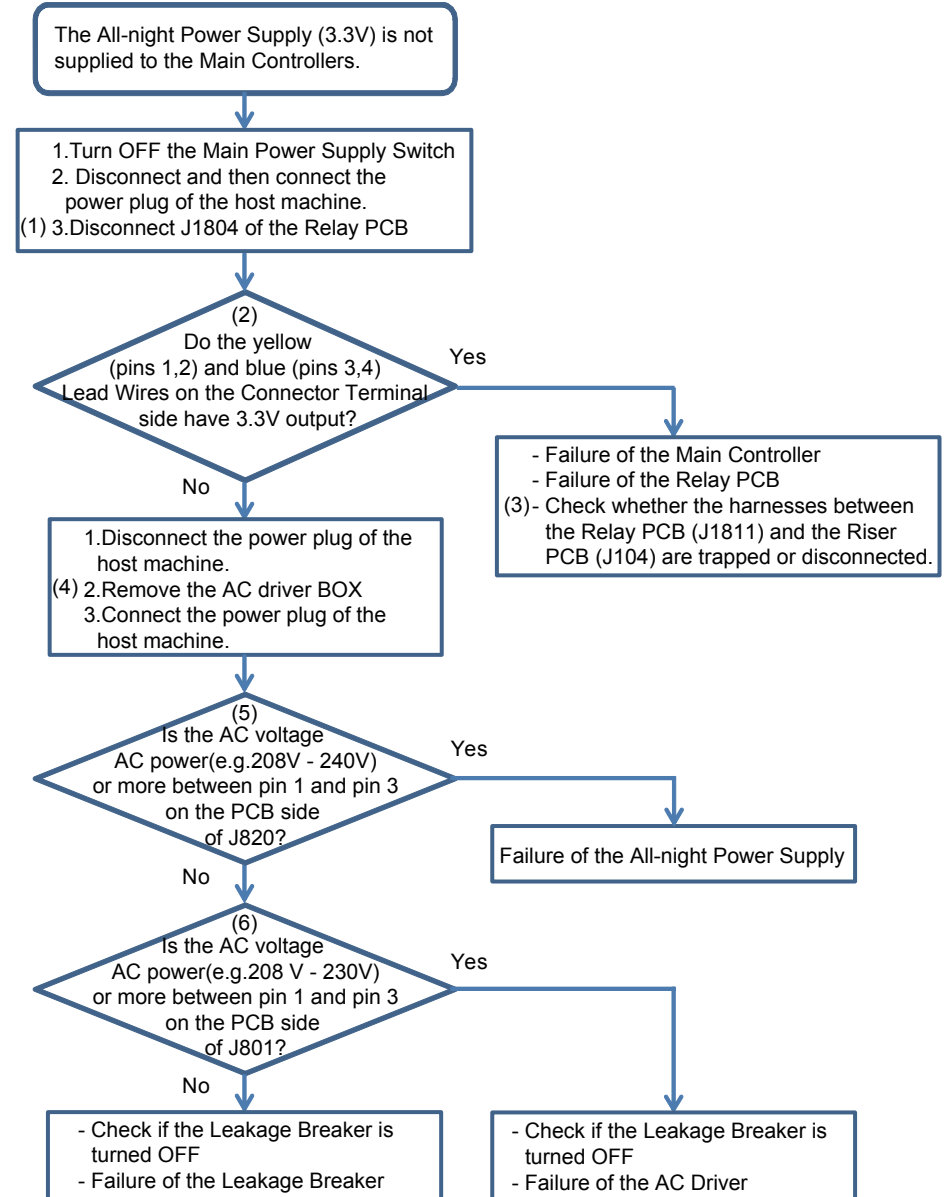

Disconnect J1804 of the Relay PCB and, if 3.3V is not supplied to the yellow and blue Lead Wires, identify the location of the failure according to the flow.

Flow for narrowing down troubles

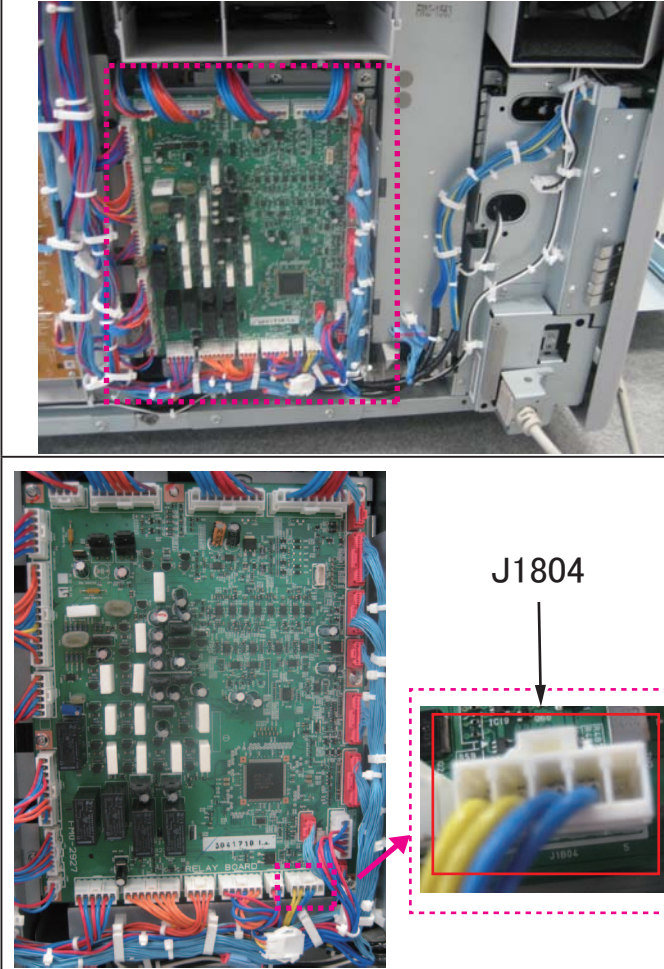

The following diagram shows the 3.3V power supply route.

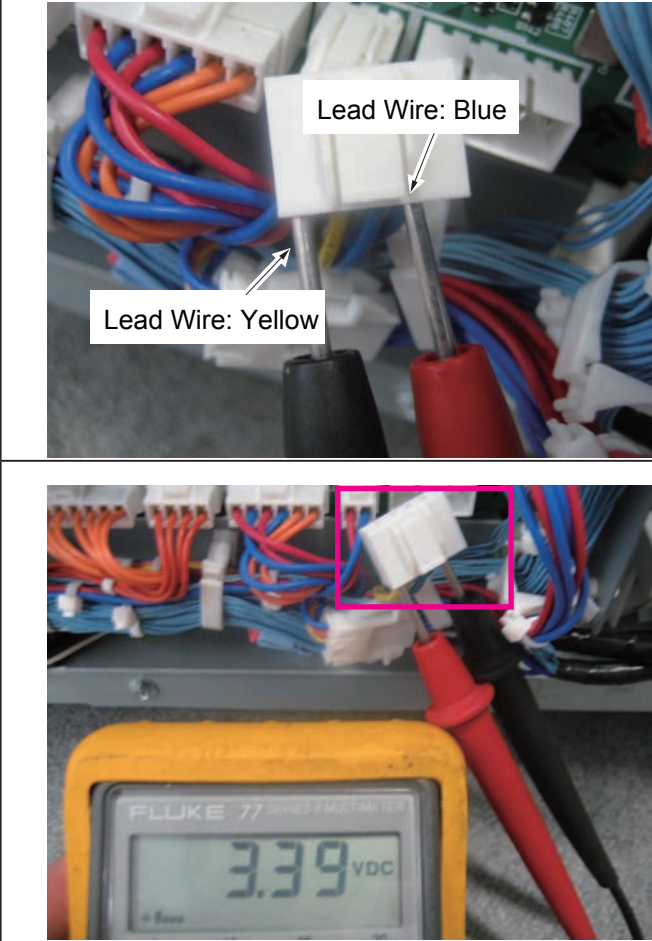

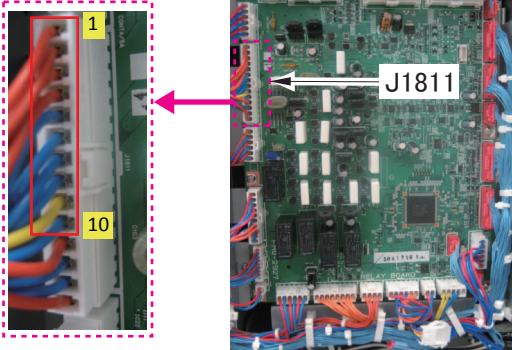

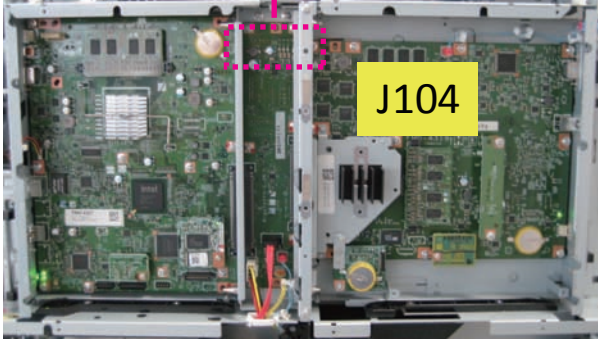

Identify the cause in the following flow:

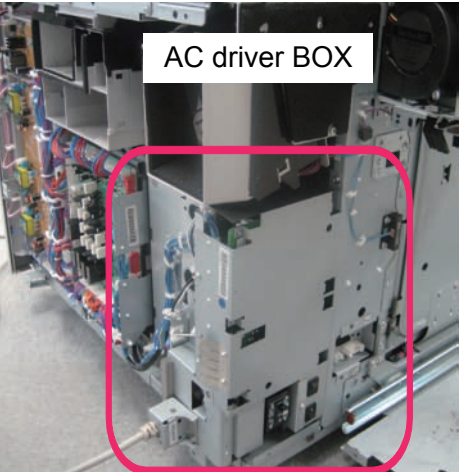

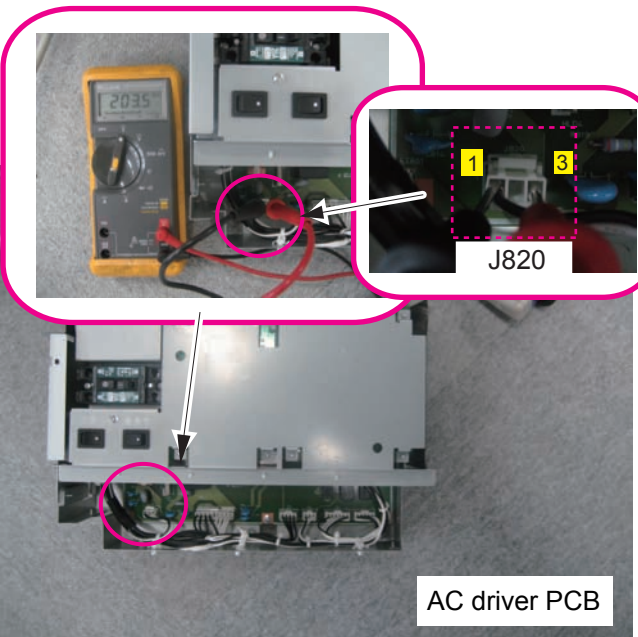

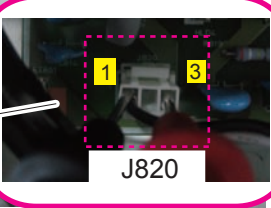

● Check item

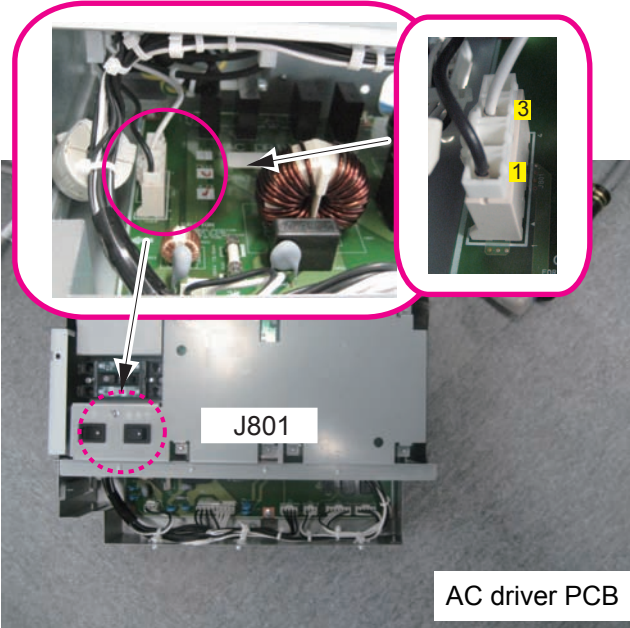

Item	Check item	Location
(1)	Relay PCB J1804	

Item	Check item	Location
(2)	Check the pins 1 and 2 (yellow) and pins 3 and 4 (blue) on the cable side, respectively. e.g. pin 1 (yellow) and pin 4 (blue)	
J1804 is the connector to input 3.3V from the 3.3V All-night Power Supply to the Relay PCB. Normal value: 3.3V		

Item	Check item	Location

Item	Check item	Location
(6)	AC driver PCB • J811(pin 12)	
	<ol style="list-style-type: none"> 1. Check the cables between J1805(pin 7) of the Relay PCB and J1224(pin 17) of the DC Controller PCB. Disconnect the connectors of J1805 and J1224. Check if power is distributed between J1805 connector(pin 7) and the corresponding pin of J1224(pin 17) connector. Normal value: 0 ohm 2. Check the cables between J1807(pin 12) of the Relay PCB and J811(pin 12) of the DC AC driver PCB. Disconnect the connectors of J1807 and J811. Check if power is distributed between J1807 connector(pin 12) and the corresponding pin of J811(pin 12) connector. Normal value: 0 ohm 3. Replace all the cables to which power is not distributed if there are any. 	

T-6-8

Reference: Activation conditions of the Control Panel Backlight

Description

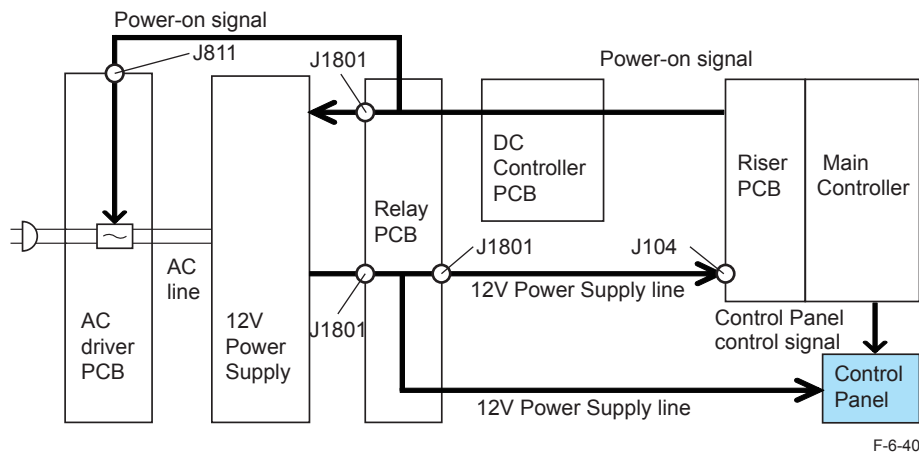

Following are the details of conditions when the Control Panel Backlight is activated:

Field Remedy

The Control Panel Backlight is turned ON when 12V power is supplied from the Relay PCB.

The details on the route to supply 12V power are as follows:

- The Control Panel Backlight is turned ON when 12V power is supplied. The 12V power is supplied through the following route:
AC Driver PCB > 12V Power Supply PCB > Relay PCB > Control Panel
- The power-on signal (which keeps the supply of 12V power) is sent through the following route:
Main Controller 2 > Main Controller 1 > Riser PCB > DC Controller > Relay PCB > 12V Power Supply
- The 12V Power Supply receives its power supply from the AC Driver PCB and the power-on signal (which keeps the supply of AC power) is sent through the following route:
Main Controller PCB2 > Main Controller PCB1 > RISER PCB > DC Controller PCB > Relay PCB > AC driver PCB

F-6-40

Reference:

When the power-on signal is blocked, the power supply stops even if the Power Supply Unit is operating properly.

The power-on signal is output at 1 to 3V.

Flow F: Execution Flow of Startup System Failure Diagnosis

Status Check

If startup does not complete properly with only the Control Panel bar displayed, identify the location of the failure according to the flow.

Flow for narrowing down troubles

Description

The workflow of the Controller system failure diagnosis to be executed when only the Control Panel bar is displayed.

F-6-41

Check item

Boot Method

- 1) Turn ON the Main Power Supply Switch while pressing the numeric keys '2' and '4' simultaneously.

F-6-42

- 2) Keep pressing the numeric keys (for approx. 20 seconds) until the following screen appears on the Control Panel.

F-6-44

F-6-43

Procedure A: Detailed Procedure of Startup System Failure Diagnosis

1. Perform the following checks if the failure diagnosis does not start. If it starts, proceed to the next step.
 - Install the system software (Download by 2+8 startup)
 - Replace the Main Controller PCB1
 - Replace the HDD.
 - Replace the Main Controller PCB2

2. When the detected location is displayed on the screen where "NG" is displayed, identify the location of the failure by referencing the controller system failure diagnosis, and perform the remedy. If the diagnosis does not proceed to a status where "NG" is displayed, proceed to the next step.

3. If the failure diagnosis does not finish, perform the following work:
 - Install the system software (Download by 2+8 startup)
 - Replace the HDD.
 - Replace the Main Controller PCB1
 - Replace the Main Controller PCB2

Controller Self Diagnosis

Controller Self Diagnosis

Introduction

Operation of the (2 types of) error diagnosis tools added to the main body and remedy for errors are described. These tools can reduce time to determine cause of errors occurred in field and improve the accuracy of specifying error locations.

This manual can be applied when the main body is placed in the following conditions.

- An error is suspected to have occurred in the Main Controller PCB 1/2 and other related PCBs (child PCBs such as SDRAM or TPM mounted in the Main Controller PCB 1/2).
- Startup takes too long (the progress bar seems to stop halfway), or the Touch Panel of the Control Panel is slow to respond. (<S.M.A.R.T Check>)

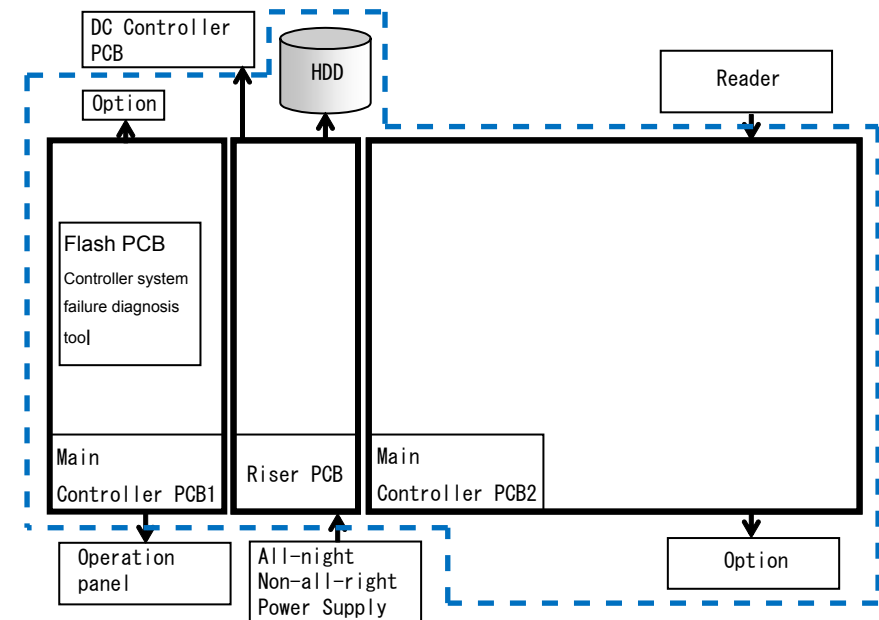

PCBs and units diagnosed by each tool are as follow:

Controller System Error Diagnosis Tool

- Main Controller PCB 1 side <Main Controller PCB 1, SDRAM, TPM PCB>
- Main Controller PCB 2 side <Main Controller PCB 2, SDRAM (M0, M1), SDRAM (P), SDRAM (S), Memory PCB, Open I/F PCB (option)>
- Rizer PCB / HDD

Overview

Error diagnosis tools are installed in this machine, and stored in the locations shown below.

F-6-45

Controller System Error Diagnosis Tool covers the components shown in the blue frame (dotted line).

Controller System Error Diagnosis Tool

This tool automatically checks the Main Controller PCB 1/2, child PCBs mounted on the Main Controller PCB 1/2, and HDD, and display the result on the Control Panel.

Layout Drawing

Layout Drawing of PCBs Subject to Diagnosis

F-6-46

Main Controller PCB 1

F-6-47

Main Controller PCB 2

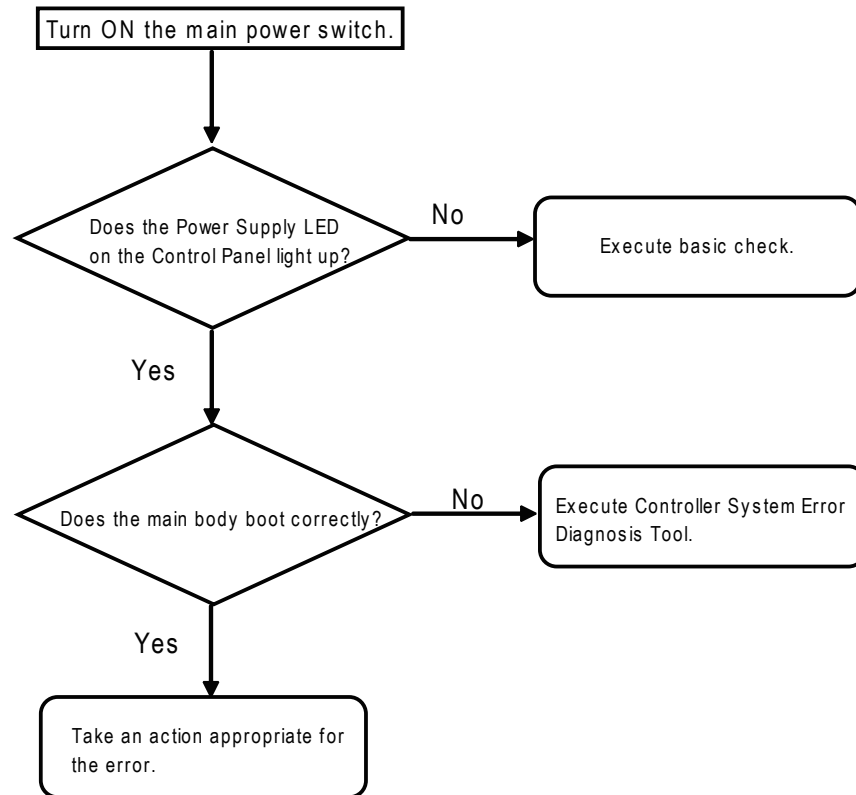

F-6-48

Basic Flowchart

Basic Check Items

Check all of the items shown below.

F-6-49

Basic Check Items

1. Check if the Leakage Breaker is turned OFF.
2. Check if the Power Supply Plug is disconnected.
3. Check if the Connection Cable between the Main Controller PCB 1 and Control Panel is disconnected.
4. Check if the Connection Main Controller PCB 1 and Main Controller PCB 2 definitely?
5. Check if the Connection An All-night Power Supply. Change Non-all-night Power Supply if not recovered.

Controller System Error Diagnosis

Boot Method

- 1) Turn ON the Main Power Supply Switch while pressing the numeric keys '2' and '4' simultaneously.

F-6-50

F-6-51

- 2) Keep pressing the numeric keys (for approx. 20 seconds) until the following screen appears on the Control Panel.

F-6-52

NOTE:

When this tool is not installed correctly, the following regular screen is displayed. In this case, perform the following remedy.

Turn OFF the Main Power Supply Switch again, and execute step 1 and 2 shown above.

If this tool still does not boot, it means that BCT is deleted. So, install BCT.

If BCT is not installed correctly, "--.--" is displayed in Service Mode (COPIER > DISPLAY > VERSION > BCT) in the main body.

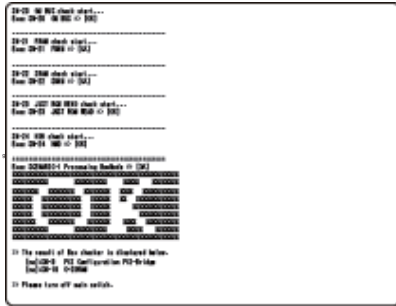

F-6-53

● Diagnosis Time

Diagnosis is completed in approx. 3 minutes.
The result is displayed on the Control Panel.

<When the diagnosis result is normal>

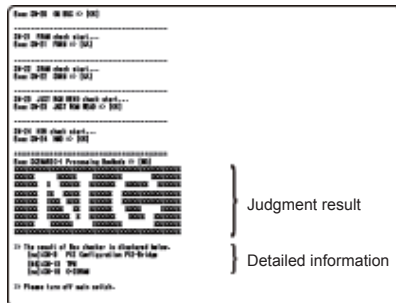

```

>> The result of Box checker is displayed below.
[no]:SN-9 PCI Configuration PCI-Bridge
[no]:SN-13 TPM
[no]:SN-19 O-SDRAM
>> Please turn off main switch.
  
```

F-6-54

<When an error is detected by diagnosis>

Detailed information is displayed under the judgment result. In detailed information, the name of the test where the error was detected is displayed.

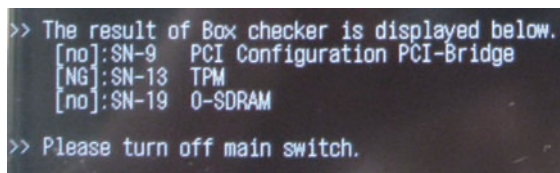

```

>> The result of Box checker is displayed below.
[no]:SN-9 PCI Configuration PCI-Bridge
[NG]:SN-13 TPM
[no]:SN-19 O-SDRAM
>> Please turn off main switch.
  
```

F-6-55

<When an error is detected by diagnosis>

Detailed information is displayed under the judgment result. In detailed information, the name of the test where an error was detected is indicated.

```

>> The result of Box checker is displayed below.
[no]:SN-9 PCI Configuration PCI-Bridge
[NG]:SN-13 TPM
[no]:SN-19 O-SDRAM
>> Please turn off main switch.
  
```

F-6-56

<How to view the error result>

The following screen is an enlarged view of the detailed information indicated above.
Explanation of the detailed error information is described.

[no] means that optional PCBs are not mounted.

When [no] is displayed although an optional PCB is mounted, it means that an error has been occurring.

[NG] means that an error occurred to PCBs mounted as standard.

<Controller System Error Diagnosis Table>

The error locations are identified according to the following table.

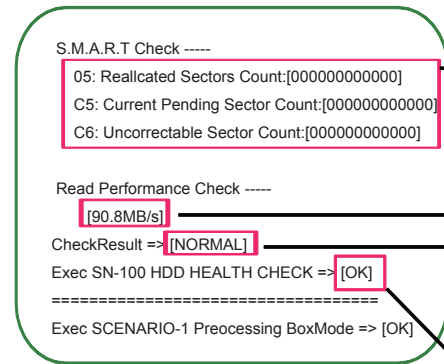

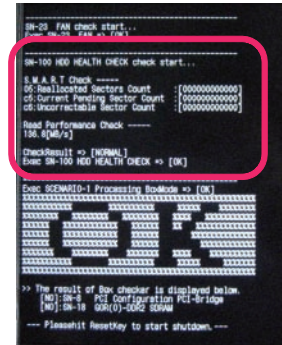

Test Name	Description	Assumed Error Location	Remedy	Error Code
SN-1 MN-DDR2 SDRAM	Check an error between the Main Controller PCB 1 and SDRAM on the Main Controller PCB 1.	<ul style="list-style-type: none"> Main Controller PCB 1 SDRAM on Main Controller PCB 1 	1 Replace the Main Controller PCB 1.	-

T-6-10

Note:

Correspondence at the HDD Data Encryption & Mirroring Kit use.

The SMART contents are diagnosis results of the master HDD.

In case the master HDD cannot be located, turn OFF/ ON the power to check whether the green LED is lit on the LED PCB. The firstly blinked green LED (ChA or ChB) in a high speed tells the Master HDD, which is accessed firstly. The green LED not lit on a channel tells the location of Backup HDD.

■ Restrictions

● <Boot System Error Diagnosis>

- If an error cannot be resolved by executing remedy according to the error diagnosis table described above, consider boot failure of the main power supply and take appropriate actions.

● <Controller System Error Diagnosis>

- Regarding the diagnosis for the test names (SN-1, 2, 7, 15, 21), if an error occurs in the diagnosis under the test names, this diagnosis tool will not boot.
- When no PCBs are installed on the Main Controller PCB 1/2, the following judgment results are displayed.

Standard PCB: [NG]

Optional PCB: [OK]

However, [no] is displayed in detailed error information for optional PCBs.

Operation Check of the Main Controller LEDs

You may be able to determine the remedies against Main Controller-related troubles by checking the lighting status of LEDs on the PCB.

Location of LEDs

F-6-58

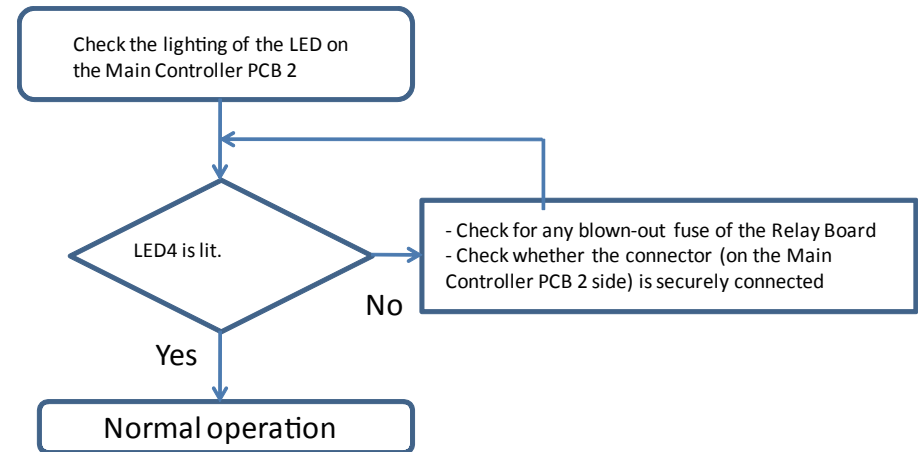

Preconditions

Check whether the Main Controller PCB 1 and the Main Controller PCB 2 are properly inserted.

Check whether the connectors are securely connected. LEDs are not lit when the contactation is poor. (Power-on is not possible)

When the LED of the Control Panel main power is not lit, check the connection of cables (such as UI Cable).

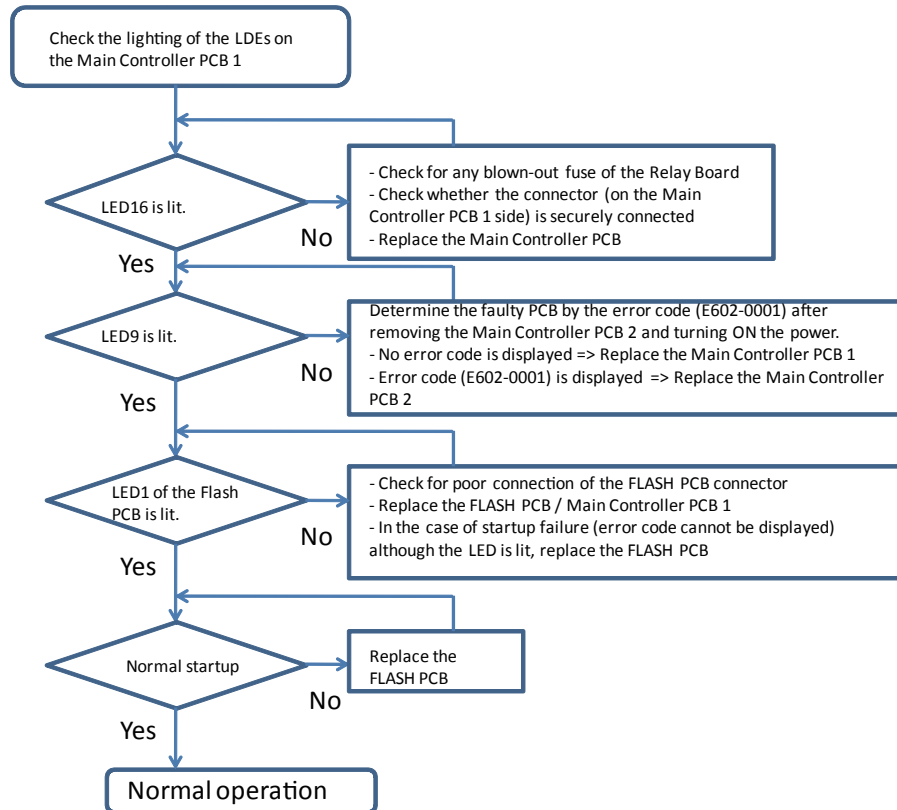

Checking the lighting of the LED4 RED on the Main Controller 2

F-6-59

Check the lighting of the LDEs on the Main Controller PCB 1

- Flash PCB - LED1

F-6-60

Debug log

Scope of Application

Purpose

When the Canon quality-appointed staff determines the need for an analysis of debug log by the R&D department, we ask the field to collect log for an investigation to determine the cause.

Overview

Function Overview

Debug log is an integrated log for failure analysis that gathers logs prepared by the software modules in the device for debug purpose.

In the case of a field failure that is hard to be reproduced, this measure is intended to improve efficiency in failure analysis and reduce the time for failure support by collecting debug log at the user site (which was created immediately after the failure) and sending it to the R&D.

When the Canon quality-appointed staff determines the need for an analysis of firmware debug log by the R&D department, we ask the field to collect log for an investigation to determine the cause.

Effective Instances of Collecting Debug Log

- The error occurs only at the customer site and cannot be reproduced by the sales company or the Canon staff who is in charge of quality follow-up.
- When the error frequency is low.
- When the error is suspected of links with firmware rather than a mechanical/electrical failure.

* Collection of Sublog is not necessary when the reproduction procedure is identified and the error can be reproduced by the sales company HQ or the Canon staff who is in charge of quality follow-up.

Types of Logs

There are continuous logs, event logs, and manual logs.

Type	Collecting method	Size of logs	Setting
Manual log	Perform the following procedure. 1. Hold down the [Counter] button (10 seconds or longer). 2. Press 1 on the numeric keypad. 3. Press 2 on the numeric keypad. 4. Press 3 on the numeric keypad. While logs are being obtained, the screen is locked. It takes approx. 3 minutes before obtaining the logs is completed and the user can work on the screen.		n/a

T-6-11

Conditions of Log Collection

- Logs can be collected on a PCB-by-PCB basis. (SUBLOG, SUBLOG_RCON, SUBLOG_DCON)

Location	File name	Automatic collection		Manual collection
		Logs generated while the host machine is being operated.	Event log When an event has occurred	Manual log
Main Controller	SUBLOG	Yes	Yes	Yes
Reader Controller	SUBLOG RCON	No	Yes	Yes
DC Controller	SUBLOG DCON	No	Yes	Yes

T-6-12

Collection of Logs

Connect SST or a USB memory device, and select COPIER > FUNCTION > SYSTEM > DOWNLOAD > OK to collect logs.

Description of Log to be Collected

When operation from the Control Panel or an event log (exceptional operation, error code, or reboot) occurs, the number of logs increases.

Logs are stored from the latest one, and the latest file is always stored.

Logs earlier than those logs are overwritten and deleted from the oldest log.

When collecting logs from the machine, the log file in the machine is deleted.

Note:

The number of files stored differs depending on the model and situation.

F-6-61

Collecting System Information

Collection Destination

To retrieve debug log to an external location from the device, use a USB memory device, FTP server or SST (Ver. 4.74 or later).

Collection Method

Retrieve debug log from the machine by any of the following methods.

- Make the machine recognize the USB memory device. Select the following in service mode Lev1: COPIER > FUNCTION > SYSTEM > DOWNLOAD; and click OK.
- Use SST on a PC with the network cable connected to transfer the debug log.
- Transfer the debug log to a USB memory device that stores the system of the machine.

File Name of Sublog

Whether the file is new or old can be judged by the year, month, day, hour, and minute.

SUBLOG04_0014_0515204388.Z

Layer number Sequence number mmdhhmm

F-6-62

Collecting Debug Log (USB memory device)

NOTE:

When the data is sent to the USB memory device:
USB memory where the system software for this machine has been registered using the SST.

1) Lev1 COPIER > FUNCTION > SYSTEM > DOWNLOAD > OK

Connect the USB memory device to the machine.

2) [5] Execute [BACKUP].

```
[[[[[ download Menu (USB) ]]]]]]]]]]]
```

```

F-6-65

■ Uploading Data by SST

The following shows a method to collect a log by connecting a PC with SST (Ver. 4.74 or later) running to the machine.

■ Preconditions:

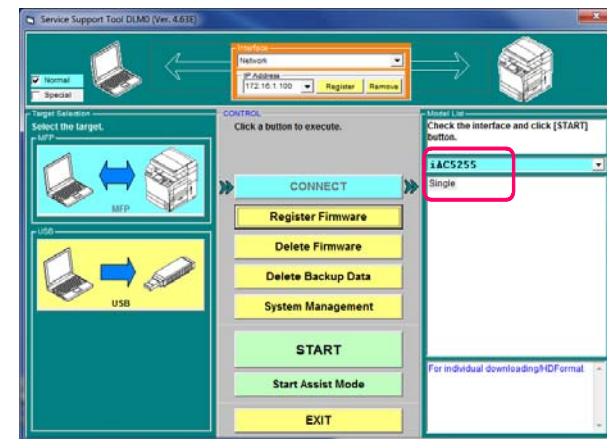

In addition to continuous logs, obtained manual logs (holding down the counter + 1, 2, and 3 keys) and event logs (DEBUG-1) are stored in the machine.

A PC where SST is running is connected to the machine, and the machine is in download mode.

Note:

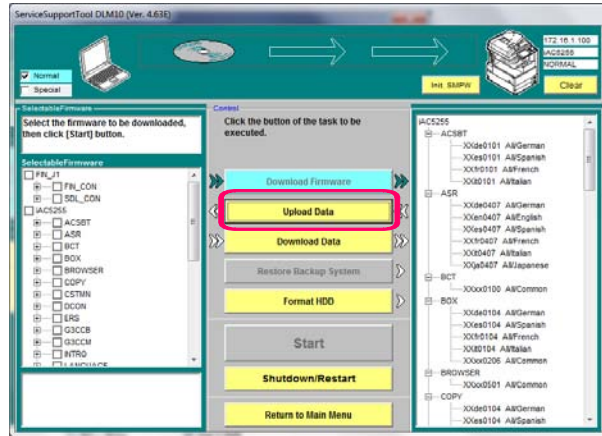

Executing a log collection by SST deletes logs in the machine.

1. Start SST (Ver. 4.74 or later) and select iPRC800 from Model List. Press the Start button.

F-6-66

2. Press the Upload Data button.

F-6-67

3. Select the data to be uploaded, then click [Start] button.

When there is no log in the machine, it results in blank option items for "data to upload".

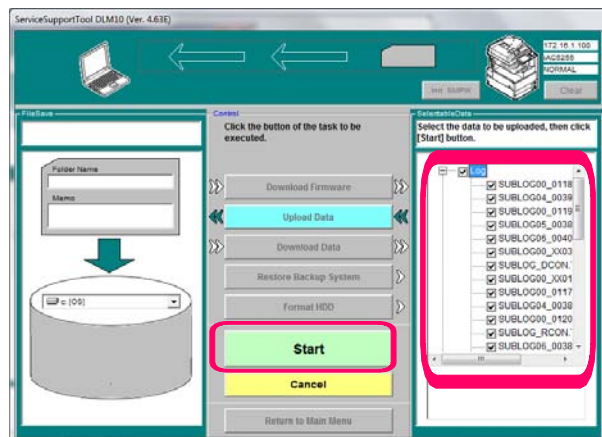

When the file name is longer than the frame, it displays that it is a log in the comment column just below.

It is displayed as "log" in the figure below.

Note:

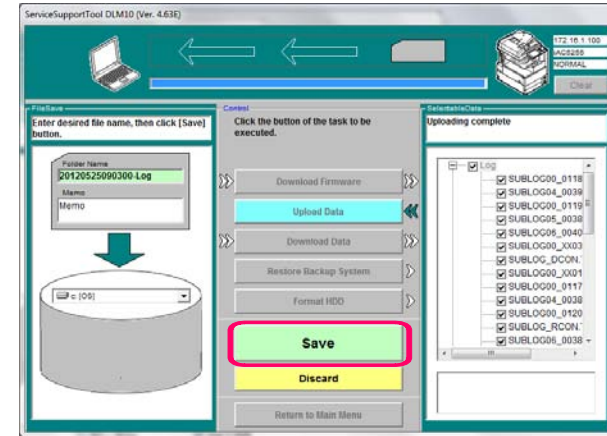

The log is not stored when You cancel it before pushing the Start button.

It is deleted from the main body.

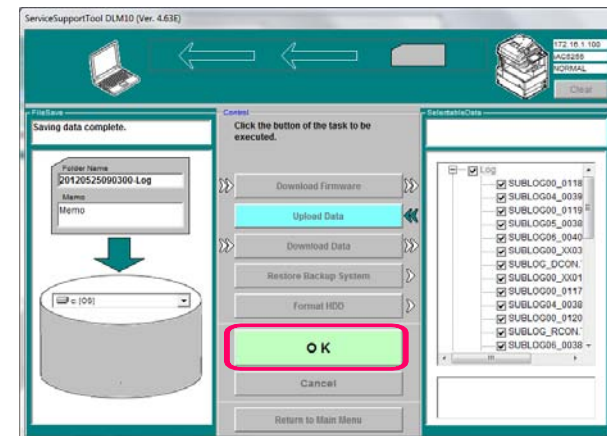

F-6-68

4. Press the "Save" button.

F-6-69

5. Check that the data storage is completed and click the "OK" button.

F-6-70

6. Check that the log is stored in the specified location in the PC.

In the initial setting:

Windows(C:) > ServData > iPRC800(Model) > JWH00003(Serial number) > 20120524192934-Log(yymmddhhmm)

F-6-71

When to Obtain Logs

The assumed procedure to be taken when a request for log collection has been received is shown below.

Preconditions

When the Canon staff who is in charge of quality follow-up determines the need for an analysis of debug log by the R&D department, log collection is requested via sales company HQ. Logs are used to determine the cause.

Anticipated log collection procedure

1. Contact the user to identify the date and time the failure to be analyzed occurred. (The date and time of occurrence is used to judge whether it is included in the dates and times of the obtained log files. The date and time of occurrence needs to be informed together with the obtained logs. The information is necessary in order to shorten the time required for the analysis. If multiple failures have occurred, the dates and times of those failures need to be informed. If the exact date and time is not clear, just a rough idea will do.)
2. At the user's site, enter download mode and obtain logs.
3. Check that files of around the specified date are included in the logs.
4. If the symptom can be reproduced, reproduce it.
5. Press the counter + 1, 2, and 3 keys to obtain logs.
6. Collect all the obtained logs.

NOTE:

- Prepare a USB memory device of 2 GB or more in capacity as the USB memory device used for log collection. It is necessary in order to secure enough capacity when logs are obtained multiple times.
- As for the collected logs, all the logs moved to the USB memory device should be sent.
- The logs are directly saved to the HDD. It is assumed that logs of a day (if various operations are continuously performed) or logs of approx. 30 days (in the case of common use) can be stored. In the case of logs within the foregoing assumed storage period, it is rare that the logs are overwritten and need to be collected again.

Checking the name of the log file

Check the date of the file whose name begins with SUBLOG00_00. It is highly possible that files of around the date and time the symptom occurred contain information recorded at the time when the failure occurred.

SUBLOG00_0014_0515204388.Z

Log classification Sequence number

mmddhhmm

F-6-72

An example of log acquisition when the occurrence date has been specified

- An example of a failure which occurred around 20:38 on October 3:

F-6-73

NOTE:

- If the obtained log file name contains "SHT", it means that the log was recorded at the time of shutdown.

Example:

SUBLOG00_0001_0918140788SHT.TXT

When checking the occurrence date and time with the user, if the performed operations include turning OFF the power, use the file name "SHT" as a clue for identifying the date and time.

- If the number of seconds is expressed as "99 + three-digit number", the number shows the cause which triggered the log acquisition (e.g. acquisition due to an error code E[three-digit number]).

Example:

When an error code E747 occurred
SUBLOG00_0001_0918140799747.TXT

When checking the occurrence date and time with the user, if an error code has occurred, use E[three-digit number] as a clue for identifying the date and time.

Network Packet Capture

Overview

The network capture function is an embedded function of the machine. The network data sent to and received from the machine can be collected (captured) without using any special equipment.

Until now, in the case of network failures that could not be solved at the first visit, the service technician collected packet at the second visit to solve it.

By providing this function, investigation to determine the cause is available before the second visit to take some measures. Also, service technicians can reproduce the symptoms of network failure and collect network packet to bring it back to the office.

The network capture data can be collected using SST/USB memory.

There is no need to prepare dedicated equipments (PC, HUB, cable, packet capture software, etc.) that have been needed before.

The following effects can be expected thanks to the embedded feature.

- The packet in customer environment can be collected by remote operation.
- Packet collection can be continued when the symptom is not reproduced during the visit.
- For network failures on iR-ADV collaboration (a function to communicate between machines across a network), packet collection for both sides becomes easy.

Caution:

The network capture function may fail to collect a part of packet in a high-loaded network environment.

The network capture function of the machine is more prone to failures in collecting packet than when using a PC to do so.

When collecting packet due to trouble of print data, etc., a case is assumed in which it is impossible to judge whether it is a failure in the print data or a failure in collecting packet.

To check whether packet is failed to be collected by the network capture function of the machine, there may be a case where user is requested to collect packet using a PC.

Overall flow

- 1) Enable network capture
- 2) Start the network capture function
- 3) Overwrite function
- 4) Encryption function
- 5) Start/stop network capture
- 6) Stop the network capture function
- 7) Disable network capture

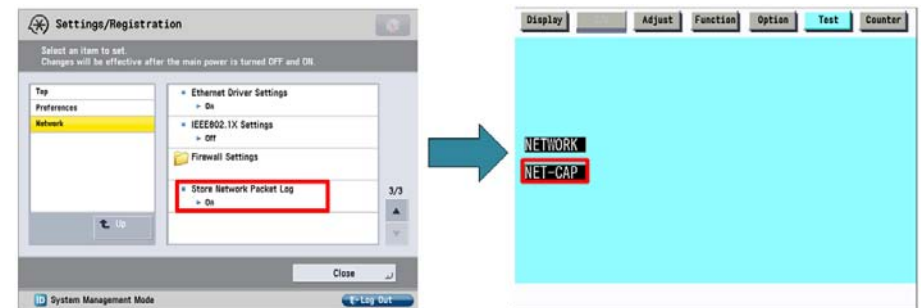

Embedded Network Packet Capture Collection

Enable network capture

To enable this function, the following 2 steps need to be executed.

- Enabling the license of network capture
- Enabling user mode > Network > Store Network Packet Log

Because this function is able to acquire the customer information such as print data, it is not standard function. You make it valid as free license option after obtaining permission from the customer. Then it displays "OFF/ON" in the user mode, you obtain permission from the customer again and let the customer change it to ON.

F-6-74

Changing it to "ON" in user mode, it is displayed in Service Mode.

Start the network capture function

Select the following: Service Mode(level 2) Copier > Test > NET-CAP > CAPOFFON > "1".

F-6-75

*1: ON (enabled) The capture function is available.

Overwrite function

Select the following: Service Mode(Level 2) Copier > Test > NET-CAP > OVERWRIT > 1

F-6-76

Note:

When the HDD space becomes full after starting the capture, the oldest file is deleted and the captured data continues to be saved; therefore, it is necessary to set "1: Overwrite" in advance.

The following shows the machine behavior when the HDD space reaches full.

When the overwriting setting is ON

- The oldest packet file is deleted. The oldest file is determined by the last update time of the file (not by the date and time attached to the file).
- When the HDD space reaches full during packet collection, the oldest file is deleted to continue collecting packet data to the currently-stored file.
- CAPSTATE of capturing continues to be "RUNNING".

When the overwriting setting is OFF

- Capturing is stopped.
- CAPSTATE of capturing becomes "HDDFULL". Note that STT-STP remains as start state (1). Capturing is started again by changing the value from STT-STP (0) to STT-STP (1).
- If the HDDFULL state is cleared when starting capturing again, capturing is started.
- CAPSTATE of capturing becomes "RUNNING".
- If the HDDFULL state is not cleared, starting data capturing results in an error.
- CAPSTATE of capturing remains as "HDDFULL".
- When a command of stopping data capturing is given during the "HDDFULL" state, CAPSTATE of capturing remains as "STOP".

Encryption function

Select the following: Service Mode(Level 2) Copier > Test > NET-CAP > ENCDATA >2.

0: Data is encrypted at data extraction (factory setting value).

1: Data is not encrypted at data extraction.

2: Two types of files (one in encrypted format and another in clear text format) are extracted at data extraction.

F-6-77

Note:

When collecting data using SST, the above service mode setting is not reflected and both files in encrypted format and clear text format are always collected.

When the encryption setting is enabled, the extension of the extracted packet data is XXX.can.

When the encryption setting is disabled, the extension of the extracted packet data is XXX.cap.

This setting applies only when using USB memory for data extraction.

This setting is ignored when using SST for data collection because both files in encrypted format and clear text format are extracted.

Start/stop network capture

- 1) Select the following: Service Mode(Level 2) Copier > Test > NET-CAP > STT-STP > 1.
- 2) To stop capturing, set "0".

F-6-78

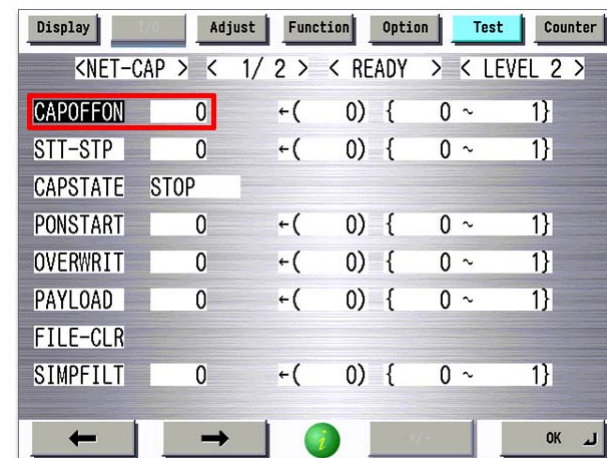

"RUNNING" is displayed for the item CAPSTATE during packet collection.

"STOP" is displayed at the time of shipment or at completion of packet collection, and

"HDDFULL" is displayed when 1GB of data (the upper limit for packet collection) is collected.

Stop the network capture function

Select the following: Service Mode(Level 2) Copier > Test > NET-CAP > CAPOFFON > 0.

F-6-79

Caution:

Be sure to stop the network capture function after collecting network packet capture data.

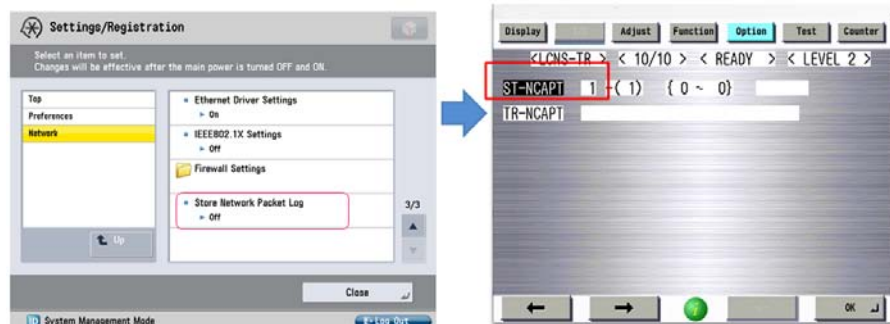

0: OFF (disabled) The capture function is not available. At the time of shipment.

1: ON (enabled) The capture function is available.

● Disable network capture

1) Select the following: Service Mode(Lv2) Copier > Option > LCNS-TR > ST-NCAPT > 0, and click OK.

2) Select the following in user mode: Network > Store Network Packet Log > OFF.

F-6-80

Caution:

Be sure to disable the network capture function once analysis of network failure is complete. It is required to disable and transfer the license; however, the further step, LMS license transfer, is not required.

■ Other functions

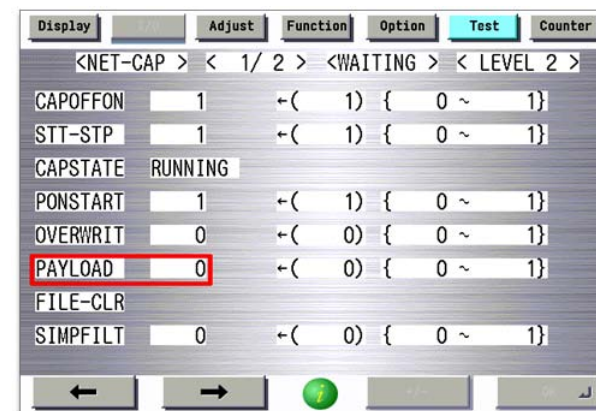

● Payload discard function

Payload is customer data. Data is collected including payload by default. To prevent leak of customers' information or large volume of network packet, the network packet can be collected while payload is discarded.

Service Mode(Level 2) Copier>Test>NET-CAP>PAYLOAD

0: Payload is not discarded (factory setting value)

1: Payload is discarded

F-6-81

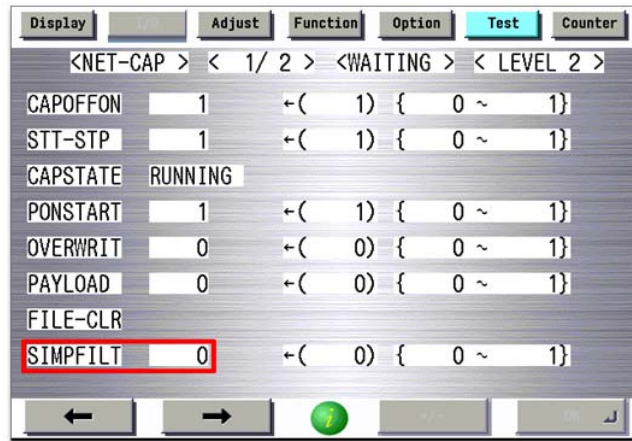

● Filter function

Filtering setting is available.

Service Mode(Level 2) Copier > Test > NET-CAP > SIMPFILT

0: Filtering is performed. All the data is collected (factory default setting).

1: Only the packet data where the machine's MAC address is included in the destination address or sender's address of Ether header is captured.

F-6-82

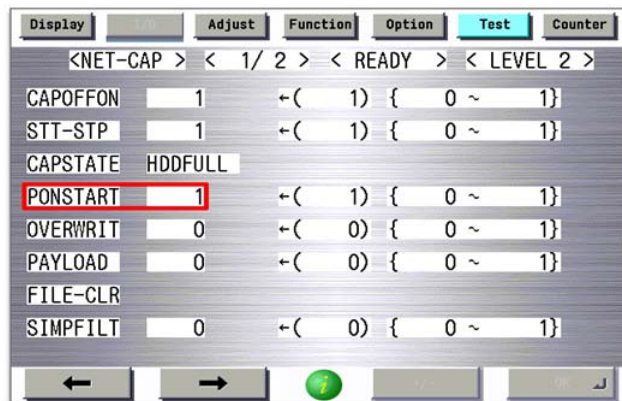

Collection function at startup

Setting this service mode automatically starts collecting packet data if the condition of network capture operation is satisfied when the main power of the host machine is turned ON. Completion of packet data collection needs to be executed manually.

Service Mode(Level 2) Copier > Test > NET-CAP > PONSTART

0: Data is not automatically collected at startup (factory setting value).

1: Data is automatically collected at startup.

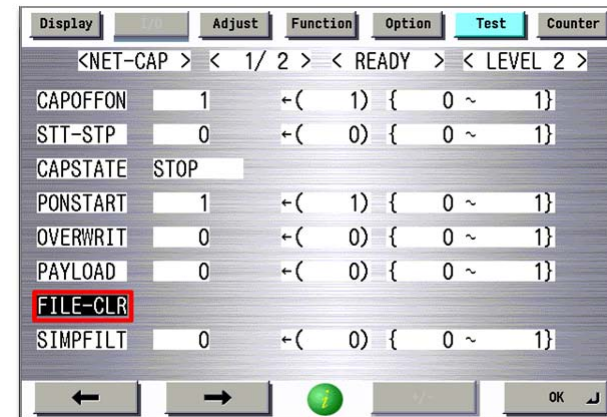

F-6-83

Delete files

Delete all the network capture data stored on the HDD.

Select Service Mode(level 2) Copier > Test > NET-CAP > FILE-CLR, and then click the OK button.

F-6-84

SST Network Packet File Collection

Overview

- Collect the network capture data that has been stored in the machine using SST.
- It is possible to use files in clear text format for in-house analysis by using free software, such as Wireshark. Note that only Canon Inc. can analyze encrypted files. In the case of failure in solving problems, send encrypted files to Canon Inc.
- When using SST for collecting data, the setting of encryption function in Service Mode(level 2) Copier > Test > NET-CAP > ENCDATA is disabled and files in clear text format/encrypted format can be always collected.

Preparation

PC with SST (V4.62 or later) registered

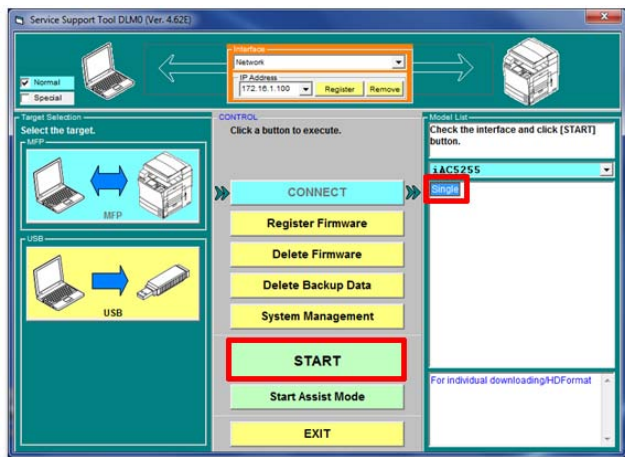

(The system software of the corresponding model must have been registered with SST.)

Overflow

- 1) Connect the machine to SST
- 2) Upload data
- 3) Collect the network capture data

Starting the Machine and SST

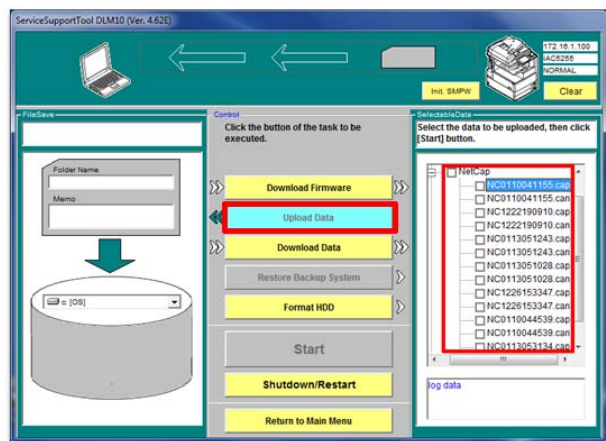

- 1) Start the machine using the 2 and 8 keys, and connect SST in Single mode.
- 2) Click the "Start" button.
- 3) Select a model to connect and "Single", check the network settings, and then click the "Start" button.

F-6-85

Upload data

- 1) Click the [Upload Data] button on SST.
- 2) When a list of packet files stored in the device appears, select target data files to upload.

F-6-86

Note:

When using SST to collect data, you can select both files in encrypted format and clear text format.

Collect the network capture data

- 1) In the case of the default installation destination for SST, click the folder with the name of the serial number of the machine stored in C drive > ServData > target model (e.g.: iACS255) on the PC.
- 2) Three types of files are collected; a file in clear text format (xxx.cap), a file in encrypted format (xxx.can), and a list of collected network capture files (ufset.txt).

F-6-87

F-6-88

- 3) Use free software to analyze the collected network packet capture data in clear text format (xxx.cap).

Note:

When the analysis work fails, send the file in encrypted format (xxx.can) to Canon Inc.

■ USB Network Packet File Collection

● Overview

- Collect the network capture data that has been stored in the machine using a USB memory.
- It is possible to use files in clear text format for in-house analysis by using free software, such as Wireshark. Note that only Canon Inc. can analyze encrypted files. In the case of failure in solving problems, send encrypted files to Canon Inc.

● Preparation

USB memory

Store in advance the system software of the machine to connect to.

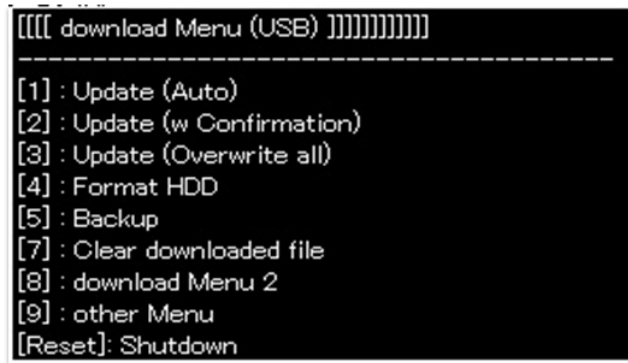

For the system software, it is fine to store just one of the system software of the machine (LANG, etc). There is no need to store the full set.

● Overall flow

- 1) Enter download mode
- 2) Select Backup
- 3) Transfer the network capture data
- 4) Collect the network capture data

● Enter Download Mode

- 1) Connect the USB memory to the USB port.
- 2) Select COPIER > FUNCTION > SYSTEM > DOWNLOAD, and then press [OK].
- 3) When the machine recognizes the USB memory, download Menu (USB) appears on the Control Panel.

F-6-89

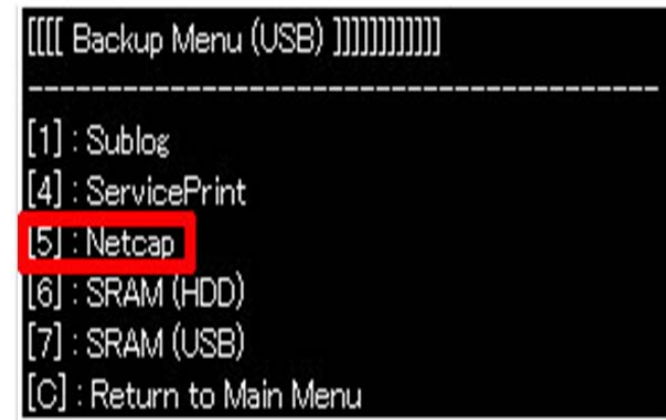

● Select Backup

- 1) When Download Menu (USB) appears, select [5]: Backup.

F-6-90

- 2) Select - (OK): 0.
- 3) When Backup Menu (USB) appears, select [5]: Netcap.

F-6-91

- 4) Select - (OK): 0.

● Transfer the network capture data

1) Store all the network capture data stored in the machine on the USB memory.

```
[NC1212010345.can] OK.
+ 'NC1212010345.can' was saved on 'USB-H device'
Complete /dev/sdb1::/iAC5255/NC201112220754/NC1212010345.can
[NC1130090215.can] OK.
+ 'NC1130090215.can' was saved on 'USB-H device'
Complete /dev/sdb1::/iAC5255/NC201112220754/NC1130090215.can
[NC1212055720.can] OK.
+ 'NC1212055720.can' was saved on 'USB-H device'
Complete /dev/sdb1::/iAC5255/NC201112220754/NC1212055720.can
[NC1212024106.can] OK.
+ 'NC1212024106.can' was saved on 'USB-H device'
Complete /dev/sdb1::/iAC5255/NC201112220754/NC1212024106.can
---Please hit any key---
```

F-6-92

2) When “---Please hit any key---” appears, press any key.

3) Press the [C] key to return to the download Menu (HDD).

4) Press the [Reset] key to shut down the machine.

● Collect the network capture data

1) Check that the network capture files are stored on the USB memory.

2) Two types of files are collected; a file in clear text format (xxx.cap) and a file in encrypted format (xxx.can).

Name	Date modified	Type
NC0110041155.can	1/20/2012 2:37 PM	CAN File
NC0110041155.cap	1/20/2012 2:37 PM	CAP File
NC0110044539.can	1/20/2012 2:37 PM	CAN File
NC0110044539.cap	1/20/2012 2:37 PM	CAP File
NC0113051028.can	1/20/2012 2:37 PM	CAN File
NC0113051028.cap	1/20/2012 2:37 PM	CAP File
NC0113051243.can	1/20/2012 2:37 PM	CAN File
NC0113051243.cap	1/20/2012 2:37 PM	CAP File
NC0113053134.can	1/20/2012 2:37 PM	CAN File
NC0113053134.cap	1/20/2012 2:37 PM	CAP File
NC1222190910.can	1/20/2012 2:37 PM	CAN File
NC1222190910.cap	1/20/2012 2:37 PM	CAP File
NC1226153347.can	1/20/2012 2:37 PM	CAN File
NC1226153347.cap	1/20/2012 2:37 PM	CAP File

F-6-93

3) Use free software to analyze the collected network packet capture data in clear text format (xxx.cap).

Note:

When the analysis work fails, send the file in encrypted format (xxx.can) to Canon Inc.

Version upgrade

Overview

For PRISMAsync model, refer to PRISMAsync service manual.

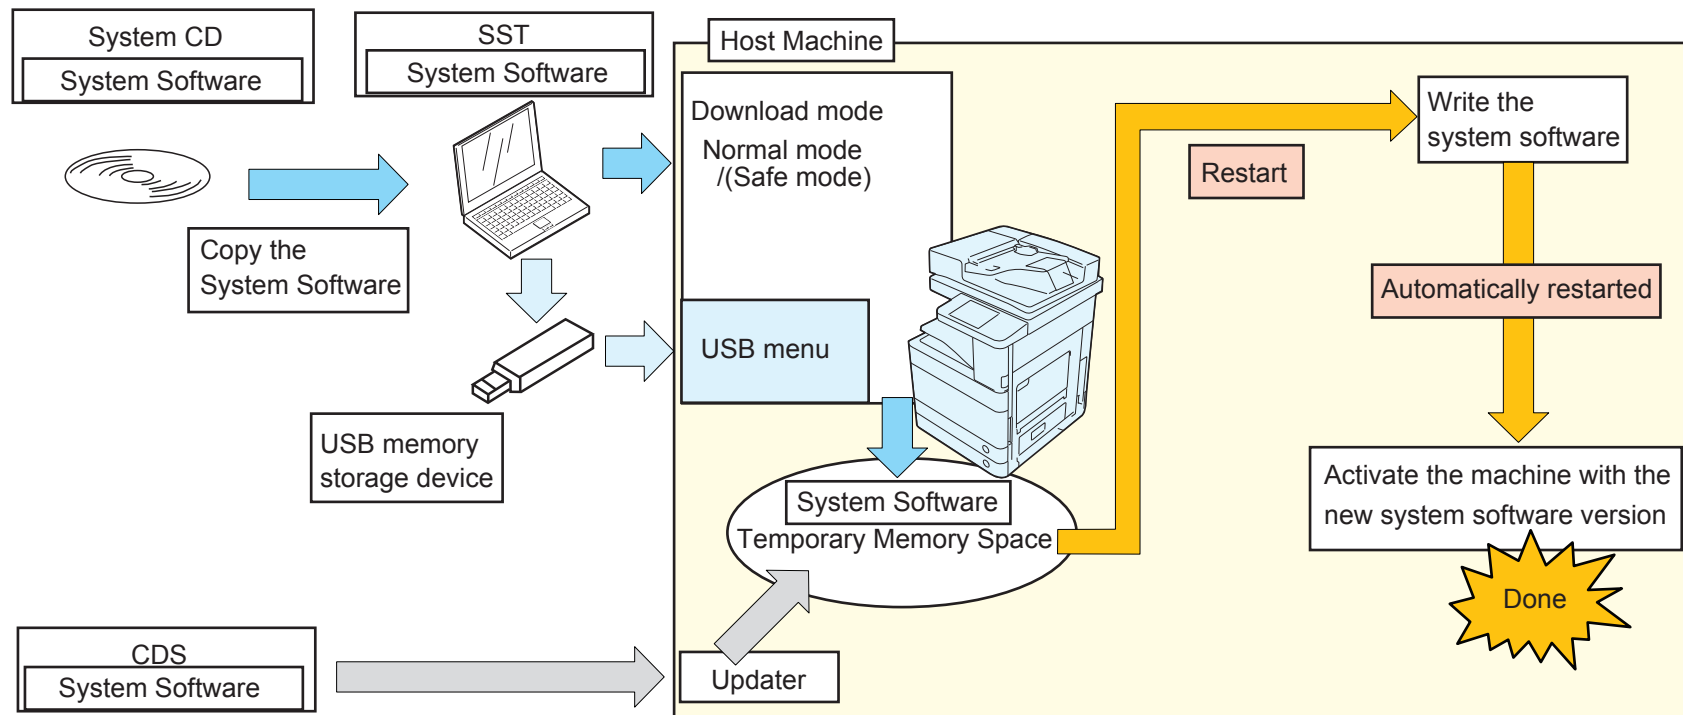

Overview of Version Upgrade

The system software version is upgraded in 2 steps, downloading and writing the new version of the system software.

Downloading System Software

This machine supports the following 3 downloading methods.

1. Download via the service support tool (hereinafter "SST")
Connect this machine to the PC by the cross cable to download the system software using SST installed in the PC.
2. Download using the USB memory storage device
Insert the USB memory storage device to the slot of the machine and download the system software stored in the device.
3. Download via Contents Delivery System (hereinafter "CDS")
Access to CDS via Internet to download the system software directly to the machine.

F-6-94

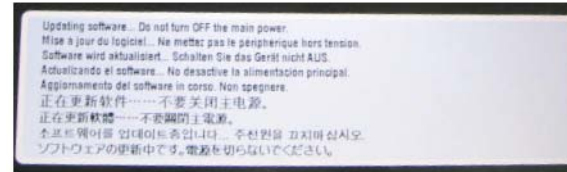

■ Writing System Software

The system software downloaded in either of the above-mentioned methods is stored in the temporary memory space.

After the system software is successfully downloaded, restart the machine to write the software in the machine.

In case the main power switch is turned OFF during the writing process, the machine may not be started.

This machine supports the remote version upgrade via CDS. When upgrading the system software via CDS, the warning message is shown on the control panel to alert the user not to turn OFF the power switch.

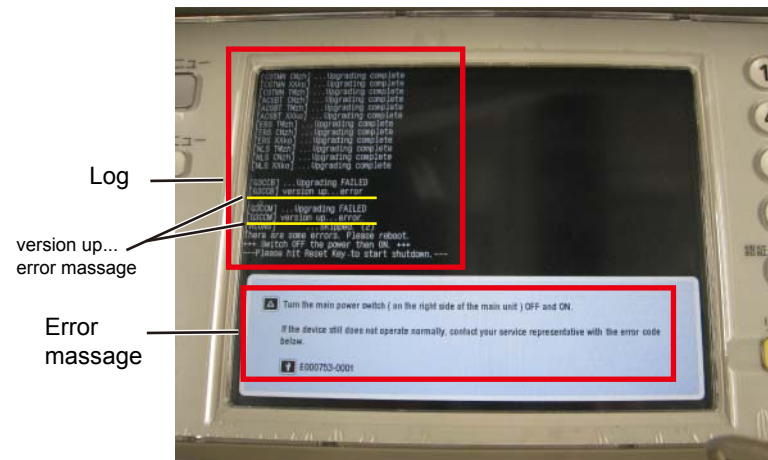

F-6-95

When the system software is successfully written, the machine is automatically restarted to activate the downloaded system software.

If any error occurs during the writing process, the error code, E753-0001, is shown.

The name of the system software component is shown to the left of the error log message, “version up....error”. Check the name if the software is for the option not attached to the machine. If so, turn OFF / ON the machine to recover the error (see Troubleshooting for details).

F-6-96

■ Download Mode

When the version is upgraded via SST or with the USB memory storage device storage device, start the machine in Download mode. This machine has the following 2 Download modes similarly with other iR-series models.

● Normal mode(recommend):

- Start from Copier > FUNCTION > SYSTEM > Download.
- Conventionally, the main power switch of this machine was turned ON while pressing 1 and 7 keys. However, the procedure above automatically assigns a static IP address and enables the download same as before.
- You can obtain the version information and avoid unnecessary download and errors.

NOTE :

When entering Download mode, be sure to go into Service mode after all items of main menu have been displayed.
This machine reads the version information of system software when it starts. You must start Download mode after the version information has been obtained.

● Safe mode:

- Press 2 and 8 keys simultaneously on the numeric keypad when turning on the power.
* Be sure to use "Single mode" when using SST. SST "Assist mode" cannot be used in safe mode. Any mode can be used when using USB.

System Software Components

The table below shows the system software components for this machine.

Software to be upgraded		Display on SST		How to upgrade versions			Remarks
		Registered name of product	Name of system software	SST	USB memory	CDS	
Host Machine	Main Controller	iPRC800	SYSTEM	Yes	Yes	No	
	Language Module		LANGUAGE	Yes	Yes	No	
	Remote UI Contents		RUI	Yes	Yes	No	
	RUI portal		RPTL	Yes	Yes	No	
	Accessibility		ACSBT	Yes	Yes	No	
	UI-BOX		BOX	Yes	Yes	No	
	UI-COPY		COPY	Yes	Yes	No	
	UI-SEND		SEND	Yes	Yes	No	
	MEAP Library		MEAPCONT	Yes	Yes	No	
	Paper Type Information File		MEDIA	Yes	Yes	No	
	Service Mode Contents		SMCNT	Yes	Yes	No	
	DC Controller		DCON	Yes	Yes	No	
			DSUB1	Yes	Yes	No	
	Box Checker		BCT	Yes	Yes	No	
	WebDAV Contents		WEBDAV	Yes	Yes	No	
	Custom Menu Application		CSTMN	Yes	Yes	No	
	Error Recovery System		ERS	Yes	Yes	No	
	Job Hold Application		HOLD	Yes	Yes	No	
	WDS-SCAN (JAVA UI)		WSDS	Yes	Yes	No	
Key/Certificate for Encrypted Communication	iAXXXX	KEY	Yes	Yes	No

	Resources for Web Browser		BROWSER	Yes	Yes	No	
	OCR Library	iAXXXX	SDICT	Yes	Yes	No	

T-6-13

This machine holds the increased number of system software components compared to conventional iR machines to meet vastly extended functionality.

The finisher for this machine supports version upgrade via the host machine in any of the above-mentioned methods, i.e., via SST, USB memory storage device storage device or CDS. Note that the External 2-hole Puncher UNIT B1T does not support version upgrade via the host machine. To upgrade versions, connect the option with the PC using the downloader PCB to download the system software via SST.

Note on Download Process

CAUTION: Never turn OFF the power during the download / writing process.

Turning off the power during the download / writing process may cause a failure of machine start-up at power-on.

If this occurs, start the machine in Safe mode (by pressing 2 and 8 keys simultaneously on the numeric keypad).

When the machine is successfully started in Safe mode, execute formatting of BOOTDEV partition, retry downloading the system software.

CAUTION:

Be sure to use normal mode when using download mode except in a case where it is not possible to start this machine and enter service mode.

In safe mode, version information of SYSTEM, MEAPCONT, LANGUAGE, RUI, and SDICT can be obtained, but version information of other system software such as DCON and RCON cannot be obtained. Therefore the following points to note are required when downloading in safe mode.

[RCON]

The version is not upgraded except in a case where Single mode of SST is used or when "Overwrite all" of USB download menu is used.

[DCON and others]

The following symptoms occur when SST (Single mode) or USB download menu (Auto) is used.

- The time for download/write becomes longer because the software is overwritten even when system software of the same version is being written.
- A confirmation message is not displayed when a lower version is going to be downloaded.

CAUTION: error code E753-0001

When an error occurs during writing process of the system software downloaded using SST or USB memory, error code E753-0001 is displayed.

Check if the target option is properly installed and see if the software to download is for the correct target option, and then execute downloading again.

Version Upgrade via SST

Overview

The system software can be downloaded either of the two modes below via SST.

- Assist mode (recommended)
- Single mode

Assist mode provides the following features.

- Attached option types are automatically recognized.
- The new versions of the system software for attached option types are automatically searched.
- The set of system software with interactive behavior confirmed is automatically downloaded.
- The accessories attached to the host machine are automatically recognized to download the system software for each accessory.

This machine holds a number of system software components that mutually interacts during operation. Behaviors of such system software should be confirmed when these are downloaded as the set. Thus, Assist mode is basically recommended to download the system software for this machine.

NOTE :

Use Single mode only when any of the following conditions is met.

- When downloading some the system software components, i.e. DCON, RCON or options.
- When reloading the system software after HDD is formatted.

Downloading System Software

System software is saved in the temporary storage area on HDD after downloaded with SST. Restart the machine after download so that it will be written to the system area, and the flash ROM.

After the writing has been completed normally, this machine automatically restarts with the new system software.

■ Copying System Software

● System CD to SST

Copy the system software stored in the system CD to SST.

NOTE:

The system software is compressed if the file size exceeds the CD memory capacity. If the above is the case, decompress the file before copying it to SST.

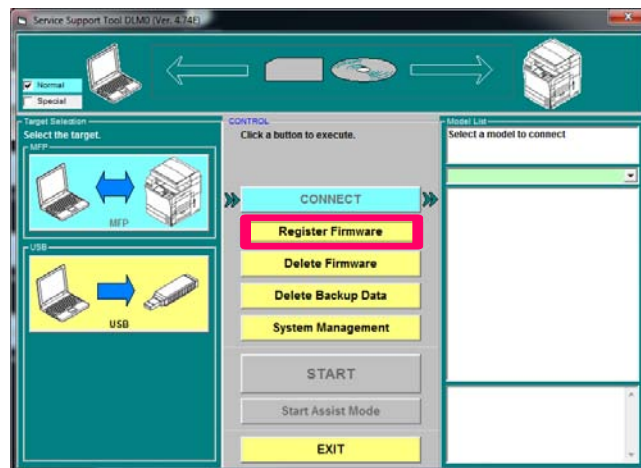

Preparation

Requirements:

- PC with SST Ver.4.74 or later installed
- The system CD for this machine

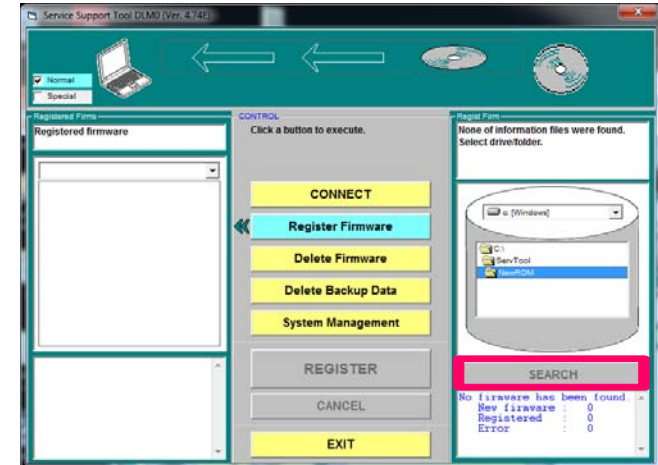

Steps to copy the system software

- 1) Start the PC
- 2) Set the system CD in the PC
- 3) Start SST
- 4) Click "Register Firmware" button.

F-6-98

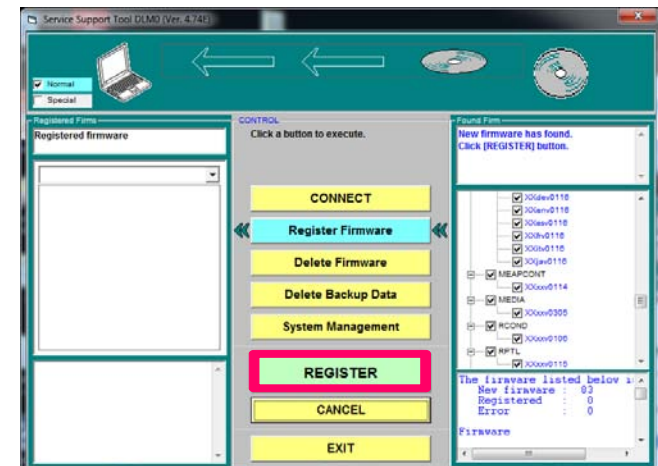

- 5) Select the drive where the system CD is set and click "Search" button.

F-6-99

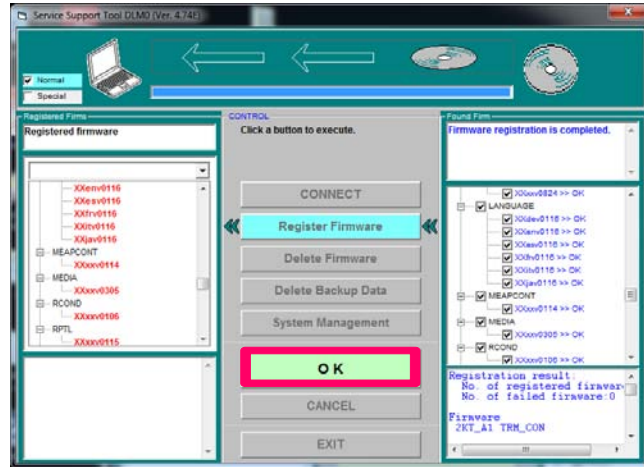

- 6) The system software stored in the system CD is listed.

Uncheck the box(es) for unnecessary folder(s) and/or system software and click "Copy" button.

F-6-100

7) The message is shown when the system software is successfully copied. Click “OK” button.

F-6-101

Connection

The following IP address is automatically set for this machine at start-up in Download mode.

- IP address: 172.16.1.100
- Subnet mask: 255.255.255.0

When the PC with SST installed is connected to this machine, change the PC network address to the following.

- IP address: 172.16.1.xxx (except 172.16.1.100)
- Subnet mask: 255.255.255.0
- Default gateway: arbitrary

CAUTION:

If the PC has the connection to the network, the settings changed to the above-mentioned may cause network failures due to redundant IP addresses, etc. Ensure that the PC is disconnected from the network when you change the PC network settings. Alternatively use the cross cable to connect the PC to this machine.

Preparation

Requirements

- PC with SST Ver. 4.74 or later installed and the system software for this machine is stored
- Cross cable
 - 10Base-T : Category 3 or 5
 - 100Base-T : Category 5
 - 1000Base-T : Enhanced Category 5 (CAT5e) or later

CAUTION:

Disconnect USB memory storage device storage devices if connected.

Communication to SST is disabled in this machine if any USB memory storage device storage device is recognized. SST and the USB memory storage device storage device cannot be used concurrently.

F-6-102

4) Check the IP address of the PC.

Go to Start menu to select Program > Accessory > Command Prompt.

Type IPCONFIG and press [Return] to see the network settings of the PC.

If any discrepancies from the description in the figure below are found, change the network settings of the PC.

```
Administrator: Command Prompt
C:\>ipconfig
Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . : 
    IP Address. . . . . : 172.16.1.160
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 

Tunnel adapter Local Area Connection* 8:

    Media State . . . . . : Media disconnected
    Connection-specific DNS Suffix  . : 
C:\>
```

F-6-103

CAUTION:

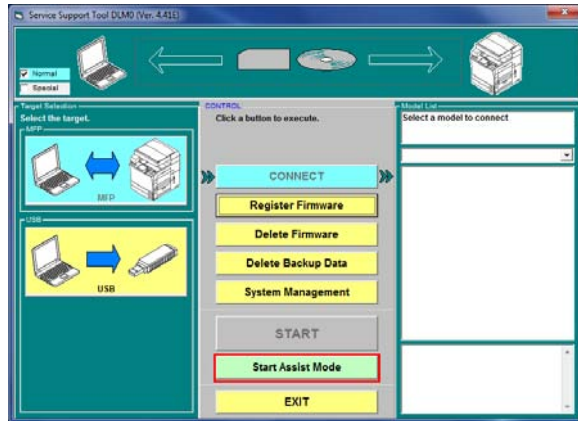

The network settings are not shown with IPCONFIG if the PC is disconnected from the network. To check the settings, connect the PC to this machine at power-on by the cross cable.

Steps

- 1) Use the cross cable to connect the machine to the PC with SST installed.
- 2) Turn on the main power switch of this machine.
- 3) Enter Service mode to start the machine in Download mode.
Select COPIER > FUNCTION > SYSTEM > DOWNLOAD and press [OK].

■ Downloading System Software (Assist mode)

- 1) Start this machine and enter Download mode (COPIER > FUNCTION > SYSTEM > DOWNLOAD).
- 2) Connect the PC to this machine and start SST.
- 3) Click “Start Assist mode” button.
Skip this step when starting SST in Assist mode.

F-6-104

If the upgraded set of the system software is stored in SST, the new set is automatically selected.

NOTE:

If no upgrade is stored, the existing system software set is unchanged. At any rate, any versions of the system software can be downloaded by manual selection.

NOTE:

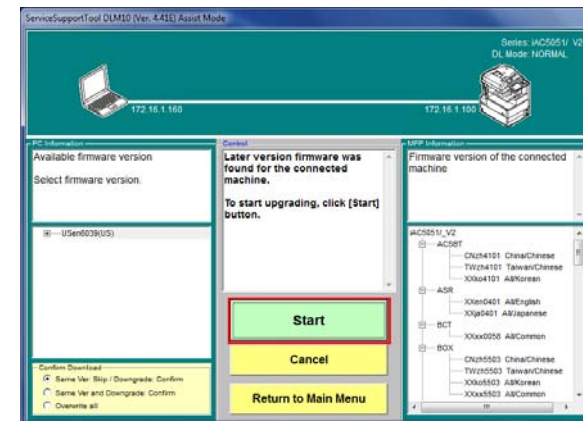

If the PC in Assist mode is connected to the machine in Safe mode,

F-6-105

only the system software of SYSTEM, LANGUAGE, RUI, MEAPCONT and SDICT can acquire version information.

- 4) Click “Start” button

F-6-106

When download is completed, the machine is automatically restarted to initiate the writing process. The machine may repeat restarting several times depending on option configuration. Upon the system software written, the machine is restarted again and the main menu is displayed.

NOTE: Download Confirmation Message Modes
Download is confirmed in any of the three message modes.

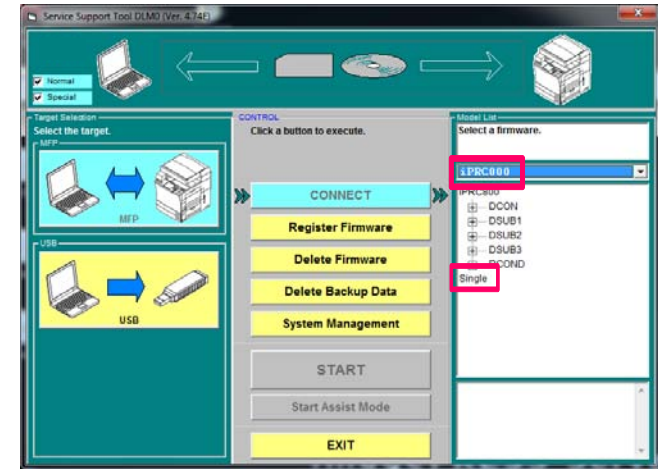

- Skip the existing versions and confirm whether to download downgraded versions
Upgraded versions are downloaded without message.
Skip download of the existing versions.
Confirm whether to download downgraded versions.
- Confirm whether to download the existing versions / downgraded versions
Upgraded versions are downloaded without message.
Confirm whether to download and overwrite the existing versions.
Confirm whether to download downgraded versions.
- Overwrite all versions
Regardless of version upgrade or downgrade, all versions of the system software are downloaded without message.

By default, "Skip the existing versions and confirm whether to download downgraded versions" is selected.

■ Downloading System Software (Single mode)

The following is the sample steps to download DCON (the other components of the system software can be downloaded similarly).

- 1) Start the machine in an appropriate Download mode.
- 2) Connect the PC to this machine to start SST.
- 3) Select the model to be connected and "Single", check the network settings. Click "Start" button.

F-6-108

- 5) Click "Next" button.

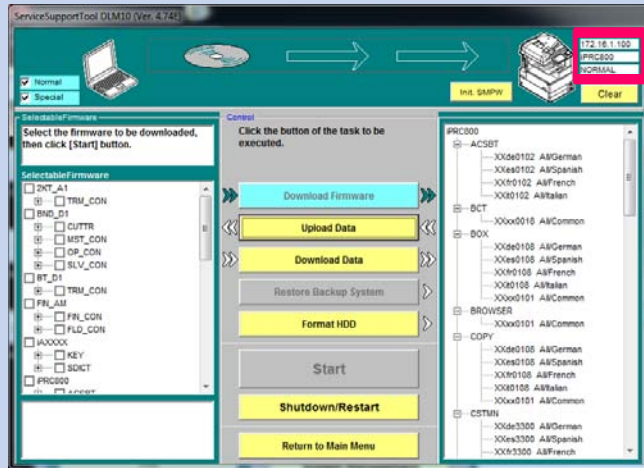

F-6-107

- 6) Disconnect the cross cable from the machine.
- 7) Enter Service mode to check the system software versions.
- 8) Click "OK" button.
The main menu is displayed.

NOTE:

The following device information is shown at the right top of SST screen.

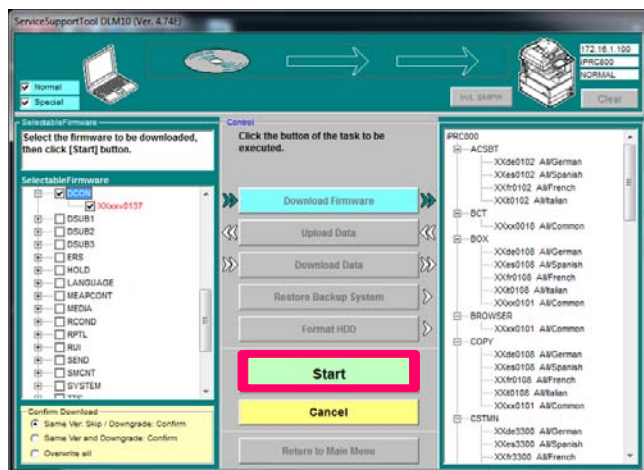

- IP address
- Model name
- Download mode

F-6-109

4) Select the DCON version to be downloaded and click "Start" button.

Multiple files can be selected in this step.

F-6-110

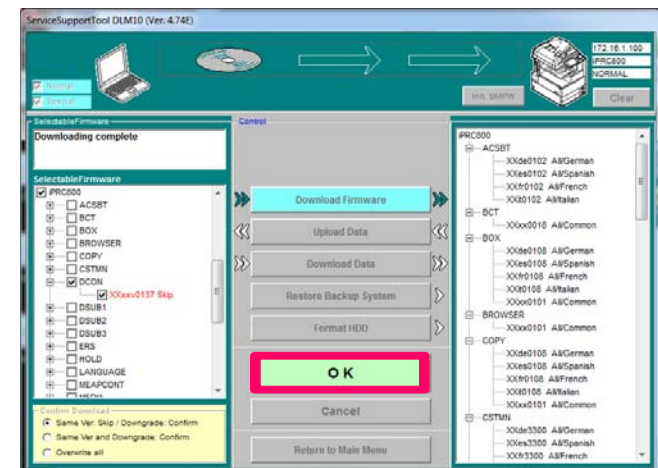

NOTE: Download Confirmation Message Modes

Download is confirmed in any of the three message modes.

- Skip the existing versions and confirm whether to download downgraded versions. Upgraded versions are downloaded without message. Skip download of the existing versions. Confirm whether to download downgraded versions.
- Confirm whether to download the existing versions / downgraded versions. Upgraded versions are downloaded without message. Confirm whether to download and overwrite the existing versions. Confirm whether to download downgraded versions.
- Overwrite all versions. Regardless of version upgrade or downgrade, all versions of the system software are downloaded without message.

By default, "Skip the existing versions and confirm whether to download downgraded

5) When download is completed, click "OK" button.

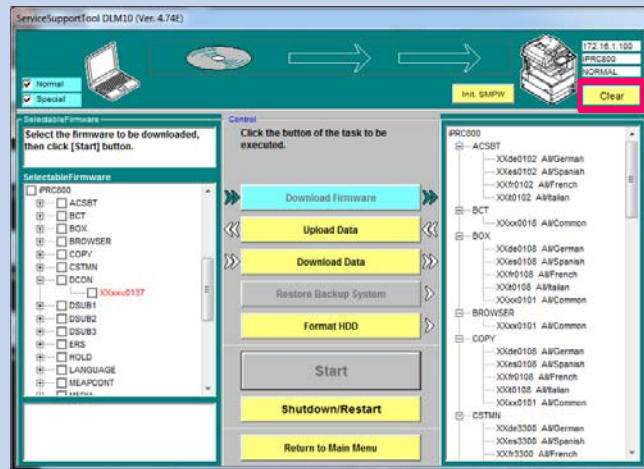

F-6-111

The main menu is displayed.

NOTE:

If it is before restarting the machine, the downloaded system software can be deleted not written on HDD or Flash ROM.

- 1) Click "Clear" button.
"Clear" button

F-6-112

- 2) Click "Execute Clear" button.

The system software, which is stored in the temporary memory space of HDD, is deleted.

F-6-113

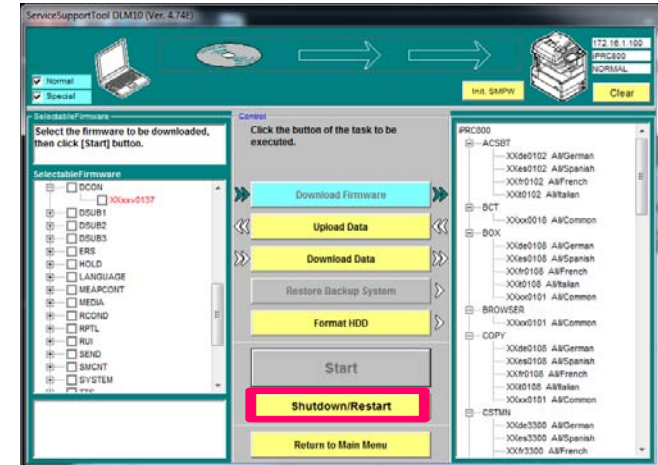

- 3) Click "OK" button.

Return to the previous screen.

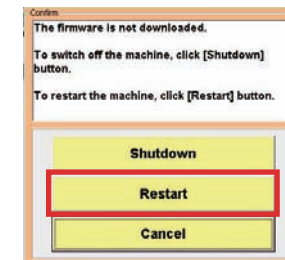

F-6-114

- 6) Click "Shutdown / Restart" button.

F-6-115

- 7) Click "Restart" button.

F-6-116

The machine is restarted.

The downloaded system software is written on HDD or Flash ROM.

- 8) Click "OK" button.

- 9) Enter Service mode to check the versions.

■ Formatting HDD

● Overview

This machine provides the following two types of HDD Formatting.

- ALL: to format the whole HDD
 - When HDD set as the service parts (the new HDD) is mounted
 - When clearing the system software and data completely from HDD and reloading the system software.

Once Format ALL is executed in your machine, all the user data and MEAP applications held in HDD will be cleared. Ensure to gain an agreement from the user before formatting.

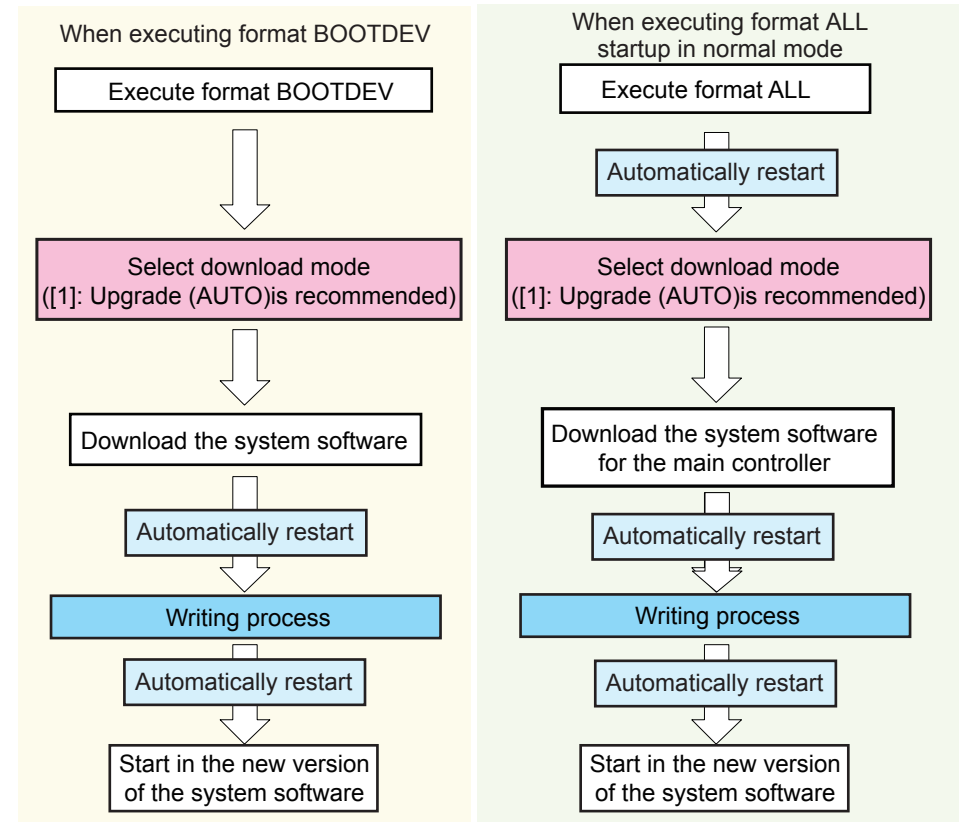

- BOOTDEV: to format the system software storage area on HDD.
 - When clearing the system software storage area and reloading the system software HDD needs not to be formatted at version upgrade.

HDD can be formatted only in Single mode.

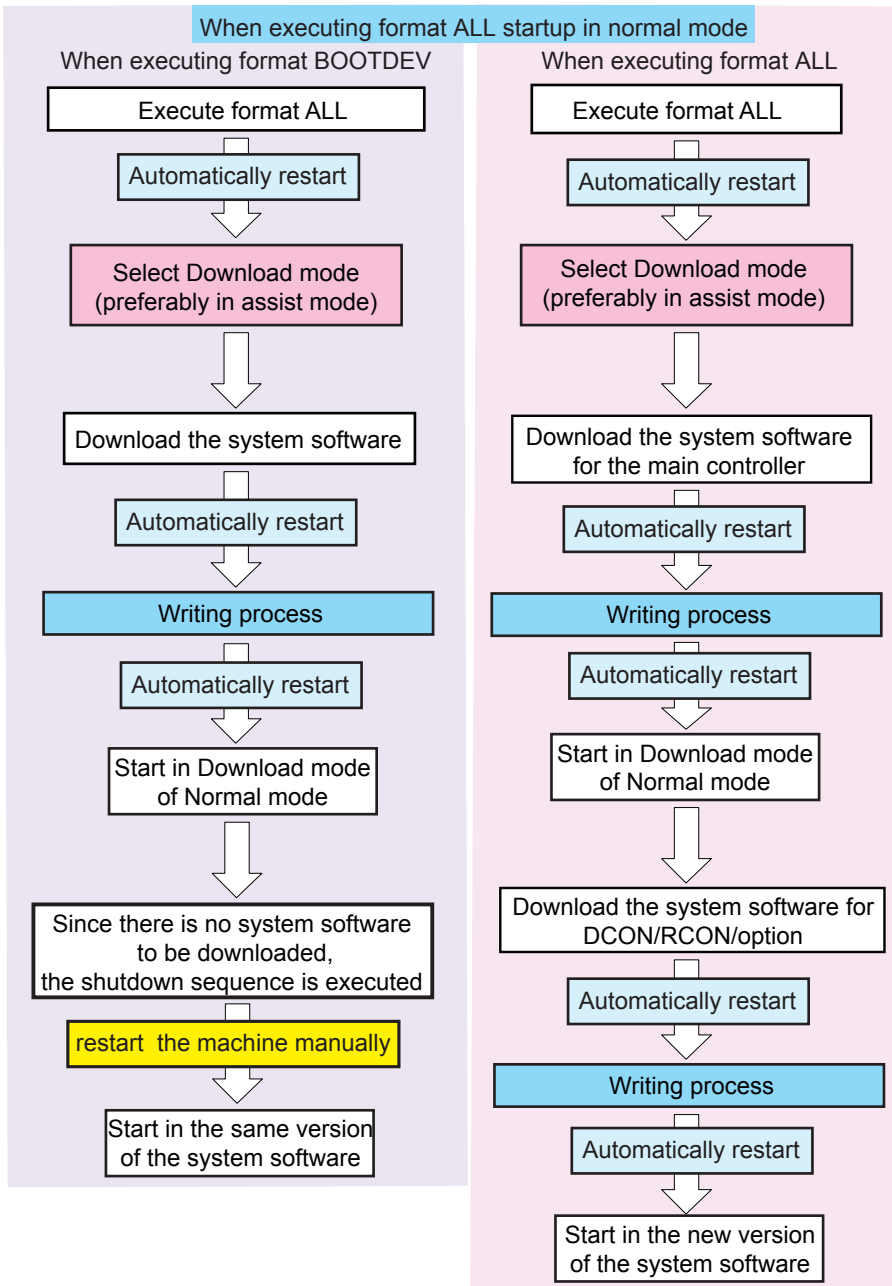

After HDD is formatted, the machine cannot be started before the system software is downloaded.

After Format ALL is executed, the machine is automatically restarted to reflect formatting to HDD. At this time, the machine automatically starts in Download mode. For BOOTDEV format, the machine is ready to download the system software without restarting.

After formatting, enter either Assist mode (recommended) or Single mode to download the system software.

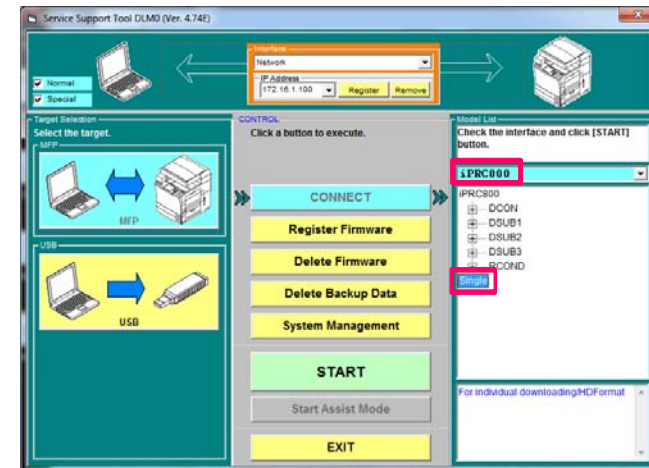

F-6-117

F-6-118

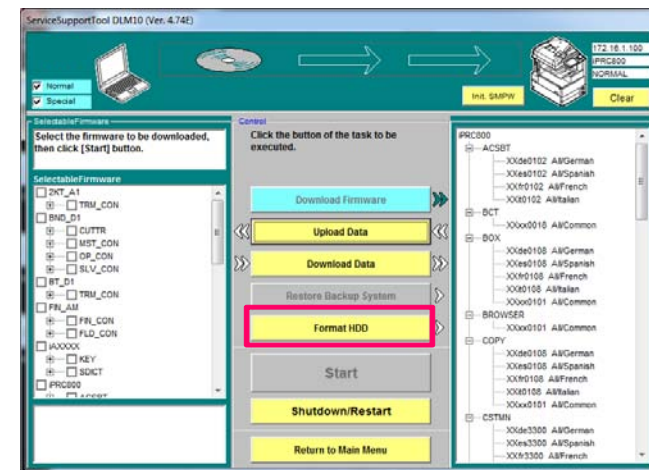

Steps of Formatting

- 1) Enter Download mode. (Enter Safe mode when you mount the new HDD or when the machine is unable to start normally due to HDD failures, etc.)
- 2) Connect the PC to the machine to start SST.
- 3) Select the model to be connected and "single". Check the network settings and click "Start" button.

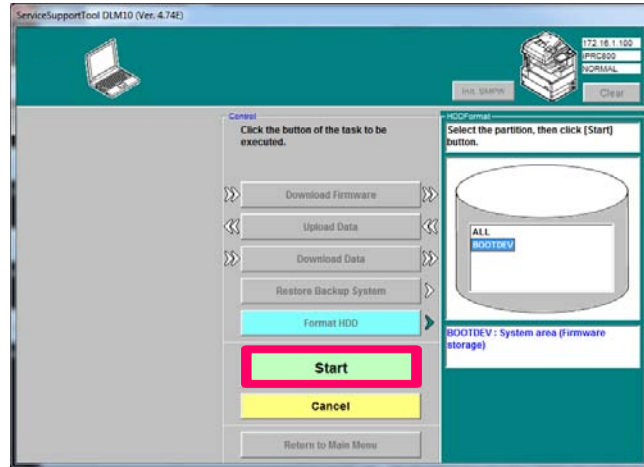

F-6-119

- 4) Click "Format HDD" button

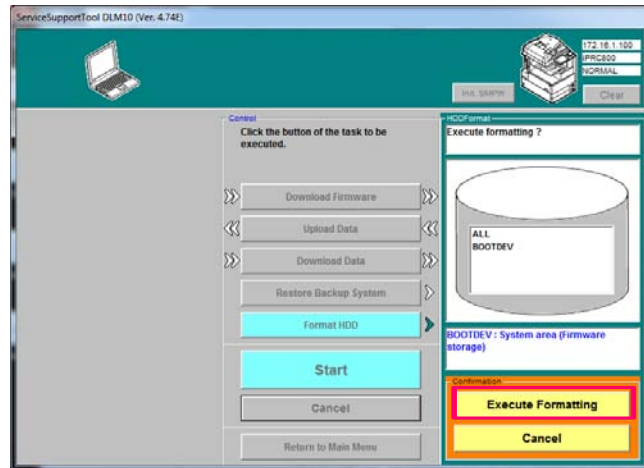

F-6-120

5) Select "BOOTDEV" or "ALL" to click "Start".

F-6-121

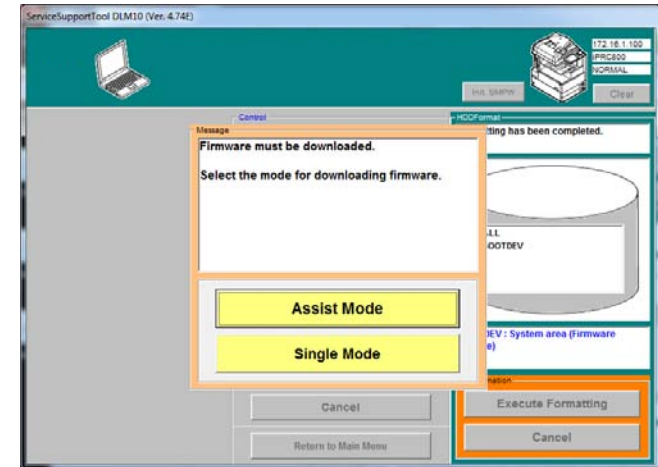

6) Click "Execute Format" button.

F-6-122

HDD is formatted.

7) Download the system software in any Download mode (Assist mode recommended). See the steps to download the system software for details.

F-6-123

CAUTION:

After HDD is formatted, ensure to download the system software. If the system software is not downloaded, E602 error is triggered at power-on.

CAUTION:

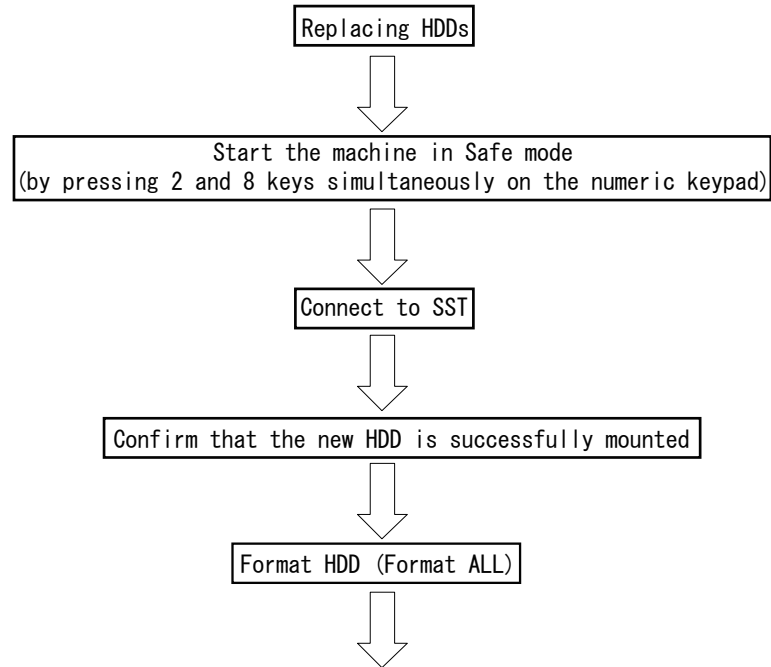

Restarting takes more time after HDD is formatted and the system software is downloaded (to write the downloaded software).

Down time may be approx. 5 minutes in maximum to proceed the writing process. Never turn OFF the machine while Starting screen is shown.

● Mounting New HDD

After HDD set as the service parts is mounted, the new HDD should be formatted initially. In this case, the message is shown to confirm if the new HDD is mounted.

The figure below shows the abbreviated steps.

Follow the steps as described in Format ALL section.

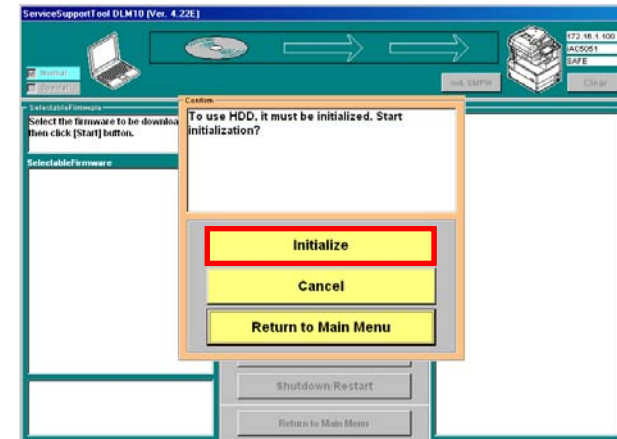

F-6-124

When the new HDD is mounted, the machine cannot be started in the normal procedure. Start the machine in Safe mode as Download mode. When gaining connection to SST, the message is shown to confirm if the new HDD is mounted.

F-6-125

Click "Yes" and the message is shown, confirming whether to format HDD.

F-6-126

Click "Initialize" button to initialize HDD (Format ALL). Follow the steps described in Format ALL section to download the system software.

Backup

Overview

At the time of replacing controller PCBs, the backup function enables to save data held in the PCB to migrate them to the new PCB.

- Backup via SST

Backup data	Downloaded/Uploaded file names
Backup data RAM	SramImg.bin(to be uploaded / downloaded)
MEAP applications	MeapBack.bin(to be uploaded / downloaded)
For investigation in Dev	Sublog.bin((Uploadable))
Service Print	The text file of the contents which You output to paper with a service mode(Uploadable).

T-6-14

- Backup RAM holds the data from Backup RAM of the Main Controller PCB 2.
(Because setting data of service mode for the parts counter and the Main Controller are stored, be sure to back up the data when replacing the Main Controller PCB and the DC Controller PCB.)
- MeapBack holds MEAP applications and their data stored in HDD

- Backup via Service mode

Backup data	Service mode
Backup of Reader Controller PCB	COPIER > FUNCTION > SYSTEM RSRAMBUP (Backup) COPIER > FUNCTION > SYSTEM RSRAMRES (Restore)
Backup of DC Controller PCB	COPIER > FUNCTION > SYSTEM DSRAMBUP (Backup) COPIER > FUNCTION > SYSTEM DSRAMRES (Restore)

T-6-15

Data is stored in HDD.

NOTE:

Before replacing the Reader Controller PCBs, back up the data from Service mode. The backup data can be restored from Service mode when the PCBs are replaced. This enables to maintain the setting data including Service mode stored in the old Reader Controller PCB.

Before replacing the DC controller PCBs, back up the data from Service mode. The backup data can be restored from Service mode when the PCBs are replaced. This enables to maintain the setting data including Service mode stored in the old Controller PCB.

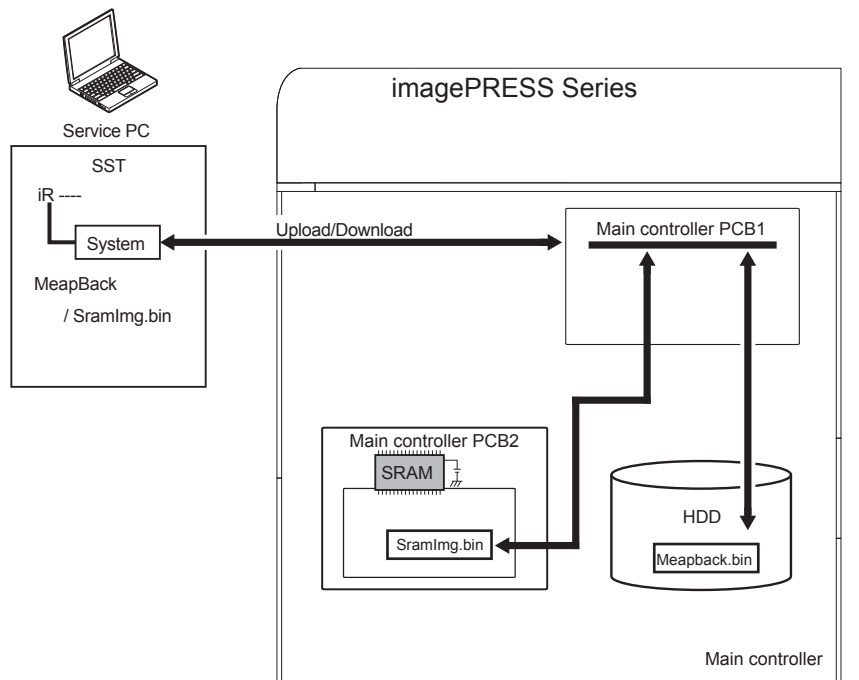

Before replacing the Main Controller PCB 2, upload SramImg.bin. By downloading SramImg.bin after replacement, the new Main Controller PCB 2 inherits the data including Service mode stored in the old PCB

Store Meapbackup.bin; and "Settings/Registration > Data Management> Initialize All Data/Setings"; Restore it; even if it, cannot log in to SMS.
Restore Meapbackup.bin which backed up after "Initialize All Data/Setings"; store it.

Steps to Upload Data

CAUTION:

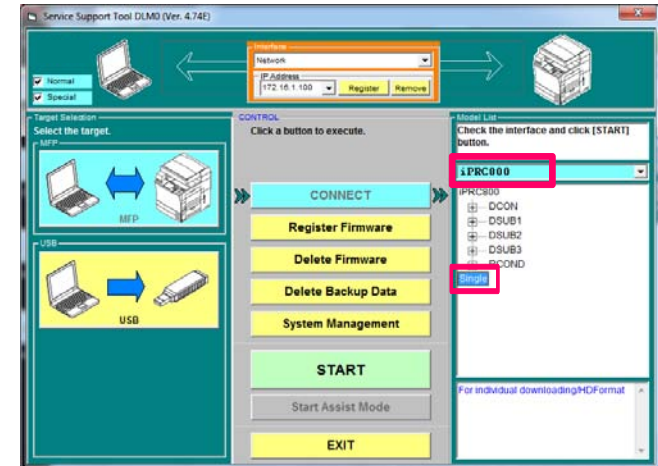

- When the Canon quality-appointed staff determines the need for an analysis of debug log by the R&D department, we ask the field to collect log for an investigation to determine the cause.
- The backup data can be downloaded only on the machine from which the data were uploaded.
- This machine does not use SramRCON and SramDcon

F-6-127

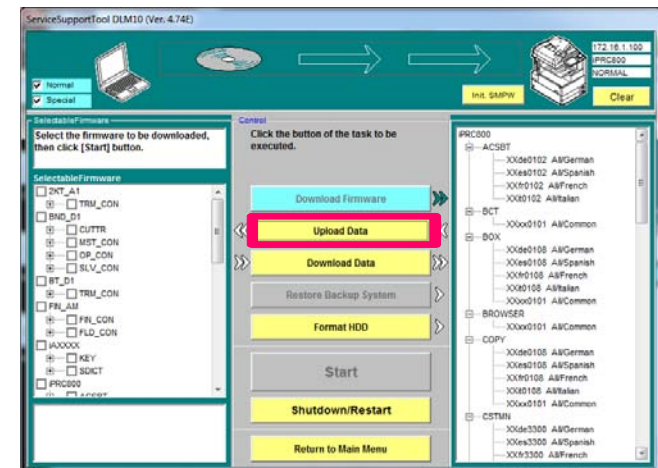

Listed below are the sample steps to upload MeapBack.

- Enter Download mode.
- Connect the PC to the machine to start SST.
- Select the model to be connected and "Single". Check the network settings and click "Start".

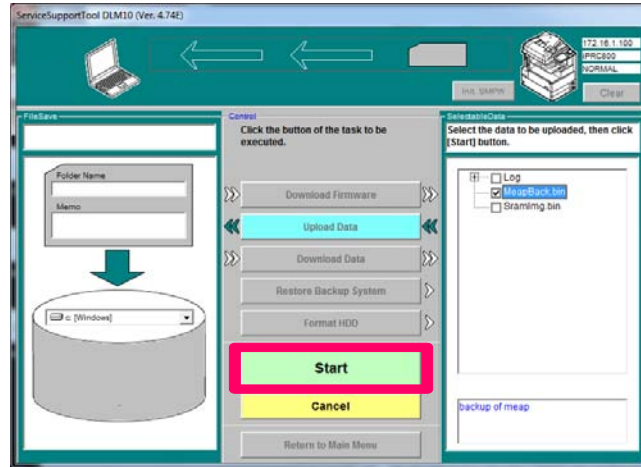

F-6-128

- Click "Upload Data" button.

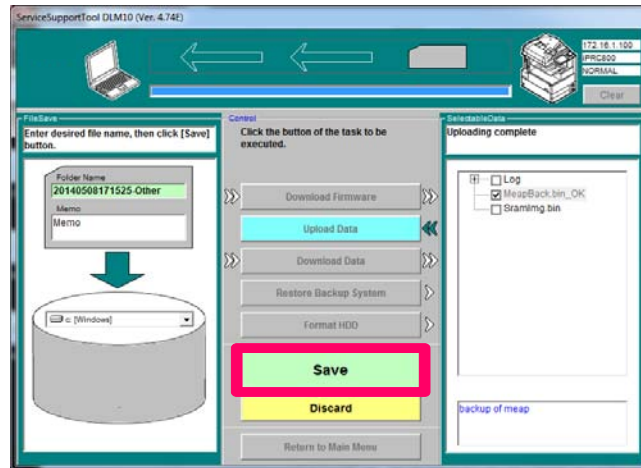

F-6-129

5) Select "MeapBack.bin" to click "Start" button.

F-6-130

6) Enter the file name to be saved and comments when necessary. Click "Save" button.

F-6-131

7) Click "OK" button.

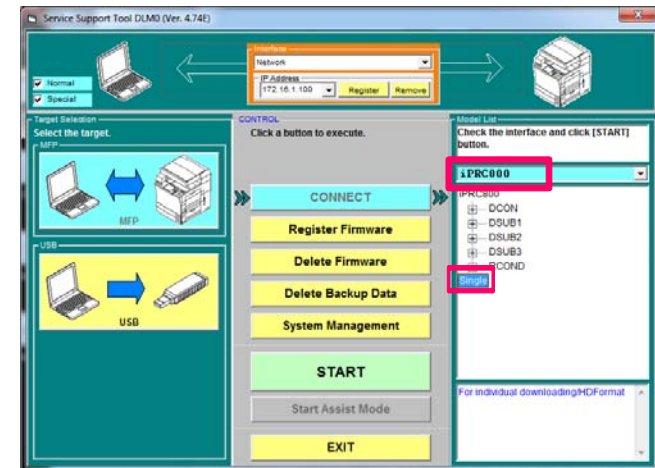

Steps to Download Data

CAUTION:

- The backup data can be downloaded to the machine from which the data were uploaded
- Store Meapbackup.bin; and "Settings/Registration > Data Management> Initialize All Data/Setings"; Restore it; even if it, cannot log in to SMS. Restore Meapbackup.bin which backed up after "Initialize All Data/Setings"; store it.

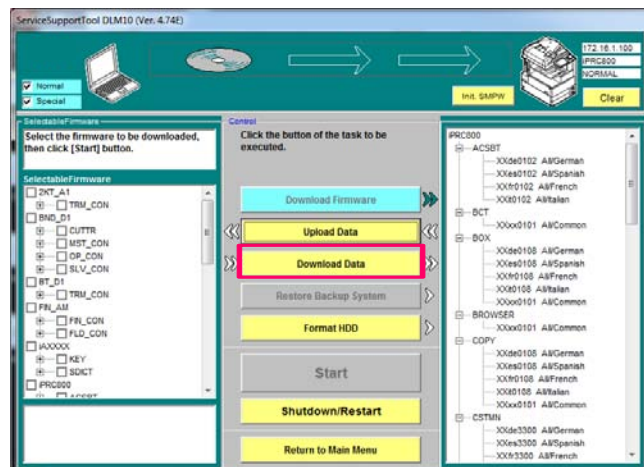

Listed below were the sample steps to download MeapBack.

- 1) Enter Download mode
- 2) Connect the PC to the machine and start SST.
- 3) Select the model to be connected and "Single". Check the network setting and click "Start" button.

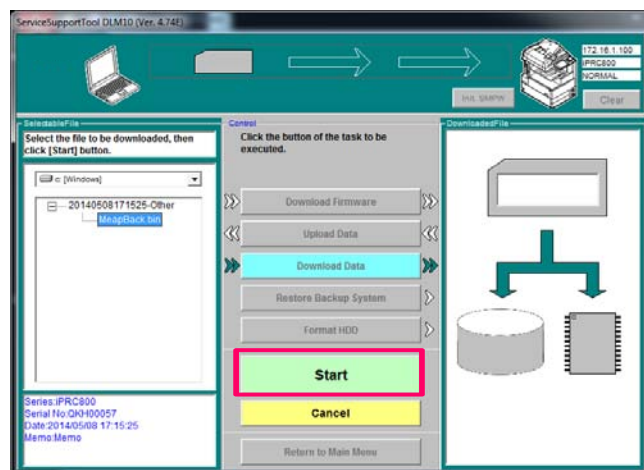

F-6-132

4) Click "Download Data" button.

F-6-133

5) Select the data to be downloaded and click "Start" button.

F-6-134

6) When the data are successfully downloaded, click "OK" button.

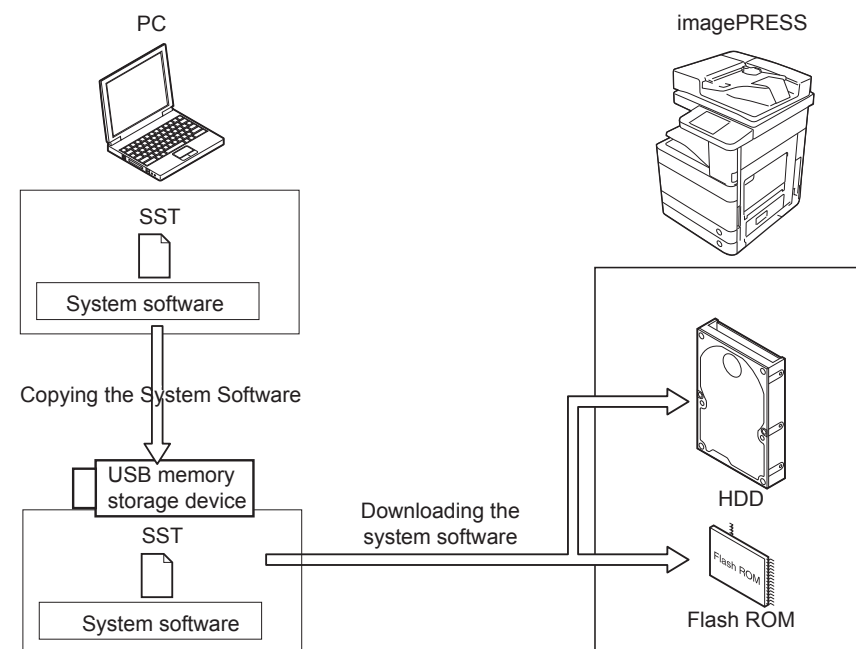

7) Restart the machine

Version Upgrade using USB memory Storage Device

Relation between SST and USB memory storage device Storage Device

When using the USB memory storage device storage device for version upgrade, the system software should be copied to the USB memory storage device storage device. By inserting the USB memory storage device storage device to the slot of the machine, the system software can be upgraded.

The figure below shows the relation between SST and USB memory storage device storage device.

F-6-135

When downloading the system software, enter any of Download modes below.

- Normal mode (recommended)
Select COPIER > FUNCTION > SYSTEM > Download in Service mode and press [OK].
- Safe mode (only when any system error occurs or the machine is unable to start normally;
turn ON the main power switch by pressing 2 and 8 keys simultaneously on the numeric keypad)

● Downloading System Software

Copy the system software from SST to the USB memory storage device storage device. Right after download from the USB memory storage device storage device, the system software is stored in the temporary memory space in HDD.

The system software is written in the system memory area, Boot area and Flash ROM upon the machine restarted.

When the writing process is successfully completed, the machine is automatically restarted with the new version of the system software.

■ Copying System Software

● System CD to SST

Copy the system software stored in the system CD to SST.

NOTE:

The system software is compressed if the file size exceeds the CD memory capacity. If the above is the case, decompress the file before copying it to SST.

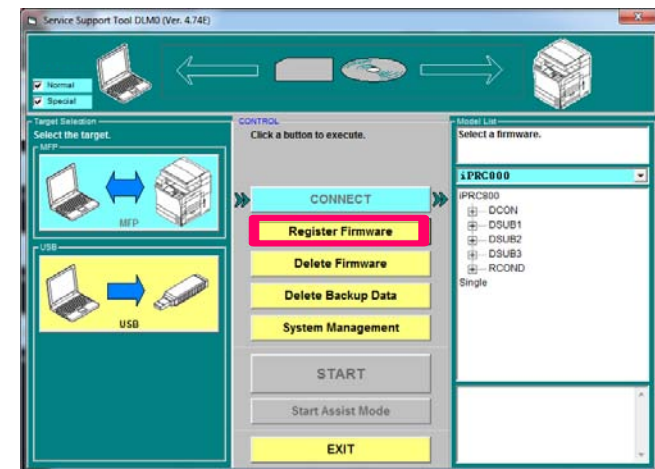

Preparation

Requirements:

- PC with SST Ver. 4.74 or later installed
- The system CD for this machine

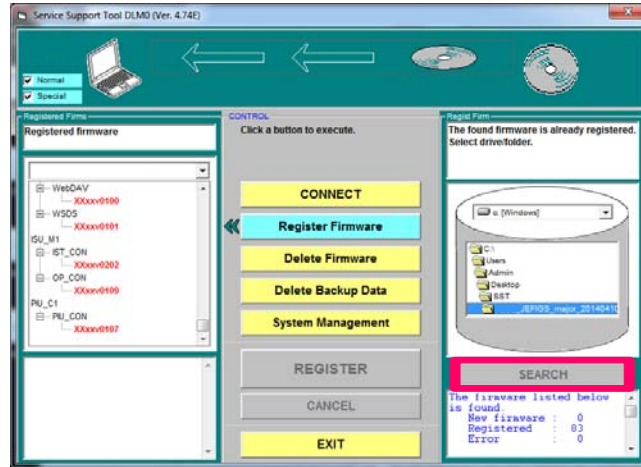

Steps to copy the system software

- 1) Start the PC.
- 2) Set the system CD to the PC.
- 3) Start SST.
- 4) Click "Register Firmware" button.

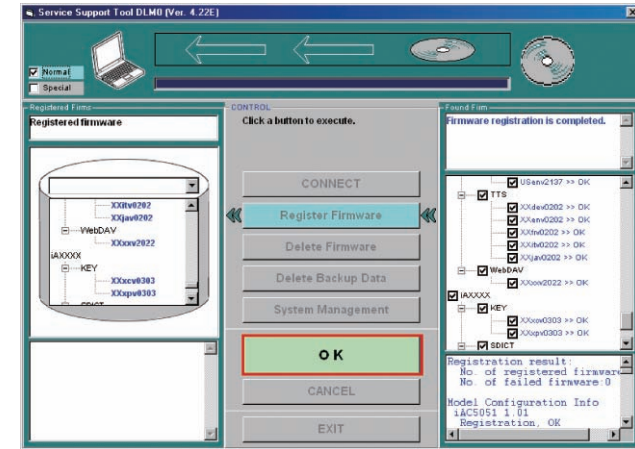

F-6-137

5) Select the drive where the system CD is set and click "Search" button.

F-6-138

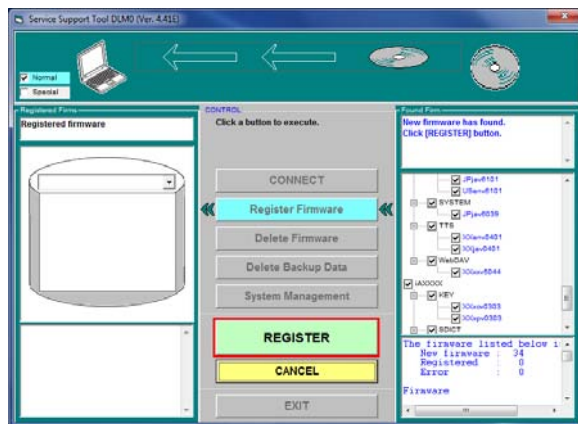

7) The message is shown when the system software is copied. Click "OK" button.

F-6-140

6) The list of the system software components stored in the system CD is shown on the screen.

Uncheck the box(es) of unnecessary folder(s) and/or system software component(s) and click "Copy" button.

F-6-139

● SST to USB memory Storage Device

Copy the system software stored in SST to the USB memory storage device storage device.

Preparation

Requirements:

- PC with SST Ver. 4.74 or later installed
- USB memory storage device (*)

Requirements for USB memory storage device:

Interface: USB 1.1 or later (USB 2.0 is recommended)

Memory capacity: 1GB or more is recommended (the total file size of the system software is approx. 500MB).

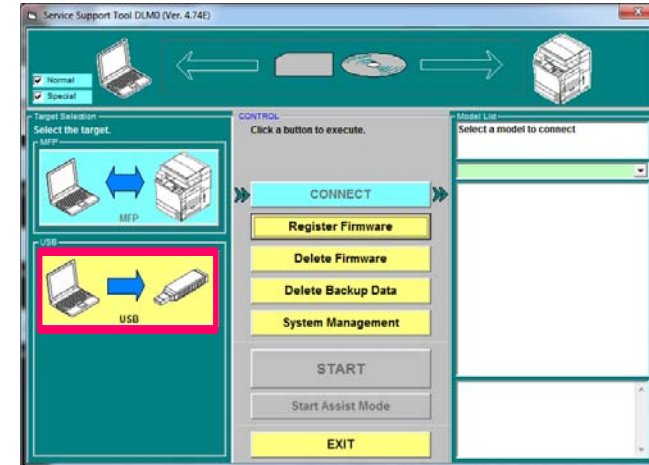

Format: FAT (FAT 16), FAT32 (NTFS and HFS are not supported). The memory is formatted in a partition (multiple partitions are not supported)

Unavailable USB memory: memory that is protected by a password or the encryption technology.

Steps to copy the system software

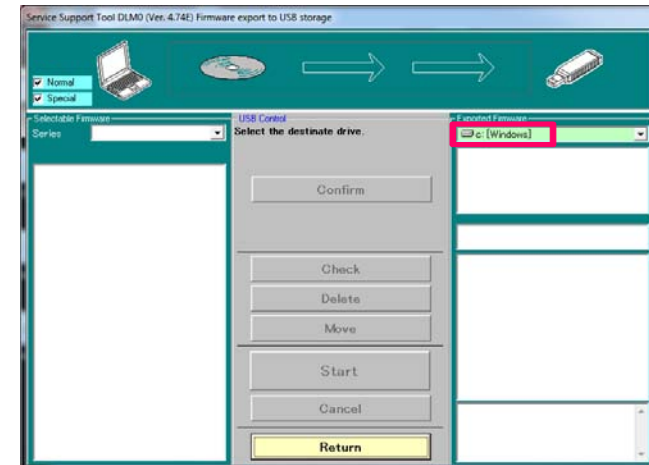

- 1) Start the PC.
- 2) Insert the USB memory storage device storage device to the slot of the PC.
- 3) Start SST.

4) Click the USB icon shown in "Select the target" Screen.

F-6-141

5) Select the drive (removable disk) where the USB memory storage device storage device is inserted.

F-6-142

6) Select "Series" and "Version" (the System Version).

F-6-143

NOTE:

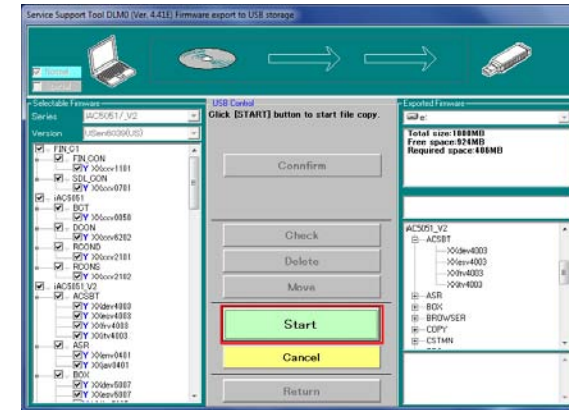

The signs shown in the field of "Firmware registration static" indicate the following:

Y: Stored in SST

N: Not stored in SST

7) Click "Start" button.

Start copying the system software to the USB memory storage device storage device.

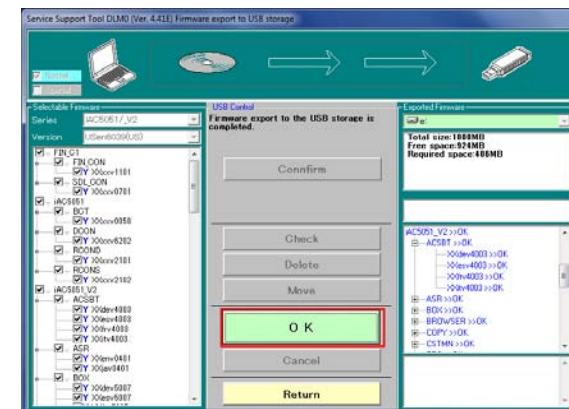

F-6-144

NOTE:

When the accessory configuration is known for the machine where the system software is to be downloaded, uncheck the boxes of unnecessary accessories. E753-0001 is triggered if the software for an unnecessary accessory is downloaded. (If this occurred, turn OFF/ON the power to recover the error.)

8) Click "OK" when the system software is successfully copied in the USB memory storage device storage device.

F-6-145

Connection

CAUTION:

This machine does not communicate with SST once it recognizes a USB memory storage device; therefore, SST and a USB memory storage device cannot be used at the same time.

Preparation

Item to prepare: a USB memory storage device, which the system software for this machine is stored.

Procedure

- 1) If a cross cable is connected to this machine, remove the cross cable.
- 2) Connect the USB memory storage device to the USB port.

F-6-146

3) Switch to the download mode to use.

- In the case of normal mode (Recommended)
Select the following in Service Mode: COPIER > FUNCTION > SYSTEM > DOWNLOAD;
and then press [OK].
- In the case of safe mode (This mode should not be used as general rule. To be used only when normal startup fails, such as a system error, etc.)

While pressing 2 + 8 keys at the same time, turn ON the Main Power Switch.

Once this machine recognizes the USB memory storage device, the following menu is displayed on the Control Panel.

```
[[[[[ download Menu (USB) ]]]]]]]]]]]
```

```
[1]: Upgrade (Auto)
[2]: Upgrade (w Confirmation)
[3]: Upgrade (Overwrite all)
[4]: Format HDD
[5]: Backup
[7]: Clear downloaded files
[8]: download Menu 2
[9]: Other Menu
```

```
[Reset]: Shutdown
```

F-6-147

CAUTION:

Depending on the manufacturer or the model, this machine may not recognize the USB memory storage device.

This machine retries the detection of a USB memory storage device for up to 60 seconds after power-ON. The above menu is not displayed if the recognition of a USB memory storage device is failed within the time period.

In such a case, use another USB memory storage device.

■ Upgrading System Software

● Menu/Function Overview

```

[[[[[ download Menu (USB) ]]]]]]]]]]
-----
[1]: Upgrade (Auto)
[2]: Upgrade (w Confirmation)
[3]: Upgrade (Overwrite all)
[4]: Format HDD
[5]: Backup
[7]: Clear downloaded files
[8]: download Menu 2
[9]: Other Menu

[Reset]: Shutdown

```

F-6-148

Downloading System Software

[1]: Upgrade(Auto)

To download/write the system software (automatic)

[2]: Upgrade (w Confirmation)

To download the system software (confirmation)

[3]: Upgrade (Overwrite all)

To download the system software (overwriting)

[4]: Format HDD

To format the HDD/BOOTDEV partition

[5]: Backup

Collection of debug Log or Service Print(Because You are for R&D review, do not use it other than the following.)

[7]: Clear downloaded files

To clear the system software immediately after downloading (before writing)

[8]: Download Menu 2

To move to Download Menu 2

[9]: Other Menu

Others (e.g.: version information)

[Reset]: Shutdown

To execute shutdown sequence

Press the key on the Control Panel to select/execute the functions.

● Points to Note When Operating/Using System Software

NOTE:

The following download method is recommended to execute normal download of the system software (any download work other than downloading after replacing/formatting the HDD):

Download mode --- Normal mode

Download menu --- [1]: Upgrade (Auto)

CAUTION: Prohibition to turn OFF the power during downloading/writing

Do not turn OFF the power during downloading or writing of the system software; otherwise, this machine may not be started even if the power is turned ON.

If the machine fails to be started even if the power is turned ON, start the machine in safe mode (pressing 2 + 8 keys).

When the machine can be started in safe mode, be sure to download the system software once again.

If the machine fails to be started, replace the HDD and then download the system software.

CAUTION: Note when the power is turned OFF

Be sure to execute shutdown sequence to quit download mode.

Pressing the [Reset] key and then the [0] key on the menu screen executes the shutdown sequence.

Once the message on the touch panel disappears, turn OFF the Main Power Switch.

F-6-149

■ Downloading/Writing System Software (Automatic)

● [1]: Upgrade (Auto)

The version is compared between the host machine/option and the system software in the USB memory storage device to download only the system software with newer version in the USB memory storage device to the temporary storage area of the HDD.

In safe mode, only the following system software can retrieve the version information (the version is compared).

SYSTEM, LANGUAGE, RUI, MERAPCONT, SDICT

As for system software of the host machine whose version information cannot be obtained, the software for RCON is not downloaded, but other software are downloaded.

For the system software of the option that is not connected, it is handled as follows:

<In the case of startup in normal mode (Recommended)>

- When Download Mode Version (to be displayed on the initial screen when starting the download mode) is before 00.36
 - All the system software including the one of the non-connecting option is to be downloaded as well (E753 is displayed).
- When Download Mode Version (to be displayed on the initial screen when starting the download mode) is 00.36:
 - For the Finisher that is not connected, the system software is not to be downloaded. G3CCB/G3CCM is to be downloaded even if Super G3FAX Board – AE1 is not installed (E753 is displayed).
- When Download Mode Version (to be displayed on the initial screen when starting the download mode) is 00.40 or later:
 - For the option that is not connected, the system software is not to be downloaded.

<In the case of startup in safe mode>

The system software of the options which are not connected are not downloaded.

After downloading is complete, this machine is automatically restarted to write the downloaded system software to the HDD system area/flash ROM.

Operation procedure

- 1) Enter download mode.
 - 2) Connect the USB memory storage device to the USB port.
 - 3) Press the key on the Control Panel.
- [1] -> [0]: To execute downloading/Any key other than [0] key: To return to the menu screen.

```

[[[[[ download Menu (USB) ]]]]]]]]]]
-----
[1]: Upgrade (Auto)
[2]: Upgrade (w Confirmation)
[3]: Upgrade (Overwrite all)
[4]: Format HDD
[5]: Backup
[7]: Clear downloaded files
[8]: download Menu 2
[9]: Other Menu

[Reset]: Shutdown

```

F-6-150

During downloading, download status is displayed on the Control Panel.

F-6-151

Once downloading is complete, this machine is automatically restarted to start writing to the HDD system area/flash ROM.

The screen shows the countdown once writing process is properly complete.

F-6-152

Once the countdown shows 0, this machine is automatically restarted.

- 4) When the main menu is displayed, press the removal key at the lower right on the touch panel and select removal of the memory media, and then remove the USB memory storage device.

CAUTION:

After HDD formatting and downloading, this machine takes a long time (for writing the software).

This machine, in some cases, stays in standby screen up to 10 min during writing. At this time, do not turn off the main power switch.

■ Downloading System Software (Confirmation)

● [2]: Upgrade (w Confirmation)

The version is compared between the host machine/option and the system software in the USB memory storage device to download the system software with newer version in the USB memory storage device to the temporary storage area of the HDD.

When the system software version in the USB memory storage device is the same or older, a confirmation message is displayed on the Control Panel so that the user can select whether to overwrite or not.

In safe mode, only the following system software can retrieve the version information (the version is compared).

SYSTEM, LANGUAGE, RUI, MERAPCONT, SDICT

As for system software of the host machine whose version information cannot be obtained, the software for RCON is not downloaded, but other software are downloaded.

For the system software of the option that is not connected, it is handled as follows:

<In the case of startup in normal mode (Recommended)>

- When Download Mode Version (to be displayed on the initial screen when starting the download mode) is before 00.36:
All the system software including the one of the non-connecting option is to be downloaded as well (E753 is displayed).
- When Download Mode Version (to be displayed on the initial screen when starting the download mode) is 00.36:
For the Finisher that is not connected, the system software is not to be downloaded. G3CCB/G3CCM is to be downloaded even if Super G3FAX Board – AE1 is not installed (E753 is displayed).
- When Download Mode Version (to be displayed on the initial screen when starting the download mode) is 00.40 or later:
For the option that is not connected, the system software is not to be downloaded.

<In the case of startup in safe mode>

The system software of the options which are not connected are not downloaded.

Unlike menu [1], this machine is not automatically started despite completion of downloading. By manually turning OFF/ON the power, the system software is written at the time of startup. In this case, starting the machine in safe mode deletes the downloaded system software saved in the temporary storage area; therefore, do not press the numeric keys (2 + 8), but execute normal startup to execute writing.

Operation procedure

- 1) Enter download mode.
- 2) Connect the USB memory storage device to the USB port.
- 3) Press the key on the Control Panel.
[2] -> [0]: To execute downloading/Any key other than [0] key: To return to the menu screen.

```
[[[[[ download Menu (USB) ]]]]]]]]]]]
```

```
-----
[1]: Upgrade (Auto)
[2]: Upgrade (w Confirmation)
[3]: Upgrade (Overwrite all)
[4]: Format HDD
[5]: Backup
[7]: Clear downloaded files
[8]: download Menu 2
[9]: Other Menu
```

```
/[2] has been selected. Execute?/
- (OK):0 / (CANCEL):Any other keys -
```

F-6-153

During downloading, download status is displayed on the Control Panel.

NOTE:

When the system software version in the USB memory storage device is the same or older than the system software in the HDD, a message is displayed in each case to confirm whether to overwrite or not.

Press the key on the Control Panel.

[0]: To overwrite/Any key other than [0]: Not to overwrite

```
////Copying files from USB-dev.////
[Warning] Same version or old version.
-----
[BOOT XXxx]. ... Same. OVERWRITE?
-- (YES):0 / (NO):The other keys--
```

F-6-154

Once downloading is complete, a message is displayed to encourage pressing the "Reset" key.

F-6-155

- 4) Press the "Reset" key.
Shutdown sequence is executed.
- 5) Once the message on the touch panel disappears, turn OFF the Main Power Switch.
- 6) Remove the USB memory storage device.
- 7) Ensure the LED at the lower right on the Control Panel is turned OFF, and turn ON the Main Power Switch.
Writing to the HDD system area/flash ROM is started after the startup. The screen shows the countdown once the writing process is properly completed.
The screen shows the countdown once the writing process is properly completed. This machine is restarted with the downloaded system software at the count of 0.

■ Downloading System Software (Overwriting)

● [3]: Upgrade (Overwrite all)

Regardless of the system software version in the host machine, all the system software in the USB memory storage device is downloaded.

Regardless of the system software version in the host machine, all the system software in the USB memory storage device is downloaded.

Unlike menu [1], this machine is not automatically started despite completion of downloading. By manually turning OFF/ON the power, the system software is written at the time of startup. In this case, starting the machine in safe mode deletes the downloaded system software saved in the temporary storage area; therefore, do not press the numeric keys (2 + 8), but execute normal startup to execute writing.

Operation procedure

- 1) Enter download mode.
- 2) Connect the USB memory storage device to the USB port.
- 3) Press the key on the Control Panel.
[3] -> [0]: To execute downloading/Any key other than [0] key: To return to the menu screen.

```

[[[[[ download Menu (USB) ]]]]]]]]]]]
-----
[1]: Upgrade (Auto)
[2]: Upgrade (w Confirmation)
[3]: Upgrade (Overwrite all)
[4]: Format HDD
[5]: Backup
[7]: Clear downloaded files
[8]: download Menu 2
[9]: Other Menu

/[3] has been selected. Execute?/
- (OK):0 / (CANCEL):Any other keys -

```

F-6-156

During downloading, download status is displayed on the Control Panel.

CAUTION:

In overwriting download mode of the USB memory storage device, all the system software stored in the USB memory storage device is downloaded as well. Therefore, be sure to keep the following in mind: If the USB memory storage device includes the system software of non-connecting option, E753-0001 is displayed when the writing process is completed.

In the case of an error in downloading of the non-connecting option, the machine can be recovered by turning OFF/ON the power.

To prevent such error, uncheck the applicable system software so that the system software of the non-connecting option is not downloaded when downloading the system software from SST to USB.

Once downloading is complete, a message is displayed to encourage pressing the “Reset” key.

F-6-157

- 4) Press the “Reset” key.
Shutdown sequence is executed.
- 5) Once the message on the touch panel disappears, turn OFF the Main Power Switch.
- 6) Remove the USB memory storage device.
- 7) After checking that the LED is turned OFF at the lower right on the Control Panel, turn ON the Main Power Switch.

Writing to the HDD system area/flash ROM is started after the startup. The screen shows the countdown once the writing process is properly complete.

When the countdown shows 0, this machine is restarted with the downloaded system software.

■ Formatting HDD

● HDD Format Overview

The following 2 types of formatting methods are available with this machine:

- ALL: To initialize the entire HDD
 - In the case of installing the HDD provided as a service part (a new HDD).
 - In the case of cleaning the entire software and data in the HDD to reinstall the system software.

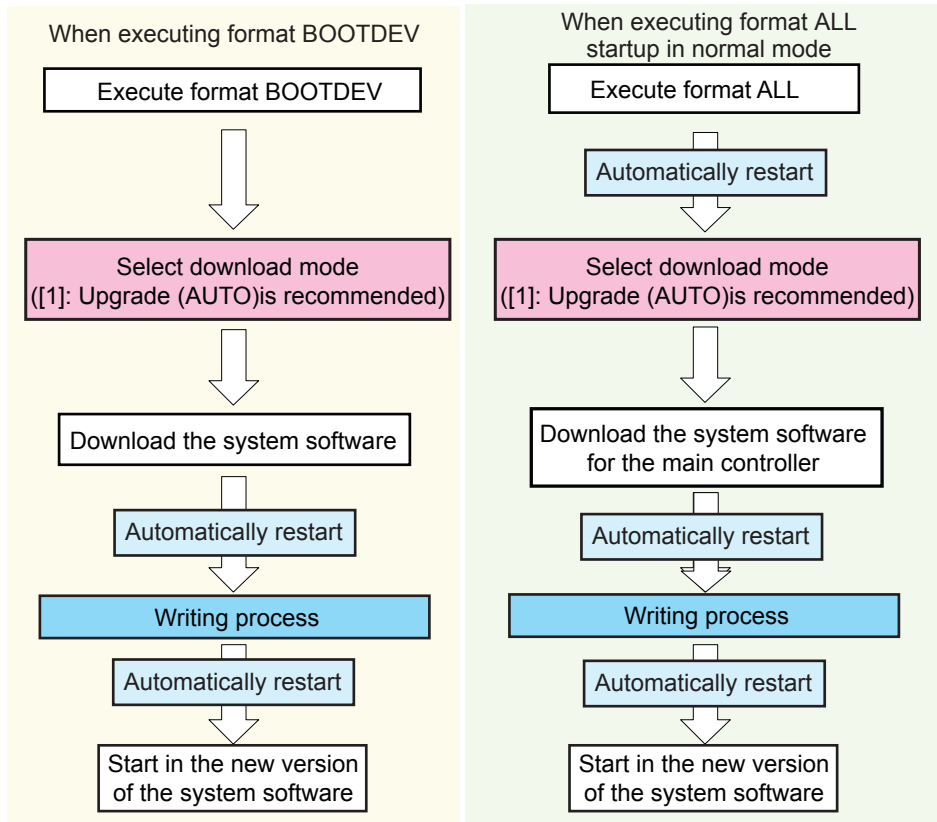

All the user data and MEAP application in the HDD is deleted when executing Format ALL with the machine in use; therefore, be sure to obtain agreement from the user to execute Format ALL.

- BOOTDEV: to format the system software storage area on HDD.
 - In the case of normal upgrading by cleaning the storage area of the system software
 - User data will not be deleted.

To reinstall the system software, HDD formatting is not required.

After formatting, this machine cannot be started unless the system software is downloaded. When Format ALL is executed, initialization process is reflected to the HDD so that this machine is automatically restarted to automatically enter download mode. In the case of formatting BOOTDEV, the machine is not automatically restarted, but the system software can be downloaded.

After formatting is executed, be sure to download the system software by “[1]: Upgrade (AUTO)” in main menu.

F-6-158

● [4]: Format HDD

This mode executes formatting of BOOTDEV partition or the entire HDD.

Operation procedure

- 1) Enter download mode.
 - 2) Connect the USB memory storage device to the USB port.
 - 3) Press the key on the Control Panel.
- [4] -> [0]: To execute formatting / Any key other than [0] key: To return to the menu screen.

```
[[[[[ download Menu (USB) ]]]]]]]]]]]
```

```
-----
[1]: Upgrade (Auto)
[2]: Upgrade (w Confirmation)
[3]: Upgrade (Overwrite all)
[4]: Format HDD
[5]: Backup
[7]: Clear downloaded files
[8]: download Menu 2
[9]: Other Menu
```

```
/[4] has been selected. Execute?/
- (OK) :0 / (CANCEL) :Any other keys -
```

F-6-159

4) Press the key on the Control Panel.

[1] -> [0]: To execute formatting BOOTDEV/Any key other than [0]: To return to the menu screen.

[2] -> [0]: To execute formatting the entire HDD/Any key other than [0]: To return to the menu screen.

[C]: To return to the menu screen.

F-6-160

Once downloading is complete, a message is displayed to encourage pressing the "Reset" key.

5) Press any key to return to the menu screen.

6) Download the system software.

Refer to "Separate Download" for details.

Backup

[5]: Backup

CAUTION:

This function includes R&D review.

Do not usually use it other than the following function.

The USB memory collecting log uses the USB memory where You registered a system software for this Host machine with by SST.

Operation procedure

1) Enter download mode.

2) Connect the USB memory storage device to the USB port.

3) Press the key on the Control Panel.

[5] -> [0]: To execute formatting /Any key other than [0] key: To return to the menu screen.

4) SRAM backup of Main Controller PCB 2

[1] Sublog -> Collect debugging log.

[4] ServicePrint -> Save the service data which P-PRINT or etc. output to paper with a text format.

```

[[[[[ Backup Menu (USB) ]]]]]]]]]]]
-----

```

[1]: Sublog

[4]: ServicePrint

[5]: Netcap

[C]: Return to Main Menu

F-6-161

■ Clearing Download File

● [7]: Clear downloaded files

This menu clears the system software stored in the temporary storage area of the HDD. This function is used to clear the downloaded file without writing it after downloading the system software in menu [2] or [3].

Operation procedure

- 1) After downloading by menu [2] or [3], press the "Reset" key to execute shutdown sequence, and then turn OFF the main power once the screen display disappears.
- 2) Start the machine in safe mode (while pressing 2 + 8 keys at the same time, turn ON the Main Power Switch).

If the system software is stored in the HDD temporary storage area when starting the machine in safe mode, the system software is deleted. In such a case, the following message is displayed on the touch panel.
"All downloaded file is deleted."

- 3) Turn OFF the Main Power Switch.
- 4) Remove the USB memory storage device.

■ Download Menu 2

● [8]: Download Menu 2

[1]: Service Mode Password Clear

```
[[[[[ download Menu 2nd (USB) ]]]]]
```

```
[1]: Service Mode Password Clear
```

```
[C]: Return to Main Menu
```

F-6-162

■ Other Menu

● [9]: Other Menu

This mode displays other menu.

Operation procedure

- 1) Enter download mode.
- 2) Connect the USB memory storage device to the USB port.
- 3) Press the key on the Control Panel.
[9] -> [0]: To display other menu/Any key other than [0] key: To return to the menu screen.

● [1]: Version Information

This mode displays the version of download mode.

F-6-163

Press any key to return to the main menu.

Troubleshooting

■ Error Code: E753-0001

● Cause

In the case of an error during writing process of the system software or in the case of writing the system software of the option that is not installed, an error is determined to display E753-0001.

● Remedy

The result of writing process is displayed at the upper side of E753-0001 error display.

Be sure to check the system software with the error (error or NG) displayed.

Check if the target option is properly installed and see if the software to download is for the correct target option, and then execute downloading again.

Upgrading by SST

Be sure to use Assist mode as a general rule because the system software of the non-connecting option is not to be downloaded in Assist mode.

In Single mode, it is available to download the system software of the option that is not installed.

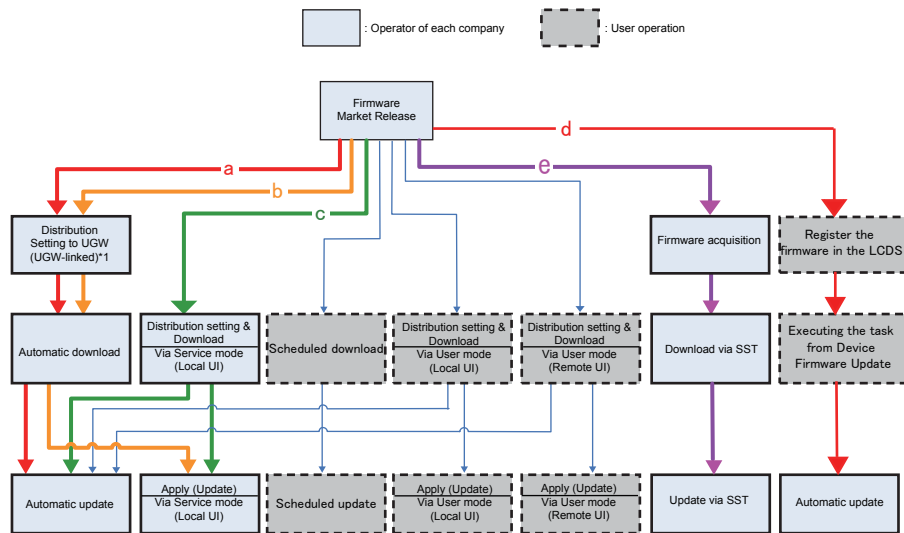

In the case of downloading the Finisher's system software, make the download mode of the Host Machine in normal mode and connect to SST, and then download just the system software of the Finisher with the version information displayed at the right side of the SST screen.

Version Upgrade via CDS

Overview

Among the 4 methods in which service technicians provide firmware install services, the following 3 methods are available using Updater functions.

- a. UGW-linked Download and Update (Full-remote Update)
- b. UGW-linked Download (Remote Distribution Update)
- c. Manual Download and Update (On-site Update from Service Mode)
- d. Local CDS Download and Update (iW EMC + DFU Plug-in)
- e. Update via SST

F-6-164

*1: Schedules for UGW-linked distribution are maintained on CDS.

NOTE:

- See User Manual of the device for how to connect the device to the external network.
- When needed, perform the communication test before actual download to check if the communication with the distribution server is normal.

■ Preparation

● Overview of Preparation

The following should be prepared before using Updater.

- For updating of firmware

Service Mode	COPIER > FUNCTION > INSTALL	COPIER > OPTION > FNC-SW				
	CDS-CTL		CDS-UGW	CDS-FIRM	LOCLFIRM	LCDSFLG
Installation Method	Setting Sales Company's HQ	Network Settings	Enabling UGW Link	Enabling [Update Firmware] Button of User Mode	Enabling [Manual Update] Button of User Mode (Remote UI)	Enabling [Local CDS]
UGW-linked Download and Update	Yes	Yes	Yes	-	-	-
UGW-linked Download	Yes	Yes	Yes	-	-	-
Manual Download and Update	Yes	Yes	-	-	-	-
Manual Download and Update via Local UI	Yes	Yes	-	Yes	-	-
Manual Download and Update via Remote UI	Yes	Yes	-	Yes	-	-
Special Download and Update via Remote UI	Yes	-	-	-	Yes	-
Scheduled update via Local CDS	-	-	-	Yes	-	Yes

T-6-16

- For Install of Application

Installation Method	Network Settings	Enabling [Install Application/Options] Button of User Mode
LMS-linked Installation	Yes	-
LMA-linked installation via Local UI	Yes	Yes
LMS-linked installation via Remote UI	Yes	Yes

T-6-17

● Setting Sales Company's HQ

When using devices input in the markets listed below, the default setting of Sales Company's HQ should be changed before obtaining firmware distributed from CDS. Unless the setting is changed properly, the desired firmware may not be able to be selected.

Market	Default Setting of Sales Company's HQ	Setting of Sales Company's HQ after Change
Canada	US	CA
Latin America	US/SG	LA
Hong Kong	SG	HK

T-6-18

Go to the following screen to change the setting of Sales Company's HQ.

Service Technician	Setting of Device Service Mode (Level 1)	COPIER > FUNCTION > INSTALL > CDS-CTL
--------------------	--	---------------------------------------

NOTE:

The list below shows the setting of Sales Company's HQ for CDS-CTS by market. Check and adhere to the appropriate setting for your market.
<List of Sales Company's HQ and the settings for CDS-CTL>

Japan = JP	China = CN
USA = US	Hong Kong = HK
Singapore = SG	Australia = AU
Europe = NL	Canada = CA
Korea = KR	Latin America = LA

● Network Settings

1.Connecting to External Network

The method of connecting to external network is similar to a normal network connection method. Refer to user manual of the device for details.

NOTE:

- See User Manual for how to connect the device to the external network.
- Before using UGW link or User mode, see the sections below to prepare as required.
"Enabling UGW Link"
"Enabling [Update Firmware] Button of User Mode"
"Enabling [Install Application/Options] Button of User Mode"

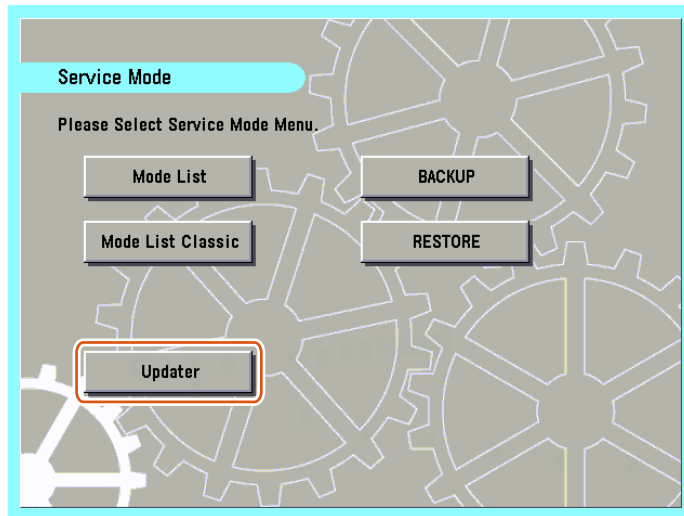

NOTE:

"External Network" here means the network connecting the device to CDS via Internet.

2.Confirming URL Setting of Distribution Server

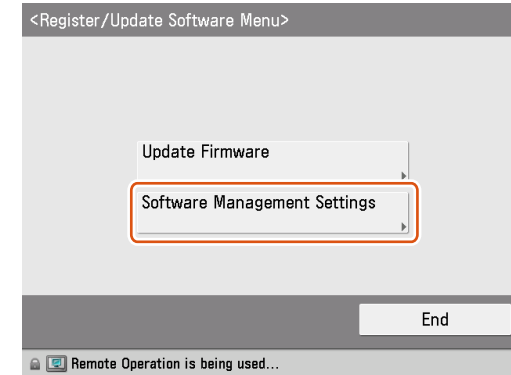

This section describes how to confirm the URL setting of the distribution server.

1. Start [Service Mode] at Level 1.
2. Press [Updater] button.

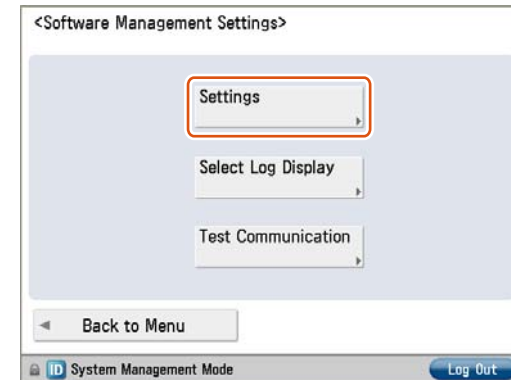

F-6-165

3. Press [Software Management Settings] button.

F-6-166

4. Press [Settings] button.

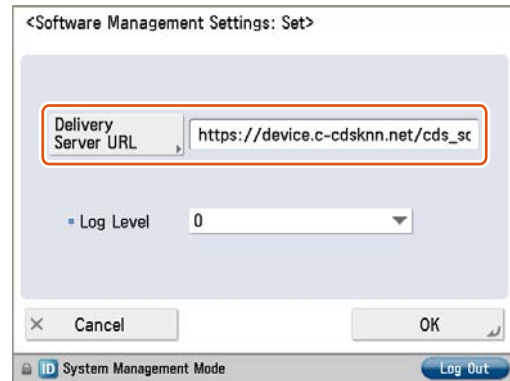

F-6-167

5. Ensure to enter "https://device.c-cdsknn.net/cds_soap/updaterif" in the field beside the [Delivery Server URL] button.

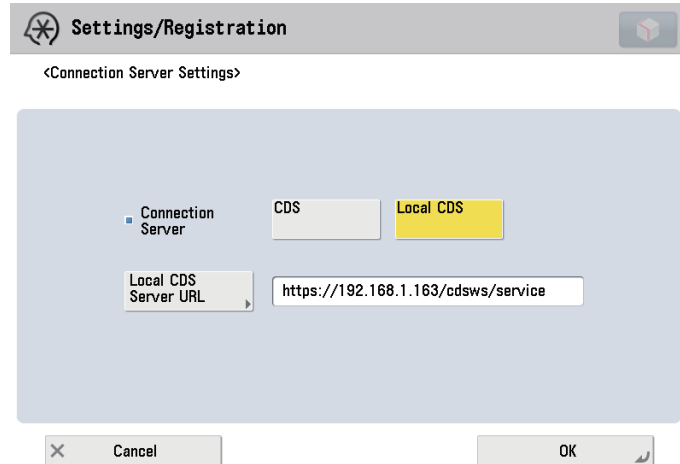

If the URL is not entered or a wrong URL is entered in the field, click [Delivery Server URL] button to show the virtual keypad. Check the URL and enter the correct one.

Delivery Server CDS

F-6-168

Delivery Server Local CDS

F-6-169

Note:

For the URL of the L-CDS server, enter the address beginning with "https://" specified in L-CDS. If the port number has not been specified, 443 is internally added as the port number.

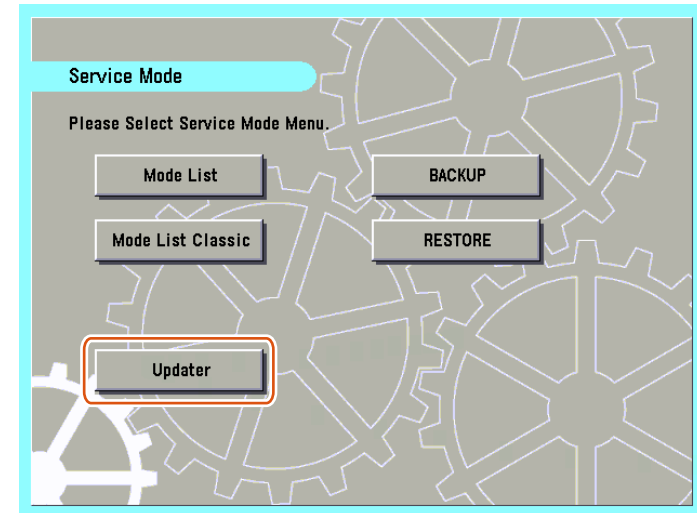

To display the button of the local CDS, execute Settings/Registration > Management Settings > License/Other > Register/Update Software. It is not displayed in service mode.

6. Press [OK] to set the entered items. Now the URL of the distribution server is successfully set.

3.Communication Test

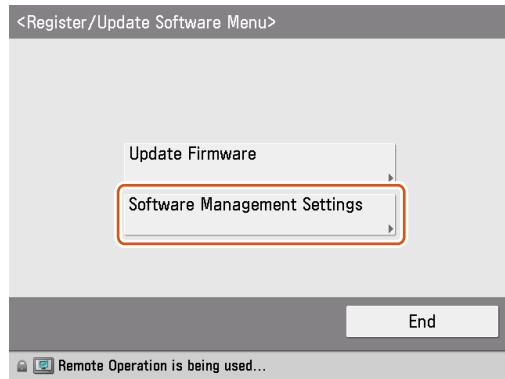

This section describes how to check if the communication is normally done to the distribution server and/or the file server.

1. Start [Service Mode] at Level 1.
2. Press [Updater] button.

F-6-170

3. Press [Software Management Settings] button.

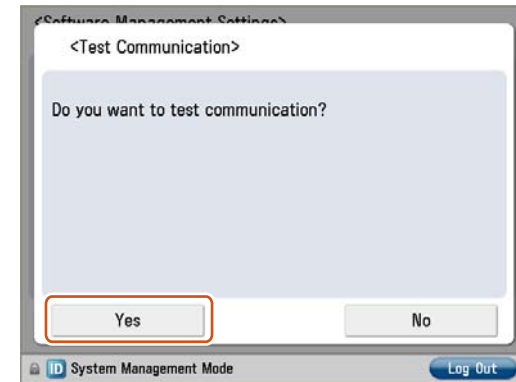

F-6-171

4. Press [Test Communication] button.

F-6-172

5. Press [Yes] button.

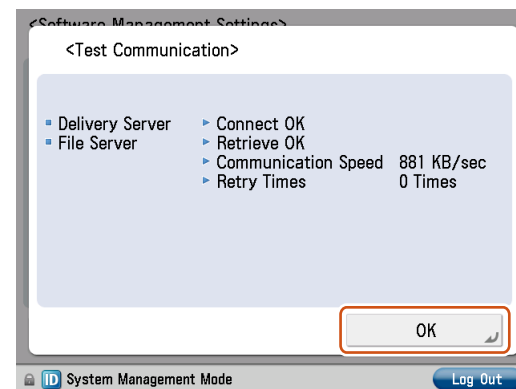

F-6-173

Obtain the download file information for communication test from the distribution server (to execute the communication test to the distribution server).

Using the download file information for communication test, the contents for test are downloaded from the file server (for the communication test to the file server).

6. Upon the communication test completed, the communication test result screen is shown. Press [OK] button to exit this operation.

F-6-174

● Enabling UGW Link

When installing the firmware in the method of “UGW-linked Download and Update” or “UGW-linked Download”, the following should be set before actually using UGW link.

Service Technician	Setting of Device Service Mode (Level 1)	COPIER > OPTION > FNC-SW > CDS-UGW (0 -> 1)
	Setting of UGW WebPortal	In [Customer Management] screen, set [Do not distribute firmware] to [Distribute firmware].
Sales Company's HQ	Setting of Authorities on UGW WebPortal	See "Analysis>Firmware Distribution Information" to grant the appropriate authorities to each account.

NOTE:

- See “imageWARE Remote Operator’s Manual / e-Maintenance Business Operation Manual” for how to operate UGW WebPortal.
- [Distribute Firmware] should be set on [Customer Management] screen for staff in charge of setting for [Enter customer information] or [Command for firmware distribution] in order to allow them to select the desired device on [Firmware Distribution Information] screen.
- When using the Device Firmware Update Plug-in and Local CDS, it is necessary to disable "UGW linkage".

a. UGW-linked Download and Update (Full-remote Update)

See the figure below for the operational flow of “UGW-linked Download and Update”.

F-6-175

STEP1: Scheduling via UGW

The firmware distribution schedule to the certain device should be set on UGW. See “UGW-linked Download and Update” in chapter 5 of Operation Manual of Content Delivery System V1.0 for Firmware Distribution for details.

The device checks the schedule concerned every 12 hours on UGW. This allows the device to register the firmware distribution setting, enabling automatic firmware download and update.

CAUTION:

[Devices without Wait for EOJ (end of job) Function]

- Firmware update will delete print jobs in the queue. Ensure to notify users of this before you start updating. It is recommended to perform firmware update during non-business hours.

[Devices with Wait for EOJ Function]

- Firmware update will not be triggered when any of the following jobs remains in the queue.

- Print
- Scan
- Fax (except I-FAX; this function is enabled for I-FAX only during Print/Scan operation)

See Chapter 1 “Limitations and Cautions” of this manual for more detailed information.

NOTE:

To contacts registered for E-mail notification on UGW, the E-mail is sent from UGW upon completing firmware update.

b. UGW-linked Download (Remote Distribution Update)

See the figure below for the operational flow of “UGW-linked download”.

F-6-176

STEP 1: Scheduling via UGW

The firmware distribution schedule to the certain device should be set on UGW. See “UGW-linked Download” in Operation Manual of Content Delivery System (for Firmware Distribution) for details.

NOTE:

The firmware downloaded by scheduling via UGW can be checked/deleted from User mode, but cannot be updated. If a user download the other firmware, the firmware downloaded with “UGW-linked Download” is overwritten.

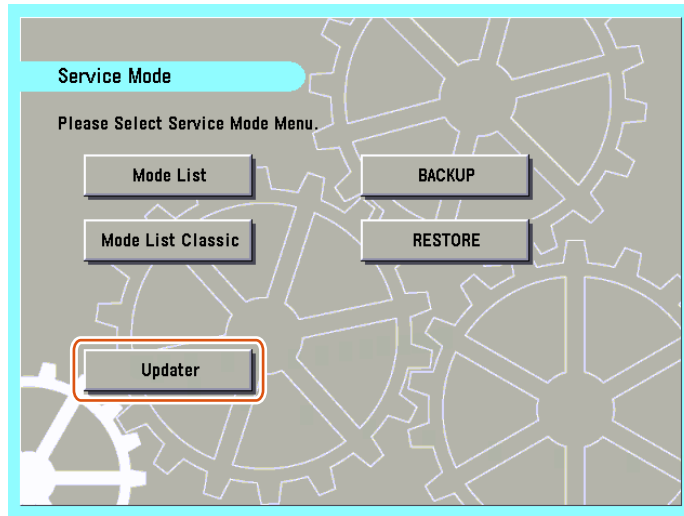

STEP 2: Update using Updater

The firmware downloaded on the device can be updated using Updater functions.

1. Start [Service Mode] at Level 1.

- 1). Press [Setting/Registration (User mode)] button on the control panel.
- 2). Press [2] and [8] buttons at a time on the control panel.
- 3). Press [Setting/Registration (User mode)] button on the control panel.
- 4). [Service Mode] screen is shown.

2. Press [Updater] button.

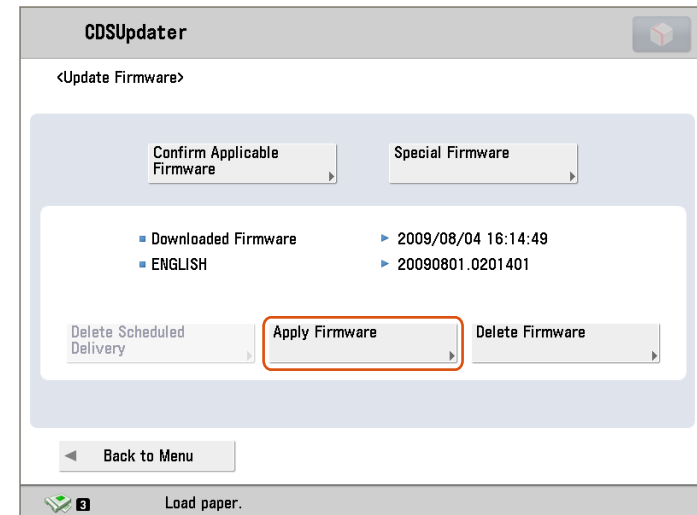

F-6-177

3. Press [Update Firmware] button.

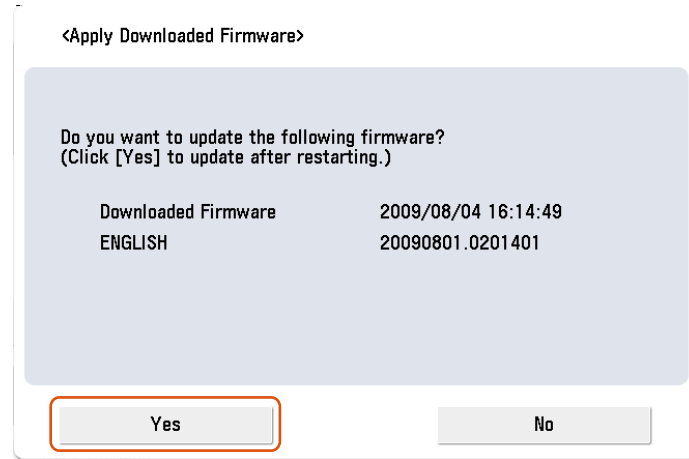

F-6-178

4. Press [Apply Firmware] button.

F-6-179

5. Confirm the downloaded firmware and press [Yes] button.

F-6-180

6. The firmware is applied to the device. The device is automatically restarted when the firmware is successfully applied.

7. When the device is restarted, confirm the version of the firmware.

- 1). Press [Check Counter Key] button on the control panel.
- 2). Press [Check Device Configuration] button.
- 3). Confirm if the updated firmware version corresponds to [Controller Version].

Now the firmware is successfully updated in the method of "Manual Download and Update".

CAUTION:

[Devices without Wait for EOJ (end of job) Function]

- Firmware update will delete print jobs in the queue. Ensure to notify users of this before you start updating. It is recommended to perform firmware update during non-business hours.

[Devices with Wait for EOJ Function]

- Firmware update will not be triggered when any of the following jobs remains in the queue.

- Print
- Scan
- Fax (except I-FAX; this function is enabled for I-FAX only during Print/Scan operation)

See Chapter 1 "Limitations and Cautions" of this manual for more detailed information.

NOTE:

To contacts registered for E-mail notification on UGW, the E-mail is sent from UGW upon completing firmware update.

c. Manual Download and Update (On-site Update from Service Mode)

The figure below shows the operational flow of “Manual Download and Update”.

F-6-181

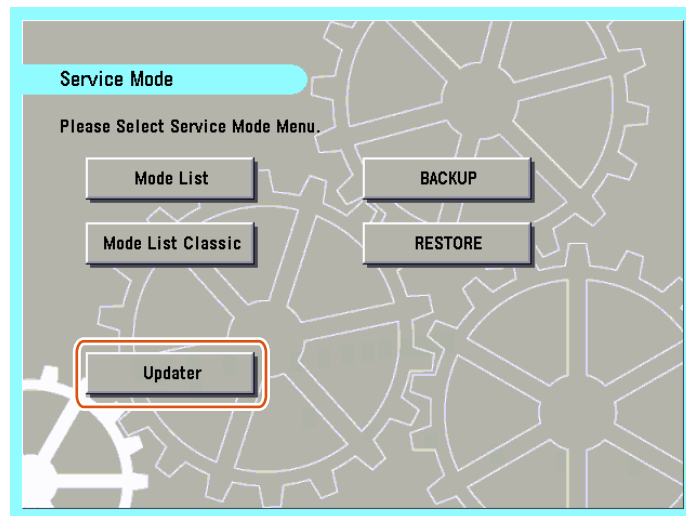

STEP 1: Download using Updater

The firmware can be downloaded from CDS to the device using Updater.

1. Start [Service Mode] at Level 1.

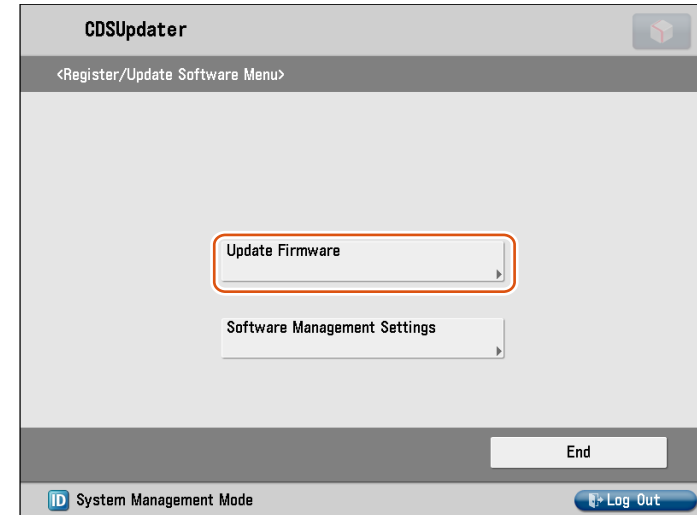

- 1). Press [Setting/Registration (User mode)] button on the control panel.
- 2). Press [2] and [8] buttons at a time on the control panel.
- 3). Press [Setting/Registration (User mode)] on the control panel.
- 4). [Service Mode] screen is shown.

2. Press [Updater] button.

F-6-182

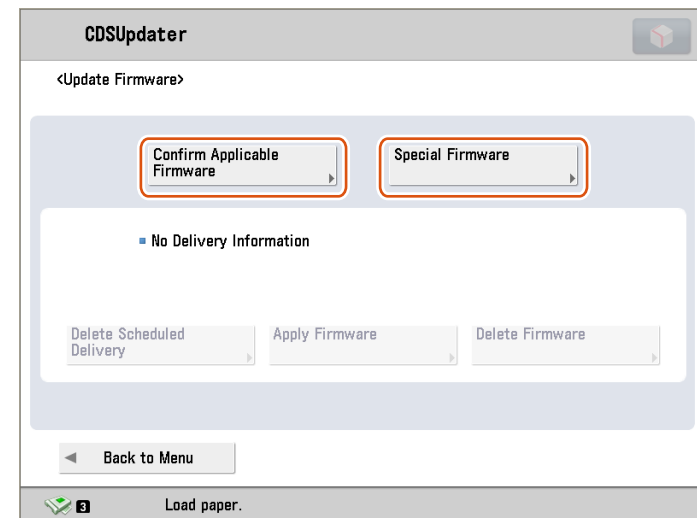

3. Press [Update Firmware] button.

F-6-183

4. Confirm the firmware to be updated in either of the following 2 ways.

- To update to the official edition, press [Confirm Applicable Firmware] button and go to Step 6.
- To update to the individual response edition, press [Special Firmware] and go to Step 5.

F-6-184

5. [Special Firmware] screen is shown as below. Enter the fields and press [OK] button.

F-6-185

- [Retrieval ID]:
Enter numeric up to 8 characters.
- [Password]:
Enter numeric up to 8 characters.

6. [New Firmware] screen is shown as below. Check the contents and press [Next] button.

F-6-186

- [Version]:
The current firmware version is shown.
- [Applicable Firmware]:
Select the firmware applicable to the device from the dropdown list.
- [Additional Languages]:
If there are any additional languages, they are displayed.
More than 1 language can be selected, and it is possible to add another language when upgrading the firmware.
Up to 8 languages can be added, including Japanese and English. The languages already registered in the device are always selected, and SST is used to delete an unnecessary language from the device.
- [Release Note]:
If any release note is published, the contents are shown here.

NOTE:

To update to the individual response edition, the firmware corresponding to the ID and password that you input is displayed in [Applicable Firmware].

7. [Delivery Settings] screen is shown as below. Enter the fields and press [OK] button.

The screenshot shows the 'CDSUpdater' application in 'System Management Mode'. The 'Delivery Settings' screen contains the following elements:

- Delivery Time:** A section with 'Now' and 'Set Time' buttons, and a numeric keypad for entering a date and time in 'yyyy/mm/dd hh:mm:ss' format. A note states 'You can use numeric keys.'
- Timing to Apply:** A section with 'Auto' and 'Manual' buttons.
- Deliver Acquisitions:** A section with 'On' and 'Off' buttons.
- E-Mail:** A text input field for an email address.
- Comments:** A text input field for a comment.
- Disclaimer:** A note at the bottom of the form: 'If you consent that your email address is transferred to Canon Inc. in Japan to receive notices, please register.'
- Navigation:** 'Cancel', 'Back', and 'OK' buttons at the bottom. The 'OK' button is highlighted with a red box.
- Footer:** 'ID System Management Mode' and a 'Log Out' button.

F-6-187

- [Delivery Time]:
 - Press either [Now] or [Set Time] button.
 - [Now]:
 - The firmware is downloaded immediately after distribution schedule is set.
 - [Set Time]:
 - Be sure to specify the date (within 30 days) and time. The firmware is downloaded on the specified date and time.
 - Enter the date and time using the numeric keypad in the format of "yyyy/mm/dd hh:mm:ss"
- [Timing to Apply]:
 - Press either [Auto] or [Manual] button.
 - [Auto]:
 - The firmware is applied automatically upon firmware downloaded.
 - [Manual]:
 - The firmware is automatically downloaded. Go to [Apply Firmware] to set up for updating the downloaded firmware.
- [Updated Module Only]:
 - Press either [On] or [Off] button.
 - [On]:
 - Only difference between the current and new firmware is downloaded.
 - [Off]:
 - The firmware to be applied is wholly downloaded.

[E-mail]:

- E-mails concerning update statuses are sent from the device to the contact registered here. Enter the E-mail address of the service technician in charge. Enter 1-byte alphanumeric or symbols up to 64 characters.
- [Comments]:
 - Enter the comment in 1-byte alphanumeric or symbols up to 128 characters.
 - Enter the comment to be automatically included in E-mail. Model Name in the comment will be helpful to identify the device relevant to the E-mail.

NOTE:

[Timing to Apply]

- For firmware versions with no remote update permission, [Auto] cannot be selected in [Timing to Apply]

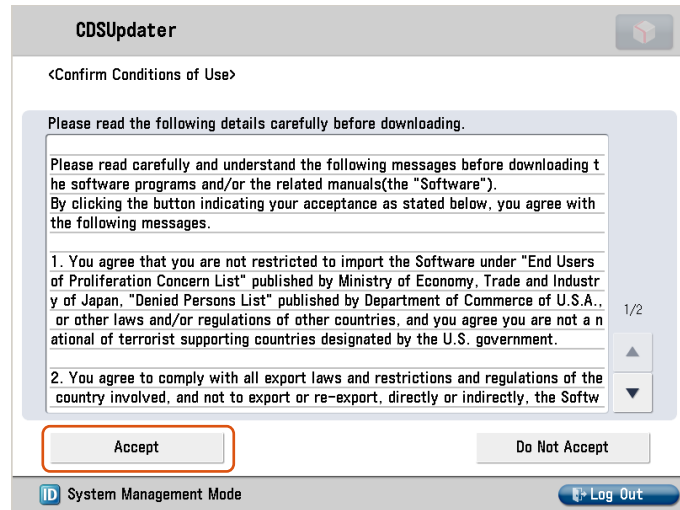

[Updated Module Only]

- For firmware versions with difference-only delivery disabled, only [OFF] can be selected in [Updated Module Only].

[E-mail]

- To send E-mails to multiple destinations, each E-mail address should be delimited with comma (,) or semi-colon (;).
- For E-mail addresses entered in this field, a notification E-mail is sent at the following timing.
 - Distribution Set
 - Distribution Started
 - Distribution Finished
 - Update Started
 - Update Finished
 - Error Occurred

8. Confirm Export Criteria screen is shown as below. Check the contents and press [Accept] button.

F-6-188

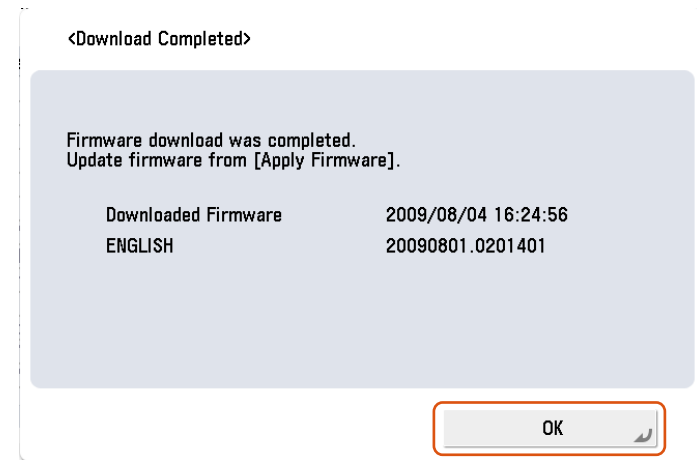

9. One of the screens below is shown according to the setting.

- When Distribution Time and Timing to Apply of Distribution Setting are set to [Now] and [Auto], respectively:
Firmware is downloaded and updated automatically to the device. The device is automatically restarted upon update completed. Now STEP 1 is successfully completed.

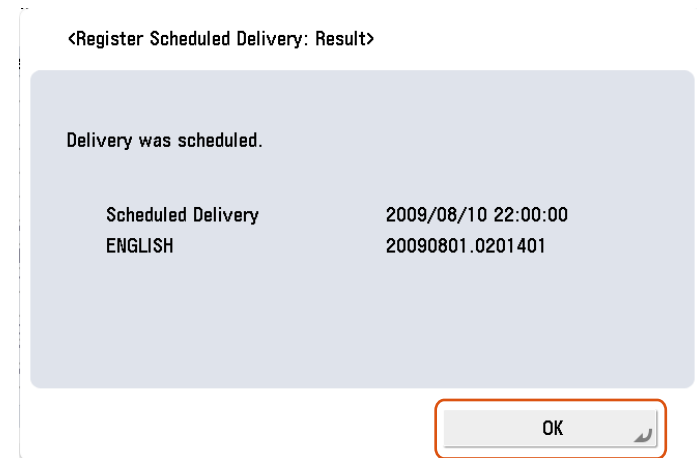

F-6-189

- When Distribution Time and Timing to Apply of Distribution Setting are set to [Now] and [Manual], respectively:
Confirm the firmware and press [OK] button. Now STEP 1 is successfully completed.

F-6-190

- When Distribution Time is set to [Set Time] in Distribution Setting:
Confirm the distribution schedule and press [OK] button. Now STEP 1 is successfully completed.

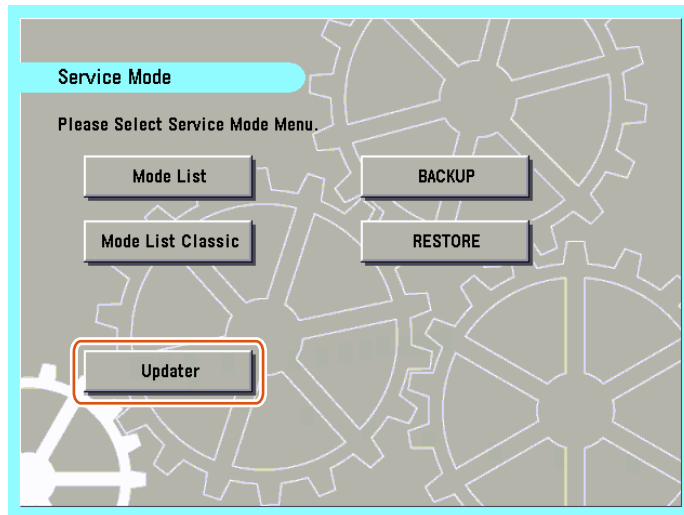

F-6-191

STEP 2: Update using Updater

The firmware downloaded to the device can be updated using Updater functions.

When Timing to Apply is set to [Auto] in Distribution Setting in STEP 1, the firmware is updated automatically. Only when Timing to Apply is set to [Manual], follow the steps below to update the firmware.

1. Start [Service Mode] at Level 1.
 - 1). Press [Setting/Registration (User mode)] button on the control panel.
 - 2). Press [2] and [8] buttons at a time on the control panel.
 - 3). Press [Setting/Registration (User mode)] button on the control panel.
 - 4). [Service Mode] screen is shown.
2. Press [Updater] button.

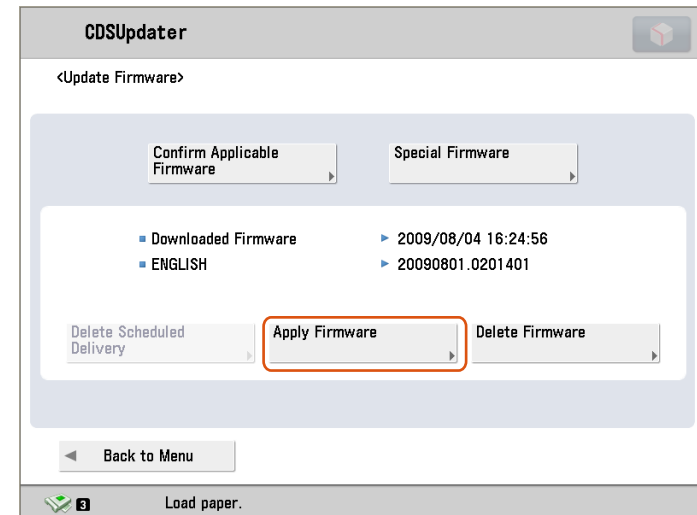

F-6-192

3. Press [Update Firmware] button.

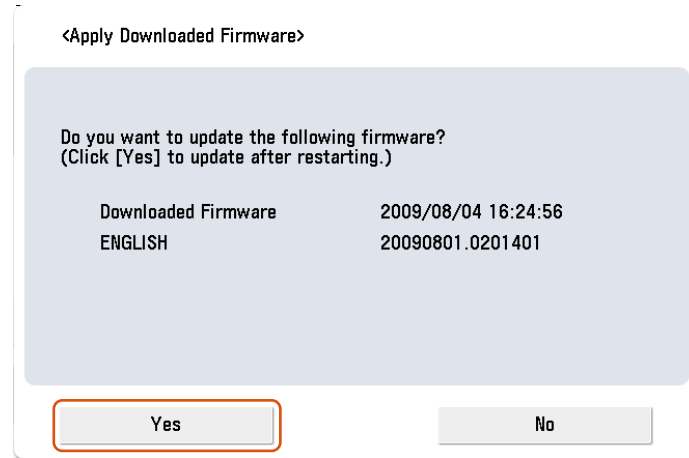

F-6-193

4. Press [Apply Firmware] button.

F-6-194

5. Confirm the downloaded firmware and press [Yes] button.

F-6-195

6. The firmware is applied to the device. The device is automatically restarted when the firmware is successfully applied.

7. When the device is restarted, confirm the version of the firmware.

- 1). Press [Check Counter Key] button on the control panel.
- 2). Press [Check Device Configuration] button.
- 3). Confirm if the updated firmware version corresponds to [Controller Version].

Now the firmware is successfully updated in the method of "Manual Download and Update".

CAUTION:

[Devices without Wait for EOJ (end of job) Function]

- Firmware update will delete print jobs in the queue. Ensure to notify users of this before you start updating. It is recommended to perform firmware update during non-business hours.

[Devices with Wait for EOJ Function]

- Firmware update will not be triggered when any of the following jobs remains in the queue.

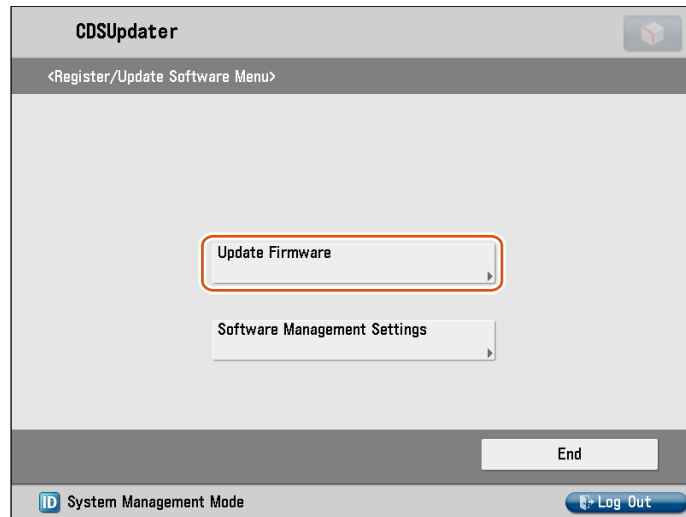

- Print
- Scan
- Fax (except I-FAX; this function is enabled for I-FAX only during Print/Scan operation)

See Chapter 1 "Limitations and Cautions" of this manual for more detailed information.

Deleting Firmware Distribution Schedule

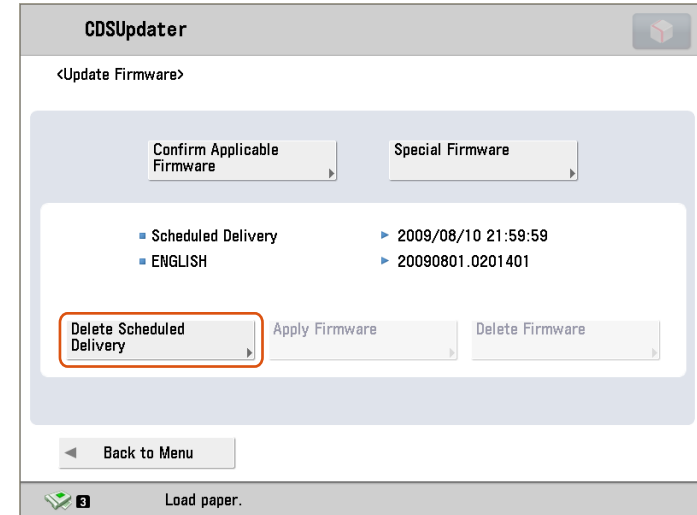

This section describes how to delete firmware distribution schedule set by Updater.

1. Start [Service Mode] at Level 1.
 - 1). Press [Setting/Registration (User Mode)] button on the control panel.
 - 2). Press [2] and [8] button at a time on the control panel.
 - 3). Press [Setting/Registration (User Mode)] button on the control panel.
 - 4). [Service Mode] screen is shown.
2. Press [Updater] button.
3. Press [Update Firmware] button.

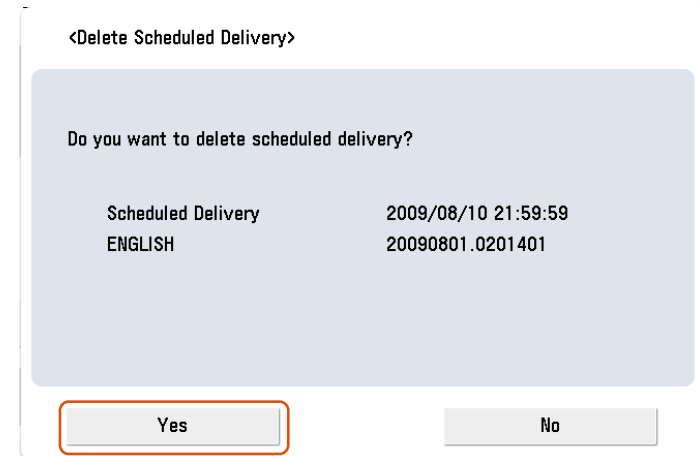

F-6-196

4. Press [Delete Scheduled Delivery] button.

F-6-197

5. Confirm the contents of the distribution schedule and press [Yes] button.

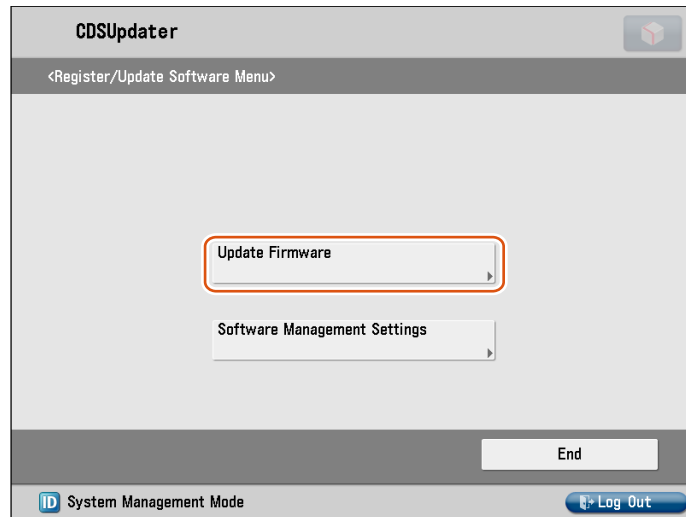

F-6-198

6. Confirm the result of deletion shown on the screen and press [OK] button. Now the firmware distribution schedule is successfully deleted.

■ Updating Downloaded Firmware (Applying Firmware)

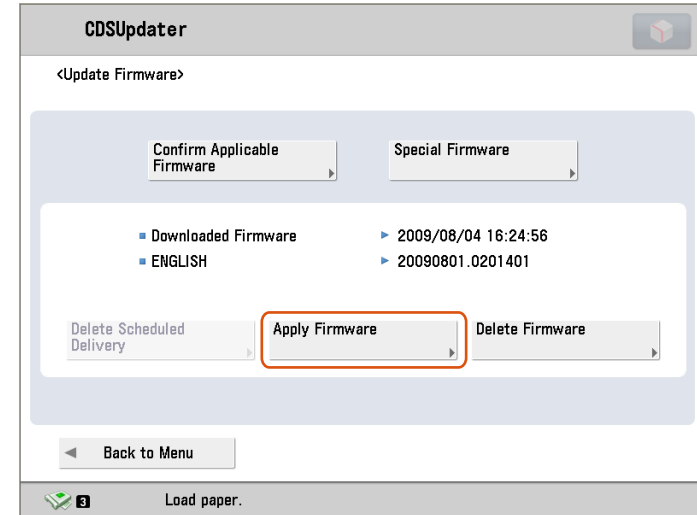

This section describes how to update the downloaded firmware.

1. Start [Service Mode] at Level 1.
 - 1). Press [Setting/Registration (User mode)] button on the control panel.
 - 2). Press [2] and [8] buttons at a time on the control panel.
 - 3). Press [Setting/Registration (User mode)] button on the control panel.
 - 4). [Service Mode] screen is shown.
2. Press [Updater] button.
3. Press [Update Firmware] button.

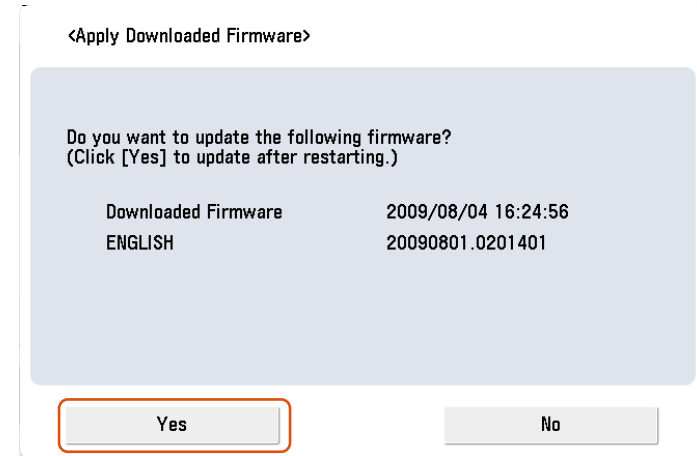

F-6-199

4. Press [Apply Firmware] button.

F-6-200

5. Confirm the downloaded firmware and press [Yes] button.

F-6-201

6. The firmware is applied to the device. The device is automatically restarted when the firmware is successfully applied.

7. When the device is restarted, confirm the version of the firmware.
 - 1). Press [Check Counter Key] button on the control panel.
 - 2). Press [Check Device Configuration] button.
 - 3). Confirm if the updated firmware version corresponds to [Controller Version].

Now the firmware is successfully updated in the method.

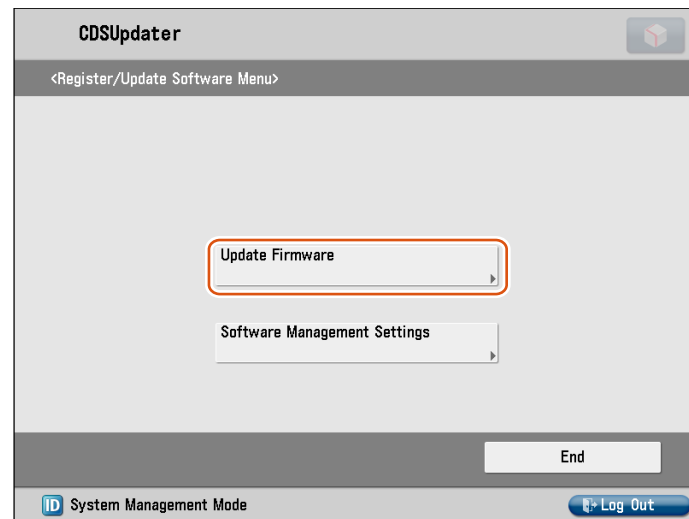

■ Deleting Downloaded Firmware

This section describes how to delete the downloaded firmware using Updater.

1. Start [Service Mode] at Level 1.
 - 1). Press [Setting/Registration (User Mode)] button on the control panel.
 - 2). Press [2] and [8] button at a time on the control panel.
 - 3). Press [Setting/Registration (User Mode)] button on the control panel.
 - 4). [Service Mode] screen is shown.

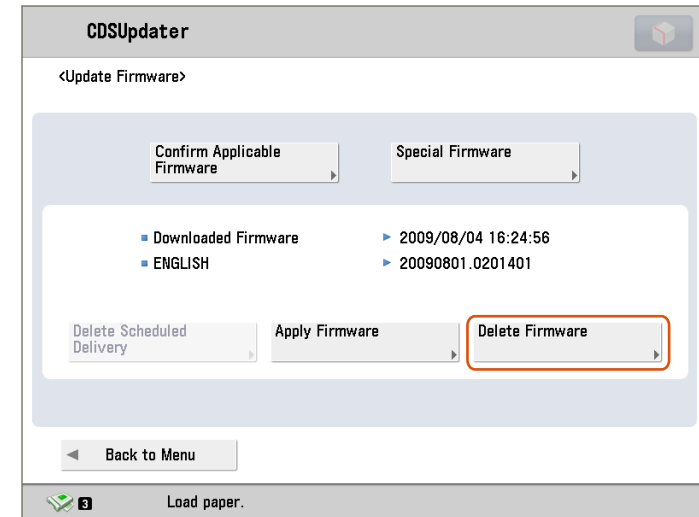

2. Press [Updater] button.

3. Press [Update Firmware] button.

F-6-202

4. Press [Delete Firmware] button.

F-6-203

5. Confirm the downloaded firmware to be deleted and press [Yes] button.

F-6-204

6. Confirm the result of deletion and press [OK] button. Now the downloaded firmware is successfully deleted.

Troubleshooting on Firmware Installation

No.1

Symptom: I can't find the firmware to be updated using Updater.

Cause: Preparation has not been properly done.

Action: Confirm the setting of Sales Company's HQ below.

Setting of Device [SERVICE MODE] (Level1)

COPIER > FUNCTION > INSTALL > CDS-CTL

F-6-205

Cause: The version currently in use is not available for update.

Action: Download the release note from CDS separately to upgrade to the version available for update.

Cause: You try to download firmware from User mode. You can download only the latest version of firmware from User mode.

Action: Download from Service mode.

F-6-206

F-6-207

No.2

Symptom: Firmware download is aborted during operation using Updater functions.

Cause: The network cable is disconnected or the power went off due to blackout and the like.

Action: Retry download. Firmware under download is cancelled upon aborted.

No.3

Symptom: Firmware update is aborted during operation using Updater functions and the device cannot be started.

Cause: The power went off due to blackout and the like.

Action: Service technicians should follow the steps below via SST.

1. Press [2] and [8] buttons at a time to start the device.

1) Turn on the power and hold down [2] and [8] buttons at a time on the control panel.

2) [Download Mode] is shown on Local UI.

If the operation above does not trigger the download mode, BOOT (Flash Memory, service parts) should be replaced (takes up to 1 minute for rewriting).

If the operation above successfully triggers the download mode, go to the next steps below.

2. Via SST, format the HDD of BOOT Dev only.

3. Via SST, install the firmware in the device.

No.4

Symptom: Firmware has not been downloaded according to the distribution schedule.

Cause: Other firmware distribution schedule is set. Since only 1 distribution schedule is held, the registered schedule may be overridden by the new firmware distribution schedule.

Action: Once the schedule is overridden, the firmware cannot be downloaded. Distribution should be rescheduled for the firmware.

Cause: At the scheduled distribution date and time, the firmware registered was not found on CDS.

Action: Distribution should be rescheduled for the firmware.

Cause: After distribution is scheduled, device is updated to other version of firmware via SST. (Status of the firmware in the device is changed.)

Action: Distribution should be rescheduled for the firmware.

Cause: The power of the device was off at scheduled date and time.

Action: Distribution should be rescheduled for the firmware.

Cause: The network between the updater and the CDS server has stopped.

Remedy: Conduct a communication test and check the state of network.

There are some cases where the network is stopped only at night, during which update is performed. If the communication test ended in success, check the state of network during the period when update is scheduled.

No.5

Symptom: The firmware presumed to be downloaded to the device cannot be found.

Cause: Since only 1 firmware can be held on the device, the firmware previously downloaded was overridden by the newly downloaded one.

Action: Retry the firmware download.

Information required for Reports

Information required for Service Technicians to Obtain on Site

- Update Logs
- System Logs (Log Level: 4)

Information to Report

- Symptom occurred
- Location of the device
- Date and Time that symptom occurred
- Steps taken for reproduction
- Firmware / Application you tried to install
- Occurrence frequency
- Model dependency (if the same symptom occurred in other models)
- Dependency on firmware/MEAP application/system option
- Conditions of symptom occurrence
 - Model
 - Firmware version installed on the device
 - List of MEAP applications installed on the device
 - Network setting information of the device
 - Service mode setting information

Setting of device service mode (Level 1)	COPIER > FUNCTION > INSTALL > CDS-CTL
	COPIER > OPTION > FNC-SW > CDS-UGW
	COPIER > OPTION > FNC-SW > CDS-FIRM
	COPIER > OPTION > FNC-SW > CDS-MEAP
	COPIER > OPTION > FNC-SW > LOCLFIRM
	COPIER > OPTION > FNC-SW > CDS-LVUP

* As many as the items listed above should be obtained on site. More information provided will be helpful for investigation.

Debug Logs

Obtaining Log Files

Updater log files can be obtained by copy & paste from remote UI. This procedure is shown below.

1. Check that the “CDS-MEAP” or “CDS-FIRM” is enabled in the service mode. If they are not enabled, change the value to “1” and then restart the device.

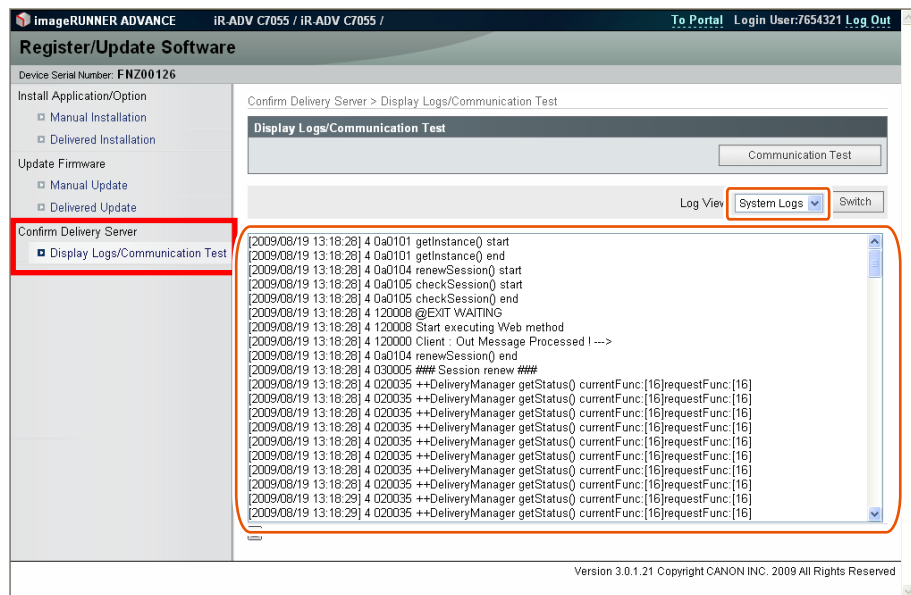

Service mode (Level1) > Mode List

- COPIER > OPTION > FNC-SW > CDS-MEAP: 1
- COPIER > OPTION > FNC-SW > CDS-FIRM: 1

2. Log in the remote UI (URL: http://<device’s IP address or host name>) using the system administrator right.

3. From “Display Logs/Communication Test” screen, obtain System Logs (log level 4) and Update Logs by copy & paste.

Top page (Remote UI) > [Settings/Registration] > [Management Settings] > [License/Others] > [Register/Update Software] > “Display Logs/Communication Test”

F-6-208

NOTE:

- See "Setting Log Level" in chapter 2 for details of changing Log Level

4. If the value of CDS-MEAP or CDS-FIRM was changed in the service mode, return to the original value and then restart the device to enable this setting.

Obtaining the log files is completed.

Error Messages

Error messages displayed in LUI on a device are shown below. As to error codes, see the next list.

No.	Messages	Timing of display	Cause	Remedy
1	An error occurred with the delivery server. Contact your sales representative. Error Code: [xxx]	In communicating with the delivery server.	System error occurred in server.	Obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
2	Delivery server is stopped. Wait a while and then try to perform the operation again. Check the following URL for details. <Stopped Delivery Server URL>	In communicating with the delivery server.	Delivery server stopped.	Check the delivery server stop information. After the delivery server starts, perform the operation from this application. When the delivery server stop information is not available, contact the sales company's Support Department.
3	Failed to connect to delivery server. Check the delivery server and network.	In communicating with the delivery server.	Communication error due to incorrect settings of CDS URL. Excluding delivery server stop, communication error to the delivery server occurred.	Set correct CDS URL in the Updater settings. Check if the network environment is correct to solve the cause of the error occurrence. If the network environment of the device is correct, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
4	Download was stopped because an error occurred with the file server. Check the network.	At the time of file download	Communication error to the delivery server occurred.	Check if the network environment is correct to solve the cause of the error occurrence. If the network environment of the device is correct, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
5	Downloaded files are invalid. Check the network.	At the time of file download	The received file is broken.	After checking the network environment of the device, re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
6	Failed to retrieve information of special firmware. Check the retrieval ID and password.	Acquisition of applicable firmware information	No information exists about firmware for special firmware retrieval ID or Password is invalid.	Enter the correct firmware ID or Password applicable to the firmware information. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
7	Scheduled delivery information of firmware does not exist. Check it because it may already have been deleted.	Acquisition of applicable firmware information	Delivery information with specified delivery ID does not exist.	Register the delivery schedule again. If this occurs at the time of canceling file download, deleting downloaded firmware or deleting scheduled delivery, no remedy is required.
8	Failed to apply firmware.	Firmware application error	Error due to the application (NLM)	Obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
9	Delivery Server : Connect Failed File Server : Retrieve Failed Error Code: [xxxx]	Communication test, etc. (communication test result dialogue)	In the communication test, failed to connect to the delivery server.	Check the network environment of the device, and re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			In SOAP communication, failed to success after 1 min retry.	Set proxy and restart the communication test. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			ID and Password required for proxy to connect to the internet are not configured in device.	Set the user environment to make the access to the following domain available. https://device.cdsknn.net/ http://cdsknn.net.edgesuite.net/ If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			The access to the network is limited.	Contact Field Support Group in the sale company. After confirmation that the delivery server has been restored, restart the communication test. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company again.
10	Delivery Server : Connect OK File Server : Retrieve Failed Error Code: [XXXX]	Delivery Server : Connect OK File Server : Retrieve Failed Error Code: [XXXX]	Due to no return of data for the communication test, time-out (in HTTP communication, no response for 1min) occurred. After that, retried but failed to connect to server.	Check the network environment of the device and re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			The network cable was disconnected during data download in the communication test.	Reconnect the network cable and then restart the communication test. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			The file server stopped during data download in the communication test.	Contact the sales company's Support Department. After confirmation that the delivery server has been restored, restart the communication test. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company again.
			Hash value in the communication test file is incorrect.	Check the network environment and re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
11	An error occurred. Error Code: [xxx]	communication test, etc. (main screen)	The max value (space/file) was exceeded and new log was not accepted. Normally an old log file is deleted before the max value (space/file) is exceeded, but error may occur due to other element (e.g. I/O error).	Check if the log file exceeded the max value. <Update log> Max space: 128KB/file Max file number: 4 <System log> Max space: 512KB/file Max file number: 4 If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
		Notice of version information (main screen)	Failed to acquire version information of device due to no CDS registration of firmware version of device.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			At the time of notifying version information, failed to connect to the delivery server.	Check if the network environment is correct to solve the cause of the error occurrence. If the network environment of the device is correct, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			No return of notifying version information	"Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			Network cable was disconnected during notice of version information.	Re-connect the network cable and re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			Failed to send notice of version information since the main power was turned OFF and then ON during the sending.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			Server stopped at the time of sending notice of version information.	Check the network environment of the device and re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			An internal error occurred at the time of sending notice of version information.	Obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
		UGW linkage (main screen)	UGW linkage was turned ON when eRDS was OFF.	For a device using eRDS, turn ON the eRDS. For a device not using eRDS, turn OFF the UGW linkage. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			An internal error occurred at the time of acquiring delivery information.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
		On-site (error dialogue)	An internal error occurred at the time of acquiring applicable firmware information.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
	An internal error occurred at the time of sending approval information.		Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.	
	An internal error occurred at the time of delivery order		Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.	
	Immediate download (error dialogue)	An internal error occurred at the time of requesting firmware delivery information.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.	
			During the download, all space in the storage disk was occupied. (DiskFull)	After adding vacant space of the storage disk, re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			At the end of receipt, an internal error occurred.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
	Manual update (error dialogue)	At the update start, an internal error occurred.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.	
	Automatic update (error dialogue)	At the update start, an internal error occurred.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.	
	Deletion of downloaded firmware	At the time of notifying cancellation, an internal error occurred.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.	

No.	Messages	Timing of display	Cause	Remedy
12	An error occurred. Check the Update Firmware screen	UGW linkage (main screen)	eRDS sent an order but Updater failed to connect to server.	Conduct a communication test to analyze the cause of the error. After solving the cause, resend the order from the eRDS. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			Delivery server stopped.	Contact the sales company's Support Department. After confirming restoration of the delivery server, re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			Scheduled date and time acquired from the delivery server was before current time (15 or more min had passed.)	Do the delivery setting from UGW again. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			Scheduled data and time acquired from the delivery server did not exist.	Do the delivery setting from UGW again. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
		Immediate download (main screen)	At the time of immediate download, turned OFF and then ON the power of device main body.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
		Manual update (main screen) Automatic update (main screen)	Updated version was different from the ordered version.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			After the update, failed to connect to the delivery server.	Check the network environment and re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			After the update, delivery server stopped.	Contact the sales company's Support Department. After confirming restoration of the delivery server, re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			After the update, the network cable was disconnected.	Re-connect the network cable and re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			After the update, server returned an error.	Obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			After the update, an internal error occurred.	If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
13	Delivery Error Error Code: [xxx]	UGW linkage (Update Firmware screen)	eRDS sent an order but Updater failed to connect to the server.	Conduct a communication test to analyze the cause of the error. After solving the cause, resend the order from the eRDS. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			The delivery server stopped.	Contact the sales company's Support Department. After confirming restoration of the delivery server, re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			The scheduled data and time acquired from delivery server does not exist.	Do the delivery setting from UGW again. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
14	Delivery Error Delivery Time Delivery Firmware Label Delivery Firmware version Error Code: [xxx]	UGW linkage (Update Firmware screen) Immediate download (Update Firmware screen)	The scheduled date and time acquired from delivery server was before current time (15 or more min had passed).	Do the delivery setting from UGW again. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			At the time of immediate download, turned OFF and then ON the power of device main body.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
15	Applicable firmware is not registered.	On-site (error dialogue)	At the user site, no latest firmware exists.	This means the current firmware is the latest, so this error has no impact. But when the latest firmware to be retrieved must exist e.g. released new firmware information has been notified, contact Field Support Group in the sales company.
			No applicable firmware exists on CDS, so the service person can't select any applicable firmware.	Contact the sales company's Support Department.
16	Restart failed. Turn the main power OFF and ON.	Manual update (error dialogue)	An error occurred at the time of the device restart.	After turning OFF and then ON the main power of the device, re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
		Automatic update (error dialogue)	An error occurred at the time of the device restart.	After turning OFF and then ON the main power of the device, re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
17	Specify [E-Mail Address] with up to 64 characters.	At the time of periodical update setting	The specified E-mail address exceeded 64 characters.	Specify E-mail address within 64 characters.
18	The following characters cannot be used for the [E-Mail Address]: .:;"()[]<>\	At the time of periodical update setting	The E-mail address was including the characters which could not be used.	Do not specify E-mail address with characters which cannot be used.
19	Specify [Comments] with up to 128 characters.	At the time of periodical update setting	Comments exceeded 128 characters.	Specify comments within 128 characters.

Error Code

Explanation on Error Codes and Their Remedies

The following shows the error codes displayed on CDS error dialogs and the Control Panel of the device (local UI) and explanation of those error codes.

How to read an error code

An error code consists of a number of eight digits (hexadecimal number) displayed on the UI shown below.

The diagram illustrates the structure of an 8-digit hexadecimal error code. The code 84014206 is shown with arrows pointing to its individual digits and their corresponding meanings in a table. The table is as follows:

Code	Value	Contents
The first digit Error field	8	Error
The second digit Operator	0 1 2 3 4 5 6	Not defined. CDS server Updater UGW Service person IT administrator (User) Scheduled Update
The 3rd - 4th digits Method category	xx	Method
The 5th digit Category code	0 1 2 3 4 5 6 7	Category code
The 6 - 8th digits Description code	000-	See Error code list

The diagram also includes two screenshots: 'Local UI' showing a 'Test Communication' dialog with 'Error Code' 84014206, and 'Error Message dialogue' showing a 'Message from webpage' dialog with 'Error Code: 81081014[CDS]' and detailed error information.

F-6-209

● Remedy by Error Code

Remedy to Be Taken When an Error Code Starting with [81-----] Is Displayed

The remedy for an error code whose first two digits are "81" is shown below.

- 1) Refer to "List of Error Codes Starting with 81", and try the remedy.
- 2) If the symptom is not resolved by performing the remedy shown in the error code list, report it to the support department of the sales company with the following information.
 - Time of occurrence
 - Serial number of the device

Remedy to Be Taken When an Error Code Starting with a Number Other than [81-----] Is Displayed

The remedy for an error code whose first two digits are not "81" is shown below.

- 1) Check the last four digits of the code, and try the remedy shown in "List of Error Codes Starting with a Number Other than 81".
- 2) In the case of an error message with a check mark on the "Network" column of "Cause of error" in the error code list, try the remedy shown below.
 - Execute the operation again.
 - Perform a communication test on the Touch Panel of the device.
 - Check the status of the network equipment (disconnection of the LAN cable, etc.).
 - Check the network settings of the device.
 - Check that there is no restriction on the network environment of the site (e.g. restriction on communication at night).
 - Check the proxy server of the customer. If it does not work properly, perform the remedy. If the problem still persists, clear the cache of the proxy server.
- 3) If the symptom is not resolved by performing the foregoing remedy, report it to the support department of the sales company with the following information.
 - The generated error code
 - The Sublog of the device
 - The update log of the device (Set the log level to 4, and then collect the log.)

■ Error Code List

● List of Error Codes Starting with 81

The list of error codes starting with 81 is shown below. This error is related to the CDS server.

Report the error to the support department of the sales company with the time of occurrence and the serial number of the device.

Error Code	Description	Remedy	Cause of error	
			CDS server	UP DATER
81--0001	No value is set in a mandatory data entry item	Contact the support department of the sales company.	✓	✓
81--0002	In the case of [81--0002] except follows. In a string type of a data entry item, digit number and/or character type is/are set against the regulations is displayed in the following cases:	(Attach information on the time of occurrence and the serial number of the device.)	✓	✓
81040002	<ul style="list-style-type: none"> The number of digits of the registration ID or password is not 8. The registration ID or password includes characters other than single-byte numeric characters. 	Enter the correct ID and password for Special Firmware. (User)	✓	✓
81060002	<ul style="list-style-type: none"> The number of digits or type of characters used for Firm Type, Firmware Version, Firmware Group Version, or Firmware Label does not meet the specified number of digits or type of characters. The character string of Firmware Group Version (firmGroupVersion) includes characters other than numeric values. The number of digits of E-mail Address (mailAddress) is larger than 128. Characters other than single-byte alphanumeric characters and symbols are used for E-mail Address (mailAddress). An invalid e-mail address was input (The domain name is missing, . (dot) was input instead of , (comma), etc.) 	Register the correct e-mail address. If it occurs again, contact the support department of the sales company. (Attach information on the time of occurrence and the serial number of the device.) (Canon Inc. Only) In the case of an error in Firm Type, Firmware Version, or Firmware Group Version, register the correct firmware again.	✓	✓
81--0003	In an data entry item, the value is set against the regulations (E.g. the set value is other than "Operator: 4. Service person, 5. User")	Contact the support department of the sales company. (Attach information on the time of occurrence and the serial number of the device.)	✓	✓
81--0004	No applicable delivery information exists		✓	-
81--0005	Error in the system settings		✓	-
Operation				
81--1001	In the case of [81--0001] except follows. Inconsistency between the current firmware component in the data entry item and delivery information (E.g. the conditions for automatic update are not met. The settings of a mandatory additional set are invalid)	If distribution of the firmware is necessary, search the applicable firmware again, and perform distribution of the firmware.	✓	✓
81071001	A cancellation notification was sent to CDS when the distribution status was not correct. (CDS has not received the status change due to a network failure, etc.)		✓	✓
81091001	<ul style="list-style-type: none"> The firmware information of the device at the time of execution of distribution differs from the firmware information of the device at the time of registration of the distribution schedule. The firmware was upgraded without using CDS when distribution schedule for the device that supports the UGW-linked function had been registered. As a result, the firmware information of the CDS server at the time of execution of distribution differs from the firmware information of the CDS server at the time of registration of the distribution schedule. When the remote update setting for the firmware to be updated was disabled after distribution schedule was registered using auto update.		✓	✓
81--1002	In a notice of delivery-allowed information, an install-set was release to the market, but the market release was stopped during the delivery	Contact the support department of the sales company. (Attach information on the time of occurrence and the serial number of the device.)	✓	-
81--1003	No mail template file exists		✓	-
81--1004	The device serial number in the data entry item differs from that in delivery information		✓	-
81--1005	User is selected as Operator in the data entry items and the retrieval type is other than the latest		✓	-
81--1006	The retrieval type in the data entry item is special and registration ID and individual Password are not set (* Operator did not enter registration ID and individual Password)		✓	-
81--1007	The retrieval type in the data entry item is special and Operator is not Service person		✓	-

Error Code	Description	Remedy	Cause of error	
			CDS server	UP DATER
81--1008	As to the device serial number in the data entry items, there is no applicable device code product	Contact the support department of the sales Company. (Attach information on the time of occurrence and the serial number of the device.) (Canon Inc. Only) Check registration of LMS.	✓	-
81--1009	The retrieval type in the data entry items is special and there are no basic-set applicable to the registration ID and Password (* When wrong registration ID or Password was entered by an operator)	Enter correct ID and the password.	✓	-
81--100A	The delivery status is Applying After the firmware was updated and when an update completion notification has not been sent to CDS, distribution of the firmware was attempted again before update time-out is processed in CDS.	After 2 hours and 30 minutes have passed since the failed attempt to distribute the firmware, search the applicable firmware again, and perform distribution of the firmware.	✓	-
81--100B	No approval information exists about EULA or the export criteria when the delivery is determined	Contact the support department of the sales company. (Attach information on the time of occurrence and the serial number of the device.)	✓	-
81--100C	The delivery status is Distributing/Distributed/Applying/Finished/Failed When the distribution status was not correct, distribution information was obtained from CDS. (CDS has not been notified of the status change due to a network failure, etc.)	Search the applicable firmware again, and perform distribution of the firmware.	✓	-
81--100D	The delivery status is Distributing/Distributed/Applying/Finished/Failed		✓	-
8108100D	When the distribution status was not correct, schedule information was checked with CDS. (CDS has not been notified of the status change due to a network		✓	-
81--100E	The delivery status is New/Waiting to Distribute/Distributed/Applying/Finished/Failed	Contact the support department of the sales company. (Attach information on the time of occurrence and the serial number of the device.)	✓	-
81--100F	The delivery code is other than Distributing. (Firmware distribution)		✓	-
81--1010	The delivery status is New/Waiting to Distribute/Distributing/Applying/Finished/Failed	Search the applicable firmware again, and perform distribution of the firmware.	✓	-
810B1010	An update start notification was sent to CDS with an invalid status. (The CDS server failed to receive the status change due to a network error, etc.)			
81--1011	The delivery status is Distributing/Distributed/Applying/Finished/Failed	Contact the support department of the sales company. (Attach information on the time of occurrence and the serial number of the device.)	✓	-
81--1012	Device is "Not applicable to CDS" (Firmware distribution) * It occurs only when a device that can access CDS is managed.	Register the device as a CDS device.	✓	-
81--1013	When the specified distribution time was within the time frame of CDS distribution stop. (Firmware distribution)	Contact the support department of the sales company. (Attach information on the time of occurrence and the serial number of the device.)	✓	-
81--1014	When confirmation of the firmware distribution settings ended in time-out. CDS was not accessed within 30 minutes after the distribution time. The device has been turned OFF, the network has been disconnected, etc.	Search the applicable firmware again, and perform distribution of the firmware.	✓	-
81--1015	When firmware distribution time-out occurs. A reception completion notification was not sent to CDS within 24 hours after the start of the distribution. The device has been turned OFF, the network has been disconnected, etc.		✓	-
81--1016	Firmware update time-out occurred. An update completion notification had not been sent to CDS even after 2 hours since the start of the update.	Check the device to see if the update has been completed. When the update has ended in failure, execute the operation again if there is no problem with the device.	✓	-
81--1017	When the firmware distribution information notification showed an error in processing the distribution information.	Contact the support department of the sales company. (Attach information on the time of occurrence and the serial number of the device.)	✓	-
81--1018	When the firmware distribution information notification showed an error in processing the scheduled update information.		✓	-
81--1019	When the status of the scheduled update information is "Set", "Finished", or "Failed".		✓	-

List of Error Codes Related to Local CDS

A list of error codes related to Local CDS is shown below.

Error Code	Description	Remedy
81--F003	Firmware information not registered. Firmware information corresponding to the target device serial number does not exist.	Contact the support department of the sales company.
81--F007	Invalid firmware version. The firmware version at the time of registration of the distribution schedule differs from the current firmware version.	
81--F008	Invalid firmware information. Firmware information to be distributed does not exist.	
81--F009	Forcible termination. Distribution information is forcibly terminated from the server UI.	
81--F00F	Invalid distribution status. Distribution status of the server is in a condition where a requested method from the client cannot be accepted.	
81--F010	Invalid parameter. Requested parameter from the client is not correct.	
81--F011	Version information not registered. Version information corresponding to the specified serial number has not been registered.	
81--F012	Distribution time-out. Distribution has not been completed even after a certain period of time from the start of the distribution.	
81--F013	Unable to judge the necessity of distribution Version information from a device has not been registered in the local CDS. Since the local CDS does not know the version information of the device, it cannot respond to the distribution request from updater. As a result of that, an error occurred when the request has been made.	
81--FFFE	DB error. General error to access DB.	
81--FFFF	DB error. Internal error other than error to access DB (file I/O, etc.).	
8X--1204	L-CDS update process for a model that does not support L-CDS	

T-6-22

Error Codes When Using the UGW-linked Function

Codes displayed as eRDS errors when the UGW-linked function is used

Error Code	Description	Remedy
8--X0000	An unexpected error occurred in the device.	Restart the device, and perform the operation again. When this problem recurs, the firmware of the device needs to be reinstalled (upgraded).
8--X0002	A time-out error occurred due to no response from Updater within the specified time (3 seconds).	Obtain the sublog, and contact the support department of the sales company.
8--X0101	Processing in the device (event processing) failed. Restart the device, and perform the operation again.	Restart the device, and perform the operation again. When this problem recurs, the firmware of the device needs to be reinstalled (upgraded).
8--X0303	Queue could not be sent due to failure of processing in the device (event processing).	Restart the device, and perform the operation again. When this problem recurs, the firmware of the device needs to be reinstalled (upgraded).
8--X0304	An error occurred in control of synchronization or interruption processing between processes being handled in parallel.	Wait for a while, and perform a communication test again.
8--X0706	Communication with Updater failed.	Restart the device, and perform the operation again after checking that Updater has been started. When this problem recurs, obtain the sublog, and contact the support department of the sales company.
8--X0707		
8--X0708		
8--X0709	At the time of firmware update, the Tracking ID ordered by UGW and the one to which the Updater responded did not match.	Obtain the sublog, and contact the support department of the sales company.

T-6-23

● Error Codes Not Included in the Error Code List and Remedy for Them

Scenes Where an Error Occurs

When an error code not included in the error code list is displayed, one of the errors shown in the following scenes may have occurred.

Scenes Where an Error Occurs

Scenes Where an Error Occurs	Content
Communication test, etc. (main screen)	Log could not be written due to maximum value (capacity/the number of files) being exceeded.
Version information notification (main screen)	Retrieval of device version information ended in failure because the firmware version of the device was not registered in CDS.
	Connection to the delivery server failed at the time of notification of version information.
	The network cable was disconnected during notification of version information.
	Notification of version information ended in failure because the device was restarted during notification of version information.
UGW linkage (main screen)	UGW linkage was turned ON while eRDS was OFF.
On-site (error dialog)	An internal error occurred when obtaining the applicable firmware information.
Immediate download (error dialog)	An internal error occurred at the time of request of firmware delivery information.
	Free space in the storage destination disk ran out during download. (DiskFull)
Manual/auto update (error dialog)	An internal error occurred at start of update.
Deletion of downloaded firmware	An internal error occurred at the time of cancellation notification.

T-6-24

Remedy

Check that the log files shown below do not exceed the maximum values.

When this problem recurs, obtain the log, and contact the support department of the sales company.

Logs and maximum capacity / number

Log name	Maximum capacity	Maximum number of files
Update log	128KB/ file	4
System log	512KB/ file	4

T-6-25

Error Code

- Over View
- Error Code
- Jam Code
- Alarm Code

Over View

Outline

For PRISMAsync model, refer to PRISMAsync service manual.

Outline

This chapter describes various codes which are displayed when a failure occurs on the product. These are classified into 3 codes as follows.

Code type	Explanation	Reference
Error code	This code is displayed when an error occurs on the machine.	p. 7-4
Jam code	This code is displayed when a jam occurs inside the machine.	p. 7-401
Alarm code	This code is displayed when a function of the machine is malfunctioned.	p. 7-429

- Error code notation

T-7-1

An error code is shown in 7-digit [E000XXX] on the display on the operation panel.

However, [000] in 2 to 4 digit is not used. Thus, an error code is described as [EXXX] using 5 to 7 digit in the service manual. (e.g.: E012 = E000012)

Location Code

Error code and jam code include the location information.

Location information is displayed as 2-digit numbers as follows.

In the error and jam display screen, the “L” row corresponds to the location code.

Device	DISPLAY>JAM	DISPLAY>ERR
imagePRESS C800/C700	00	Main Controller = 00 Printer engine = 05
Duplex Color Image Reader Unit-H1 (Reader + DADF)	01	Main Controller = 01 Reader Controller = 04
Multi-drawer Paper Deck-B1	11	11
POD Deck Lite-B1	11	11
Document Insertion Unit-M1	71	71
Perfect Binder-D1	61	61
High Capacity Stacker-G1	51	51
Paper Folding Unit-F1	02	02
Professional Puncher-B1/Integration Unit-C1	31	31
Finisher-AM1/ Saddle Finisher-AM2	02	02
Booklet Trimmer-D1	02	02
Two-Knife Booklet Trimmer-A1	02	02
External 2/4 Hole Puncher-C1	02	02
Staple Finisher-T1/ Booklet Finisher-T1	02	02

T-7-2

Pickup position code

When jam occurs, pickup location is indicated with the following pickup position code.

In the jam display screen, the “P” row corresponds to the pickup position code.

Pickup position	Pickup position code	
Cassette 1	01	
Cassette 2	02	
Cassette 3	03	
Multi-purpose Tray	05	
POD Deck Lite	06	
Duplex (At duplex printing, jam occurs after paper passes through the Duplex Paper Sensor (PS24).)	F0	
Multi-drawer Paper Deck-A1	Upper deck	11
	Middle deck	12
	Lower deck	13

T-7-3

Pickup size

When a jam occurs, a paper size is displayed. (The row displaying "SIZE" on the jam screen refers to the paper size.)

Due to the limitation of displayable number of characters, some paper size names are omitted. The following is the list of displayed row of texts and corresponding paper sizes.

* The following is based on the display specification and not all paper sizes can actually be used.

Display	Paper Size	Display	Paper Size
A0	A0	LDR	LEDGER

T-7-4

■ Points to Note When Clearing MN-CON

- Execution of clearing MN-COM deletes all data in Forwarding Settings, Settings/Registration (Preferences), Adjustment/Maintenance, Function Settings, Management Settings, TPM Settings, etc. Before execution of this operation, ask user to back up the data and get approval for this operation.
- When clearing MN-CON while any login application other than Default Authentication is, error such as not displayed login screen occurred. In this case, access SMS once and switch login application to Default Authentication to recover to the normal status.

■ Points to Note When Clearing HDD

As a remedy for error codes (E602-XXXX), HDD partition is selected and the target partition may be cleared.

When clearing partition, be sure to check which data will be deleted by referring Detail of HDD partition and explain to the user before starting work.

E029	7008	05	Title	Patch Sensor (Y) sampling detection value error
			Detection description	Variation in S-wave light value of the Patch Sensor (Y) in the ITB Unit showed 100 or higher when executing the initial installation mode of the Developing Assembly (Y) (COPIER> FUNCTION> INSTALL> INISET-Y).
			Remedy	<p>[Related parts]</p> <ul style="list-style-type: none"> - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (Y) (PS21/J8983) (Unit of replacement: REG. PATCH DETECT ASSEMBLY) - ITB (Unit of replacement: BELT, INTER. TRANSFER) - Patch Sensor (Y) (PS21) (Unit of replacement: REG. PATCH DETECT ASSEMBLY) - Registration Patch Driver PCB (UN8) (Unit of replacement: REG. PATCH DRIVER PCB ASSEMBLY) - Developing Assembly (Y) (Unit of replacement: DEVELOPING ASSEMBLY, Y) <p>[Points to note at work] When checking the harness/cable or connector, perform the following work.</p> <ol style="list-style-type: none"> 1. Disconnect and then connect the connector to check that there is no bent pin and cable disconnection. 2. Visually check that the harness is not caught or open circuit. 3. If there is any error, replace the corresponding harness/cable. <p>[Remedy] Perform the following in the order while checking whether the error is cleared.</p> <ol style="list-style-type: none"> 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (Y). 4. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (Y). <p>[CAUTION] After replacement of the Patch Sensor (Y), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ.</p> <ol style="list-style-type: none"> 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. 7. Replace the Developing Assembly (Y). <p>[CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.</p>

E Code	Detail Code	Location	Item	Description
E029	7010	05	Title	Patch Sensor (Y) soiled window error
			Detection description	Although LED light intensity of the Patch Sensor (Y) reaches the upper limit (837), reflected light intensity of the Guide Plate is less than 135 at warm-up rotation at first power-on, at PASCAL control, at initial installation of the Developing Assembly, and at density controls (ATR, real-time multiple tone control) during printing.
			Remedy	<p>[Related parts]</p> <ul style="list-style-type: none"> - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (Y) (PS21/J8983) (Unit of replacement: REG. PATCH DETECT ASSEMBLY) - Patch Sensor (Y) (PS21) (Unit of replacement: REG. PATCH DETECT ASSEMBLY) - Registration Patch Driver PCB (UN8) (Unit of replacement: REG. If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (Y). <p>[CAUTION] After replacement of the Patch Sensor (Y), execute "Adjustment during Patch Sensor replacement" in situation mode.</p> <ol style="list-style-type: none"> 4. Replace the Registration Patch Driver PCB.
E029	7021	05	Title	Patch Sensor (Y) density upper/lower limit error
			Detection description	Density of ATR patch (Y) is either 79 or lower or 970 or higher during printing/at initial installation.
