SERVICE MANUAL

Canon

September 21, 2016
Rev. 2

Introduction

Important Notices

Application

This manual has been issued by Canon Inc. for qualified persons to learn technical theory, installation, maintenance, and repair of products.
This manual covers all localities where the products are sold. For this reason, there may be information in this manual that does not apply to your locality.

Corrections

This manual may contain technical inaccuracies or typographical errors due to improvements or changes in products.
When changes occur in applicable products or in the contents of this manual, Canon will release technical information as the need arises. In the event of major changes in the contents of this manual over a long or short period, Canon will issue a new edition of this manual.

The following paragraph does not apply to any countries where such provisions are inconsistent with local law.

Trademarks

The product names and company names used in this manual are the registered trademarks of the individual companies.

Copyright

Caution

Use of this manual should be strictly supervised to avoid disclosure of confidential information.

Explanation of Symbols

The following symbols are used throughout this Service Manual.

Symbols	Explanation	Symbols	Explanation
	Check.		Remove the claw.
	Check visually.		Insert the claw.
	Check a sound.		Push the part.

Symbols	Explanation	Symbols	Explanation
	Disconnect the connector.		Connect the power cable.
	Connect the connector.		Disconnect the power cable.
	Remove the cable/wire from the cable guide or wire saddle.		Turn on the power.
	Install the cable/wire to the cable guide or wire saddle.		Turn off the power.
	Remove the screw.		Loosen the screw.
	Install the screw.		Tighten the screw.
	Cleaning is needed.		Measurement is needed.

The following rules apply throughout this Service Manual:

1. Each chapter contains sections explaining the purpose of specific functions and the relationship between electrical and mechanical systems with reference to the timing of operation.
   In the diagrams, represents the path of mechanical drive; where a signal name accompanies the symbol, the arrow indicates the direction of the electric signal.
   The expression "turn on the power" means flipping on the power switch, closing the front door, and closing the delivery unit door, which results in supplying the machine with power.
2. In the digital circuits, '1' is used to indicate that the voltage level of a given signal is "High", while '0' is used to indicate "Low". (The voltage value, however, differs from circuit to circuit.) In addition, the asterisk (*) as in "DRMD*" indicates that the DRMD signal goes on when '0'.
   In practically all cases, the internal mechanisms of a microprocessor cannot be checked in the field. Therefore, the operations of the microprocessors used in the machines are not discussed: they are explained in terms of from sensors to the input of the DC controller PCB and from the output of the DC controller PCB to the loads.

The descriptions in this Service Manual are subject to change without notice for product improvement or other purposes, and major changes will be communicated in the form of Service Information bulletins.
All service persons are expected to have a good understanding of the contents of this Service Manual and all relevant Service Information bulletins and be able to identify and isolate faults in the machine.

IMPORTANT:
Not all functions and features are available in all markets at the present time.

Contents

Safety Precautions

Laser Safety

Since radiation emitted inside the machine is completely confined within protective housings and external covers, the laser beam cannot escape from the machine during any phase of user operation.
Therefore this machine is classified in Class 1 laser products that are regarded as safe during normal use according to International Standard IEC60825-1.

Handling of Laser System

This machine is classified in Class 1 laser products.
However, inside the machine, Class 3B laser beam is emitted and is hazardous when entered into an eye.
When servicing the area around the laser assembly, be sure to turn off the main power.
If you must service while the power is turned on, be sure to keep the followings:

- Do not use a screwdriver or tools that have a high level of reflectance in the laser path.
- Remove watches and rings before starting the work. (They can reflect the laser beam, possibly hitting an eye.)

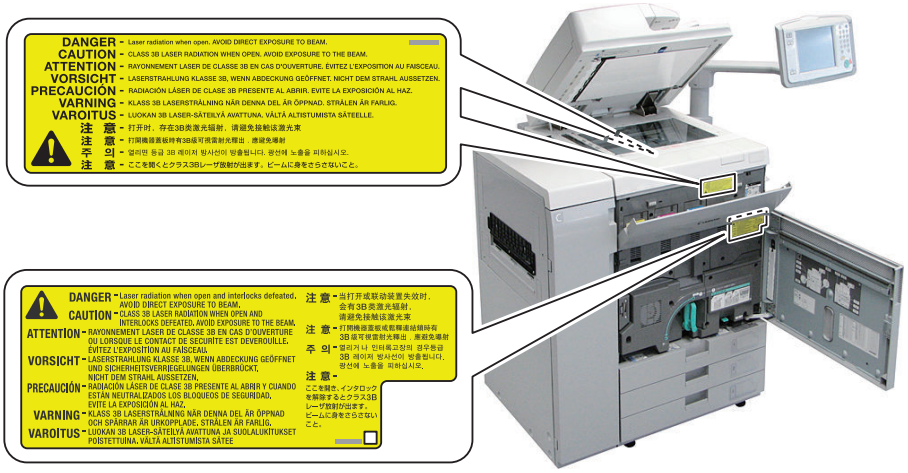
The machine's covers that confine laser beam radiation are identified by means of warning labels (Figure). If you must open the cover, be sure not to enter the laser beam into an eye during the work.

The following warnings are given to comply with Safety Principles (EN60950-1).

Diese Maschine ist der Klasse 1 der Laserprodukte zugeordnet.
Innerhalb der Maschine wird jedoch ein Laserstrahl der Klasse 3B ausgestrahlt und es ist gefährlich, wenn dieser Strahl in die Augen gerät.
Bei Servicearbeiten am oder in der Nähe des Laserteils zuerst das Hauptgerät abschalten.
Bei Servicearbeiten, die unbedingt bei eingeschaltetem Gerät durchgeführt werden müssen, auf jeden Fall die folgenden Vorsichtsmaßnahmen beachten.

- Keine stark reflektierenden Schraubenzieher oder ähnliche Werkzeuge direkt in den Lichtpfad des Laserstrahls bringen.
- Vor Beginn der Arbeit Uhren, Ringe und ähnliche Gegenstände abnehmen. (Reflektierende Laserstrahlen könnten sonst in die Augen geraten.)

Die Geräte-Abdeckungen, die Laserstrahlen reflektieren können, werden durch besondere Warnaufkleber gekennzeichnet (siehe Bild).
Muss die Abdeckung geöffnet werden, besondere Vorsicht walten lassen, damit der Laserstrahl nicht in die Augen gerät.



Turn power switch ON

The machine is equipped with 2 power switches: main power switch and control energy saver key.
The machine goes on when the main power switch is turned on (i.e., other than in low power mode, sleep mode).

CAUTION:
Do not turn off the main power switch while the progress bar is indicated, during which access is made to the HDD. If deprived of power, the HDD can suffer a fault (E602).

Toner Safety

About Toner

Toner is a nontoxic matter composed of plastic, iron and a trace of pigments.

⚠ CAUTION:
Never throw toner in flames to avoid explosion.

Handling Adhered Toner

- Use dry tissue paper to wipe off toner adhered to skin or clothes and wash in water.
- Never use warm water for cleaning up toner to prevent toner particles from being gelated to soak into fibers permanently.
- Toner particles are reactive with vinyl polymers. Avoid contacting these materials.

Notes When Handling a Lithium Battery

Dispose of used batteries according to the instructions.

⚠ CAUTION:
Risk of explosion if battery is replaced by an incorrect type.

The following warnings are given to comply with Safety Principles (EN60950-1).

⚠ CAUTION:
Wenn mit dem falschen Typ ausgewechselt, besteht Explosionsgefahr.
Gebrauchte Batterien gemäß der Anleitung beseitigen.

警告

如果更換不正確之電池型式會有爆炸的風險

請依製造商說明書處理用過之電池

Notes Before it Works Serving

- At servicing, be sure to turn OFF the power source according to the specified steps and disconnect the power plug.
- At the time of assembly and disassembly, be sure to place a sheet of paper under the parts to prevent them from being soiled or foreign matter from entering the parts.
- Before installing the parts to the host machine, ensure that they are free of foreign matter.

Points to Note at Cleaning

When performing cleaning using organic solvent such as alcohol, be sure to check that the component of solvent is vaporized completely before assembling.

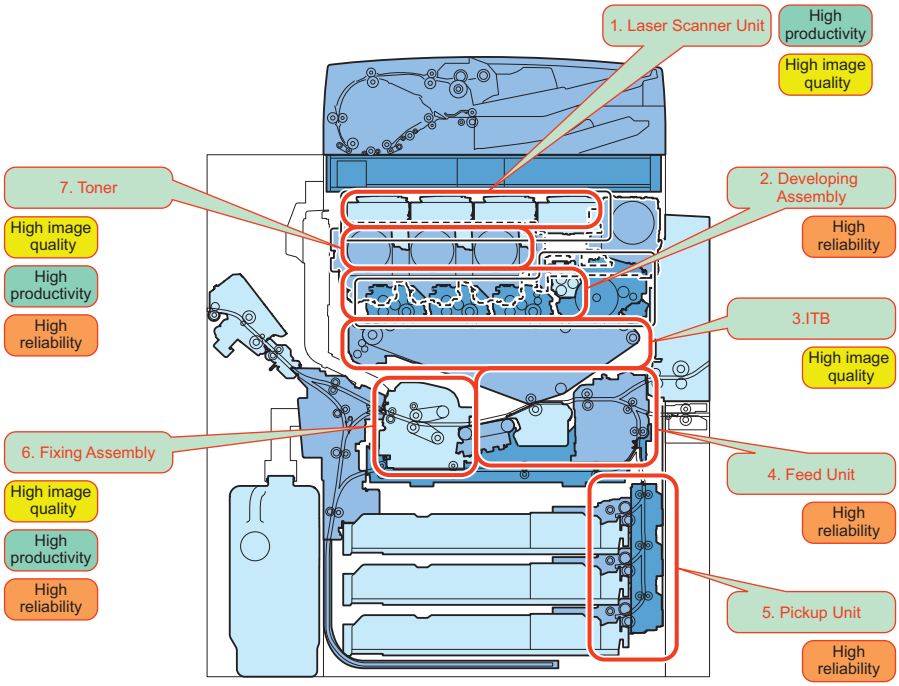
Features

Product Features



Laser Scanner Unit (See No.1 in the above figure: "Characteristics" on page 66)

- Adoption of a Laser Scanner Unit supporting 2400dpi
- Adoption of multiple laser exposure
- Adoption of VCSEL laser

Developing Assembly (See No.2 in the above figure: "Developing Assembly Cooling Control" on page 92)

- Addition of cooling function

ITB (See No.3 in the above figure: "Overview" on page 75)

- Adoption of elastic ITB

Feed Unit (see No.4 in the above figure: "Overview" on page 183)

- Addition of high accuracy registration function

Pickup Unit (see No.5 in the above figure: "Overview" on page 167)

- Adoption of high performance Feed/Separation Roller
- Increased stiffness of Pickup Unit Frame

Fixing Assembly (See No.6 in the above figure: "Overview" on page 143)

- Adoption of High Output IH Heater + Fixing Belt system (Induction Heating)
- Addition of cooling function to Fixing Belt
- Addition of a Refresh Roller

Toner (No. 7 in the above figure)

- Adoption of next generation CV toner

  [Improvement in surface characteristics]
  - Stability of the hue of large volume printing has been improved.
  - The transferability has been improved to support a wide variety of media.
  - Coarseness and toner scattering around text are reduced.

  [Improvement in dispersion of coloring agent]
  - The image quality required for production printing has been realized.

  [Improvement of the fusing characteristics]
  - Including heavy paper and coated paper, the print speed has been increased.

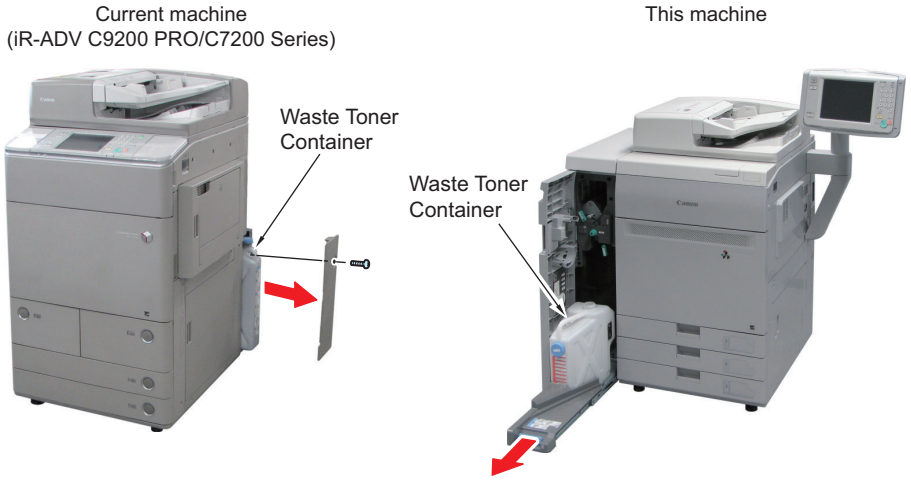
Changes from imagePRESS C800 series (version MN-CONT 30.52 or earlier)

- Increased print speed
  80 ppm => 85 ppm
  70 ppm => 75 ppm
  60 ppm => 65 ppm
- Improved image quality
  Addition of 190 lpi dot screen Improved halftone
- Improved rear registration correction operability
- Supports long length paper (30 inch, 2-sided)
  Delivery destination: Output tray, finisher
- Supports 100 V machines for Japanese market (imagePRESS C650/C65)
- New Service Mode function
  - New I/O mode: Modification of signal check for each part
  - New parts check mode: Operation check of each part has been improved.
- Simplified image position adjustment (only machines including a document reader)
  Amount of image displacement is measured by a document reader and measurement results are corrected by inputting them in Service Mode.

Features at servicing

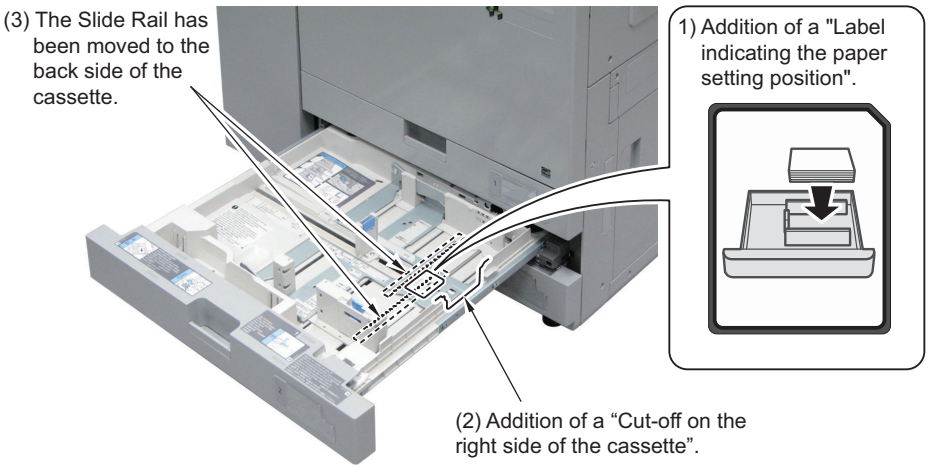
■ User Replacement of Waste Toner Container

The Toner Container of this machine can be removed from the front side. In addition, user replacement has been made possible by enabling the replacement without using any tools.
As a result, the Waste Toner Container can now be replaced even if a technician is not dispatched.



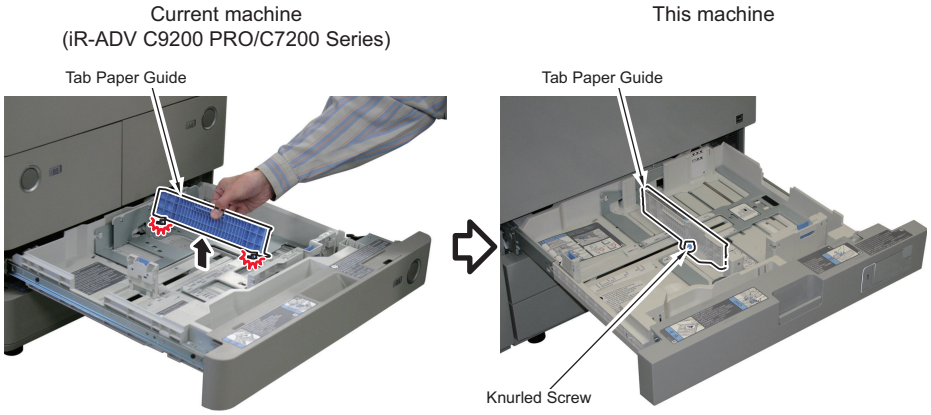
■ Preventing paper setting errors in the standard cassette

Paper jam can be caused by users incorrectly setting paper.
This has resulted in a case where a service request is made and a technician is dispatched.
In order to prevent this, the following three improvements have been made to the standard cassette.



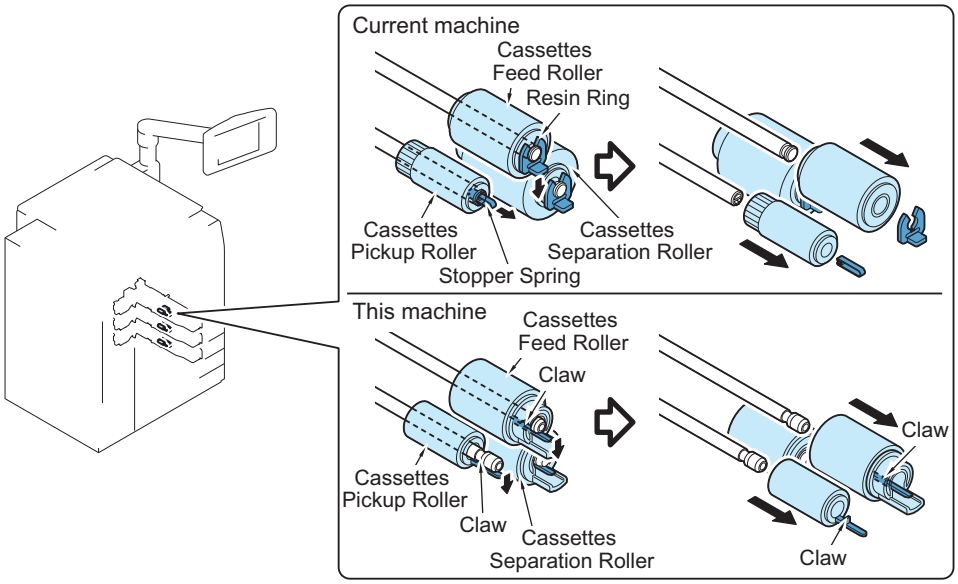
■ Improvement in the operability of the Tab Paper Guide (option)

Due to user's operation mistakes, there was a case where the guide was damaged or could not be removed from the cassette, resulting in a service dispatch. Therefore, the following improvement has been made.
Current machine: Attachment by sliding (Fixation Claws on the guide side)
This machine: Attachment by a Knurled Screw (Knurled Screw on the guide side)



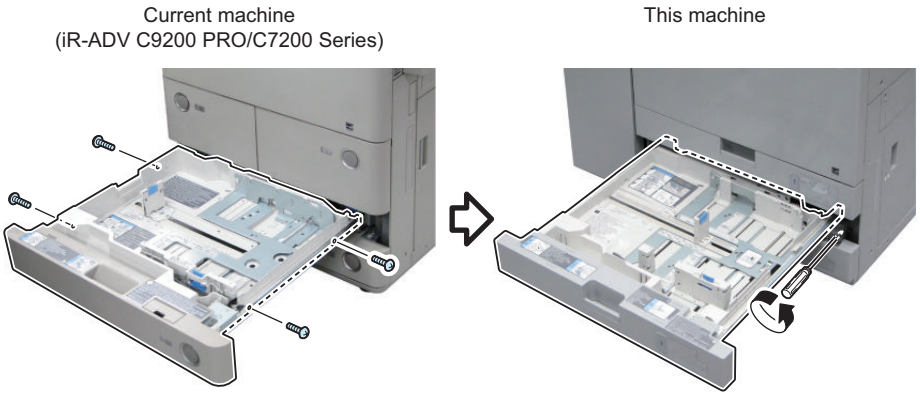
■ Improvement in the replaceability of the Pickup/Feed/Separation Roller

The fixation method of the Pickup/Feed/Separation Roller used in the standard cassette of the host machine has been changed. As a result, the time taken to replace these rollers is reduced.
Current machine: Stopper Spring, Resin Ring
This machine: Fixation by a claw



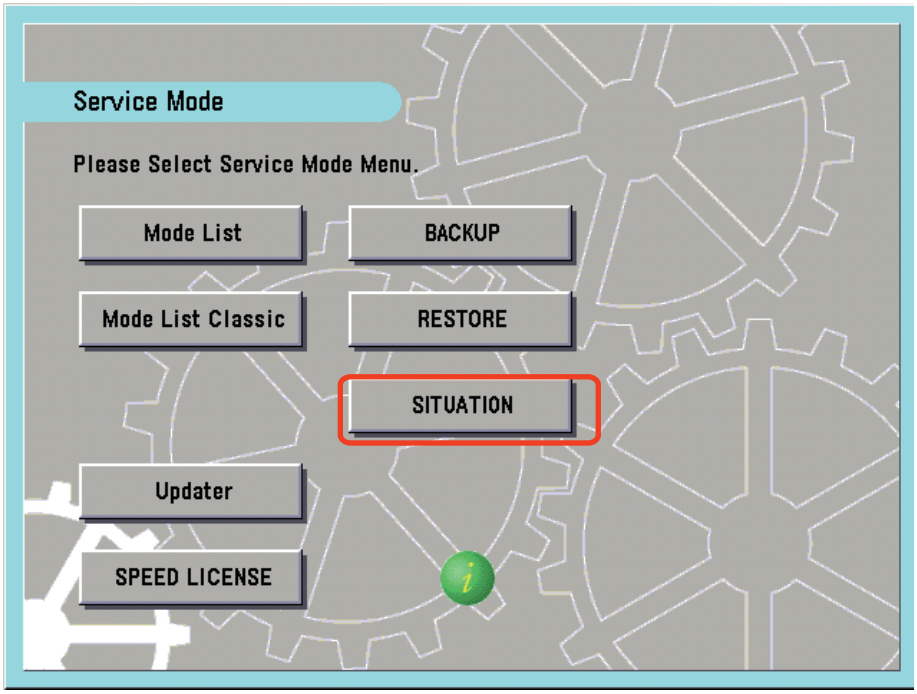
■ Improvement in the replaceability of the standard cassette

Replaceability of the standard cassette has been improved by the reduction of the fixation screws.
Current machine: Fixation by 4 screws
This machine: Fixation by 1 screw



■ Introduction of situation mode

SITUATION mode has been newly added to improve workability and searchability of on-site technicians. This mode makes it possible to easily use the service mode appropriate for the scene at the site.



Specifications

Product Specifications

Item	Specification/Function
Machine installation method	Console type
Photosensitive medium	**Black:** 84-mm diameter OPC Drum **Color:** 30.6-mm diameter OPC Drum
Exposure method	Laser exposure method
Charging method	**Black:** Corona charging method **Color:** C Roller charging method
Developing method	Dry, 2-component development method
Transfer method	Intermediate Belt transfer method (Primary transfer, Secondary transfer: Roller transfer method)
Separation method	Curvature separation method + Static Eliminator
Pickup method	**Cassette:** Separation retard method **Multi-purpose Tray:** Simple retard method
Drum cleaning method	**Black:** Cleaning Blade + Fur Brush **Color:** Cleaning Blade
ITB cleaning method	Static cleaning method
Fixing method	Twin belt method
Delivery method	Face-down
Toner type	Non-magnetic negative toner
Toner supplying method	Set-on
Toner level detection function	Yes
Leading edge image margin	4.0 mm +/- 0.5 mm
Left edge image margin	2.5 mm +/- 0.5 mm
Warm-up time*1	**When the Main Power is turned ON:** 6 min. or less **Startup from sleep mode:** 6 min. or less
First copy time	**Black:** 6.9 sec. **Color:** 7.7 sec.
Image gradations	256 gradations
Print resolution	Max. 2400 dpi x 2400 dpi
Maximum image guarantee area	313 x 754 mm
Maximum printable area	323 x 754 mm

Item	Specification/Function

The copying speed is reduced depending on the paper type, size, and feed method. Furthermore, during continuous reproduction, the operation may stop or be delayed due to temperature adjustment or image quality adjustment on the host machine.

Paper type

Usable paper types are shown on the next page and later.
For irregular-sized paper, refer to the table below.

Type	Feeding direction (mm)	Width direction (mm)
Irregular size 0-1	148.0 to 487.7	100.0 to 139.6
Irregular size 0-2	148.0 to 181.9	139.7 to 330.2
Irregular size 1-1	182.0 to 487.7	139.7 to 181.9
Irregular size 2-1	182.0 to 432.0	182.0 to 209.9
Irregular size 2-2	432.1 to 457.2	
Irregular size 2-3	457.3 to 487.7	
Irregular size 3-1	182.0 to 279.3	210.0 to 256.9
Irregular size 3-2	279.4 to 432.0	
Irregular size 3-3	432.1 to 457.2	
Irregular size 3-4	457.3 to 487.7	
Irregular size 4-1	182.0 to 228.6	257.0 to 297.0
Irregular size 4-2	228.7 to 279.3	
Irregular size 4-3	279.4 to 363.9	
Irregular size 4-4	364.0 to 432.0	
Irregular size 4-5	432.1 to 457.2	
Irregular size 4-6	457.3 to 487.7	257.0 to 330.2
Irregular size 5-1	182.0 to 228.6	297.1 to 304.8
Irregular size 5-2	228.7 to 279.3	
Irregular size 5-3	279.4 to 363.9	
Irregular size 5-4	364.0 to 457.2	
Irregular size 6-1	182.0 to 228.6	304.9 to 320.0
Irregular size 6-2	228.7 to 279.3	304.9 to 330.2
Irregular size 6-3	279.4 to 363.9	
Irregular size 6-4	364.0 to 457.2	
Irregular size 7-1	182.0 to 228.6	320.1 to 330.2

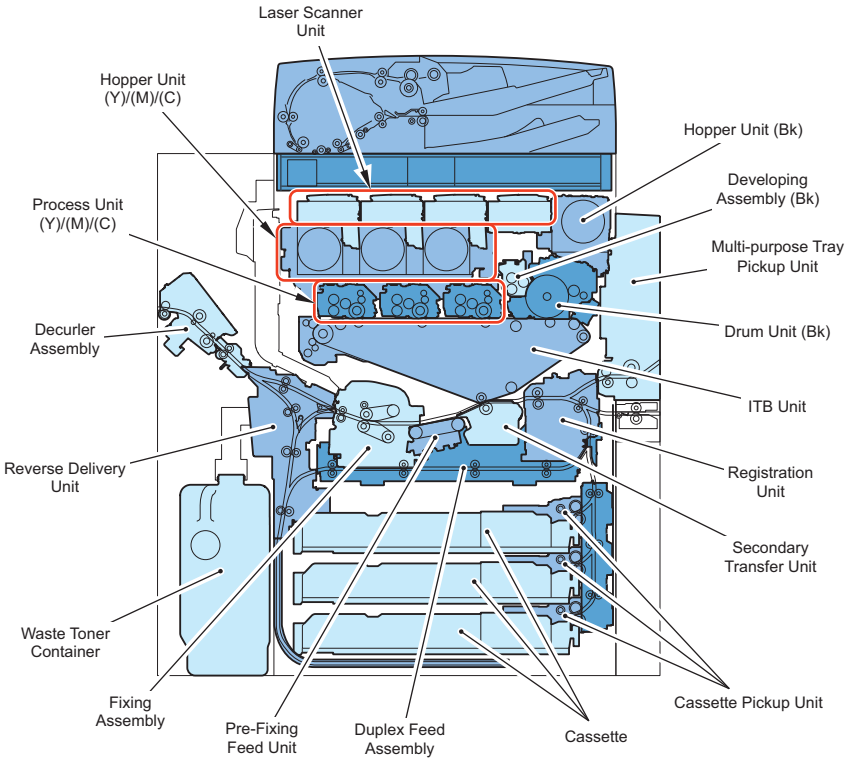
Cross Section View



Power Switch

■ Types of Power Switches

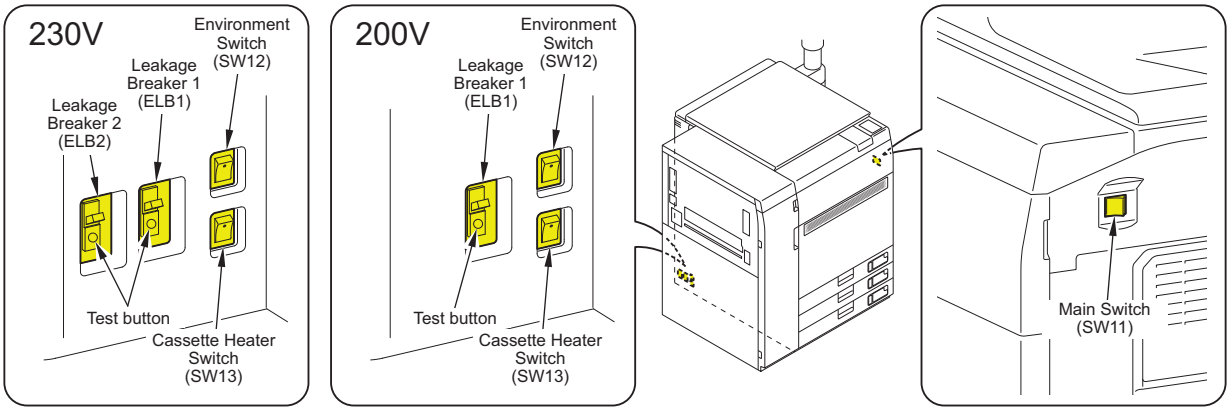
This machine has the Main Power Switch and the Environment Heater Switch.
Turning ON the Main Power Switch supplies the power in the usual case (except when the machine is in sleep mode).
The Environment Heater Switch supplies or blocks the power to the Drum Heater, the Cassette Heater and the Reader Heater.

■ Points to Note on Turning ON/OFF the Power Switch

- Do not turn OFF the Main Power Switch while the progress bar (to be displayed when the power is turned ON) is displayed, which indicates access to the HDD.
- Be sure to turn OFF the main power switch when turning OFF the power. (The conventional shut-down sequence process is not needed.)
- After turning OFF the power (after turning OFF the Main Power Switch), do not turn ON the main power switch again unless the screen disappears.
  Do not turn OFF the power during downloading.

■ Checking the Circuit Breaker

This equipment is equipped with a breaker for detecting overcurrent and electric leakage in order to prevent electrification. Inspect the circuit once a month by following the below procedures.



1. **Turn OFF the main power and check that the Control Panel LED is off.**
2. **Using a pen point, press the test button of the breaker on the rear side of the host machine.**
3. **Check that the breaker switch is OFF ("O" side).**
4. **Return the breaker switch to ON ("I" side).**
5. **Turn ON the main power.**

Control Panel

For PRISMAsync model, refer to PRISMAsync service manual.

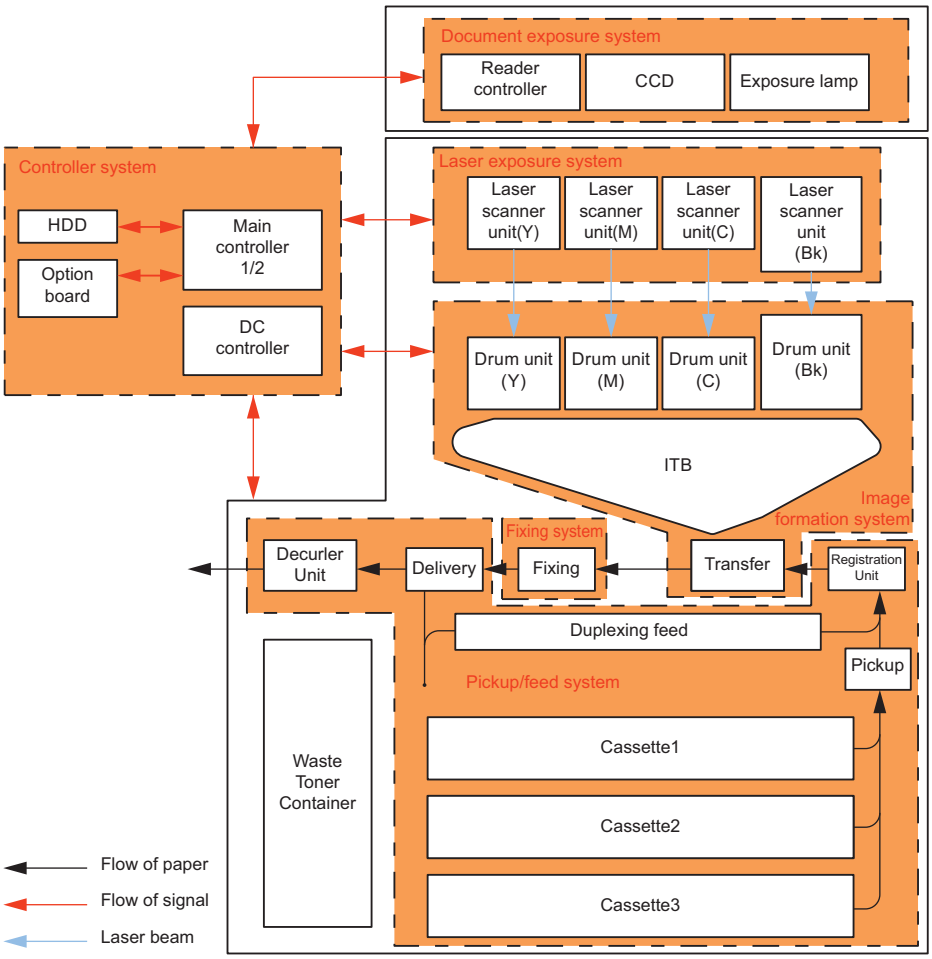
2 Technology

Basic Configuration

Functional Configuration

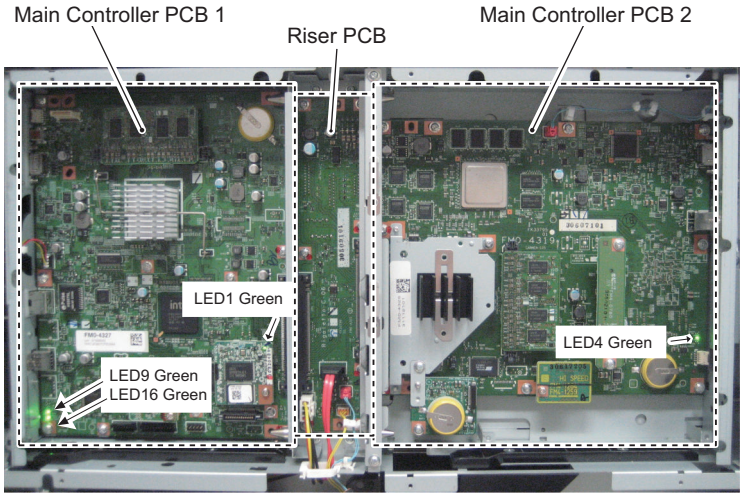
The machine may broadly be divided into the following functional system blocks; document exposure system block, controller system block, laser exposure system block, image formation system block, fixing system block and pickup/feed system block.



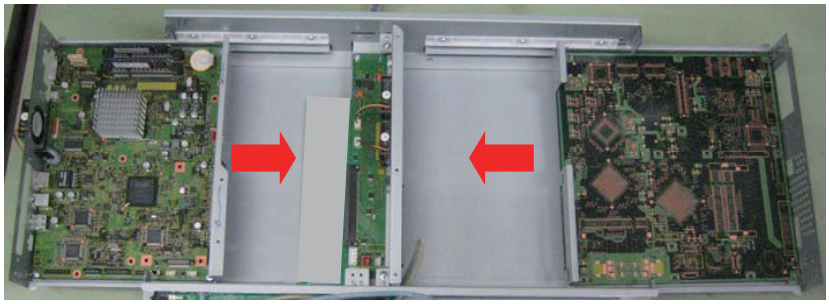
Controller System

Overview

Main Controller PCB 1 controls the entire system. Main Controller PCB 2 mainly controls image processing.

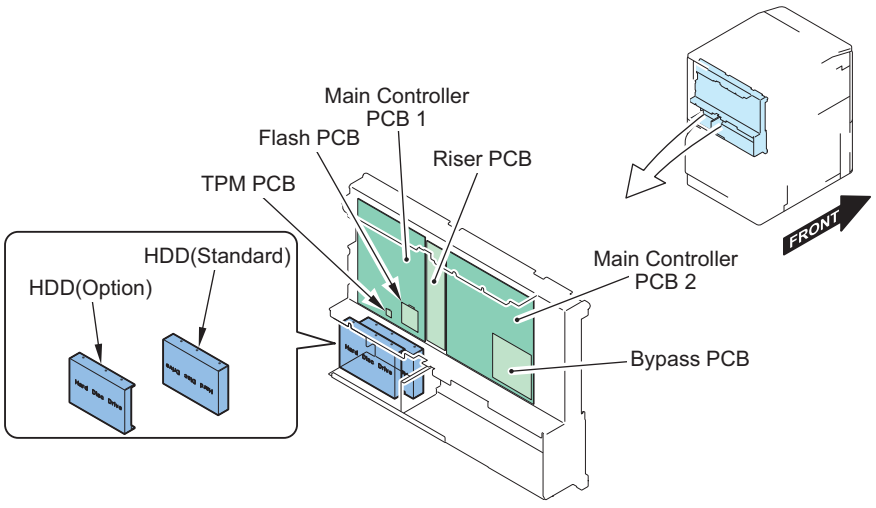


Main Controller PCBs 1 and 2 are connected through the Riser PCB.
Removability/installability of Main Controller PCB has been improved by introducing this configuration.
(Slot-in/out)



■ Specifications/configuration

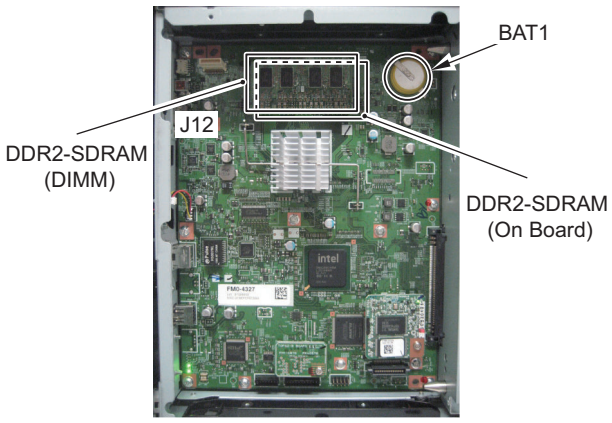
● PCBs



Parts name	Roles/Functions
Main Controller PCB 1	CPU: 1.66 GHz, Controls the entire system. Various controls (memory, Control Panel, electric power, voice), I/F Boards (PCI, USB (host)), RTC
Flash PCB	Program for booting
TPM PCB	Generation and storage of the encryption key. Management Settings > Data Management > TPM Settings; this function is enabled when the TPM setting is set “On” (default: Off) Chinese machine: Not installed
Main Controller PCB 2	CPU: 400 MHz / 200 MHz , Controls image. Image processing (color space conversion, enlargement/reduction, rotation, composition, compression, rasterizing, resolution conversion, image binarization), delay memory control between Drums, HDD control, I/F Boards (reader, USB (device))
Bypass PCB	Internal bus connection Remove this PCB and attach the Open I/F PCB when using imagePRESS Server F200/imagePRESS Server G100.
Riser PCB	I/F (Main Controller 1-2, Main Controller-HDD, Main Controller-DC Controller)
HDD	3-5 inch SATA I/F standard: 1 TB Up to 2 devices can be attached when Mirroring is configured BOX data, address book, all security information (password, certificates) Op.: Optional 3.5inch/1TB HDD-M1, 3.5inch/1TB HDD MIRROR KIT-D3 See "Appendix: Backup List" for more details.

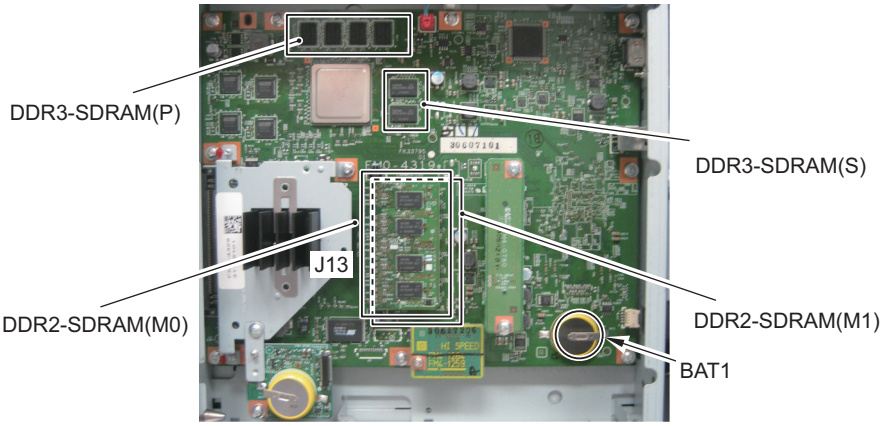
● Memory

Main controller PCB 1



Parts name	Function, specifications, features
DDR2-SDRAM (On Board)	1 GB (standard) / Clock frequency: 333 MHz Used for saving image, program data
DDR2-SDRAM (DIMM)	512 MB (standard) / Clock frequency: 333 MHz Used for saving image, program data
Lithium battery (BAT1)	For RTC Life: approx. 5 years

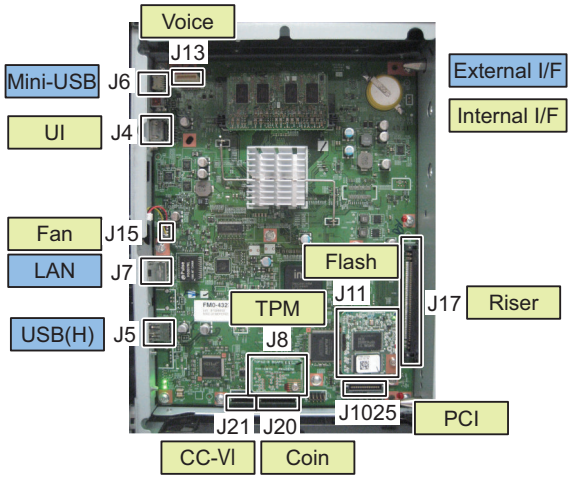
Main Controller PCB 2



Parts name	Roles/Functions
DDR2-SDRAM (M1: On Board)	1 GB (standard) / Clock frequency: 400 MHz Rasterizing, rendering, resolution conversion, coding/decoding
DDR2-SDRAM (M0: DIMM)	1 GB (standard) / Clock frequency: 400 MHz Rasterizing, rendering, resolution conversion, coding/decoding
DDR3-SDRAM (P)	2 GB (standard) / Clock frequency: 1066MHz Print image processing, delay processing between Drums
DDR3-SDRAM (S)	256 MB (standard) / Clock frequency: 800MHz
SRAM	2 MB Retention of data in the Settings/Registration mode/service mode and the image data management information in the HDD. For details, refer to Appendix: Backup List
Lithium battery (BAT1)	For SRAM Backup, Life: Approx. 5 years

● I/F, connector

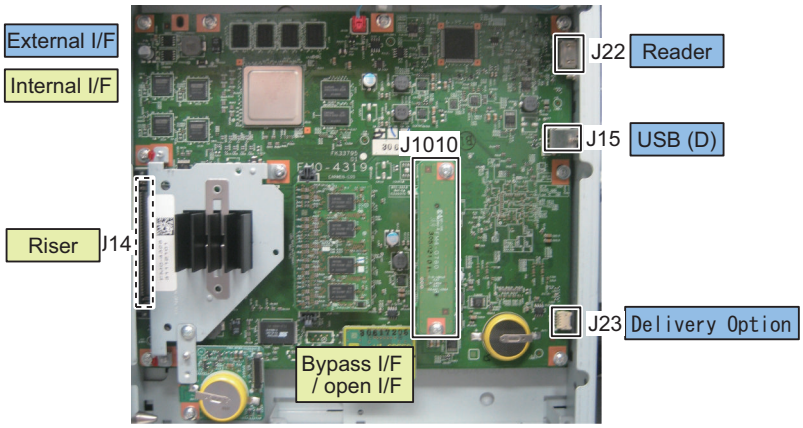
Main Controller PCB 1



No.	Functions and specifications
J13	Voice I/F (Op.)
J4	Control Panel I/F
J6	Mini-USB I/F (Op.) Connects USB Device Port.
J15	Fan I/F
J7	LAN I/F 1000BASE-T / 100BASE-TX / 10BASE-T Also used as I/F (Op.) for imagePASS.
J17	Riser PCB I/F
J11	Flash PCB I/F

No.	Functions and specifications
J5	USB I/F (Host) *1 For MEAP, For USB Keyboard (Op.)
J8	TPM PCB I/F
J1025	PCI Expansion PCB I/F (Op.)
J21	I/F for Control Interface Kit (Op.)
J20	I/F for Card Reader / I/F for Serial Interface Kit / I/F (all Op.) for Coin Manager

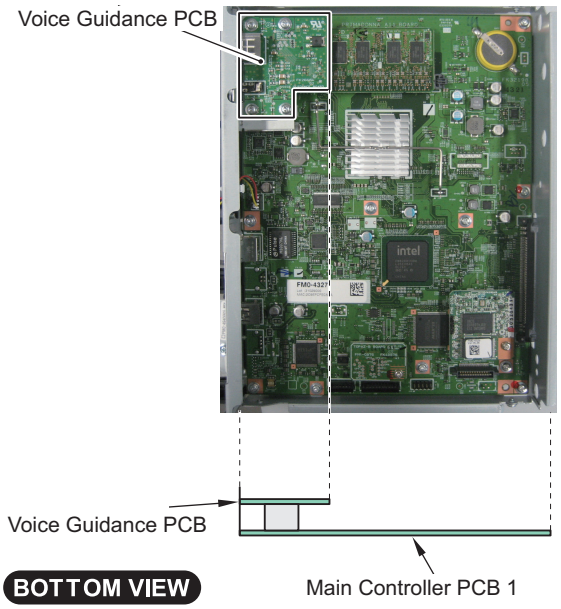
Main Controller PCB 2



Jack No.	Functions and specifications
J14	Riser PCB I/F
J15	USD (D)
J22	Reader I/F
J23	Delivery option
J1010	Bypass PCB I/F When using the imagePRESS Server F200/imagePRESS Server G100, install the open I/F PCB.

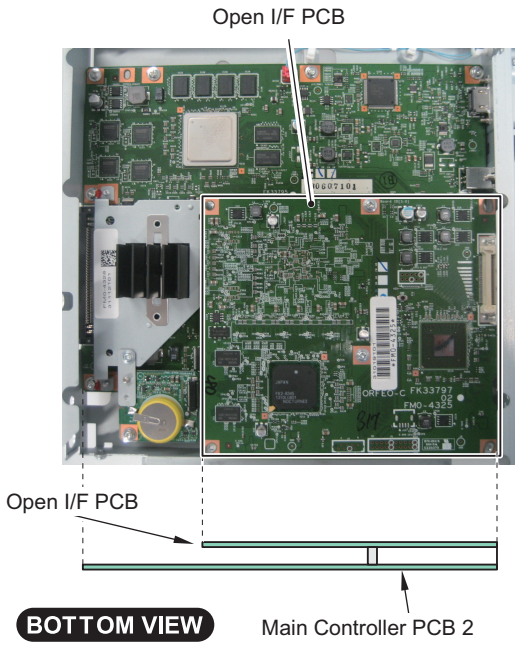
● Function expansion options

Main controller PCB1



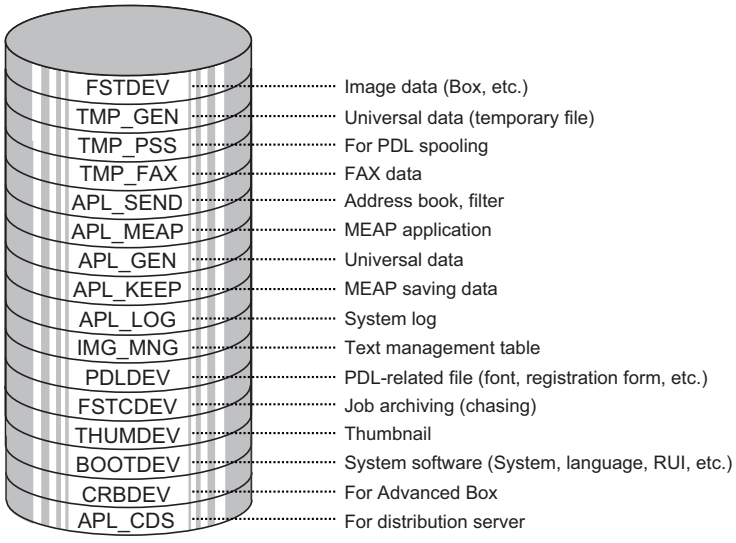
Name	Function, specifications, features
Voice Guidance PCB	Voice Guidance Kit (for non-Japanese models only)

Main controller PCB 2



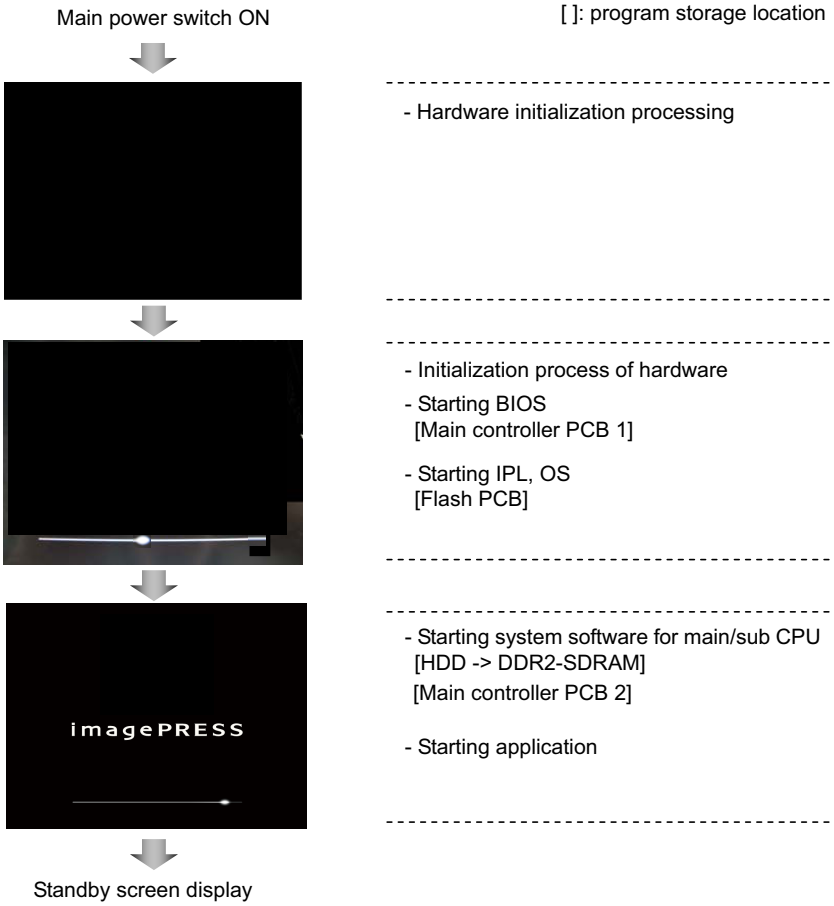
Name	Function, specifications, features
Open I/F PCB	imagePRESS Server F200/imagePRESS Server G100

• HDD



■ Boot / Shutdown sequence

● Startup Sequence



NOTE:
To achieve faster startup, the progress bar and the active PCB are not synchronized.
For this reason, the progress bar cannot be utilized for troubleshooting.
See the following error code list for the troubleshooting.

<Related error codes>

E602: HDD error
- E602-0001: Unable to recognize the HDD. Unable to find the startup partition (BOOTDEV) at startup.
- E602-0002: There is no system software for the main PCU.
- E602-0006: There is no system software for the sub CPU.

E613: Memory failure (Main Controller PCB 2)
- E613-1536: Insufficient capacity of DDR2-SDRAM (M0, M1) (1.5 GB required)

E748: Board error (Flash PCB)
- E748-2010: Unable to find the IPL (Initial Program Loader).
- E748-2011: OS was not found.

● Shutdown Sequence

Before turning OFF the power, it is necessary to perform HDD completion process (to prevent damage on the HDD), cooling internal area of the printer (to prevent fixed toner due to high temperature) and exhaust (to prevent smeared image due to chemical reaction of ozone in the machine and Photosensitive Drum). This sequential process is called “shutdown sequence”. The shutdown sequence has been manually executed with the legacy (existing) models (by holding down the power supply switch on the Control Panel for a specific duration).
With this machine, the Main Controller PCB 1 detects turning OFF the Main Power Supply Switch, and the shutdown sequence is started and executed automatically.

NOTE:
Hardware shutdown sequence also exists. If shutdown sequence is not executed normally due to occurrence of software trouble, the machine is shut down by the timer in the AC Driver PCB after a certain period of time has passed. If it does not shut down, failure of the AC Driver PCB is suspected.

Controls

■ Overview

Item	Control description	Reference
Image Processing control	Image data input from external devices and Reader Assembly is converted to video data and sent to the DC Controller.	“Image Processing Control” on page 48
Backup Battery	Data Backup Battery in case of power failure or power plug becoming unplugged.	“Backup Battery” on page 49
Power-saving Function	Control that limits power consumed in stand-by.	“Power-saving function” on page 50
Security Function	Protection of encryption keys, certificates and passwords	“Security Function (Encryption Key, Certificate and Protection of Password)” on page 50
HDD Mirroring function (Option)	HDD data mirroring process	“HDD mirroring feature (option)” on page 58
Removable HDD (Option)	Enables HDD engagement/disengagement	“Removable HDD (Option)” on page 63

■ Backup Battery

One Lithium battery is installed on the Main Controller PCB of this machine as the backup power supply for various data when power failure occurs or the power cable is unplugged.

Main Controller PCB*1

- Battery type
  Lithium Battery (3V, 620 mAh)
- Battery life
  Approx. 5 years (with the power cable unplugged)
- Battery replacement
  Replacement of a single battery is not available at the service site.

Main Controller PCB 2

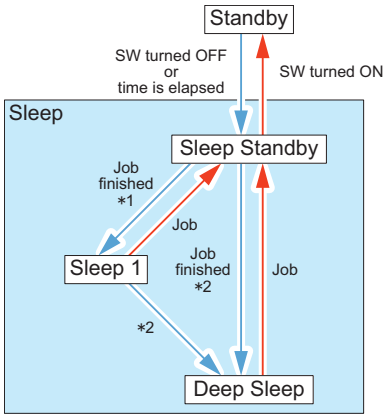
- Battery type
  Lithium Battery (3V, 620 mAh)
- Battery life
  Approx. 5 years (with the power cable unplugged)
- Battery replacement
  Replacement of a single battery is not available at the service site.

DC Controller PCB

- Battery type
  Lithium Battery (3V, 600 mAh)

- Battery life
  Approx. 5 years (with the power cable unplugged)
- Battery replacement
  Replacement of a single battery is not available at the service site.

■ Power-saving function



Sleep standby

Control panel is turned OFF.
Power supply other than the control panel is the same with Standby mode.

Power-saving

Control panel is turned OFF.
Power supply other than the control panel is the same with Standby mode.

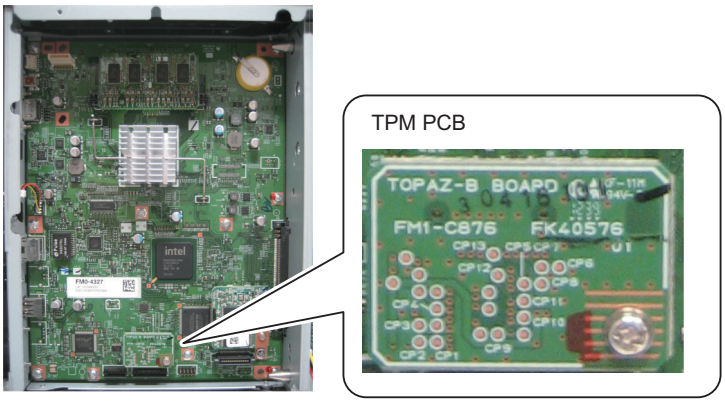
Deep Sleep

3V for all-night power PCB is only supplied. If a next job is submitted, the machine moves to Standby mode.

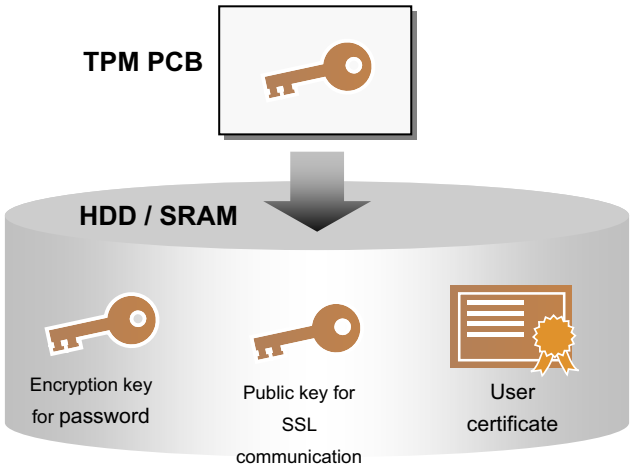
- Print job
- Control panel power switch is pressed.

■ Security Function (Encryption Key, Certificate and Protection of Password)

A new PCB called "TPM PCB" is installed on the machine's Main Controller PCB. TPM, which is an abbreviation for "Trusted Platform Module", is a name of a chip that has a function for generating and saving the encryption key as well as public-key encryption arithmetic function.



The TPM PCB protects security information (passwords, certificates and encryption keys) stored in the HDD and SRAM. It does not protect the setting/registered/saved data other than security information.
Encryption and decryption of security information use the TPM key within the chip.



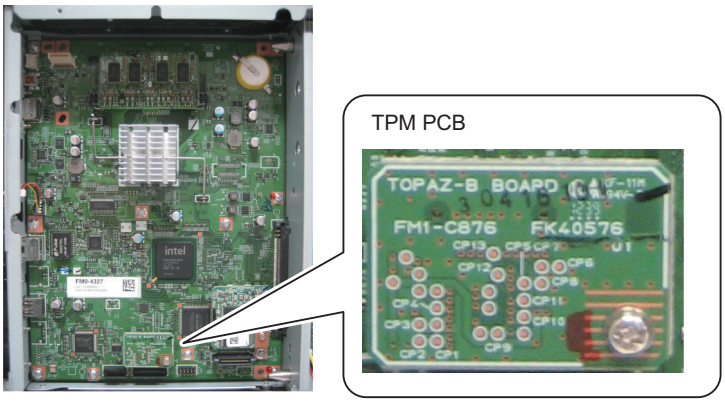
As it is practically impossible to extract the TPM key from the chip, the machine's security information is well protected even when the following cases occur:

- If the HDD or Main Controller PCB is taken out
- If the machine's system is intruded upon via the network

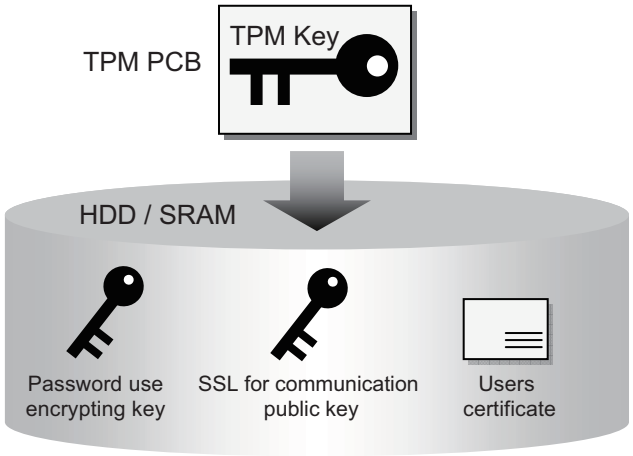
To activate this function, it is necessary to configure settings in the Settings/Registration mode.
Management Settings > Data Management > TPM Settings > On (default: Off)

● Overview

The main controller PCB 1 of the host machine holds a new PCB named “TPM PCB”. “TPM” stands for “Trusted Platform Module”, which collectively refers to the chip set for generating and storing encryption keys and computing public key encryption.



The TPM PCB protects security information (passwords, certificates, and encryption keys) stored in the HDD and SRAM. Note that this PCB does not protect set, registered or stored data other than security information.
The TPM key embedded in the chip is used to encrypt / decrypt security information.

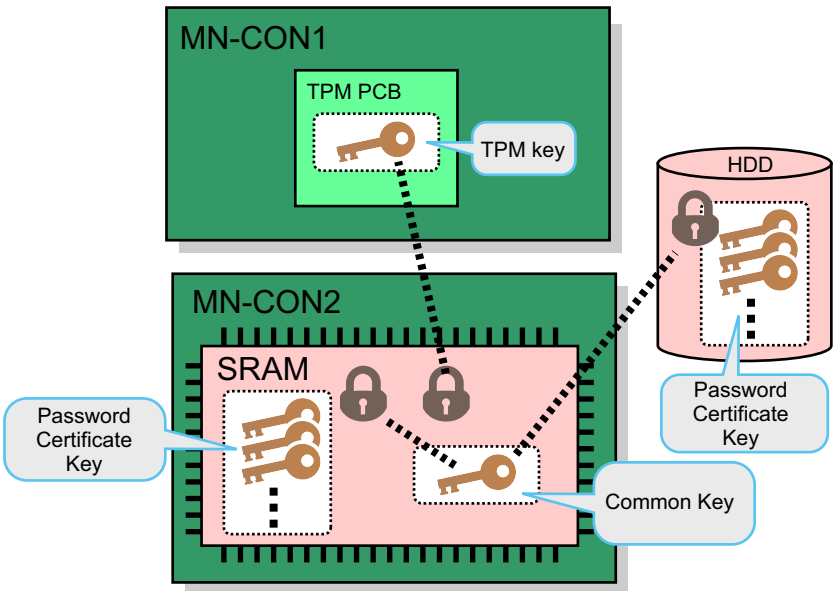


The TPM key is protected from illegal access in a virtually perfect manner, thus the security information of the host machine is securely protected even in the following conditions.

- When the HDD and / or the main controller PCB is taken out from the host machine and installed in the MFP with the different serial number (the model information held in the TPM PCB is specific to the machine originally enabled the TPM setting)
- When the system of the host machine is hacked via the network

Enable this function in Setting / Registration mode.
Management Setting > Data Management > TPM Setting -> ON (OFF by default)

● Operation overview (when the TMP settings are "ON")



Security information (passwords, certificates and encryption keys) is linked to a shared key to be encrypted and is stored on the HDD/SRAM. It can be only decoded by the pair public key.
When the TPM settings are set to "ON", the settings encrypt the pair public key itself. The TPM key is linked to the pair public key. It can be only decoded by the TPM key.
It is practically impossible to extract the TPM key from the chip.
TPM PCB can be used only when the TPM function is enabled with the target machines. It cannot be used on other models. (E746)

● Preparation before Installing TPM

Before installing TPM, ask the user to back up data.
Follow the steps below to back up data.

1. **From Remote UI, execute Setting / Registration > Management Setting > Data Management > Import / Export. The following data types should be backed up.**
   - Address book (see *1)
   - Device settings (transfer settings, address book, frequently-used Send functions) (see *2)
   - Setting / Registration
   - Printer settings can be exported
   - Favorites stored in the web browser (only when the web browser is enabled) (see *3)

   *1 Each of address books can be exported. If the address book is seen as a part of device settings, this step can be disregarded.
   *2 Among settings in the main menu, only “Frequently-used Setting” under “Scan and Send” can be backed up.
   *3 These are available only in the specific models or configurations.
2. **Select “Export” from Custom Menu of the Remote UI to back up “Custom Menu Setting Information”.**
3. **Log in to the system as Administrator from User Management of Advanced Box on Remote UI. Then, execute “Export” to back up “User Information of Advanced Box”.**

● Works to be Done Before and After Introduction

The setting is required in Settings/Registration mode. ([TPM Settings] at the time of shipment: OFF)

1. Enabling of the Function
2. TPM Key Backup
3. Restoration of the TPM key.
4. Disabling of the Function

As a general rule, this work is performed by the user.

CAUTION:
If TPM is set to ON, the TPM key will need to be restored after replacement when replacing the TPM PCB due to a failure, etc.
If the TPM key is not restored, the security information (passwords, encryption keys and certificates) cannot be used, so advise users of the following.

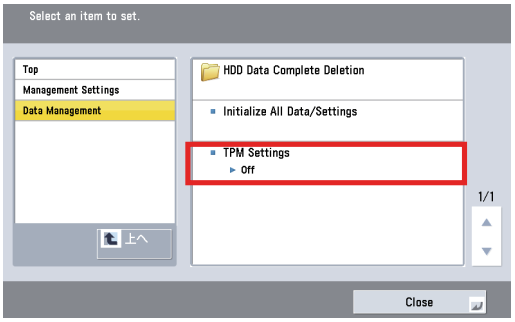
- Immediately back up the TPM key.
- Be sure to remember the password set when the TPM key was backed up.
- Do not lose the USB flash drive containing the backup file of the TPM key.

Due to reasons such as losing a USB flash drive, it will be necessary to execute "Initialize All Data/Settings" first to enable TPM settings again when the TPM key could not be restored. This is because of the security issue that arises if Settings/Registration data is kept unchanged.

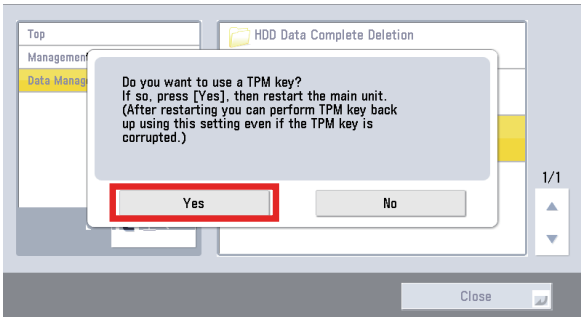
1. Enabling of the Function

CAUTION:
Setting the "System Administrator PIN"
Be sure to recommend to the user (administrator) to set the System PIN beforehand.
After configuring the TPM Setting to "On", back up the TPM key, but it can only be done once. It is effective to set the System PIN as a means to prevent possible problems, such as someone other than the administrator obtaining the backup file due to the TPM key not being backed up.

1. Specify "ON" (enable) for the following settings.
   - [Initial Setting/Registration] > [Management Settings] > [Data Management] > [TPM Setting]



2. Click "Yes" and restart the machine.



This function is enabled after restart.

2. TPM Key Backup

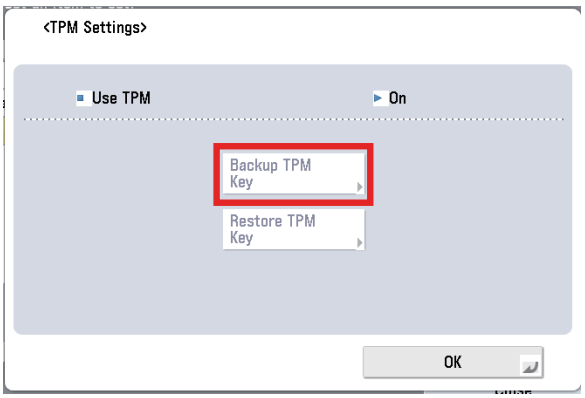
Only a USB flash drive (supported file system: FAT32) can be used as a device to save the backup file of the TPM key. The data size of this file is several MB.

1. Connect the USB flash drive to the machine.
   1 USB I/F (host) each is located on the Control Panel side and the Main Controller PCB side.

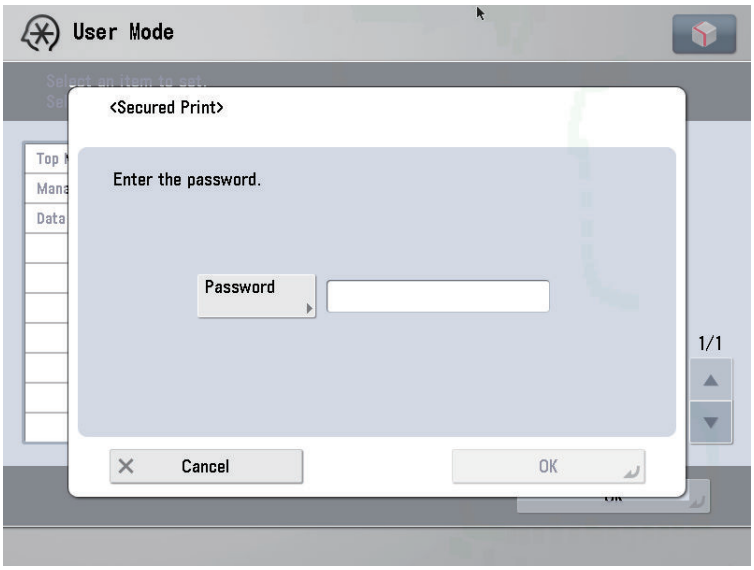
CAUTION:
Connect only one USB flash drive.
If two or more are connected when the backup operation is executed, a message is displayed indicating that the backup has failed.

NOTE:
Several TPM key back-up files can be saved in the USB flash drive.

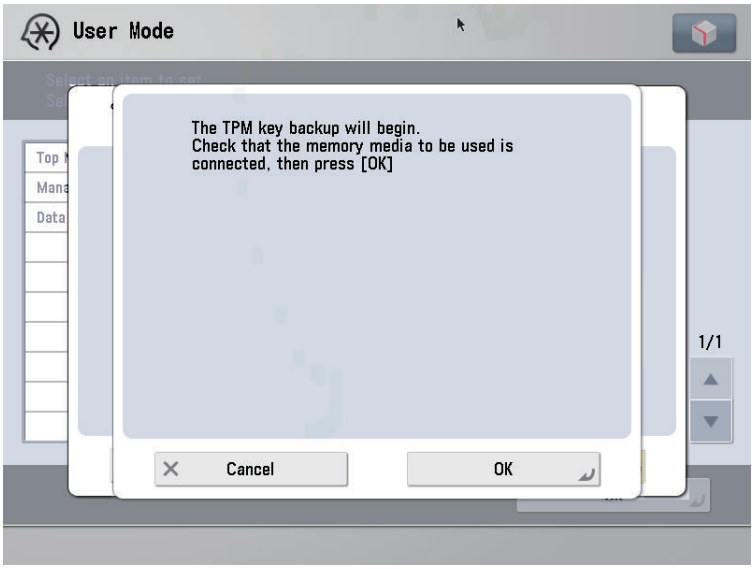
2. Execute Management Settings > Data Management > TPM Settings, and click [Back Up TPM Key].



3. After clicking [Password], enter the password (4 to 12 digits).
   Then, re-enter the verification password.



4. Click [OK]. Backup of TPM key starts.



5. When the screen indicating the completion of backup is displayed, click [OK] and remove the USB flash drive.

CAUTION:
Causes of backup failure
In the following cases, a message indicating that the backup has failed and its cause are displayed. Take the appropriate measures.

- No USB flash drive is connected.
- Two or more USB flash drives are connected.
- Not enough space on USB flash drive.
- The connected USB flash drive is read-only.
- There is no key.

CAUTION:
With respect to storing the USB flash drive,
advise users of the following.

- Store the USB flash drive under lock and key.
- Do not store the backup files of the TPM keys in a USB flash drive at a location to which the general public has access, such as on a server.

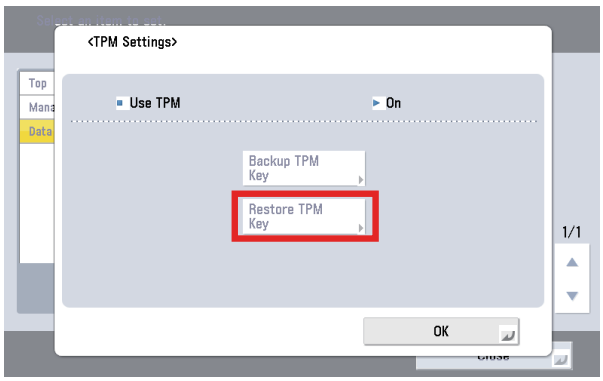
NOTE:
Name of the backup file of the TPM key
The serial number of the machine is automatically assigned to the name of the backup file.

3. Restoration of the TPM key.

The operation is almost the same as that of backup.
Differences:
When the restoration is completed, restart (turning OFF and then ON the Main Power Supply Switch) is required.

1. Connect the USB flash drive containing the saved TPM key.

2. Execute Management Settings > Data Management > TPM Settings, and click [Restore TPM Key].



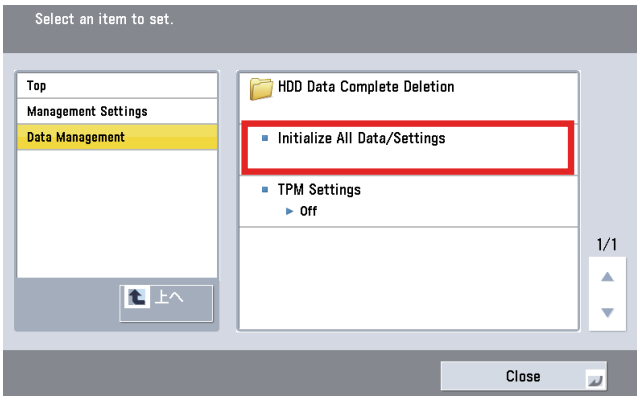
3. Enter the password set at backup operation.
4. When the screen appears confirming the start of restoration, click [OK]. Restoration starts.
5. When the screen indicating the completion of restoration is displayed, click [OK], remove the USB flash drive, and then turn the Main Power Supply Switch OFF and then ON.

CAUTION:
Causes of restoration failure
In the following cases, a message indicating that the restoration has failed and its cause are displayed. Take the appropriate measures.

- No USB flash drive is connected.
- Two or more USB flash drives are connected.
- A secured USB flash drive is connected.
- The USB flash drive contains no TPM key.
- The TPM key on the USB flash drive is not for the target machine.
- The entered password does not match.
- "Initialize All Data/Settings" is executed after backing up the TPM key.
- SRAM (Main Controller PCB 1) or HDD is faulty

4. Disabling of the Function

Execute "Initialize All Data/Settings" to configure the TPM Setting to "OFF".



● Overview of Actions taken against Troubles

Location with failure	TPM Setting = ON	TPM Setting = OFF	Relevant Error Code
TPM PCB	1. Check the TPM PCB connection 2. Replace the TPM PCBs 3. Turn OFF/ ON the power 4. See the section of “Restoring TPM Key” to restore the TPM key. 5. Turn OFF/ ON the main power for recovery	N/A (TPM PCB is not in use when the TPM setting is set to OFF.)	Initially E746-0031 is shown on the screen. When the power is turned OFF/ON after the TPM PCB is replaced, E746-0032 is shown (only when the TPM setting is set to ON).

Location with failure	TPM Setting = ON	TPM Setting = OFF	Relevant Error Code
HDD	1. Replace the HDDs. 2. Format the HDD. 3. Download the system software. 4. See the section of “Disabling Functionality” to execute “Initialize All Data/ Settings”. 5. Turn OFF/ON the power. The TPM setting is automatically set to OFF. 6. Set the TPM setting to ON (the public key and the common key are automatically set).	1. Replace the HDDs. 2. Format the HDD. 3. Download the system software. 4. Restore the password information stored in the HDD.	Initially E602-xxxx is shown (the different extension is shown depends on cases). After the system software is reinstalled, E746-0033 is shown.
Main Controller PCB 2 (SRAM)	1. Replace the main controller PCB 2. 2. The common key backed up in the HDD will be automatically restored in the SRAM. 3. The TPM setting on the control panel is reset to OFF. Manually set the TPM setting to ON (the machine is operated in the TPM setting ON). 4. Restore the password information stored in the SRAM (see *1).	1. Replace the main controller PCB 2. 2. The common key backed up in the HDD will be automatically restored in the SRAM. 3. Restore the password information stored in the SRAM (see *1).	E747-xxxx (the different extension is shown depends on cases).

*1 If “No” is indicated in the field of Backup Column in the table of “Security Information Storage Location”, the relevant information should be set manually again.

● Related Error Code

E746 (code error)

- E746 - 0031: Hardware error
  Possible cause: The TPM PCB is not installed, the TPM PCB for another model is installed, or failure of TPM Chip.
  Remedy: Install a TPM PCB for this machine. Replace the TPM PCB with a new one.
- E746 - 0032: Error from which system recovery is not possible occurs.
  Possible cause: Location of security information in HDD/SRAM is unknown.
  Remedy: Execute "Initialize All Data/Settings".
- E746 - 0033: Error occurs, but system recovery is possible (TPM).
  Possible cause: Mismatch of key
  Remedy: Execute restoration of the TPM key.
- E746 - 0034: Error occurs, but auto recovery of the system is possible.
  Possible cause: Mismatch of key occurred However, recovery by restart is possible.
  Remedy: Turn the main power OFF and then ON.

● Target data for encryption/decryption (reference)

Type	Application / Function	Security information	Storage destination
Password / PIN	**Mail Box**	Mail Box password	HDD
		Encryption password for backup of Mail Box	SRAM
		SMB server password for backup of Mail Box	SRAM
	Send	Password for sending files in the Address Book	HDD
		LDAP Server password	SRAM
		POP3 Server password	SRAM
		Password for time stamp PDF	SRAM
		Password for registering destinations	SRAM
	UI	Service mode password	SRAM

Type	Application / Function	Security information	Storage destination
Password / PIN	Network	IPP authentication password	SRAM
		FTP authentication password	SRAM

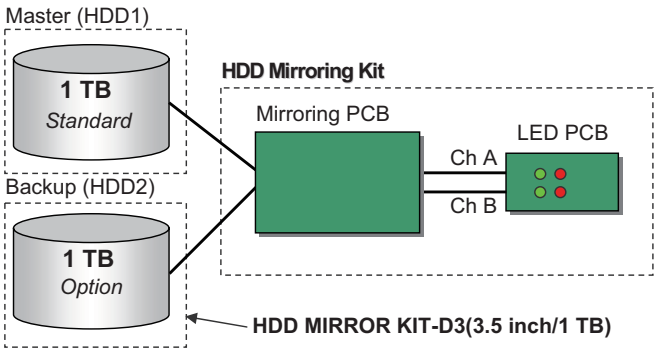
Others	User preference data	Key ring information (password)	HDD

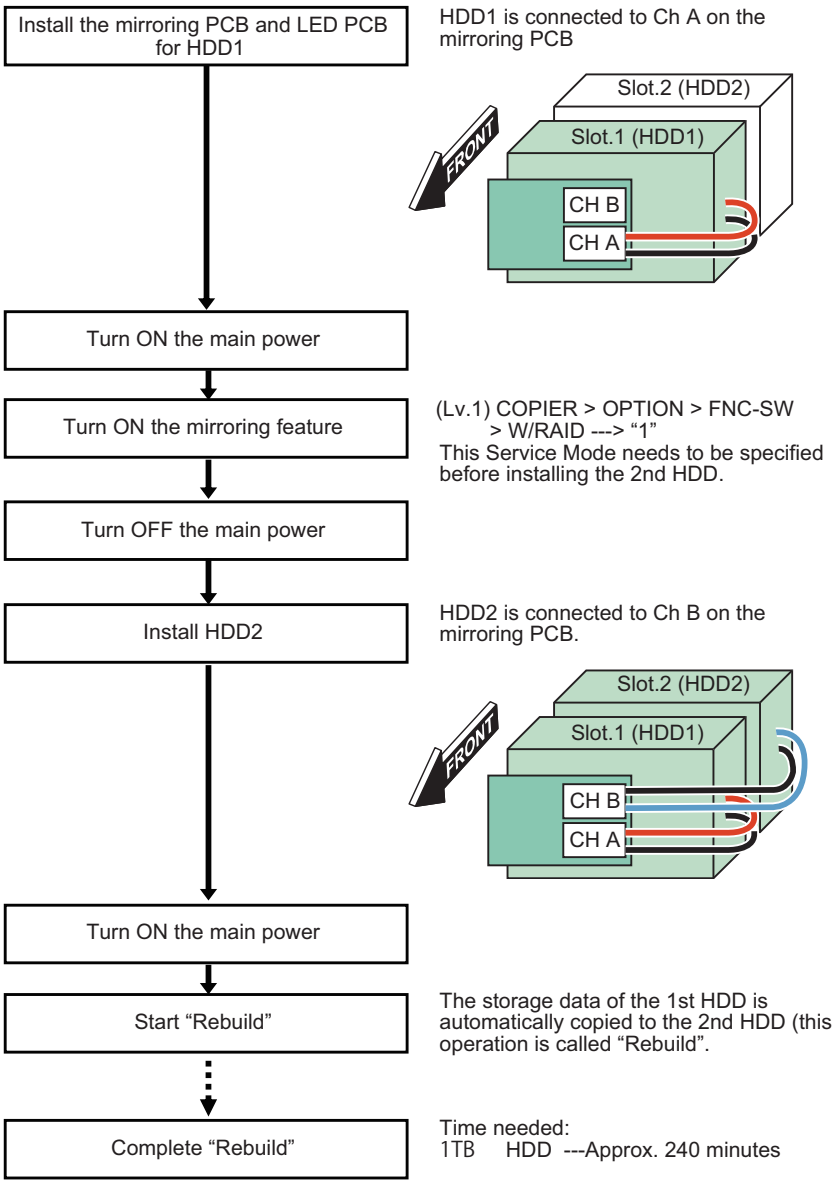
■ HDD mirroring feature (option)

Overview

This option enables HDD data mirroring (RAID1).
If one of the HDDs is faulty, the other one operates as "master".



■ Works before using this functionality (installation)



Rebuild progress is shown as messages on the status line of the control panel.
“Copying data to HDD. xx%”

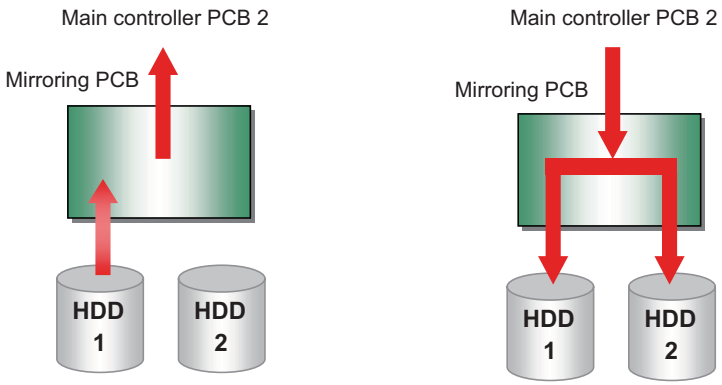
NOTE:

- This machine can be used even during “rebuild” process (operation is performed with HDD1)
- The HDD will not be damaged even if turning OFF the power during “rebuild” process. “Rebuild” is resumed once the power is turned ON the next time. This does not apply in the case of blackout or disconnecting the power code during “rebuild” process

● HDD reading / writing operation

At reading:
Data is read by HDD1 (master HDD) only

At writing:
The same data is written to each HDD at the same timing



The ACT LED (green) on the LED PCB is lighted up / blinking if reading / writing to each HDD is performed properly.
In the case of failure:

- The LED (red) on the LED PCB is blinking. If one of the HDDs is faulty, the operation continues by using the other one as "master".
- If both two HDDs are faulty, E602 error is shown on the control panel to stop the operation.

● Operating status list (LED)

The mirroring PCB controls HDD data read/write timing.
The LED PCB displays the operating status of the HDD by LED.

The below table displays the LED for each HDD status.
For example, if the HDD is being accessed, the green LED on the HDD1 (Ch A) side blinks at high speed.

Status	HDD 1 (Ch A)		HDD 2 (Ch B)		Modes
	Green LED	Red LED	Green LED	Red LED	
Normal (standby status)	----	----	----	----	Mirror mode
HDD1 is being accessed	● (*1)	----	----	----	----
HDD2 is being accessed	----	----	● (*1)	----	----
HDD1 failure	----	●	----	----	Degrade mode
HDD2 failure	----	----	----	●	Degrade mode
Data is being copied to HDD1 (Rebuild)	----/●	○	----/●	----	Rebuild mode
Data is being copied to HDD2 (Rebuild)	----/●	----	----/●	○	Rebuild mode
Failure of 2 HDD units or failure of master HDD	---- (*2)	●	---- (*2)	●	Halt mode

--- : Unlit ● : Lit ○ : Blinks at intervals of 0.5 sec.
*1: When it's this status, the LED is blinking at high speed.

*2: The green LED may be lit.

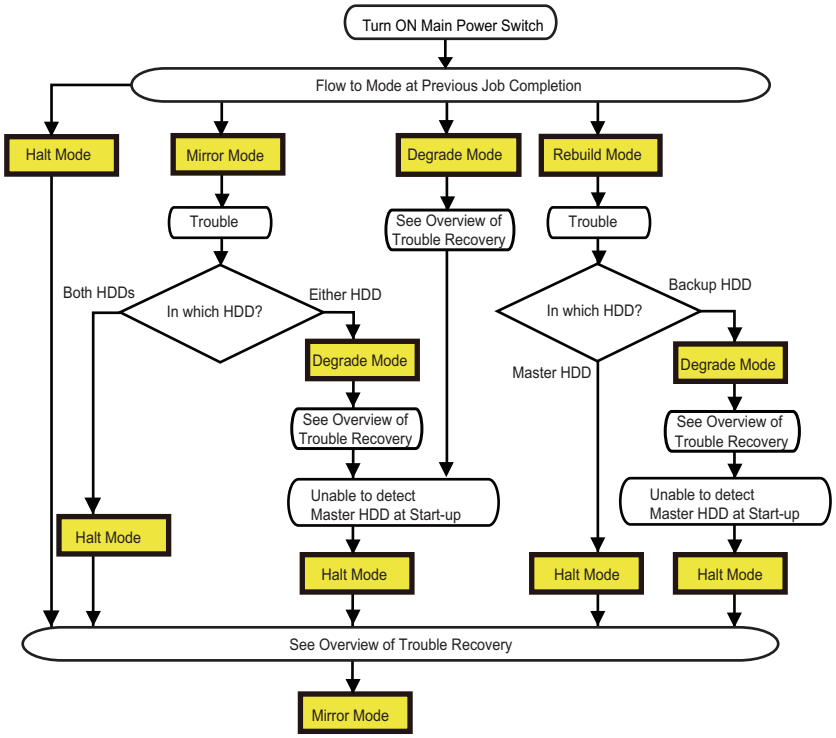
● Description of Modes

The mirroring system of this machine consists of 4 modes.
The modes in parentheses show the mirroring system statuses.
The status flows among the modes below during operation.
The table below lists descriptions of modes and operational overview.

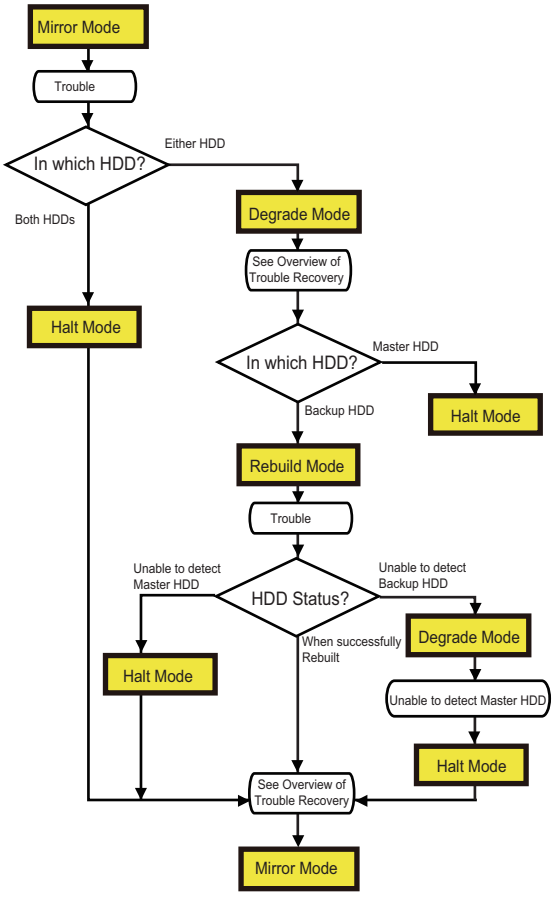
Name of Mode	Description	Master HDD Status	Backup HDD Status
Mirror Mode	Both HDDs are normally operated	In normal operation	In normal operation
Degrade Mode	Any trouble occurred in the backup HDD suspends mirroring operation. The machine can be used under this condition, however, the backup HDD should be replaced at the earliest convenience.	In normal operation	With troubles (HDD not installed/ HDD in trouble)
Rebuild mode	The data of the master HDD is copied (rebuilt) to the backup HDD. The machine can be used under this condition.	In normal operation	In recovery from the trouble (Copying data of Master HDD)
Halt mode	Both HDDs are in trouble (see *1)	In trouble (HDD not installed/ HDD installed not registered/ HDD disconnected while the mirroring board is in operation)	With troubles (HDD not installed/ HDD installed not registered/ HDD disconnected while the mirroring board is in operation)

*1: Turn OFF/ ON the power in this mode, the mode returns to the previous mode.

Mode Flow at Start-up



Mode Flow during Operation



● Overview of Countermeasures for Trouble

If a fault occurs to the mirroring system, actions which correspond to the mode names in the table below should be taken.
The installation location of the faulty HDD should be determined based on the display status of the red LED on the LED PCB.
To check which HDD is the master HDD, turn the power OFF and then ON and check whether the green LED on the LED PCB is lit.
The HDD on the side of green LED (ChA or ChB) which first repeated high-speed blinking in sync with the HDD access status becomes the master HDD. Conversely, the HDD on the side of green LED which does not light in this state becomes the backup HDD.

Mode name	Status	Remedy	HDD1 (Ch A)	HDD2 (Ch B)
			Red LED	Red LED
Mirror mode	At normal time (standby status)	Normal state	----	----
Degrade mode (Refer to *1.)	HDD 1 failure	1. Check the connection between HDD 1, the Mirroring Board and Main controller PCB 2. 2. If the problem is not solved, replace the HDD 1.	●	----
	HDD 2 failure	1. Check the connection between HDD 2, the Mirroring Board and Main controller PCB 2. 2. If the problem is not solved, replace the HDD 2.	----	●
Rebuild mode	Copying data to HDD 1 (rebuild)	Copying (during rebuild)	○	----
	Copying data to HDD 2 (rebuild)	Copying (during rebuild)	----	○
Halt mode	2 faulty HDDs	1. Check the master and backup HDDs (Refer to *2.) 2. If the problem is not solved, replace these 2 HDDs (Download System Software after HDD formatting).	●	●

---: Goes off, ●: Lights, ○: Blinks every 0.5 seconds
*1: During this mode, "The hard disk needs to be replaced (Call service rep.)" is displayed on the Operation Panel. 310006 is displayed in the CODE column of alarm history for service mode (COPIER > DISPLAY > ALARM-2).

*2: If the HDD which was used on another model is installed, it cannot be recognized by this machine since it has a different ID. Because of this, reinstall the HDD which has already been recognized by this machine.
*3: Degrade or Halt mode is a condition where data protection that is the purpose of mirroring is not enabled. It is necessary to swiftly replace the faulty HDD with a new one and perform Rebuild process.

● Points to Note in Servicing concerning Mirroring Functionality

1. The modes other than Mirror Mode indicate troubles, which require swift recovery.
   The power can be turned OFF even during Rebuild process. However, it is recommended not to turn off the power and wait until the mode flows to Mirror Mode. In addition, HDD removal after power-OFF is guaranteed only in Mirror Mode.
2. The mirroring board controls Master HDD and Backup HDD. This control is performed based on the HDD serial number and the model serial number instead of slot locations.
   If HDDs are replaced in a careless manner during servicing in the field, the Master and Backup HDDs may be switched.
   Ex) When the master HDD is in trouble, the mirroring board automatically recognizes the backup HDD as the master. Thus, the master and backup HDDs are switched even without changing the slot locations.
   If the Master HDD cannot be located, turn OFF/ ON the power to check on which channel the green LED is lit on the LED PCB.
   The firstly-blinked LED (ChA or ChB) shows the Master HDD, which is accessed firstly after power-on.
3. For users who intend to use the removable and mirroring functionality concurrently, instruct them not to change the removable HDD location in advance.
   Change of HDD locations after power-OFF is allowed as specifications only in Mirror Mode.
   Otherwise, HDD removal or change of location is not guaranteed.
4. The following conditions are required to replace HDDs at power-ON.
   - Removable HDD is extended
   - Either HDD is in trouble

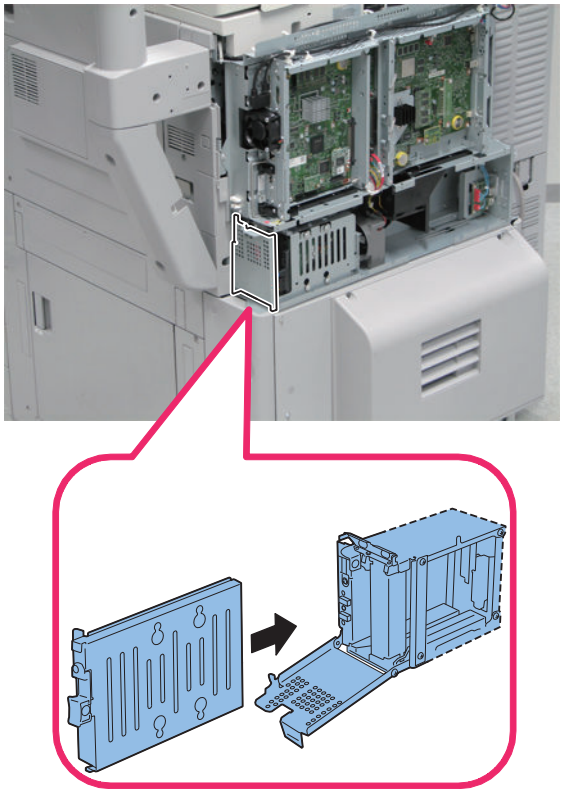
CAUTION:
Be sure to use a new HDD when replacing the HDD.

5. Upgrading should be done only in Mirror Mode while mirroring in ongoing. Upgrading in Degrade or Rebuild mode is basically prohibited. Always prioritize Mirror Mode when you take any actions.

■ Removable HDD (Option)

This option allows users to easily engage/disengage the HDD (slot out/in).
Moreover, the HDD slot opening can be locked.
Its expected usages: Enhance information security in Government offices and business enterprises

- Remove the HDD at the end of working hours and keep it in a safe.
- Install the HDD at the beginning of the working hours. Lock it during working hours.

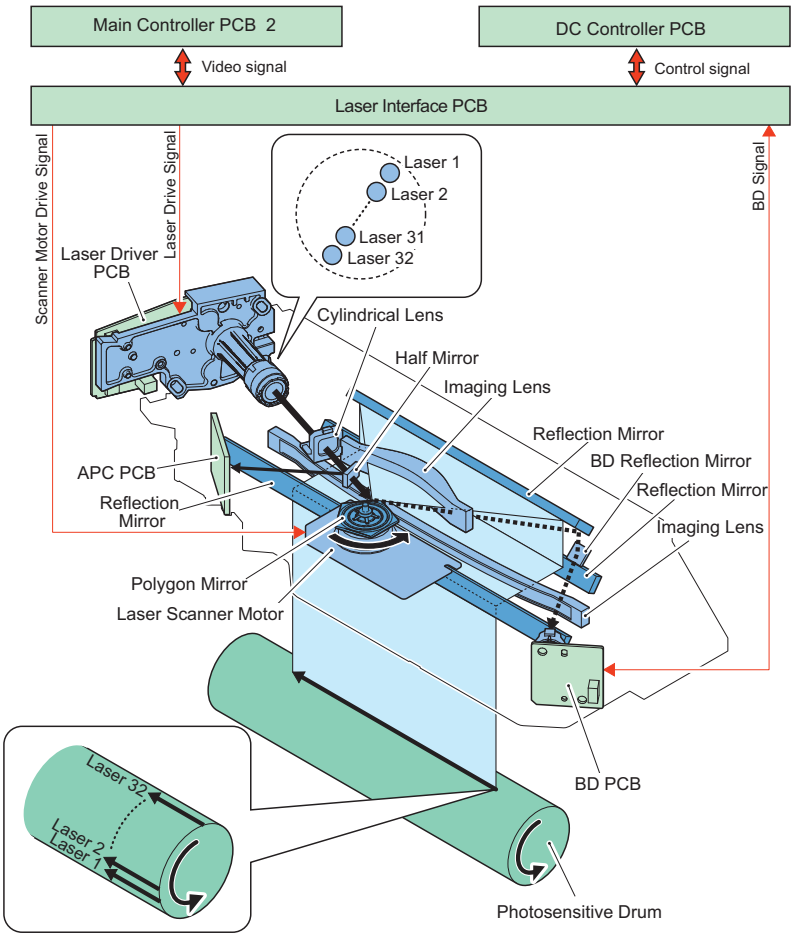


NOTE:
- Setup work, such as software settings, is not required to use it.
- The key itself is not included with this kit. This will have to be prepared by users.

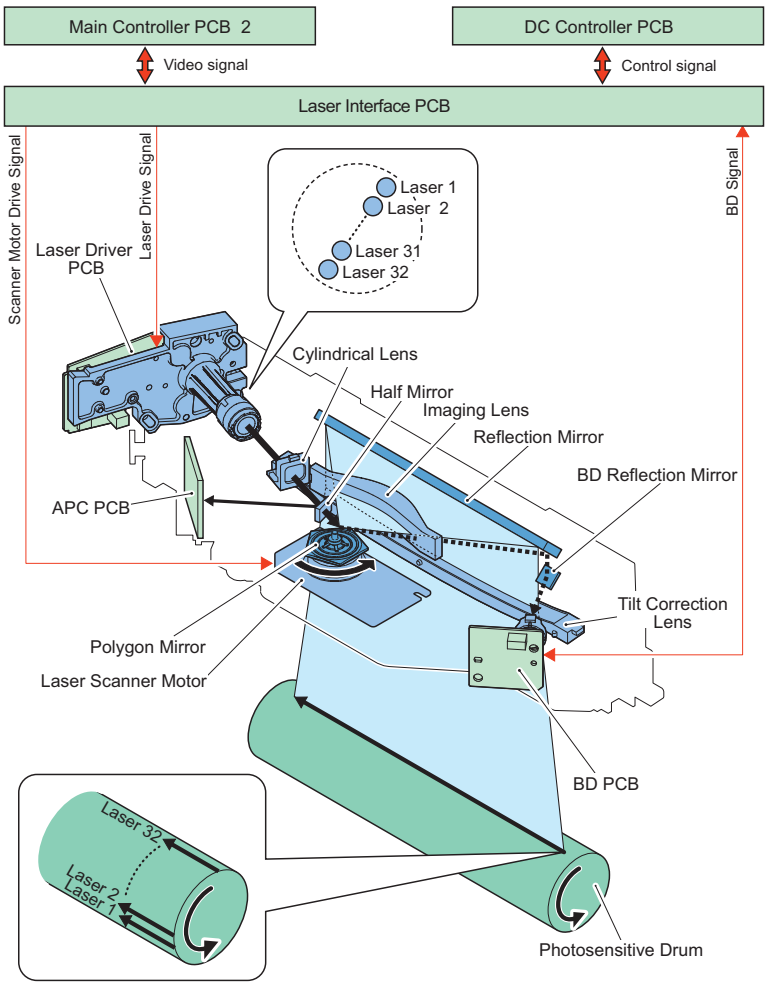
Laser Exposure System

Overview

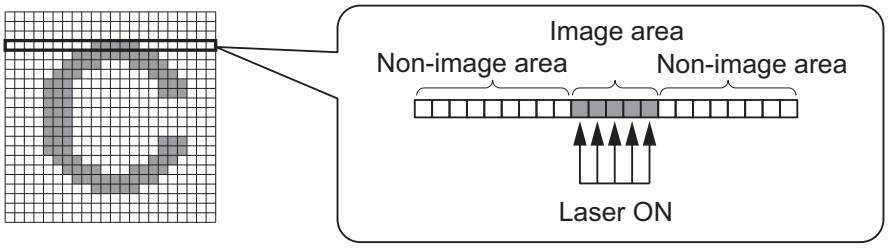
This machine has four Laser Scanner Units above each color station.
<Bk>



<CL>



Laser is applied to the image on the negatively-charged drum with this machine.



Enlarged view

■ Characteristics

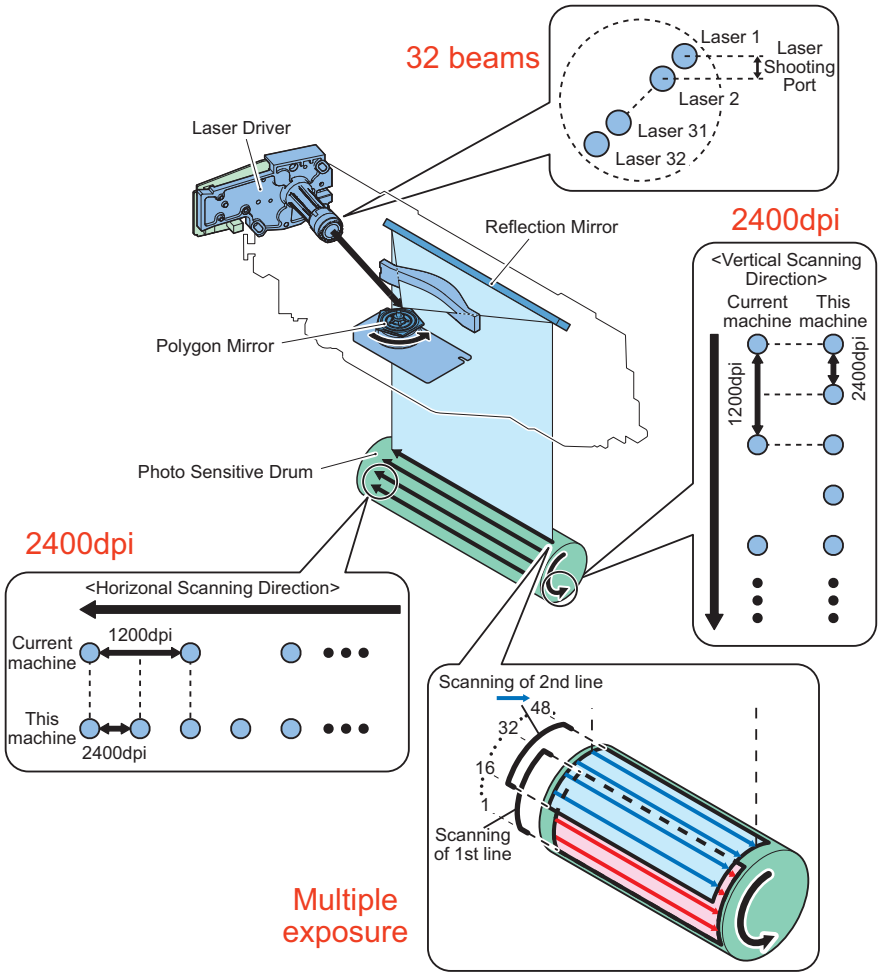
A new Laser Scanner Unit was adopted for this equipment.

Higher image quality

- 2400 dpi resolution
  In the horizontal direction, the number of laser lighting times has been reduced while in the vertical scanning direction, the width between the emission ports has been narrowed.
- Multiple exposure
  This machine performs exposure twice by overlapping the 16 beams which are half the total beams. This has enabled the formation of clearer latent image.

Higher speed

- 32 lines of laser beams are emitted simultaneously
  High speed printing is achieved by simultaneously emitting 32-line laser beams at a time.



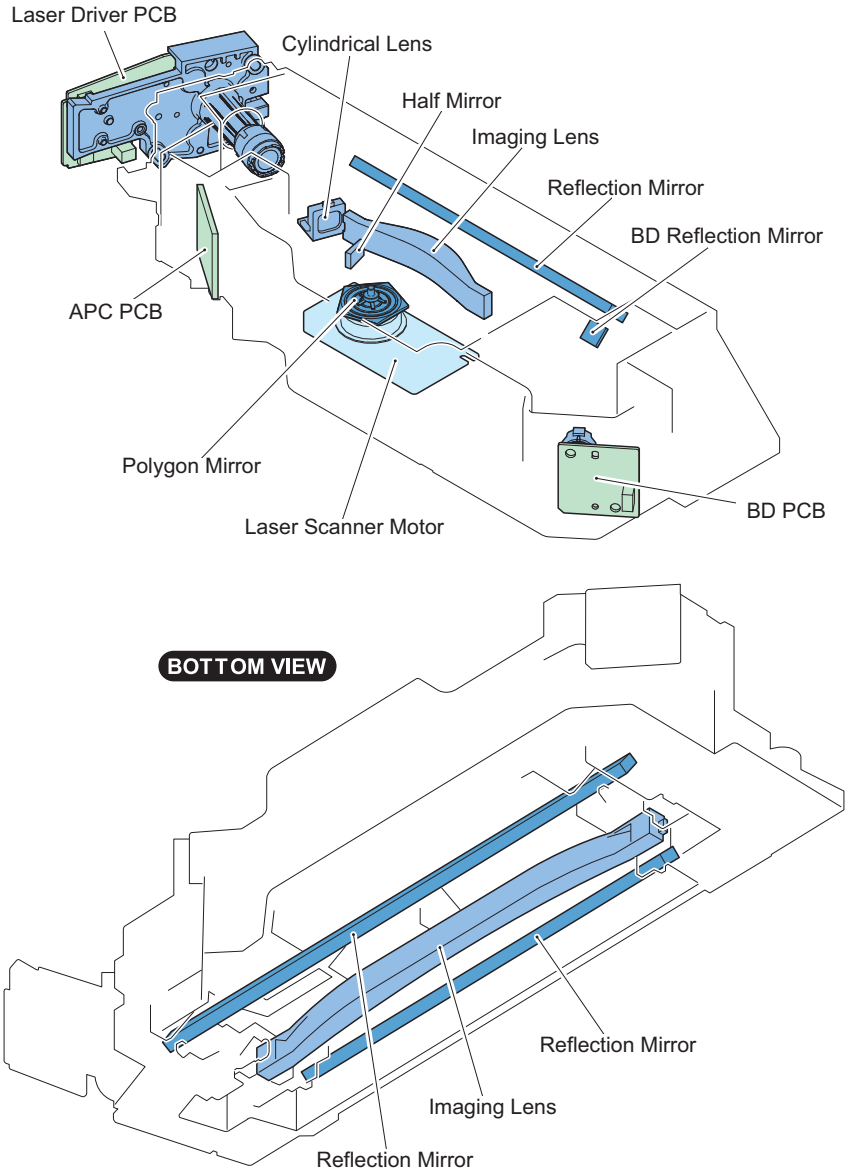
■ Specifications

Item		Description
Laser team	Wave length	682 nm
	Laser type	Red color laser
	Laser output	1 mW
	Number of laser beams	32 beams
Resolution		2400 dpi
Scanner motor	Type	Brushless motor
	Number of rotations	Approx. 24600 rpm
Number of Polygon Mirror surfaces		5
Controls	Laser ON timing control	Laser ON/OFF control Main scanning synchronization control Sub scanning synchronization control
	Laser beam intensity control	APC control
	Image position correction control	Correction of write start position in horizontal scanning direction (To be explained in Image Formation.)
		Correction of write start position in vertical scanning direction (To be explained in Image Formation.)
		Correction of magnification in horizontal scanning direction (To be explained in Image Formation.)

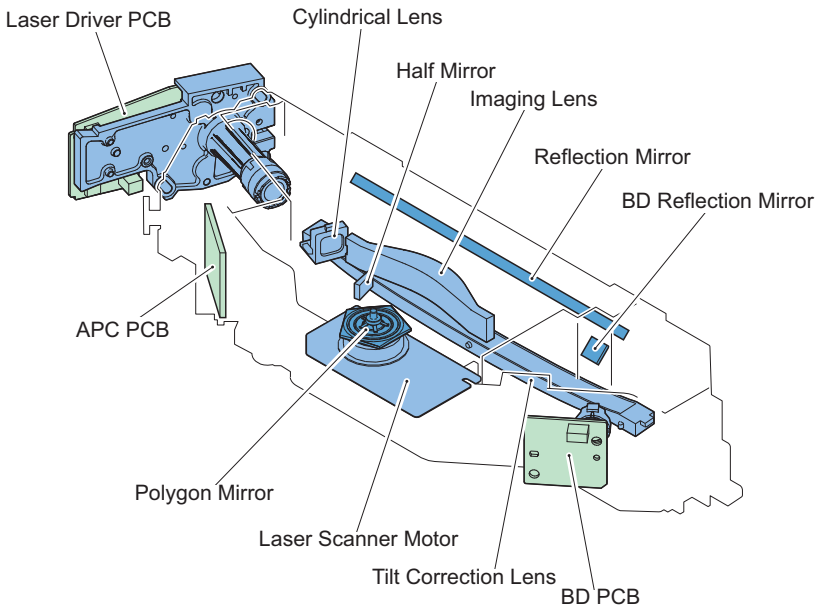
Item		Description
Controls	Image position correction control	Correction of magnification in vertical scanning direction (To be explained in Image Formation.)
		Duplex print magnification correction
	Others	Laser scanner motor control
		Control to Turn OFF Laser (Safety of Laser)

■ Parts Configuration

<Bk>



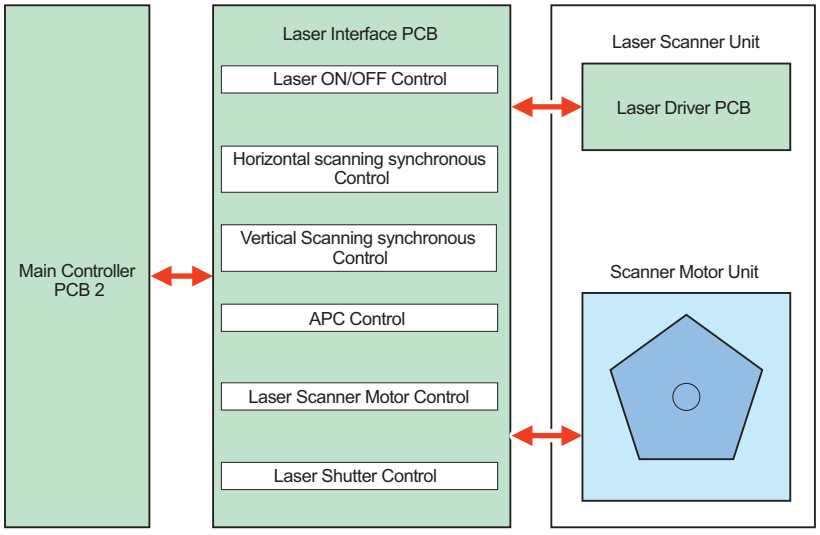
<CL>



Name	Role
Laser Driver PCB	Generates a laser beam.
Cylindrical Lens	Condenses laser beams linearly.
Half Mirror	To reflect a part of the laser light to the APC PCB.
Imaging Lens	Forms an image from laser beams on the drum.
Reflection Mirror	Reflects the laser beam to the drum.
BD Reflection Mirror	Reflects laser beams in the direction of BD Detection PCB.
APC PCB	Ensures constant laser beam light intensity for each line.
Polygon Mirror	Scans the laser beam in horizontal scanning direction.
Laser Scanner Motor	Rotates the Polygon Mirror at a specified speed.
BD PCB	Detects laser beam as a BD signal.

Controls

■ Overview



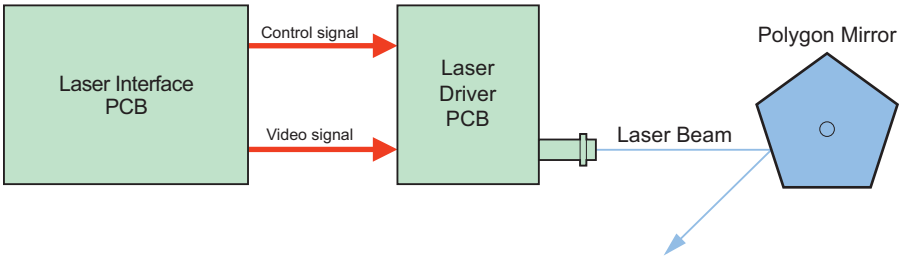
tem		Purpose/Description
Laser ON timing control	Laser ON/OFF control	Turn ON/OFF a laser beam according to the combination of laser control signals.

tem		Purpose/Description
Laser ON timing control	Main scanning synchronization control	Performed to adjust the writing position in the main scanning direction.
	Sub scanning synchronization control	Performed to adjust the writing position in the sub scanning direction.
Laser beam intensity control	APC control	Performed to keep a specified level of laser beam for each line.
Duplex print magnification correction control		To correct the magnification ratio on the front and back sides by performing image processing.
Laser scanner motor control		Performed to rotate the polygon mirror at a specified speed.
Laser shutter control		Prevent irradiation of a laser beam in the machine.

■ Laser ON Timing Control

● Laser ON/OFF Control

Turns the laser beam ON and OFF according to the combination of laser control signals.



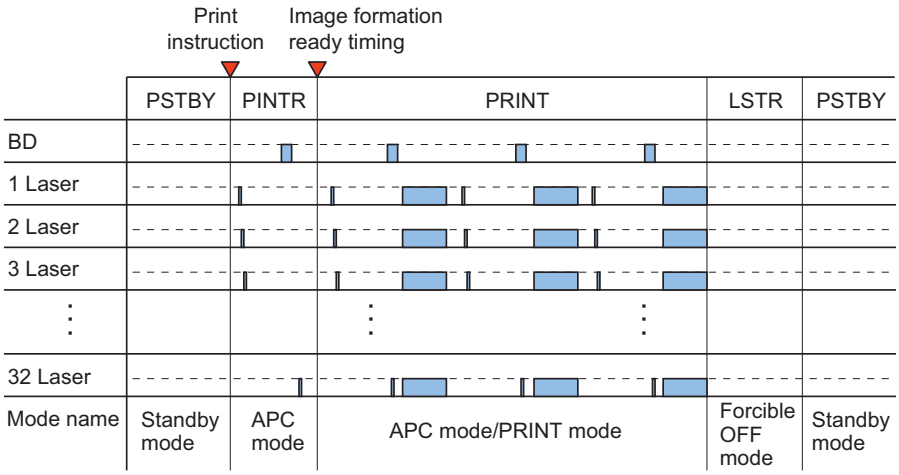
Execution timing

After power-on

Control description

The Laser Interface PCB switches between four modes (Forced OFF mode, APC mode, Print mode, and Standby mode) based on the laser control signals.

Mode	Laser status	Remarks
Forced OFF	OFF	Clears the light intensity setting determined by the APC.
APC	ON	Adjusts laser light intensity.
Print mode	OFF/ON	Emits the laser according to the video signal.
Standby mode	OFF	The machine is in standby mode.



● Horizontal Scanning Synchronization Control

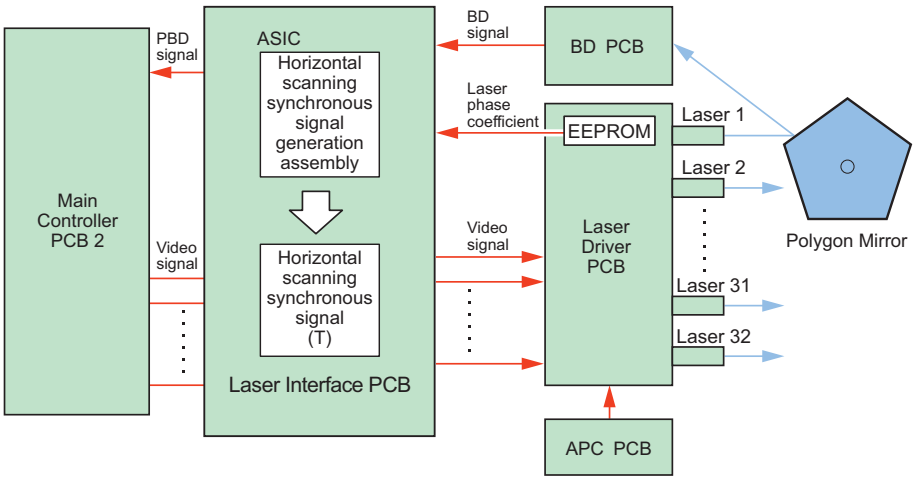
Aligns the write start position in the horizontal scanning direction.

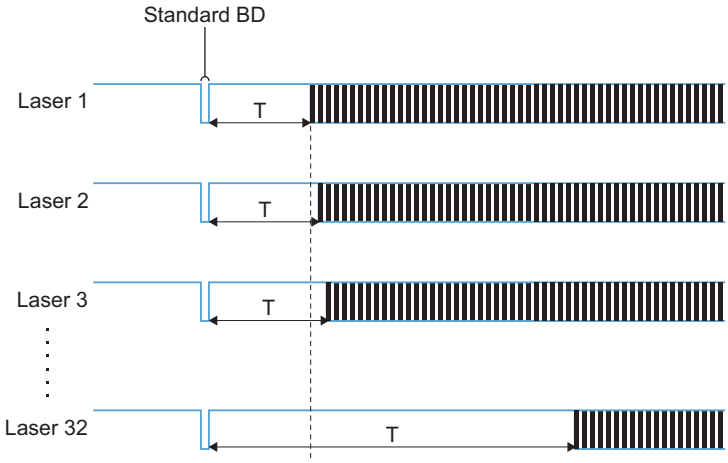
Execution timing

Every 32 lines.

Control description

1. Laser phase coefficient inside the ROM on the Laser Driver is sent to the Laser Interface PCB (when replacing the Laser Scanner Unit).
2. Similarly, the Laser Interface PCB forcibly activates the laser diode of Laser 1 on the Laser Driver PCB by setting the Laser 1 control signal to APC mode.
3. The BD PCB is located on the light path of Laser 1 laser beam and the laser beam is emitted to the BD PCB.
4. The BD PCB generates the reference BD signal by detecting the Laser 1 laser beam, and sends the signal to the Laser Interface PCB.
5. The Laser Interface PCB generates synchronization signals in horizontal scanning direction at every 32 lines, based on this laser coefficient and reference BD signal.
6. The video signal sent from Main Controller is output to the Laser Driver PCB according to the synchronization signal in horizontal scanning direction.





● Vertical Scanning Synchronization Control

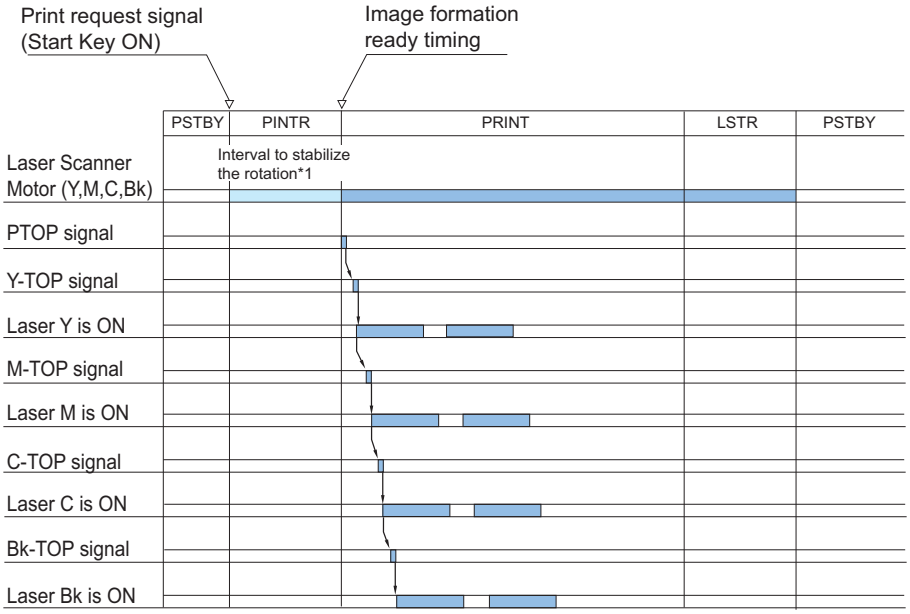
Aligns the write start position in the vertical scanning direction.

Execution timing

At every print

Control description

- Synchronization control in the vertical scanning direction is performed with reference to the PTOP signal (image formation start signal).
- When image formation becomes possible, the PTOP signal (image formation start signal) is generated, and each color laser lights up at the timing delayed by the spacing between drums based on this signal.



■ Laser Beam Intensity Control

● APC (Auto Power Control)

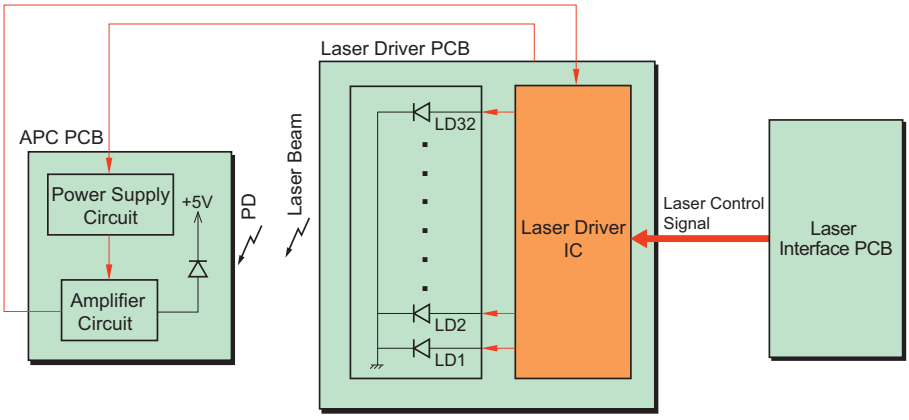
Ensures constant laser beam intensity for each 32 beam.

Execution timing

While the Polygon Mirror is rotating (non-imaged area)

Control description

1. The Laser Interface PCB outputs the laser control signal to the Laser Driver IC in the Laser Driver PCB.
2. The Laser Driver is set to APC mode to forcibly activate the laser diodes (LD1 to LD32) sequentially. At the same time, the Laser Driver IC monitors the light intensity of the laser diodes (LD1 to LD32) using photodiodes (PD), and adjusts the input to the laser diodes to ensure that the light intensity from each laser diode has uniform intensity.



■ Duplex Copy Ratio Correction

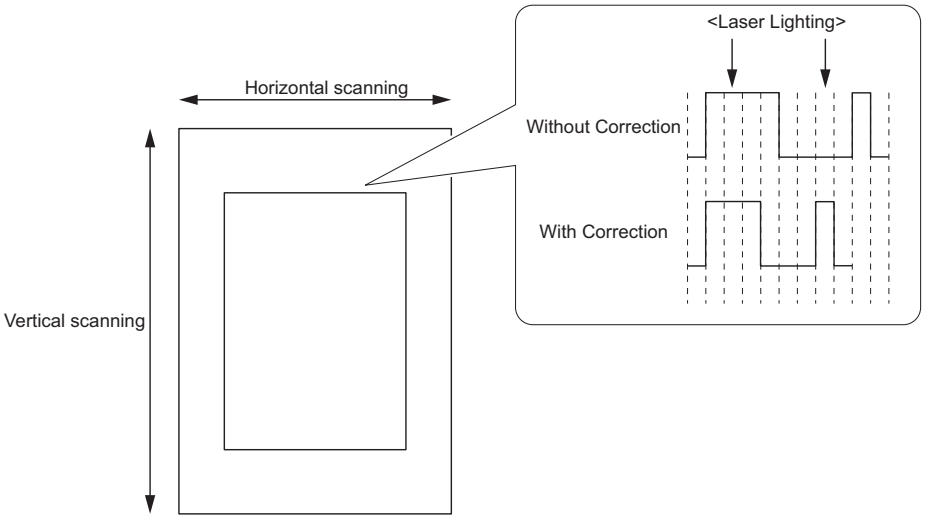
To correct magnification difference between the front and the rear due to shrinkage level between the 1st side and the 2nd side During 2-sided printing, the paper temporarily shrinks when it passes through the fixing area after the image formation of the 1st side. If image formation on the 2nd side continues unchanged, the image on the 2nd side is extended (which makes the image on the 2nd side larger than that on the 1st side and causes a mismatch in copy ratio) when the paper size returns to the original size after the paper is delivered outside the machine.

Execution timing

At image formation on the 2nd side of 2-sided print

Control description

When the 2nd side is printed, the following controls are executed with consideration of paper's shrinkage level.
Reduces the image by skipping image data.
Enlarges the image by adding image data.



■ Laser Scanner Motor Control

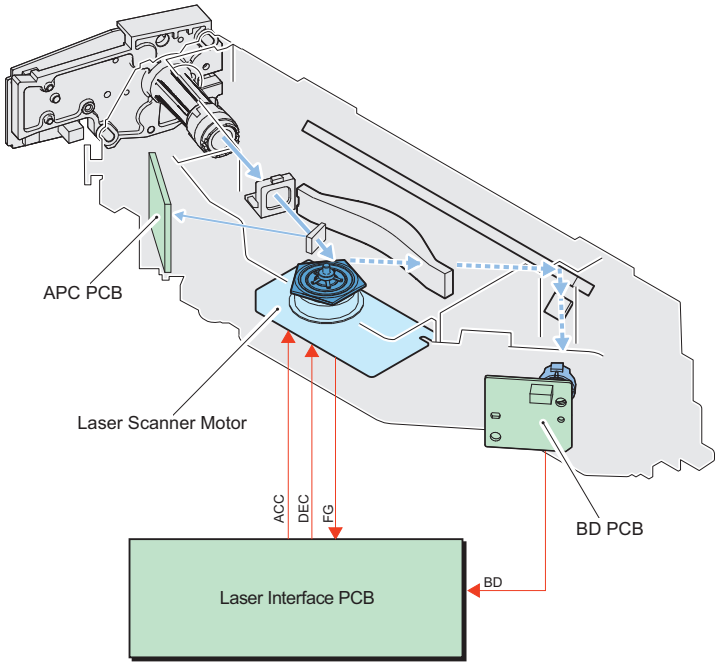
Rotates the Polygon Mirror at a specified speed.

Execution timing

At power-on and startup.

Control description

1. The motor speed control unit on the Laser Interface PCB forcefully rotates the motor.
2. It detects the speed detection signal (FG, BD), compares it with the reference signal generated by the reference signal generator, and controls the acceleration signal (ACC) and deceleration signal (DEC) to keep the standard speed.



Related Error Code

E100: Laser Scanner Motor BD Error
E110: Laser Scanner Motor Error

■ Control to Turn OFF Laser (Safety of Laser)

Prevents exposure of laser light in the machine.

Execution timing

At power-on or startup.

Control description

The DC Power Supply PCB (12V) stops the power supply and output signal of the laser driver when the front door is opened. By doing so, laser exposure is prevented.

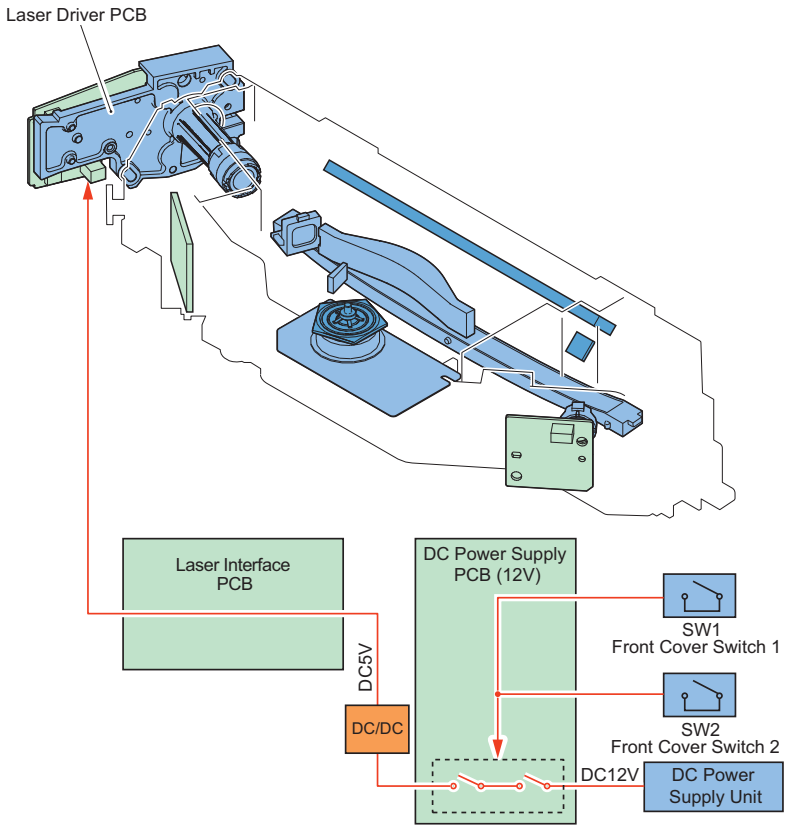


Image Formation System

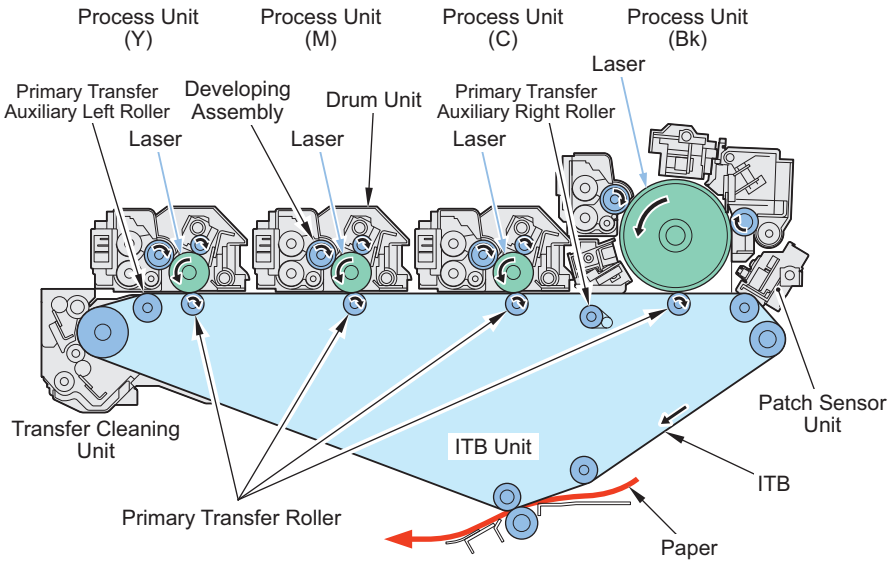
Overview

■ Overview

The ITB of this machine's image formation system adopts an elastic ITB to achieve optimal secondary transfer to various types of paper. The elastic ITB, whose material has been changed from resin to rubber, realizes highly-reproducible images with increased transfer efficiency even on rough-surfaced texture paper.
In addition, high image quality has been realized by the addition of a cooling function to the Color Developing Assembly, which lowers the temperature in the area surrounding the Developing Assembly to improve stability of hue and prevent deterioration of developer and toner.



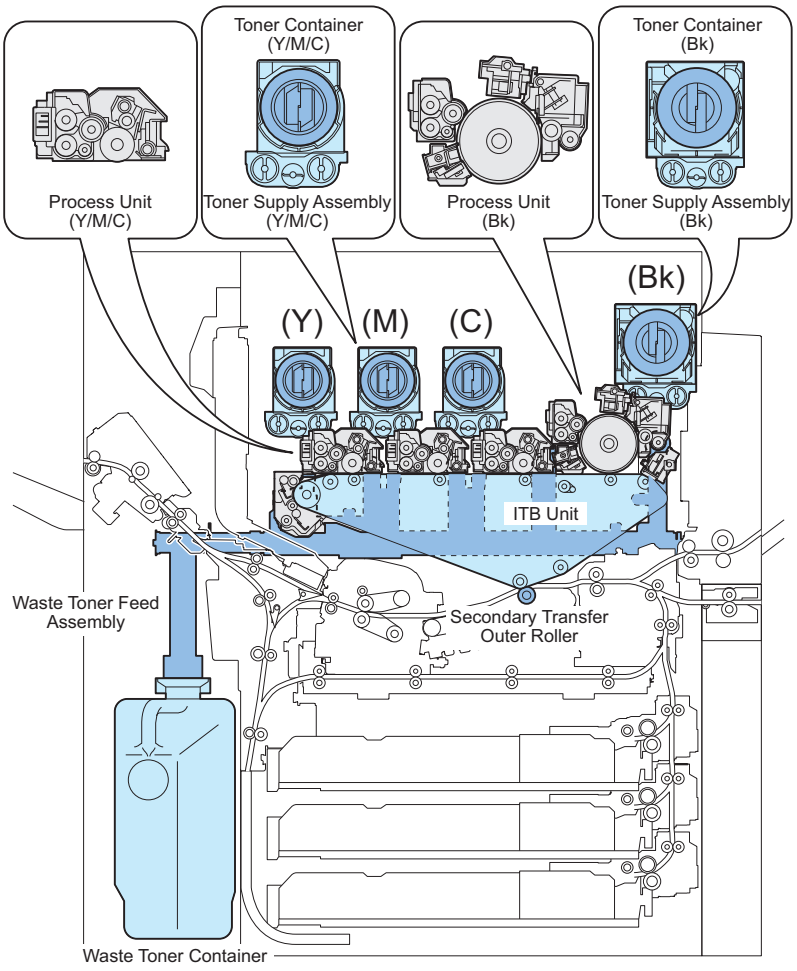
■ Roles/Functions

Item			Roles/Functions
Controls “Controls” on page 87	Configuration		Drum Unit (Drum, Charging Assembly, Cleaner, Patch Detection Sensor, Cleaning Post-exposure) + Developing Assembly
	Photosensitive Drum	Material	OPC
		Drum diameter	84 in diameter
		Cleaning	Drum Cleaning Blade + Fur Brush
		Patch Detection	Patch Sensor (Photo sensor)
	Developing Assembly	Developing method	Dry, 2-component AC development method
		Toner	Non-magnetic negative toner
		Developing Cylinder OD	Diameter: 20
		Toner density detection	Yes (Magnetic Sensor: TS1)
	Primary charging	Charging method	Corona Grid charging (Wire (1) + Grid Plate)
		Cleaning	Yes (Cleaning Pad) To clean both the Wire + Grid Plate
Drum Unit, Developing Assembly Unit (CL) “Drum Unit / Developing Assembly (CL)” on page 99	Configuration		Integrated P-CRG (Developing Assembly and Drum Unit can be separated.)
	Photosensitive Drum	Material	OPC
		Drum diameter	Diameter: 30.6
		Cleaning	Cleaning Blade
	Developing Assembly	Developing method	Dry, 2-component AC development method
		Toner	Non-magnetic negative toner
		Cylinder diameter	Diameter: 20
		Toner density detection	Yes (magnetic sensor)
	Primary charging	Charging method	AC Roller charging (φ14)
		Cleaning mechanism	Yes (Sponge Roller)

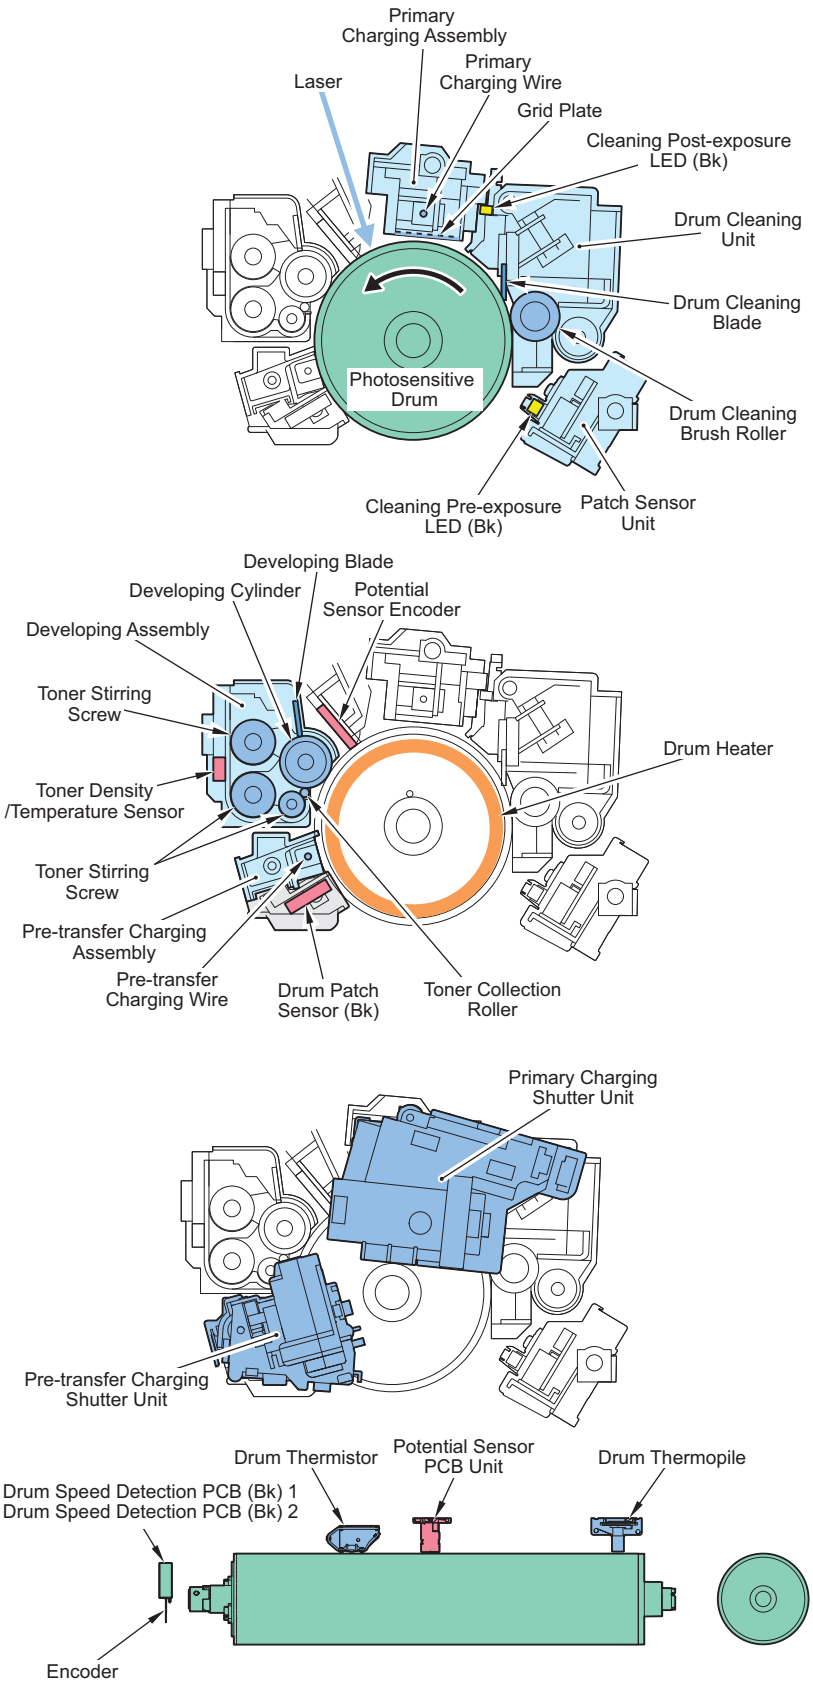
Item			Roles/Functions
Transfer Unit (ITB Unit) “Transfer Assembly (ITB Unit)” on page 103	Transfer method		Intermediate Belt transfer (ITB)
	ITB	Material	Elastic ITB: PI (polyimide) layer + Rubber layer
		Circumferential length/ width	1,148.3 mm / 360mm
		Cleaning	Static cleaning method
		Corrects belt displacement	At two locations (Light-receiving Sensor)
	Primary transfer	Transfer method	Transfer Roller (Sponge Roller/φ18)
		Disengagement mechanism	Yes (color only)
	Patch Sensor		Yes
	Secondary Transfer Unit	Transfer method	Roller (Sponge Roller/φ24.3)
		Disengagement mechanism	Yes
	Separation method		Curvature separation + Static Eliminator method
Others	Drum Unit and Developing Assembly Detection		None
	Drum Unit and Developing Assembly New/ Old Detection		None
	Drum Unit and Developing Assembly Life Detection		No (Durability (total charging time) can be confirmed in service mode.)
	Toner Container	Toner Container Detection	Yes
		New/Old Detection	Yes
		Toner level detection	Yes
	Waste Toner Container	Capacity	Equivalent to 410,000 images of A4 4-color 8.5% image
		Full level detection	Yes

■ Parts Configuration

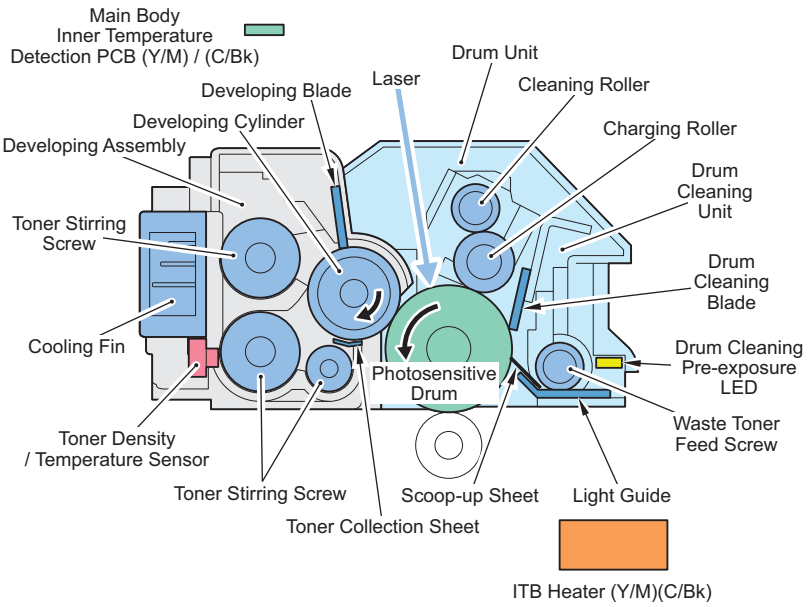
● Overall Configuration



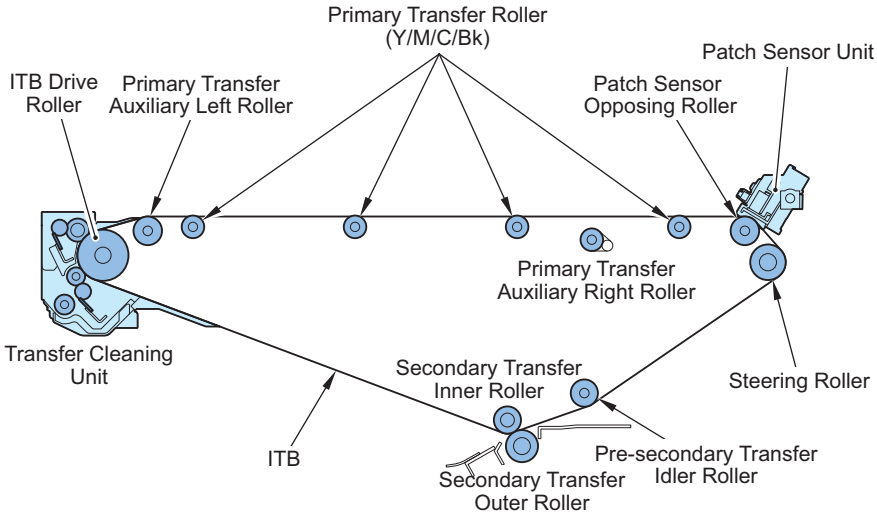
• Drum Unit and Developing Unit (Bk)



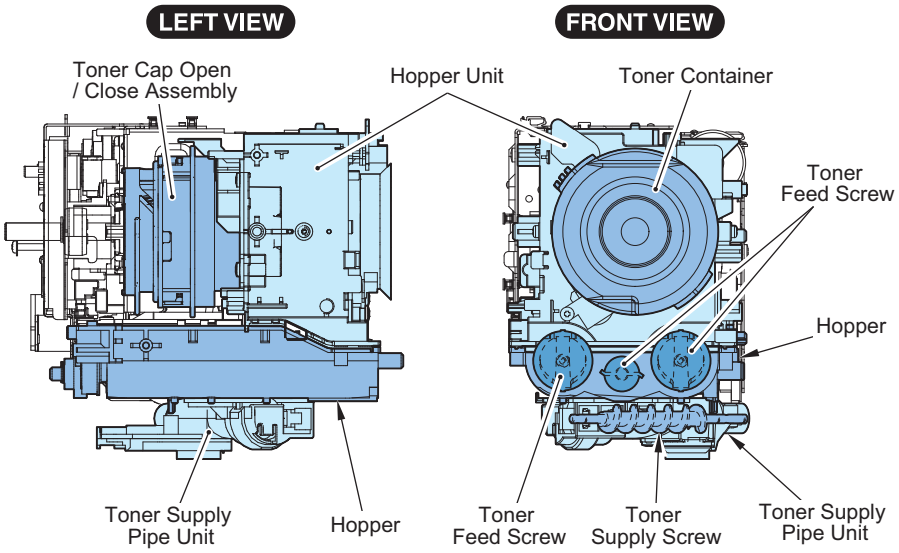
• Drum Unit / Developing Assembly (CL)



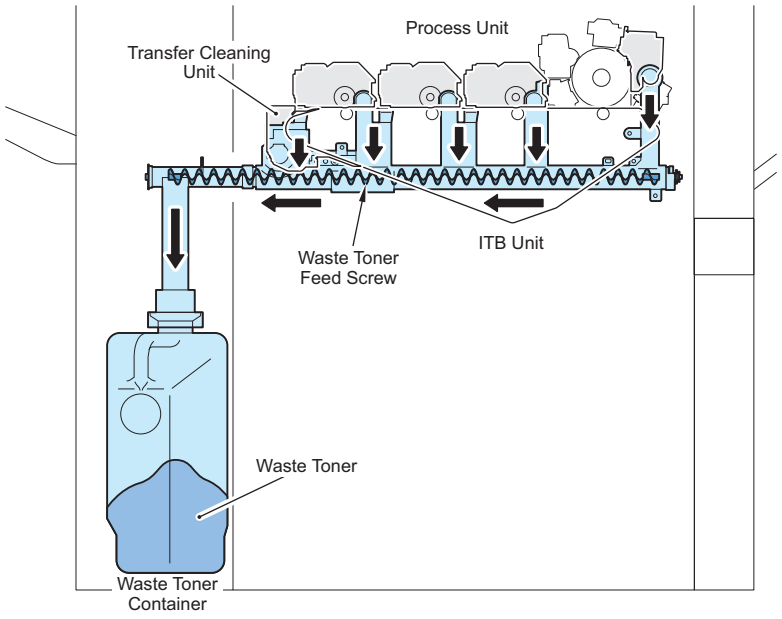
• Transfer Assembly



• Toner Supply Assembly

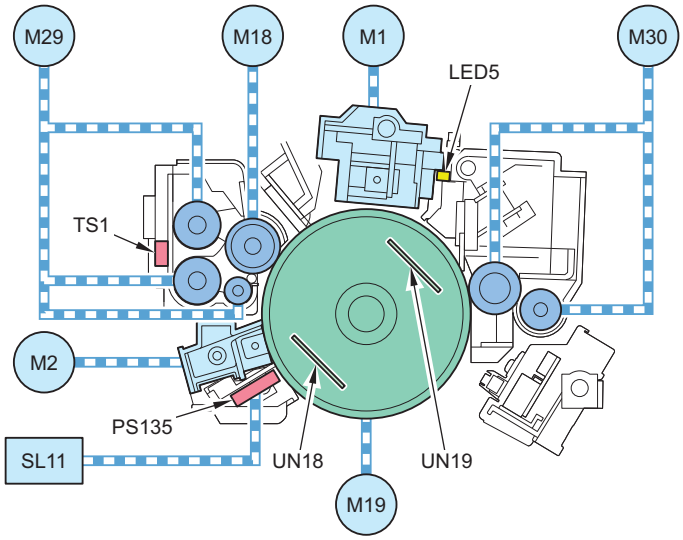


• Waste Toner Feed Assembly



■ Drive Configuration

• Drum Unit / Developing Assembly Unit (BK)



Code	Name	Roles/Functions
M1	Primary Charging Wire Cleaning Motor	To drive the Primary Charging Wire/Grid Plate Cleaning Pad and the Primary Charging Wire Shutter.
M2	Pre-transfer Charging Wire Cleaning Motor	To drive the Pre-transfer Charging Wire Cleaning Pad and the Pre-transfer Charging Wire Shutter.
M18	Developing Sleeve Drive Motor (Bk)	To drive the Developing Sleeve.
M19	Drum Motor (Bk)	To drive the Drum.
M29	Developing Stirring Motor (Bk)	To drive the Toner Stirring Screw
M30	Drum Cleaning and Waste Toner Feed Drive Motor	To drive Drum Cleaning Fur Brush Roller/Waste Toner Screw.
UN18	Drum Speed Detection PCB (Bk) 1	To detect the rotational speed of the Drum.
UN19	Drum Speed Detection PCB (Bk) 2	To detect the rotational speed of the Drum.
LED5	Cleaning Post-exposure LED (BK)	To remove drum memory on the surface of the Photosensitive Drum.
TS1	Toner Density/Temperature Sensor (Bk)	To detect the toner density and toner temperature in the Developing Unit (Bk)
PS135	Drum Patch Sensor (Bk)	Detection of the patch density (Bk)

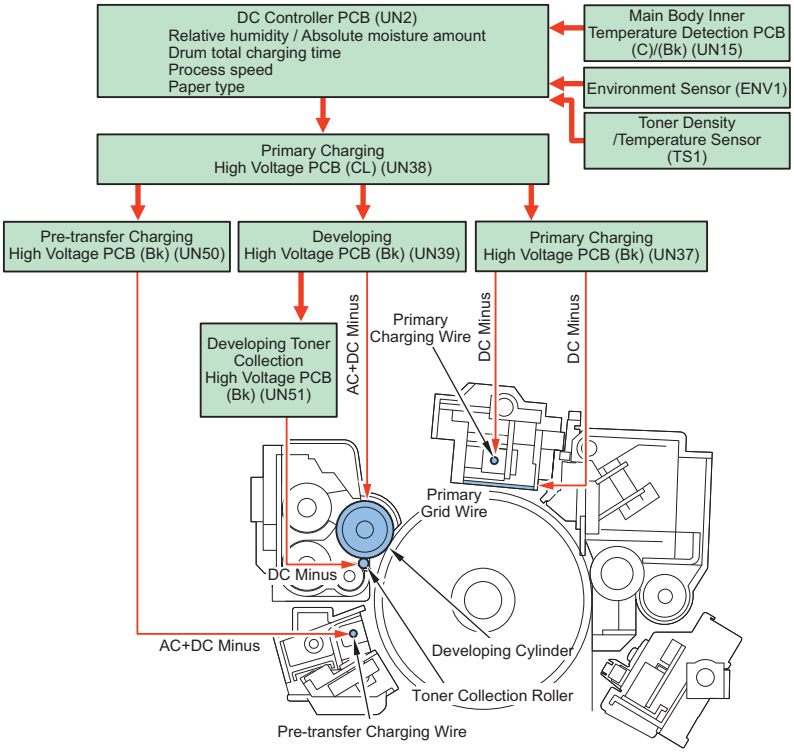
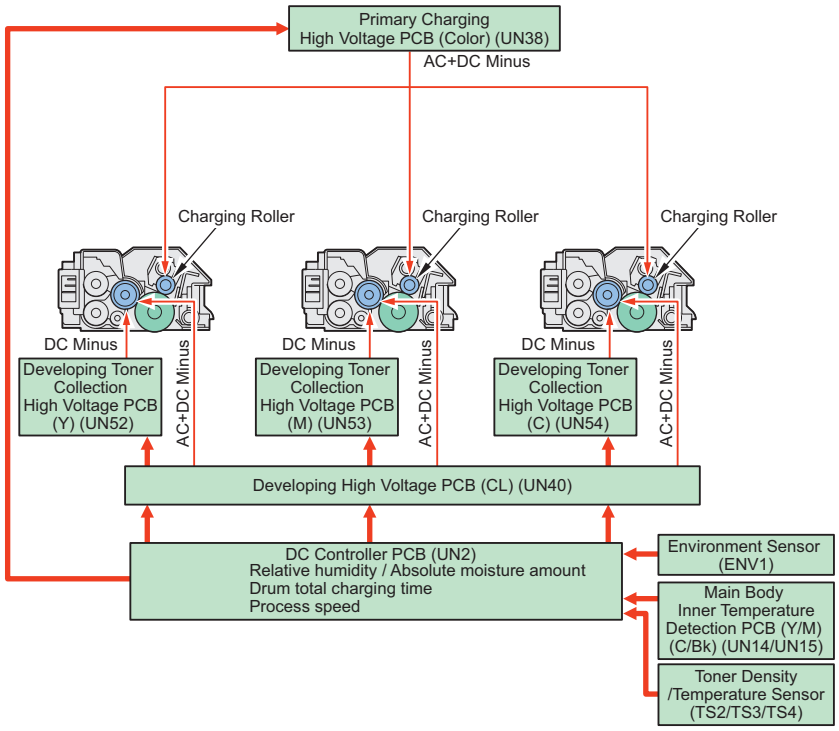
■ Byas Configuration

● Drum Unit / Developing Assembly Unit (BK)



Item		Roles/Functions
Primary charging bias	Charging method	Indirect Corona charging
	DC component rating use range	-600 to -1,000 micro A
	DC component voltage correction factor	Absolute moisture content (ENV1), total charging time of drum, process speed
Grid bias	DC component rating use range	-500 to -1,300 V (Potential Control (Bk))
	DC component voltage correction factor	Absolute moisture content (ENV1), process speed
Developing bias	AC component standard value	AC 1,100 Vpp to 1,700 Vpp
	DC component rating usage range	DC -100 to -800 V
	DC component voltage correction factor	Relative humidity (TS1), total charging time of drum, charging DC bias
Toner Collection Roller	DC component rating use range	-700 to -1,700 V (Relationship between the developing bias DC and AC bias)
Pre-primary transfer charging bias	Charging method	Corona discharge
	AC component standard value	5,500 Vpp (fixed)
	DC component rating use range	0 to -600µA (constant current)
	DC component voltage correction factor	Absolute moisture content (ENV1), relative humidity (TS1), paper type

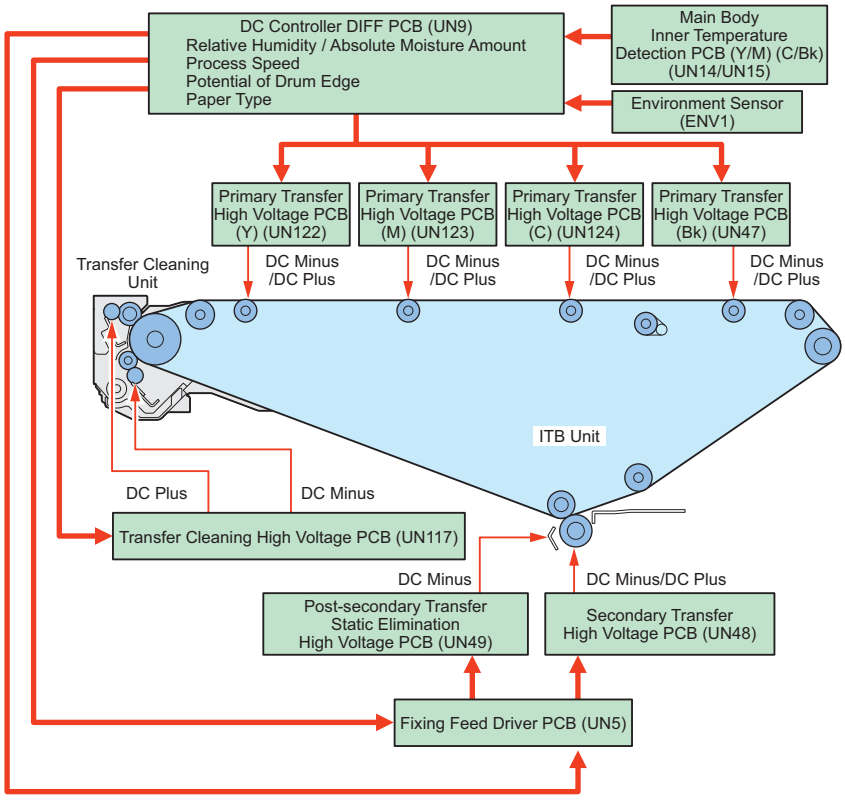
• Color Drum Unit and Developing Assembly



Item		Roles/Functions
Charging bias	Charging method	AC roller charging
	AC component use standard settings	AC 500 to 2,750 Vpp
	AC component voltage correction factor	Absolute moisture content (ENV1), total drum charging time, process speed, internal temperature
	DC component rating use range	DC 0 to -1,000 V

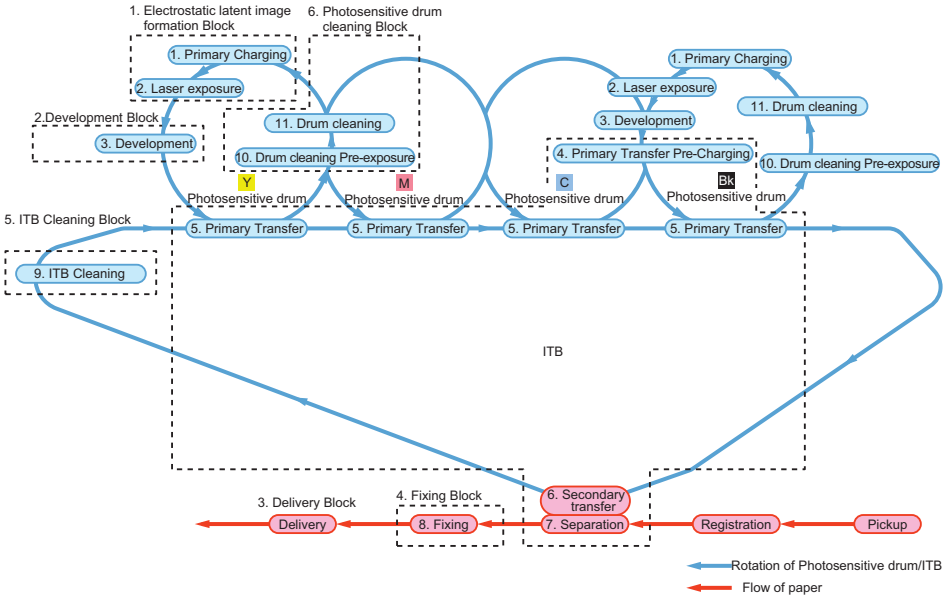
Item		Roles/Functions
Charging bias	DC component voltage correction factor	Absolute moisture content (ENV1), process speed, internal temperature
Developing bias	AC component use standard settings	AC 1,100 Vpp to 1,700 Vpp
	DC component rating use range	DC -100 to -800 V
	DC component voltage correction factor	Relative humidity (TS2/TS3/TS4), total drum charging time, DC charging bias
Toner collection sheet bias	DC component rating use range	-700 to -1,700V (relationship between the developing bias DC and AC bias)

• Transfer Assembly



Item		Role / function
Primary transfer bias	Transfer method	Roller transfer
	Target of transfer	Intermediate Transfer Belt (ITB)
	DC component rated voltage use range	DC -2,500 to 5,000 V (Y,M,C,Bk)
	DC component voltage correction factor	Absolute water volume (ENV1), Relative humidity (UN14/UN15), Process speed, Drum dark section potential (Vd)
Secondary transfer external roller cleaning bias	DC component rated voltage use range	DC -50 to 0 µA (Constant current)
	DC component voltage correction factor	Absolute water volume (ENV1), Process speed
Secondary transfer bias	Transfer method	Roller transfer
	Target of transfer	Paper (Transfer material)
	DC component rated voltage use range	DC 0 to 6,500 V
	DC component voltage correction factor	Absolute water volume (ENV1), Process speed, Paper type
Secondary post-transfer static eliminator bias	DC component rated voltage use range	DC 0 to 6,500 V
	DC component voltage correction factor	Absolute water volume (ENV1), Paper type

■ Print Process



Function Block	STEP		Function
Static formation block	1	Primary charging	The surface of the Photosensitive Drum is charged to make a uniform negative potential. The Drum Unit/Developing Assembly (Y/M/C) adopt the direct charging roller method by which the Charging Roller applies an electric charge directly to the Photosensitive Drum, while the Drum Unit/Developing Assembly (Bk) adopt the primary charging method by which the Charging Wire applies an electric charge indirectly.
	2	Laser exposure	Emission of the laser beam forms a static latent image on the surface of the Photosensitive Drum. When the laser beam is applied on the surface of the negatively charged Photosensitive Drum, the negative potential at the emitted part is neutralized.
Developing block	3	Development	With the dry, 2-component AC developing method, toner that has been negatively charged by the Developing Cylinder is attached to the latent image on the surface of the Photosensitive Drum to make it visible.
Transfer block	4	Primary Pre-transfer Charging (Bk)	Toner on the Photosensitive Drum is made to be a uniform potential.
	5	Primary transfer	Positive potential is applied to the Secondary Transfer Roller so that the toner on the surface of the Photosensitive Drum is transferred to ITB.
	6	Secondary transfer	Positive potential is applied to the Secondary Transfer Outer Roller to transfer toner to the ITB.
	7	Separation	With the curvature separation method, the paper is separated from the ITB. A negative charge determined by the paper type is applied to the Static Eliminator to ease separation of the paper from the ITB.
Fixing block	8	Fixing	The toner on the paper is fused on the paper by heat and pressure.
ITB cleaning block	9	ITB cleaning	Residual toner attached on the ITB is removed with two fur brushes.
Drum cleaning block	10	Drum Cleaning Pre-exposure	By emitting light from the Drum Cleaning Pre-exposure LED, drum charging memory on the surface of the Photosensitive Drum is removed to prevent soiling on the Photosensitive Drum.
	11	Drum cleaning	The Cleaning Blade removes the residual toner attached on the Photosensitive Drum.

Controls

■ Overview

Item	Operation description
Drum Unit / Developing Assembly Unit (Bk)	

Item	Operation description
Primary charging bias control	Control for charging the surface of the Photosensitive Drum to make a uniform negative potential
Primary Charging Wire Cleaning Control	To prevent charging failure caused by soil of the Primary Charging Wire and Grid Plate.
Primary Charging Shutter Control	To prevent uneven potential on the Photosensitive Drum caused by discharge products (nitrogen oxide) accumulated on the Primary Charging Assembly.
Developing bias control	Developing bias (AC component and negative DC component) is applied to the Developing Cylinder so toner on the Developing Cylinder is attached to the Photosensitive Drum (bright area) to form a toner image.
Collection Roller Bias Control	Toner scattered from the Developing Assembly is returned to the Developing Cylinder by the difference of biases of the Toner Collection Roller and the Developing Cylinder at the time of development.
ACR Control	While developer in the Developing Assembly is gradually ejected in order to ensure a longer life of developer, developer is supplied from the Toner Container.
Developing Assembly Cooling Control	Addition of cooling mechanism to the Developing Assembly to prevent toner deterioration by heat
Pre-transfer Charging Bias Control	To make the charging amount of toner on the Photosensitive Drum appropriate to improve transfer performance.
Pre-Transfer Charging Wire cleaning control	To prevent charging failure caused by soil of the Pre-transfer Charging Wire.
Pre-transfer Charging Shutter Control	To prevent uneven potential on the Photosensitive Drum caused by discharge products (nitrogen oxide) accumulated on the Primary Charging Assembly.
Drum Cleaning Pre-exposure	Control in which light is emitted from the Pre-exposure LED in order to remove residual charge on the surface of the Photosensitive Drum
Drum Cleaning Post-exposure	Control in which light is emitted from the Post-exposure LED in order to remove residual charge on the surface of the Photosensitive Drum
Drum Cleaning Control	The blade, which is in contact with the Drum, removes residual toner on the Photosensitive Drum.
Control of the rotation speed of the Drum	The rotational speed of the Drum is kept constant to increase accuracy of the image position (color displacement).
Color Drum Unit and Developing Unit (CL)	
Primary Charging Roller Bias control	Primary charging bias (CL) is a bias to ensure that the Photosensitive Drum surface is charged to a negative potential evenly.
Developing Bias Control (CL)	Developing bias (AC component and negative DC component) is applied to the Developing Cylinder so toner on the Developing Cylinder is attached to the Photosensitive Drum (bright area) to form a toner image.
Drum Cleaning Pre-Exposure LED (CL)	To prevent reverse transfer of toner on the Cleaning Blade due to residual charge.
Drum Heater Control	A drum heater is provided in the ITB Unit in order to deliver charging and exposure that is stable against changes in the internal environment.

■ Drum Unit / Developing Assembly (Bk)

● Primary Charging Bias Control

Overview

Primary charging bias is a bias to ensure that the Photosensitive Drum surface is charged to a negative potential evenly.
The primary charging bias (DC negative) generated by the Primary Charging High Voltage PCB (Bk) (UN37), is applied to the Primary Charging Wire and the Grid Plate.

- Primary charging DC bias: the bias to be applied to the Primary Charging Wire (Constant Current).
- Grid DC bias: the bias to be applied to the Grid Plate

Control description

The value of the Primary Charging DC bias is determined by absolute moisture content and process speed.
The value of the Grid DC bias is determined by the fogging removal potential (Vback), which is determined by absolute moisture content and process speed, and the potential control (Bk) from the contrast potential (Vcont). (See “Potential Control (Bk)” on page 131 for more details)

● Primary Charging Wire Cleaning Control

Overview

It prevents charging failure caused by soiling the Primary Charging Wire and Grid Plate.

Execution timing

- At auto adjustment of the paper interval (every time a cumulative total of 4,000 images has been printed)
- At auto adjustment of the last rotation (every time a cumulative total of 2,000 images has been printed)
- At auto adjustment of warm-up rotation (power is ON) (Fixing temperature is less than 100 deg C / total of 2,000 images from the previous Dhalf control)
- In the case of executing “Clean Wire” in user mode

Control description

The drive of the Primary Charging Wire Cleaning Motor (M1) makes the Cleaner Screw rotate clockwise/counterclockwise, which moves the Primary Charging Wire Cleaning Pad and Grid Cleaning Pad back and forth to clean the Primary Charging Wire and Grid Plate.
The home position is detected by the Primary Charging Shutter HP Sensor (PS92).

● Primary Charging Shutter Control

Overview

To prevent uneven potential on the Photosensitive Drum caused by discharge products (nitrogen oxide) accumulated on the Primary Charging Assembly.

Execution timing

- When the Main Power is turned OFF
- When a specified period of time has passed after the machine moved to energy saver mode

Control description

The shutter is opened or closed by the cleaning mechanism of the Primary Charging Wire.
The Primary Charging Shutter is made of fiber and usually taken up by the bobbin.
The drive of the Primary Charging Wire Cleaning Motor (M1) moves the Cleaning Pad to the rear and the shutter taken up by the bobbin becomes extended to make the shutter closed.
Because the shutter comes between the Grid Plate and the Photosensitive Drum, discharge products from the Primary Charging Assembly do not reach the Photosensitive Drum.
The Primary Charging Shutter Position Sensor (PS92) detects opening/close of the shutter.

<Related error codes>

● Developing bias control

Overview

Developing bias (AC component and negative DC component) is applied to the Developing Cylinder so toner on the Developing Cylinder is attached to the Photosensitive Drum (bright area) to form a toner image.

Control description

- Developing DC bias
  The bias to generate potential difference with the Photosensitive Drum.
  Based on DC charging bias (Vd) determined by potential control (Bk), the bias value is determined by relative humidity and process speed.

- Developing AC bias
  The bias to improve image quality.
  The value of the developing AC bias is determined by relative humidity and process speed.

<Related service mode>

- COPIER > DISPLAY > DENS > DEV-DC-K
  : Display of the Bk developing DC bias

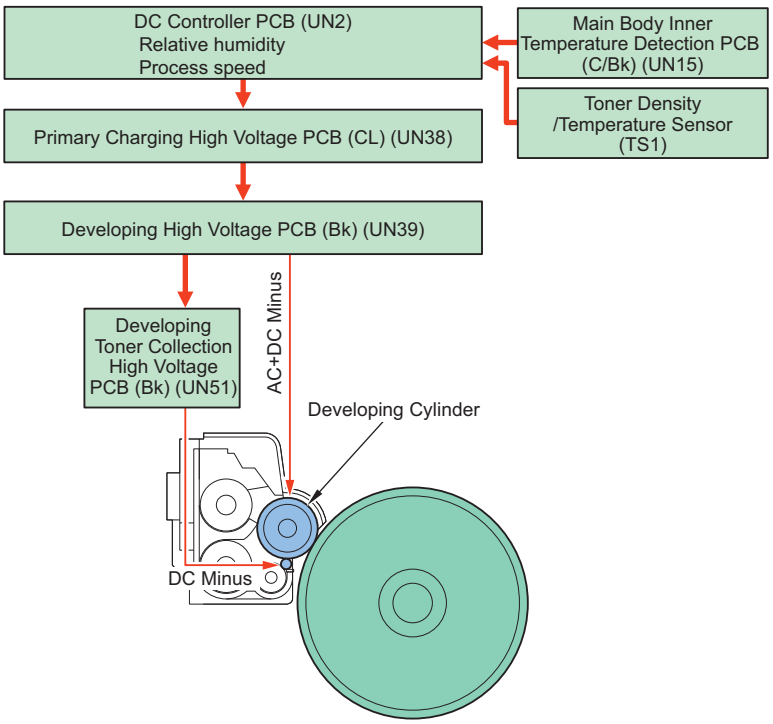
● Collection Roller Bias Control

Overview

Toner scattered from the Developing Assembly is returned to the Developing Cylinder by the difference of biases of the Toner Collection Roller and the Developing Cylinder at the time of development.

Details of the Control

The collection roller bias (DC negative) created by the developing toner collection high voltage PCB (Bk) (UN51) is applied to the collection roller.
The value of the Toner Collection Roller bias is determined by the developing DC bias and the developing AC bias.



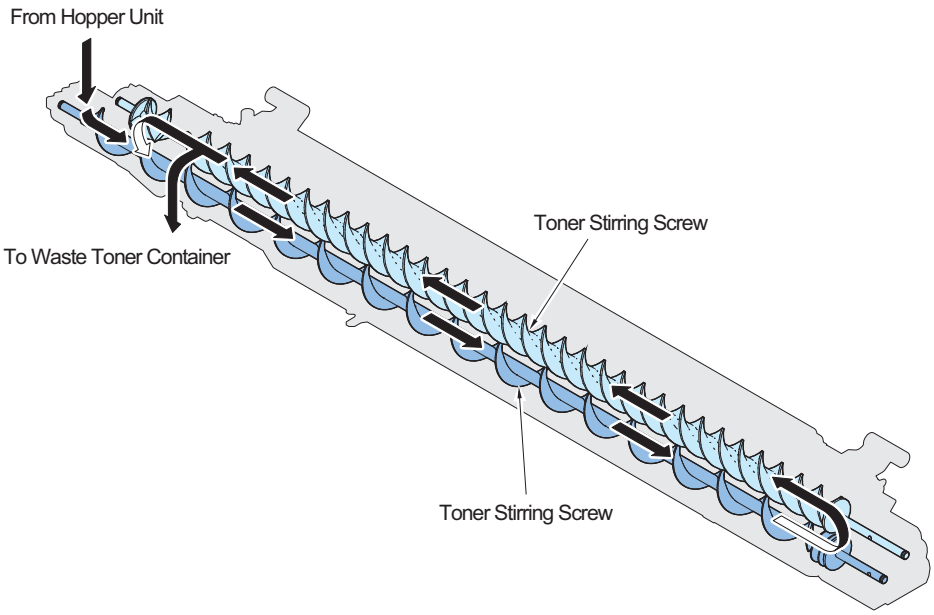
● ACR Control

Overview

The purpose of ACR (Auto Carrier Refresh) control is to keep long life of the developer, and developer is supplied from the toner container while gradually discharging developer in the developing assembly.

Details of the Control

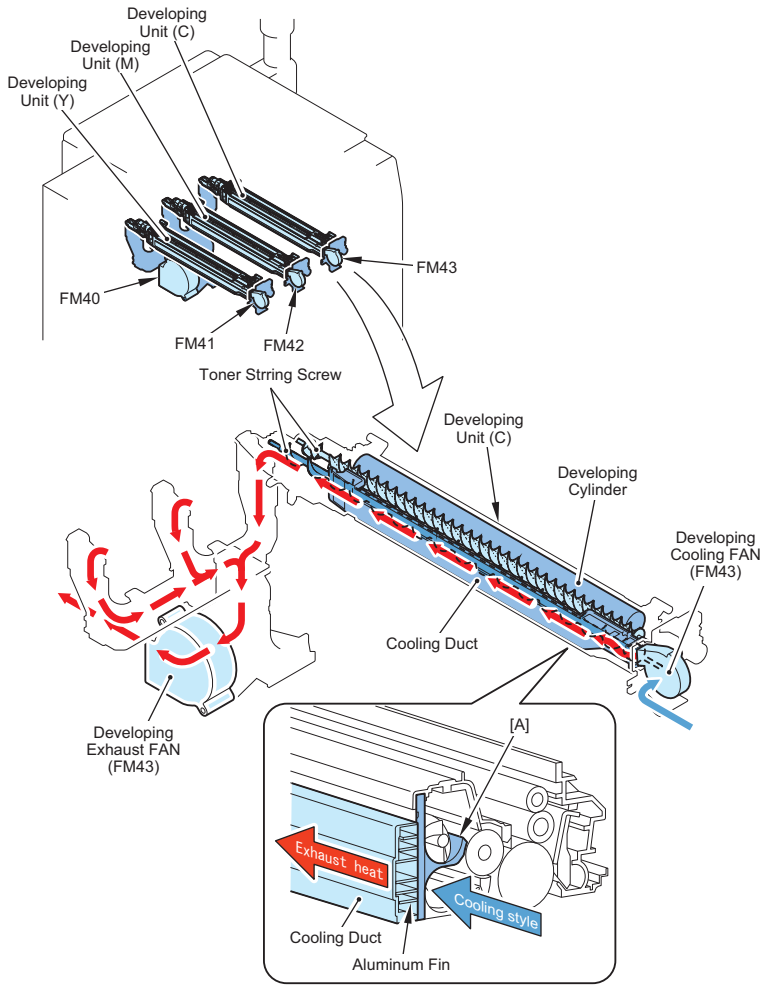
The exit slot is located at the downstream side of the developer. The developer is discharged when the volume of the developer increases.
The same control is performed in the developing assembly of the Drum Unit / Developing Assembly (CL).



● Developing Assembly Cooling Control

Overview

A cooling mechanism has been added to the Developing Assembly to prevent toner deterioration by heat.



Details of the Control

The Developing Assembly of each color sends cold air into the Cooling Duct using the Developing Cooling Fan (FM41, FM42, or FM43) on the front side of the host machine. The cold air sent into the Cooling Duct is discharged from the Developing Cooling Exhaust Fan (FM40) on the rear side of the host machine.

In the Cooling Duct, heat is exchanged between cold air in the duct and heat in the Developing Assembly by the Aluminum Fin and the Aluminum Guide [A]. This prevents deterioration of toner due to heat and allows significant reduction of toner ejection also in the case of low duty images.

● Pre-transfer Charging Bias Control

Overview

To make the charging amount of toner on the Photosensitive Drum appropriate to improve transfer performance.

Control description

Pre-transfer Charging AC bias (5500Vpp) and Pre-transfer Charging DC bias (0 to -600µA) generated by the Pre-transfer Charging High Voltage PCB (Bk) (UN5) are applied to the Pre-transfer Charging Wire.
The value of the Pre-transfer Charging bias is determined by absolute moisture content, relative humidity and paper type.

● Pre-primary Transfer Charging Wire cleaning control

Overview

It prevents charging failure caused by soiling the Pre-primary Transfer Charging Wire.

Execution timing

- At auto adjustment of the paper Interval (every time a cumulative total of 4,000 images has been printed)
- At auto adjustment of the last rotation (every time a cumulative total of 2,000 images have been printed)
- At auto adjustment of warm-up rotation (power is ON) (Fixing temperature is less than 100 deg C / total of 2,000 images from the previous Dhalf control)
- In the case of executing “Clean Wire” in setting registration.
  [Settings/Registration] > [Adjustment/Maintenance] > [Maintenance] > [Clean Wire]

Control description

The drive of the Pre-Primary Transfer Charging Wire Cleaning Motor (M2) makes the screw rotate clockwise/counterclockwise, which moves the Pre-Primary Transfer Charging Wire Cleaning Motor pad back and forth to clean the Pre-Primary Transfer Charging Wire.

<Related service modes>

● Pre-primary Transfer Charging Wire Shutter Control

Overview

To prevent uneven potential on the Photosensitive Drum caused by discharge products (nitrogen oxide) accumulated on the Pre-primary Transfer Charging Assembly.

Execution timing

To be executed together with the Pre-primary Transfer Charging Wire cleaning control at the same time.

Control description

The shutter is opened or closed by the cleaning mechanism of the Pre-primary Transfer Charging Wire.
The Pre-primary Transfer Charging Wire Shutter is made of fiber and usually taken up by the bobbin.
The drive of the Pre-primary Transfer Charging Wire Cleaning Motor (M2) moves the Cleaning Pad to the rear and the shutter taken up by the bobbin becomes extended to make the shutter closed.
Because the shutter comes between the Pre-primary Transfer Charging Wire and the Photosensitive Drum, discharge products from the Pre-primary Transfer Charging Wire do not reach the Photosensitive Drum.
The Pre-primary Transfer Charging Wire Shutter HP Sensor (PS93) detects open/close of the shutter.

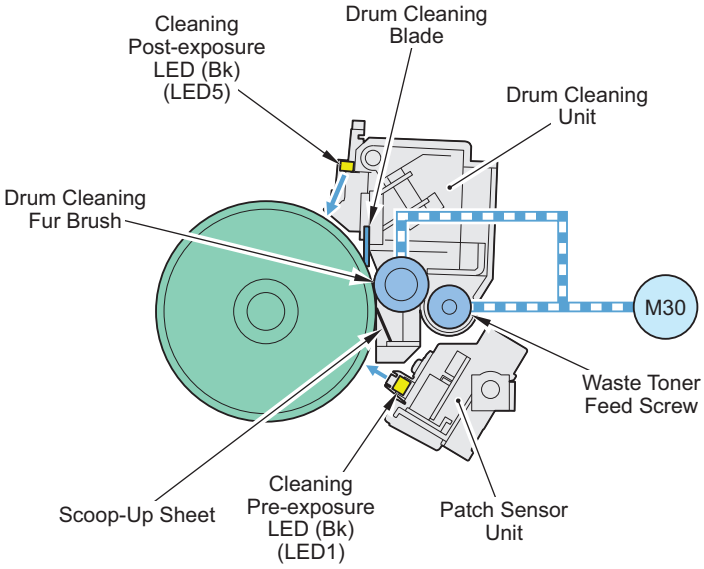
■ Cleaning

● Overview

Cleans residual toner on the Photosensitive Drum.



Parts name		Role
Drum Cleaning Unit		Scrapes off and collects residual toner attached to the drum.
	Drum Cleaning fur brush	Polishes and forms a thin toner coating layer on the surface of the Photosensitive Drum.
	Drum Cleaning Blade	Scrapes off toner attached to the surface of the drum.
	Waste Toner Feed Screw	Feeds waste toner from the Drum Cleaning Unit.
	Scoop-up Sheet	Scoops up waste toner that has spilled outside the Drum Cleaning Unit.
M30	Drum Cleaning and Waste Toner Feed Drive Motor	Drive of the Drum Cleaning Brush Roller and Waste Toner Feed Screw
LED1	Drum Cleaning Pre-Exposure LED	Removes residual charge on the surface of the Photosensitive Drum.
LED5	Drum Cleaning Post-exposure LED	Removes residual charge under toner that failed to be removed by the Pre-exposure LED.

● Drum Cleaning Pre-exposure

Overview

Control in which light is emitted from the Pre-exposure LED in order to remove residual charge on the surface of the Photosensitive Drum.

Control description

Light is emitted from the Drum Cleaning Pre-exposure LED on the Patch Sensor unit to remove the residual charge and prevent soiling on the surface of the Photosensitive Drum.

NOTE:
Due to the potential difference at the edge of the toner layer transferred onto the ITB during primary transfer, a minute gap is formed between the Photosensitive Drum and the ITB, where a discharge phenomenon occurs. This causes a drum memory to be formed on the Photosensitive Drum. Residual toner adhering to the Cleaning Blades is attracted to this drum memory area, causing the Photosensitive Drum to be soiled.

● Drum Cleaning Control

Overview

The blade, which is in contact with the Drum, removes residual toner on the Photosensitive Drum.

Control description

1. The Drum cleaning fur brush rotates by driving the Drum Cleaning/Waste Toner Feed Drive Motor (M30).
2. The Drum cleaning fur brush polishes and forms a thin toner coating layer on the surface of the Photosensitive Drum.
3. The Drum Cleaning Blade scrapes residual toner on the surface of the Drum.
4. The Toner Collection Feeding Screw feeds the scraped waste toner to the Waste Toner Container.

> **NOTE:**
> 2 Scoop-up Sheets are used to prevent the spilling of toner scraped off with the Drum Cleaning Blade.

● Drum rotation speed control

Overview

The rotation speed of the drum is kept constant to raise image position (color displacement) precision.

Control description

1. The drum rotates by driving the Drum Motor (Y: M21 / M: M23 / C: M25 / Bk: M19).
2. There is an Encoder on the Drum Shaft, and its rotation is monitored by 2 Drum Speed Detection PCBs (Bk: UN18/19, Y: UN20/21, M: UN22/23, C: UN24/25).

3. The Drum Speed Detection PCB counts the drum speed as a pulse, and speed control is achieved by the Drum rotation speed being fed back to the Drum ITB Driver PCB (UN6).

● Drum Heater Control

Overview

To make potential characteristic for charging or exposure stable by keeping the specified temperature of the Photosensitive Drum.

Control description

A planar Drum Heater is installed on the inside of the Photosensitive Drum, and a thermopile and thermistor on the surface of the Photosensitive Drum, to control the temperature of the Photosensitive Drum.

Operating conditions

		Main Power switch	
		ON	OFF
Environment Heater Control switch	ON	Following the environment control	ON*
	OFF	OFF	OFF

* When connected to a power plug outlet.

Environment control

- The control is always ON for absolute moisture content in a high-temperature and humidity environment.
- The control is OFF for absolute moisture content in a normal temperature and low humidity environment.

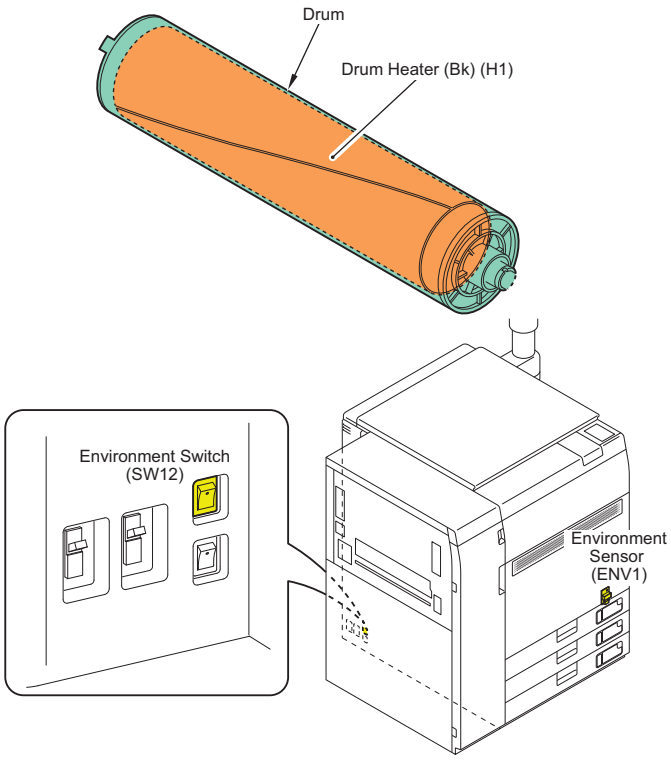
<Related service mode>

- COPIER > ADJUST > HV-PRI > DHT-ON
  : Setting of temperature of the Drum Heater (Bk)

Control description

1. The drum surface temperature is detected by the thermopile.
2. Based on the detected temperature of the drum surface, the drum surface temperature is kept constant by repeating ON/OFF of the Drum Heater.
3. When the Drum Thermistor detects the upper limit temperature, the Drum Heater is turned OFF.

NOTE:
The Thermopile is an infrared sensor which receives infrared emitted from individual objects in a non-contact manner and then generates thermal electromotive force according to their respective energy levels. The Thermopile allows the temperature of the surface of the Photosensitive Drum to be detected accurately.



■ Drum Unit / Developing Assembly (CL)

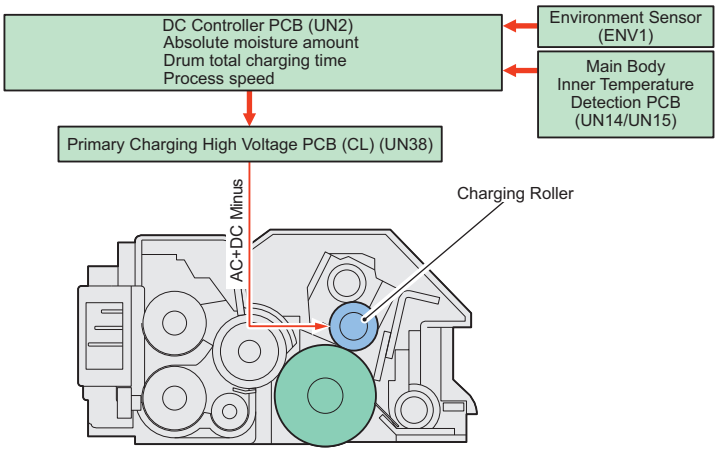
● Primary Charging Roller Bias control

Overview

Primary charging bias (CL) is a bias to ensure that the Photosensitive Drum surface is charged to a negative potential evenly.

Control description

The primary charging bias (AC component, DC negative component), which has been generated by the Primary Charging High Voltage PCB (CL) (UN38), is applied to the Primary Charging Roller.
Primary charging DC bias (CL): the DC bias to be applied to the Primary Charging Roller
Primary charging AC bias (CL): the AC bias to be applied to the Primary Charging Roller
Primary charging DC bias is determined by absolute moisture content (ENV1), total drum charging time, process speed and internal temperature, and primary charging AC bias depends on absolute moisture content (ENV1), total drum charging time, process speed and internal temperature, and its value is determined by discharge current control. (For details, refer to “Primary Charging Environment Control (CL)” on page 134.)



<Related service modes>

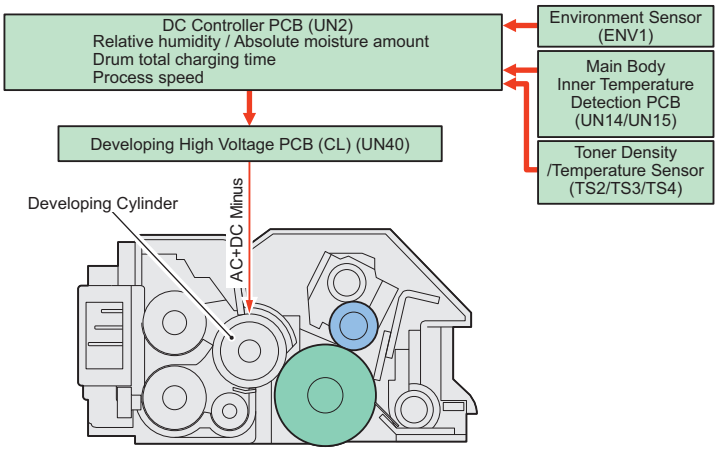
● Developing Bias Control (CL)

Overview

Developing bias (AC component and negative DC component) is applied to the Developing Cylinder so toner on the Developing Cylinder is attached to the Photosensitive Drum (bright area) to form a toner image.

Control description

- Developing DC bias
  The bias to generate potential difference with the Photosensitive Drum.
  The charging amount of the Drum is changed depending on the moisture content. The characteristics of the Drum change gradually while the Drum is used, therefore the charging amount of the Drum needs to be changed.
- Developing AC bias
  The bias to improve image quality.
  The value of the developing AC bias is determined by relative humidity and process speed.



<Related service mode>

- COPIER > DISPLAY > DENS > DEV-DC-Y/M/C
  : Display of the developing DC bias

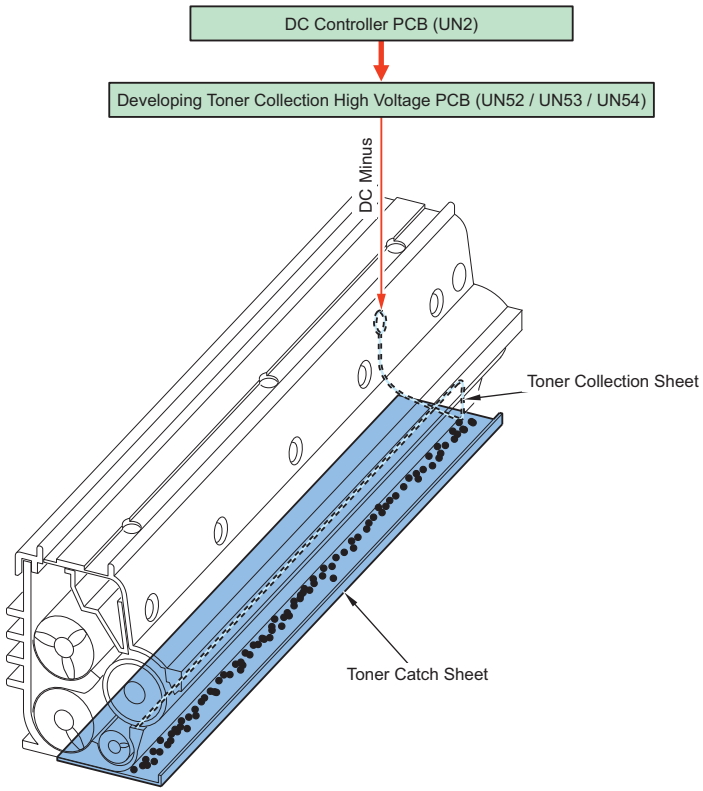
● Toner Collection Sheet Bias Control

Overview

Toner scattered from the Developing Assembly is returned to the Developing Cylinder by the difference of biases of the Toner Collection Roller and the Developing Cylinder at the time of development.

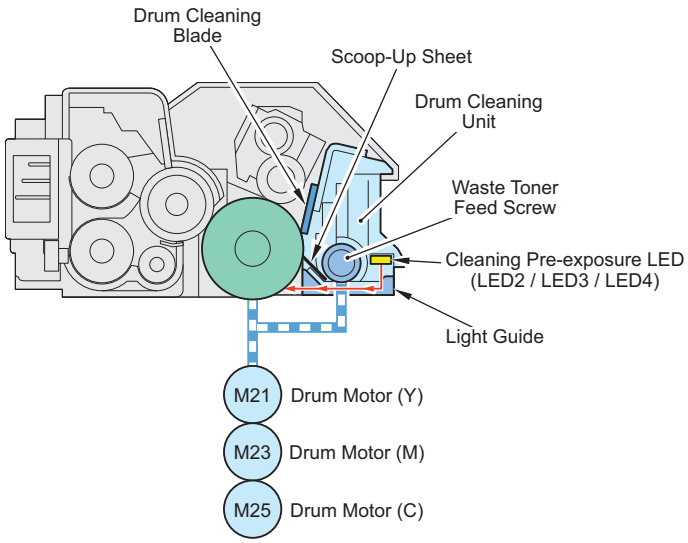
Control description

Toner Collection Sheet bias (negative DC) generated in the Developing Toner Collection High Voltage PCB (Y)/(M)/(C) (UN52/UN53/UN54) is applied to the Toner Collection Sheet.
The value of the Toner Collection Sheet bias is determined by the developing DC bias and the developing AC bias. Toner dropped from the Toner Collection Sheet accumulates on the Toner Catch Sheet located under the Developing Assembly.



■ Cleaning

● Overview



Parts name	Role
Drum cleaning part	Scrapes off and collects residual toner attached to the drum.

Parts name		Role
	Drum Cleaning Blade	Scrapes off toner attached to the surface of the drum.
	Waste Toner Feed Screw	Feeds waste toner from the Drum Cleaning Unit.
	Scoop-up Sheet	Scoops up waste toner that has spilled outside the Drum Cleaning Unit.
	Light Guide	Light released by the LED is carried to the drum surface.
M30	Drum Cleaning and Waste Toner Feed Drive Motor	Drive of the Drum Cleaning Brush Roller and Waste Toner Feed Screw
LED1	Drum Cleaning Pre-Exposure LED	Removes residual charge on the surface of the Photosensitive Drum.

● Drum Cleaning Pre-exposure (CL)

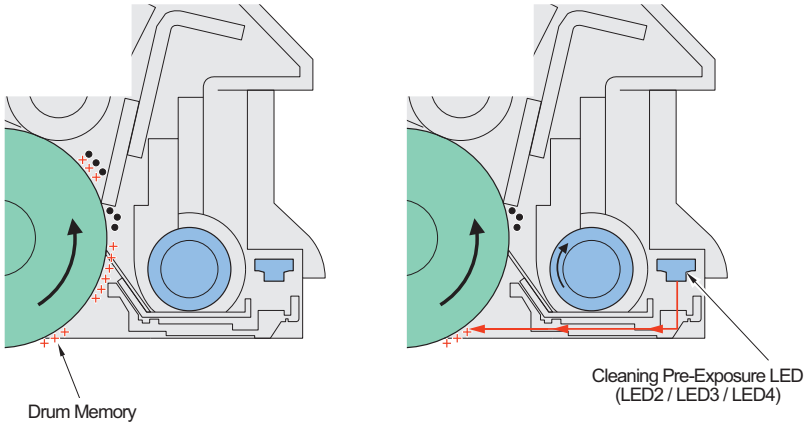
Overview

This control is performed to prevent reverse transfer of toner on the cleaning blade caused by drum memory.

Details of the Control

Light is emitted from the drum cleaning pre-exposure LEDs (LED 2 to 4) in the ITB cleaning unit to remove the drum memory on the photosensitive drum surface and prevent dirt on the surface.
The light emitted from the drum cleaning pre-exposure LEDs (LED 2 to 4) is exposed to the drum surface via the light guide.

NOTE:
A potential difference at the edges of toner layer transferred onto the ITB at primary transfer forms a minute gap between the photosensitive drum and the ITB, making a discharge symptom occur. This causes drum memory to occur on the photosensitive drum. When the residual toner adhered to the cleaning blade is attracted to the drum memory, causing dirt on the photosensitive drum.



< Without Pre-Exposure > < With Pre-Exposure >

● Drum Unit / Developing Assembly Presence Detection

This machine does not perform Drum Unit / Developing Assembly presence detection.

● Drum Unit detection (new/old)

This machine does not have a mechanism to detect new/old Drum Units.

NOTE:
The Potential characteristic (duration) of the Drum Unit varies depending on the total charging time of the drum.
Therefore, the total charging time is maintained internally and used for bias control, etc. This charging time can be confirmed by the below Service Mode, so it will be necessary to clear the total charging time from the Service Mode when replacing the Drum Unit.

<Related service modes>

- COPIER > FUNCTION > DPC > DRMRSETY/M/C
  : Executes the drum replacement mode forcibly. Clears the total charging time of the Drum.
- COPIER > DISPLAY > DPC > D-CONT-Y/M/C
  : Displays the total charging time of the Drum.

● Drum Heater Control

Overview

A drum heater is provided in the ITB Unit in order to deliver charging and exposure that is stable against changes in the internal environment.

Operating conditions

- If the Environment Heater Switch is ON, whenever the host machine is OFF, the Drum Heater is always ON. While the host machine is ON, the Drum Heater is ON if the internal temperature is less than the specified temperature.

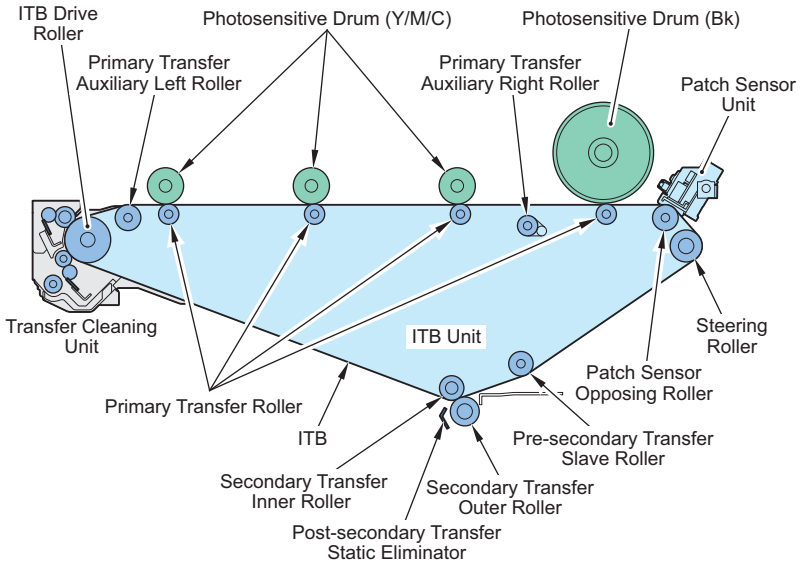
Control description

The temperature around the drum is maintained at the specified temperature by turning the thermistor ON/OFF.

■ Transfer Assembly (ITB Unit)

● Overview

Toner on the Photosensitive Drum is transferred to a paper.



Parts name		Role
ITB Unit		Toner on the Photosensitive Drum is transferred to a paper.
	ITB (Intermediate Transfer Belt)	Toner on the Photosensitive Drum is transferred to a paper.
	Primary Transfer Roller	Toner on the Photosensitive Drum is attracted to the ITB.
	ITB Driver Roller	The ITB is rotated.
	Primary Transfer Auxiliary Left Roller	The ITB surface is forced against the Drum.
	Primary Transfer Auxiliary right Roller	The ITB surface is forced against the Drum. (When the Primary Transfer Rollers Y, M, C are disengaged)
	Steering Roller	The ITB displacement is corrected.
	Transfer Cleaning Unit	Remove residual toner on the ITB.
	ITB Cleaning Screw	Waste toner from the ITB Cleaning Unit is fed.
	Secondary Pre-transfer Slave Roller	The belt behavior due to belt displacement control is stabilized.
	Patch Sensor Unit	The patch image density on the ITB and registration patch are detected.
Secondary Transfer Unit		Toner on the ITB is transferred to paper.
	Secondary Transfer Outer Roller	Paper being transferred is fed. The roller is disengaged from the ITB when reading the patch image.
	Secondary Transfer Static Eliminator	The electric charge is removed from paper after secondary transfer.

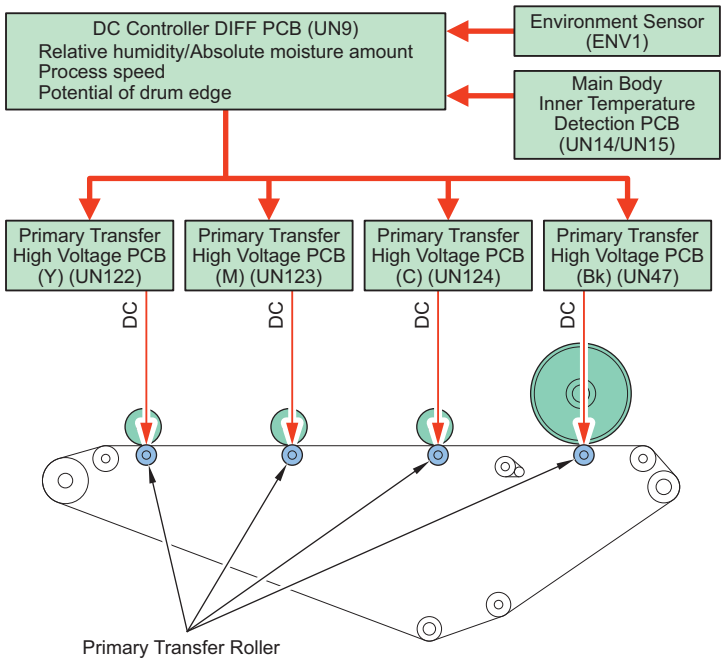
● Primary Transfer Bias Control

Overview

Toner on the Photosensitive Drum is transferred to the ITB.

Control description

The primary transfer bias (DC positive/negative) generated by the Primary Transfer High-voltage PCB (UN43), is applied to the Primary Transfer Roller.
The primary transfer bias is dependent on the absolute moisture content (ENV1), relative humidity (UN14/UN15), process speed and drum dark area potential (Vd), and the bias value is determined by the primary transfer ATVC.



<Related service modes>

- COPIER > ADJUST > HV-TR > 1TR-TGY/TGM/TGC
  : Adjustment of the primary transfer ATVC target current (1/1 speed)
- COPIER > ADJUST > HV-TR > 1TR-TGY2/TGM2/TGC2
  : Adjustment of the primary transfer ATVC target current (2/3 speed)
- COPIER > ADJUST > HV-TR > 11TR-TGY3/TGM3/TGC3
  : Adjustment of the primary transfer ATVC target current (1/2 speed)
- COPIER > FUNCTION > MISC-P > 1ATVC-EX
  : Execute the primary transfer ATVC

● Primary Transfer Roller Disengagement Control

Overview

The color Primary Transfer Rollers are disengaged in the single color Bk mode in order to increase the life of image formation parts (Photosensitive Drum, ITB).

Engagement/Disengagement state

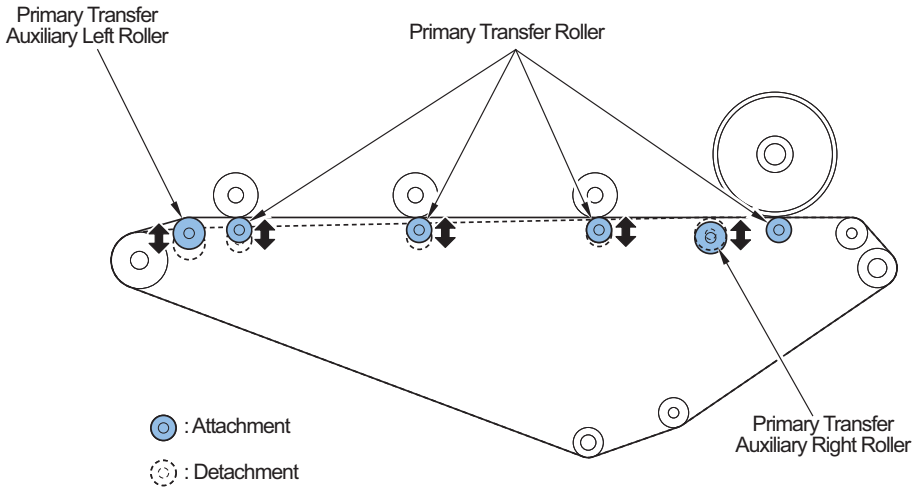
Engagement: color mode
Disengagement: Other than the above timing However, when switching to Bk single color mode from 4 colors mode, do not do the disengagement operation (Turn OFF the High Voltage).

Mode		Bk		YMC	
		Roller	High Voltage	Roller	High Voltage
Normal Speed mode	Bk single color mode	Engagement	ON	Disengagement*1	OFF
	Color mode	Engagement	ON	Engagement	ON

Mode		Bk		YMC	
		Roller	High Voltage	Roller	High Voltage
Normal Speed mode	Bk single color mode (Disengagement) -> Color mode	Engagement	ON	Disengagement -> Color mode	OFF -> ON
	Color mode -> Bk single color mode	Engagement	ON	Engagement	ON -> OFF
	Bk single color mode (Engagement) -> Color mode	Engagement	ON	Engagement	OFF -> ON
At 248 mm/sec, 174mm/sec (coated paper, etc.)		Engagement	ON	Engagement	OFF

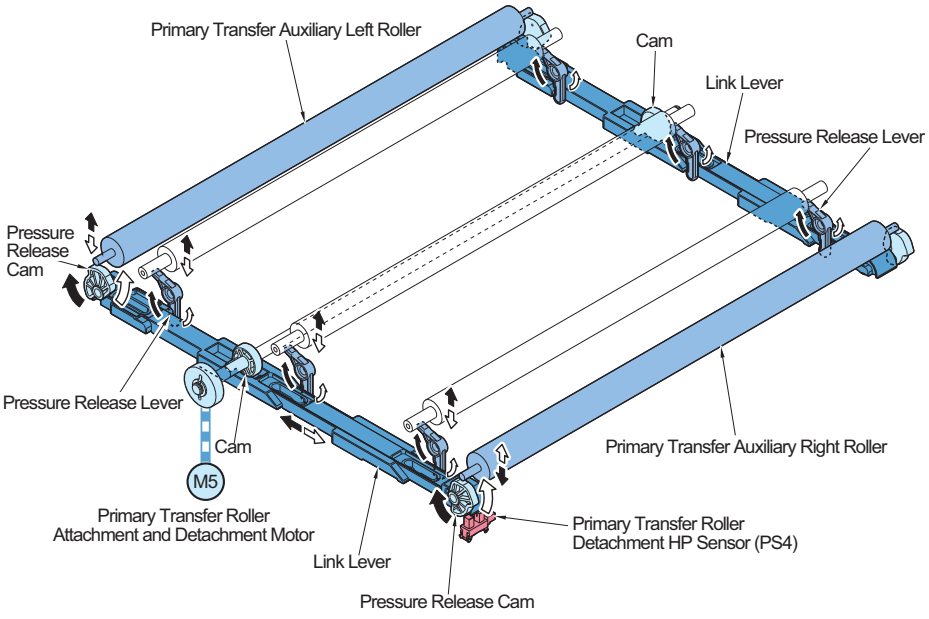
*1: Even in the single color Bk normal speed mode, there is a mode for engaging the Color Roller and turning OFF high pressure.

NOTE:
When switching Bk (Disengagement) mode to 4 colors mode, do engagement operation after pausing Bk drum drive and ITB drive.



Control description

1. The cam rotates by driving Primary Transfer Roller Detachment Motor (M5).
2. Slide the link lever by rolling the cam.
3. Operate in conjunction with sliding the link lever, Pressure Release Lever starts to roll and Primary Transfer Roller of single color disengages from ITB.
4. At the same time, Pressure Release cam rotates. Then the Primary Transfer Auxiliary Right Roller moves up, and the Primary Transfer Auxiliary Left Roller moves down.
5. Detect the position of Primary Transfer Roller by Primary Transfer Roller disengagement HP sensor (PS5).



<Related service modes>

● Secondary Transfer Bias Control

Overview

Toner on the ITB is transferred to a paper.

Control description

The secondary transfer bias (DC positive), which has been generated on the Secondary Transfer High-Voltage PCB (UN48), is applied to the Secondary Transfer Outer Roller.
The secondary transfer bias is dependent on the absolute moisture content (ENV1), process speed and paper type, and is determined by the secondary transfer ATVC control.

<Related service modes>

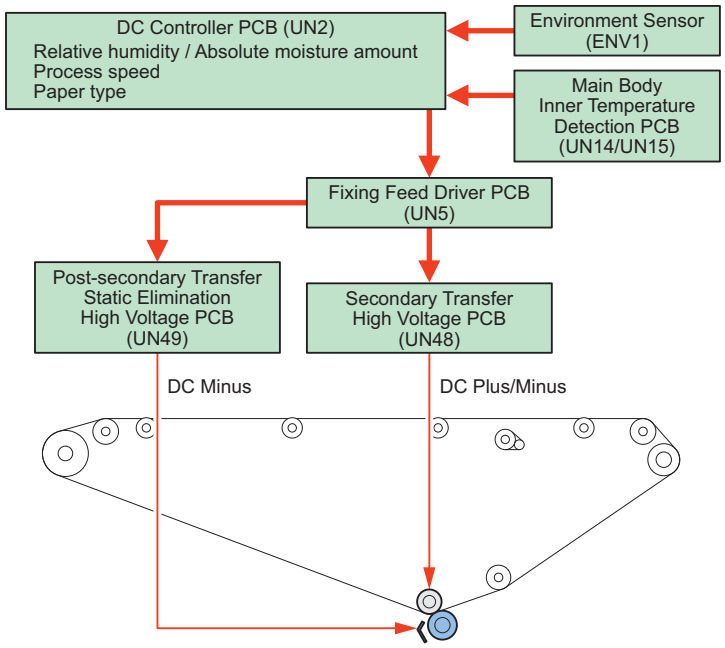
● Post-secondary transfer static elimination bias control

Overview

Sheets of paper can be separated easily from the ITB.

Control description

The secondary transfer static elimination bias (DC minus), which has been generated on the Post-secondary Transfer Static Elimination High Voltage PCB (UN49), is applied to the Post-secondary Transfer Static Eliminator.
Absolute moisture content (ENV1) and the paper type determine the secondary transfer static elimination bias (DC minus).



<Related service mode>

- COPIER > DISPLAY > HV-STS > 2EL
  : Display of the Secondary Transfer Static Eliminator voltage

● Secondary Transfer Outer Roller Disengagement Control

Overview

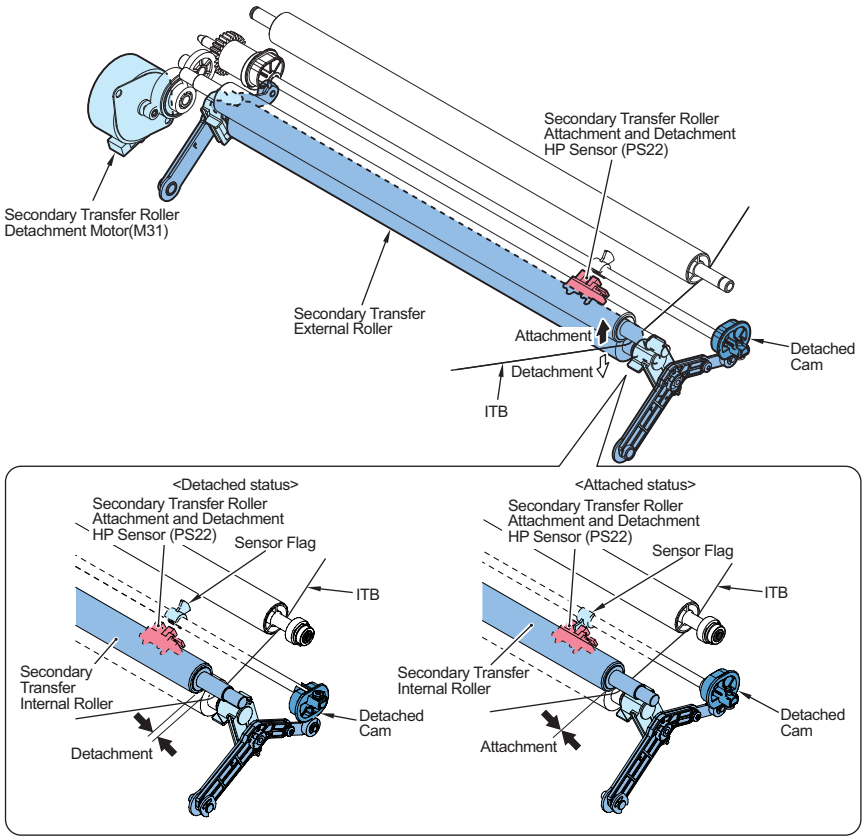
This control prevents soiling of the Secondary Transfer Outer Roller with toner.

Execution timing

Engagement: At Printing, during Secondary Transfer Roller cleaning
To make the belt disengaged: any timing other than the above

Control description

1. The Secondary Transfer Roller Detachment Motor (M31) is driven to rotate the Disengagement Cam.
2. The Secondary Transfer Outer Roller is engaged with and disengaged from the ITB by rotation of the Disengagement Cam.
3. The Secondary Transfer Roller Detachment HP Sensor (PS22) detects the position of the Secondary Transfer Outer Roller.



<Related error code>

- E077: Secondary Transfer Roller Detachment HP Sensor timeout error

● Secondary Transfer Outer Roller Cleaning Control

Overview

This control prevents soiling at the back of the sheet caused by soiling of the Secondary Transfer Outer Roller with toner.

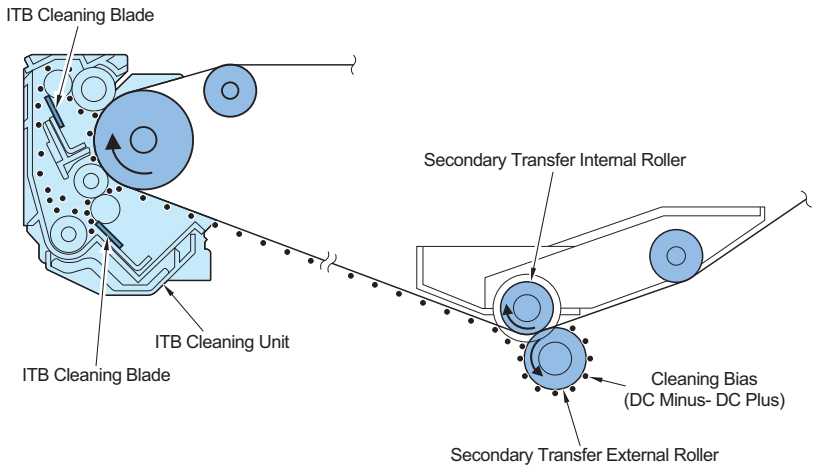
Execution timing

- At initial rotation
- At last rotation
- During printing

NOTE:
Secondary Transfer Roller cleaning is executed together when the next control is executed.
- D-max Control
- D-half control
- ARCDAT control
- ATR control (patch formation)
- Low Duty Toner Ejection Sequence
- Black Band Sequence
- Image position correction

Control description

1. The secondary transfer cleaning bias (DC plus + DC minus), which has been generated on the Secondary Transfer High-voltage PCB (UN48), is applied to the Secondary Transfer Outer Roller alternately.
2. Toner on the Secondary Transfer Outer Roller is attached to the ITB, and then collected by the ITB Cleaning Unit.



<Related service modes>

  : Cleaning of the Secondary Transfer Outer Roller:
- COPIER > COUNTER > DRBL-1 > 2TR-ROLL
  : Secondary Transfer Outer Roller parts counter

● ITB Cleaning Control

Overview

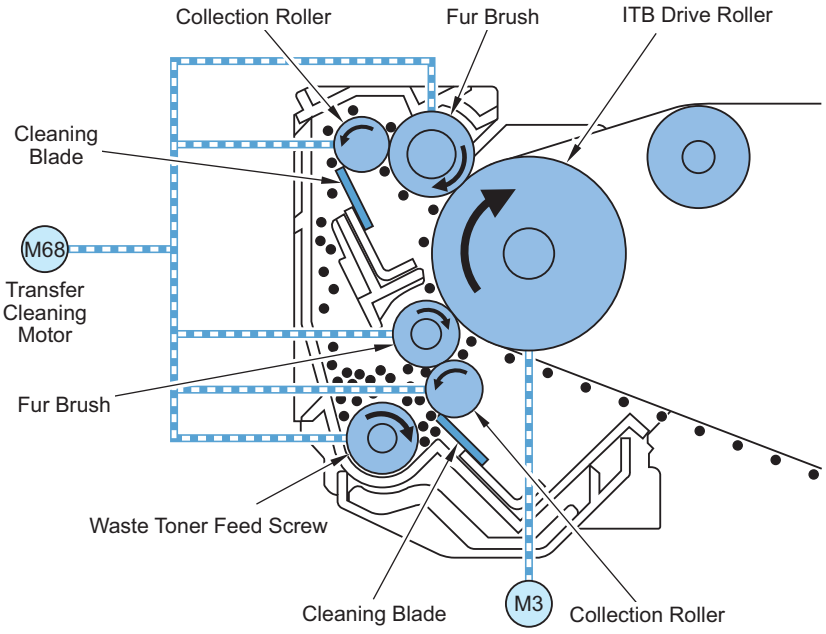
It removes residual toner on the ITB.

Control description

Static Fur Brush Cleaning Method

1. It attracts toner with 2 fur brushes.
2. Toner attracted with the Toner Collection Roller is swept by the Cleaning Blade.

3. The scraped toner is fed to the Waste Toner Container.



<Related service modes>

● Separation

Overview

Paper is separated from the ITB.
Paper is separated using the curvature separation mechanism (mechanical) and Static Eliminator (static electricity).
DC bias is applied to the Static Eliminator to absorb excess electric charge on paper for improved paper separation. The value of the Static Eliminator DC bias varies depending on the absolute moisture content (ENV1), paper type and process speed.
By grounding the Attraction Plates, attract paper toward the Attraction Plate.

  : Secondary Transfer Static Eliminator parts counter

● ITB Displacement Correction Control

Overview

This control prevents ITB damage caused by ITB displacement.

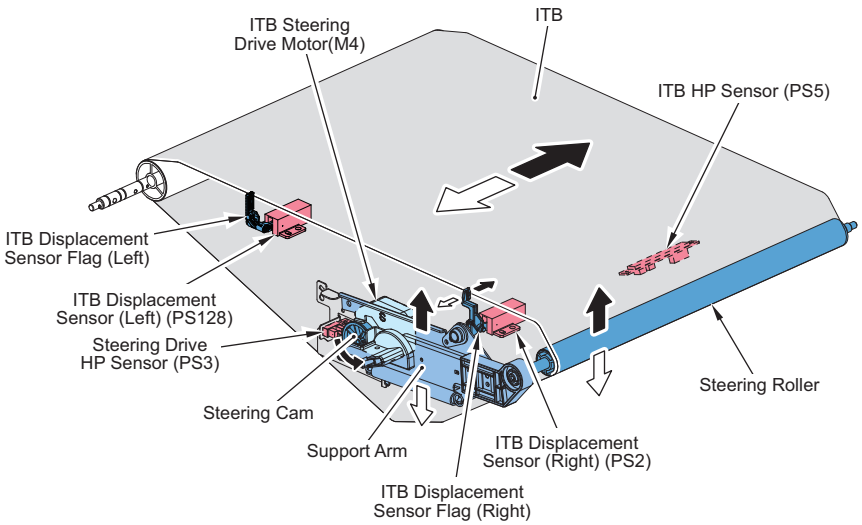
Execution timing

While the ITB is rotating.

Control description

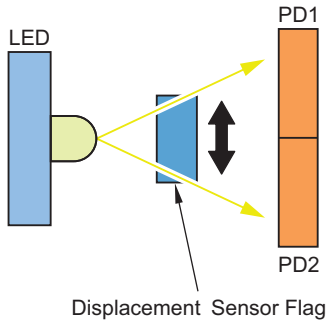
1. If the ITB is displaced to the near or far edge side, the flag of the ITB Displacement Sensor (right) moves from the edge of the ITB.
2. The ITB Displacement Sensor (PS2) detects the position of the flag of the ITB Displacement Sensor (right) (refer to <Detection of the ITB position>), and the ITB Steering Motor (M4) is driven according to the position of the ITB.
3. When M4 is driven, the steering cam rotates to move the Support Arm up and down. This makes the Steering Roller to tilt.
4. When the Steering Roller tilts, a difference in the tension of the ITB is generated, and the ITB moves to the near or far side edge.
5. Repeating the operation from 1 to 4 corrects ITB displacement.
6. The Steering Roller HP Sensor (PS3) detects the position of the Steering Roller.
7. The ITB has the HP mark (white) inside, which is detected by PS3 and used for correcting ITB edge unevenness. (Refer to <Profile of the ITB edge configuration>.)

8. Skew of the ITB is measured on the basis of information of the ITB Displacement Sensor (Left) (PS128) and the ITB Displacement Sensor (Right) (PS2).
   On the basis of this ITB skew information, the position of each color transferred onto the ITB (the position on the Drum irradiated with laser) is adjusted to reduce color displacement.



Detection of the ITB position

The ITB Displacement Sensors (PS2 and PS128) each consist of an LED and 2 photodiodes (PD).
The amount of light received by the 2 PDs in the ITB Displacement Sensor changes depending on the position of the displacement sensor flag. By detecting this amount of light received, the shift amount of the Displacement Sensor Flag is calculated to determine the displacement amount of the belt position.



Profile of the ITB edge configuration

The ITB edge configuration is wavy instead of straight. Because of this, it is impossible to detect the ITB position correctly unless the ITB position is detected with the ITB edge configuration is taken into account. This edge configuration varies depending on the ITB.
When replacing the ITB, a profile of the edge configuration is created and recorded in service mode. The ITB position is detected correctly by checking this profile and the result of measurement by the ITB Displacement Detection Sensor.
The ITB HP Sensor (PS5) detects the HP mark (white) inside the ITB to recognize the reference position when creating a profile and correcting ITB displacement.

NOTE:
When replacing the belt, it should be installed so that the HP mark (white) is positioned at the far edge side.

Neutral position of the Steering Roller

This control uses the tilting of the Steering Roller to move the ITB. The control records the neutral position of the Steering Roller and tilts the Steering Roller based on it to correct ITB displacement. This neutral position is detected and recorded by executing service mode.

  : ON/OFF of ITB Displacement Correction Control

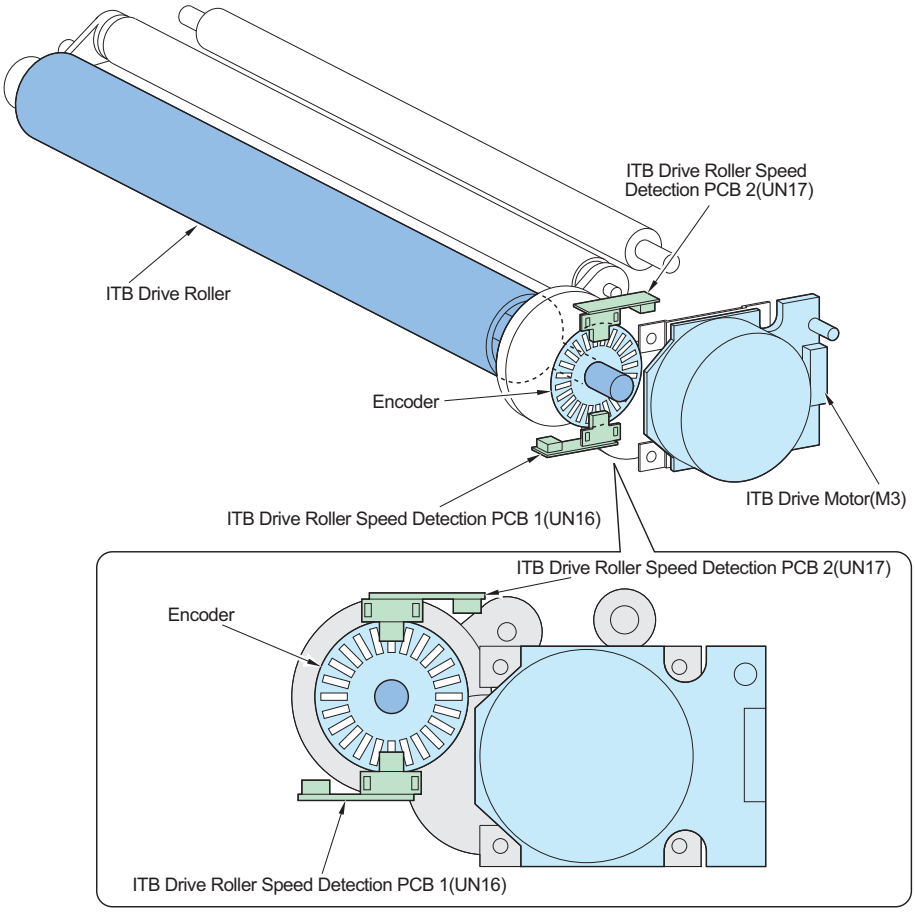
● ITB Speed Control

Overview

Image position precision is improved by keeping the ITB speed constant.

Control description

To keep the ITB speed constant, the encoder driven by the ITB Driver Roller is monitored. The ITB Drive Roller Speed Detection PCB 1/2 (UN16/UN17) counts the encoder rotations as a pulse, so the ITB Driver Roller rotation amount is fed back to the DC Controller Interface Rotation PCB (UN2) enabling speed to be controlled.



<Related service modes>

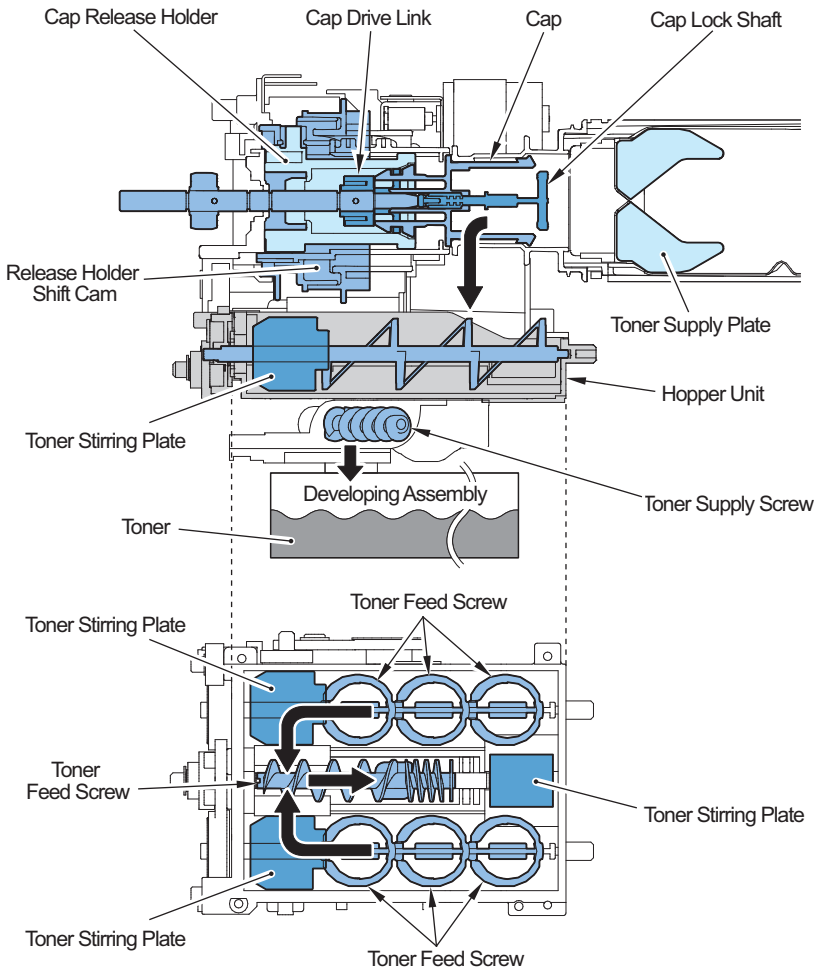
■ Toner Supply Assembly

● Overview

Toner is supplied from the Toner Container to the Developing Assembly.
With this machine, the toner container opens automatically. Therefore, the toner container cannot normally be disconnected and then connected before the toner inside the container runs out.



Parts name		Role
Toner Supply Drive Unit		Toner is supplied from the Toner Container to the Hopper Unit.
	Cap Drive Link	It merges with the Toner Cap to open/close the cap.
	Cap Release Holder	It releases the merged Toner Cap and Cap Drive Link.
	Release Holder Shift Cam	The motor transmits the rotation drive as a reciprocating motion to the cap drive.
Hopper Unit		Toner is supplied from the Hopper Unit to the Developing Assembly.
	Toner Feed Screw	Toner in the Hopper Unit is fed.
	Stirring Plate	Toner in the Hopper Unit is stirred.
	Toner Supply Screw	Toner is supplied to the Developing Assembly.
Toner Container		Toner inside the toner container is supplied to the Hopper Unit by the drive of the Toner Supply Drive Unit.
	Cap Lock Shaft	Toner Cap Lock
	Toner Supply Plate	Toner inside the toner container is drawn up.

● Toner Cap automatic opening control

Overview

This control automatically opens the cap of the Toner Container.

Execution timing

When the Toner Container is replaced

Control description

1. The Toner Cap HP Sensors (PS8/PS11/PS14/PS17) detect the position of the Toner Cap, and Toner Cap Rotation Phase Sensors* (PS81 to PS84) detect the phase of the Toner Cap and Cap Release Holder in relation to the Toner Container.
2. Driving the Toner Container Drive Motors (M7/M10/M13/M16) counterclockwise moves the Cap Drive Link and Cap Release Holder to the right (towards the Toner Container).

3. The Toner Cap is secured by the Cap Drive Link. At the same time, the cap lock shaft is pushed to the right, and this releases lock of the Cap.
4. The Toner Container Drive Motors (M7/M10/M13/M16) are driven further to move the Cap Release Holder and Cap Drive Link to the left in this order.

Sealing operation

1. Driving the Toner Container Drive Motors (M7/M10/M13/M16) counterclockwise moves the Cap Drive Link and Cap Release Holder to the right (towards the Toner Container).
2. The Toner Container is sealed with the Toner Cap. At the same time, the Cap Release Holder bends the cap claws to release securing of the Cap Drive Link and Cap.
3. The motor is driven, the Cap Drive Link and Cap Release Holder are moved to the left. This makes is possible to remove the Toner Container.

	Toner Container Reciprocation HP Sensor	Toner Cap Rotation Phase Sensors
Sealing	Light blocking	Light blocking
Moving (sealing -> opening)	Light transmission	Light transmission
Opening	Light blocking	Light transmission
Moving (opening -> sealing)	Light transmission	Light blocking

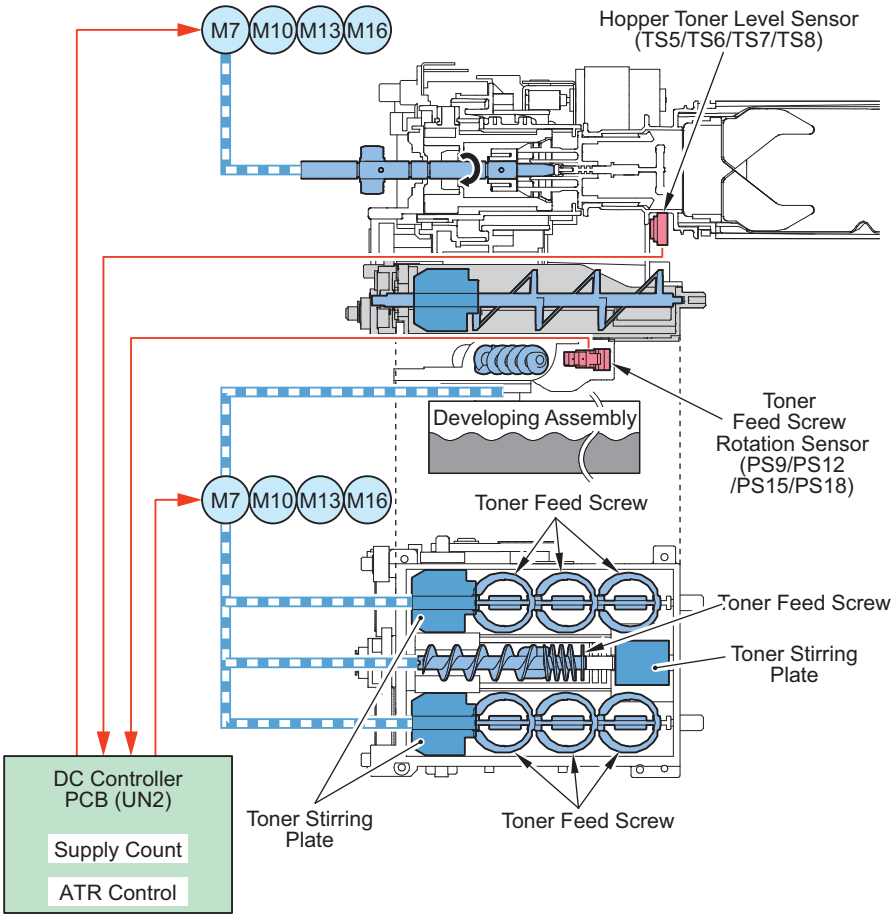
● Toner Level Detection/Toner Supply Control

Toner Supply Control

Toner is supplied from the Toner Container to the Developing Assembly.



Title	Description	Supply timing	Operation of the host machine
Supplying the Toner to the Hopper	Toner is supplied from the Toner Container to the Hopper Unit.	When the Hopper Toner Level Sensors (TS5 to TS8) switch from ON to OFF and toner is supplied to the Developing Assembly for the specified number of times.	The Toner Container Drive Motors (M7/M10/M13/M16) are driven for the specified period of time.
Supplying the Toner to the Developing Assembly	Toner is supplied from the Hopper Unit to the Developing Assembly.	When toner supply is determined necessary by the result of ATR control.	The Hopper and Stirring/Supply Motors (M6/M9/M12/M15) are driven for the specified period of time.

• Toner Level Detection

	-	Pre-toner Low Alarm	Remaining Toner Error Message	No toner
State	Container full	-	Near-end	End
Toner Level inside. Toner Container	100%～25%  	Variable between 40% and 0%  The value can be changed in service mode	0%  	0% 
Toner Level inside Hopper	 			Detection Method	-	-	Hopper Toner Level Sensor *3	Toner Supply Count *1*2
Message	-	-	Replace the toner cartridge	No toner *4
Operation of the host machine	-	-	Continuous printing is enabled	Host machine is stopped
Detection timing	-	Prediction from the toner supply count (Judged from the number of supplying toner to the Hopper Unit.)	When no toner is detected by the Toner Level Sensor in the hopper after the toner level inside the Toner Container becomes 0%	When the number of counts by the video counter has reached the specified value since no toner is detected by the Toner Level Sensor in the hopper after the toner level inside the Toner Container becomes 0%
The exchange right or wrong of the toner bottle	Impossible * The value can be changed in service mode	Impossible * The value can be changed in service mode	Possible	Possible
Alarm code	-	10-0017 10-0018 10-0019 10-0020	-	10-0001 10-0002 10-0003 10-0004

*1: Counting is performed every time the toner supply screw rotates.
*2: Prediction based on the accumulated value of the toner supply count.
*3: Detection by the Hopper Toner Level Sensor. When the sensor output changes from ON to OFF and stays OFF even through the Toner Container Drive Motor is driven. The Toner Container Drive Motor purges the toner by repeating drive and stop for a predetermined number of times.
*4: When the Toner Container is empty, how and when the message is displayed differs between Bk and color.

- Bk: When the toner level status is "End", a pop-up is displayed to prompt replacement.
- Color: When the toner level status is "End", a message is displayed in the warning bar. (No pop-up is displayed)
  When a color printing job is received later, a message is displayed in a pop-up to prompt replacement.

*5: The position of the near end line changes depending on the number of printed sheets and image duty during the repeat operation. The number of printable sheets from the near to the end is at least approximately 1,500 A4 sheets with 5% images.

<Related service modes>

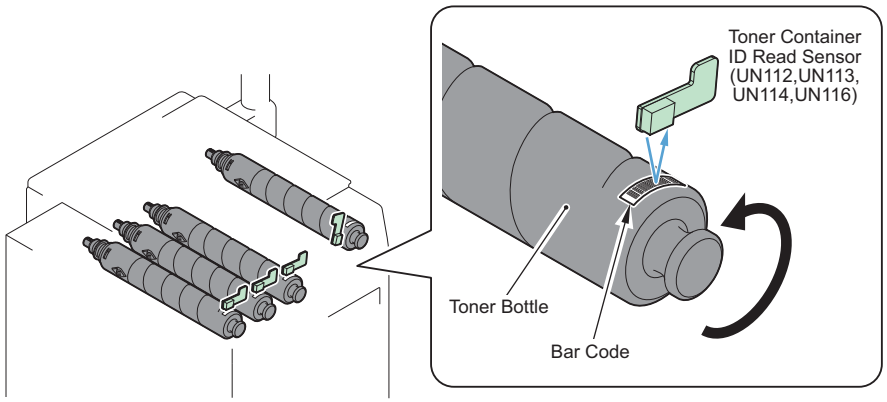
- COPIER > OPTION > USER > TNRB-SW
  : ON/OFF of the Toner Container counter display

● New Toner Bottle Detection



Each Toner Bottle has a unique bottle ID.
The bottle ID is printed as a bar code on the Toner Bottle, and is read by the Toner Container ID Read Sensors (UN112, UN113, UN114, or UN115) when the Toner Bottle is installed to the host machine.
The read Toner Bottle ID is saved in the D-CON, where up to 1,000 IDs can be stored. The host machine determines whether the Toner Container is new or old on the basis of the read number.
Toner Bottle Counters (X = 1 to 4: Bk, Y, M, and C)

General name	Counter No.	Advancement of the counter
Toner Bottle counter	007X	When a new part (a new bottle ID number) is detected
Toner Bottle Installation/Removal Counter (including premature removal)	008X	When a new part (a new bottle ID number) is detected When the same bottle ID number as that of a Toner Bottle which had been inserted before is detected When a Toner Bottle with an unidentified bar code is detected
Unidentified Bottle Counter	018X	When a Toner Bottle with an unidentified bar code is detected

<Related alarms>

Toner Bottle replacement alarm: 100100-XXXX (-XXXX represents the foregoing counter number.)

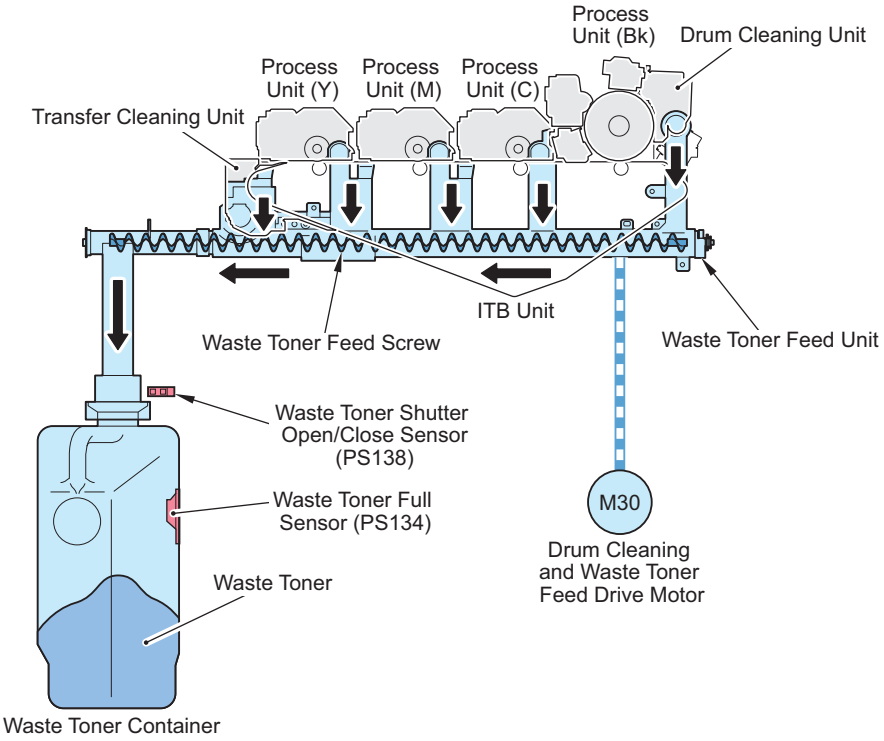
- 100100-007X: An alarm is generated at count-up.
- 100100-018X: An alarm is generated at count-up.
- 100100-008X: The alarm is generated only when a Toner Bottle that was removed before it becomes empty is inserted into the host machine again. (The alarm 008X is not generated when a new Toner Bottle or a Toner Bottle with an unidentified bar code is detected.)

The alarm log is maintained in the host machine, and a notification is sent to UGW.

■ Waste Toner Feed Assembly

● Overview

The waste toner in the drum cleaning unit and the ITB cleaning unit is fed to the waste toner container.



Parts name	Role
Waste toner feed unit	Feed the waste toner to the waste toner container.
Waste toner feed screw	Feed the toner in the waste toner feed unit.
Waste toner container	Store the waste toner.

● Waste toner full level detection

Overview

The following 2 types of detection are performed to detect waste toner level collected in the Waste Toner Bottle.

Detection by the Waste Toner Full Sensor (TS9)

Message type	Operations of the machine	Waste toner level	Detection condition
Waste toner full level alert	"The waste toner is full." is displayed on the Control Panel.	80%	When the Waste Toner Full Sensor (TS9) detects toner (equivalent to 90,000 sheets of paper when the average image duty of the original is 8.5%.)
Full level of waste toner	"The waste toner is full." is displayed on the Control Panel, and the machine is stopped.	100%	When 50,000 images (12,500 sheets of paper) were printed after the waste toner full alert was displayed (waste toner counter).

The DC Controller checks TS9 and the waste toner when the Power Supply is turned ON, the front door is opened or closed, and at printing, and then notifies 2 types of messages (a waste toner full level alert and Waste toner full).

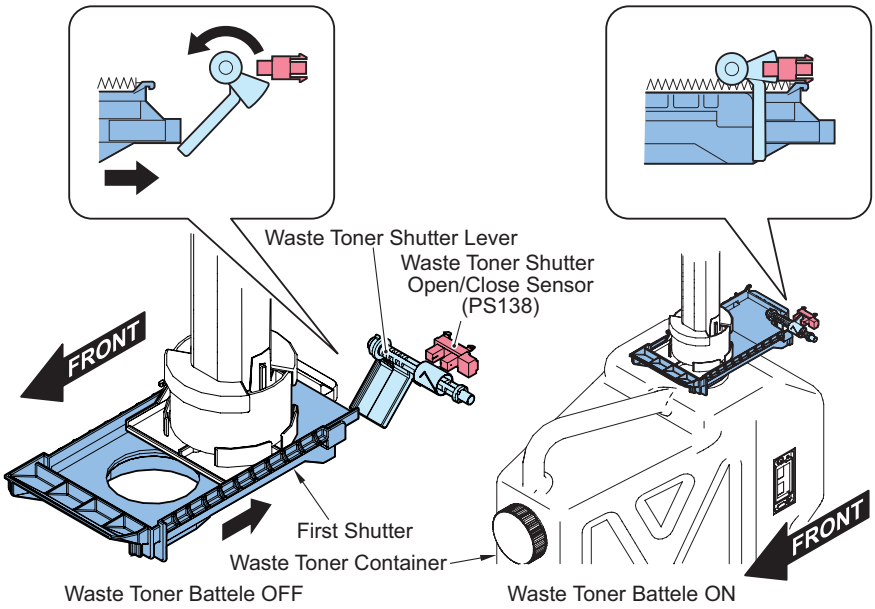
<Related error codes>

- E013-0001: Waste Toner Feed Screw Lock Detection
- E013-0003: Waste toner full detection

● Waste Toner Container Presence Detection

Overview

This machine does not perform waste toner container presence detection.



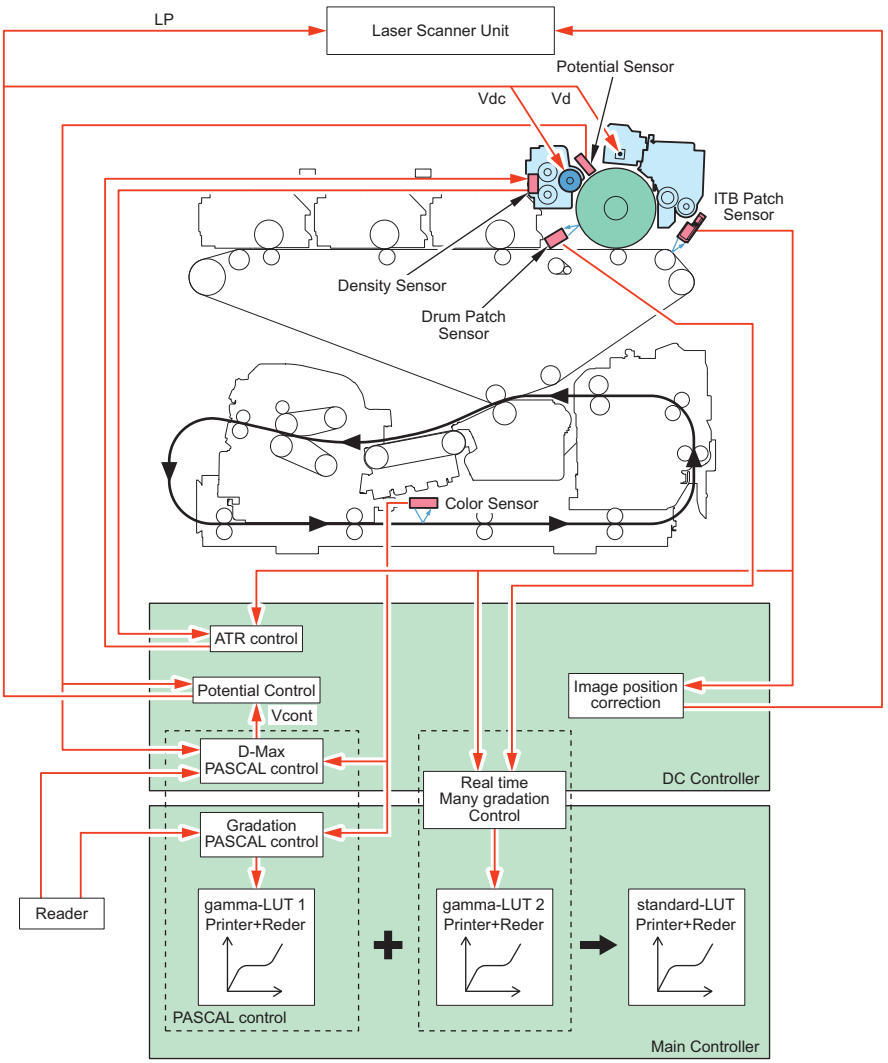
Presence of the Waste Toner Container is detected by the Waste Toner Shutter Open/Close Sensor (PS138).
The sensor is turned ON when the Waste Toner Container is pushed into place.
When pulling out the Waste Toner Container, the shutter part is moved toward the front by spring force so that the sensor is turned OFF and the lid is closed to prevent toner spilling.

■ Image Stabilization Control

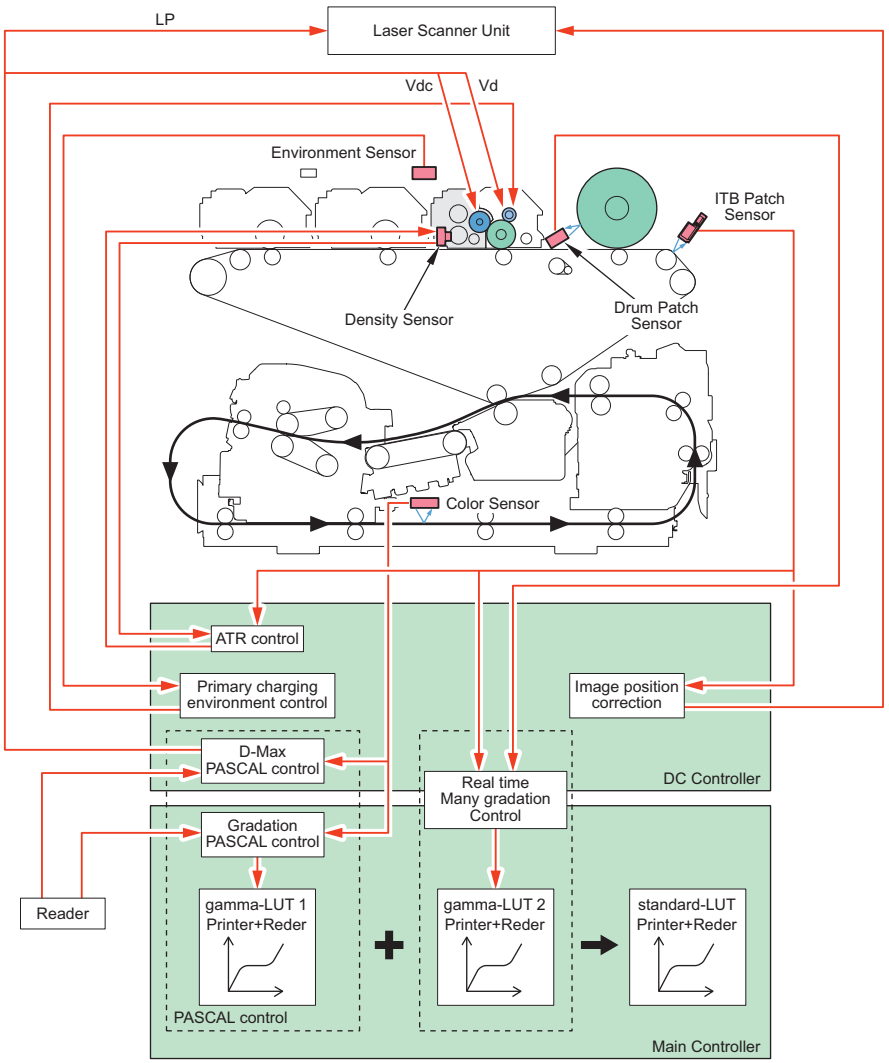
● Overview

Image failure due to change of the environment or deterioration of the Photosensitive Drum is prevented by performing image stabilization control, which ensures stabilized print.

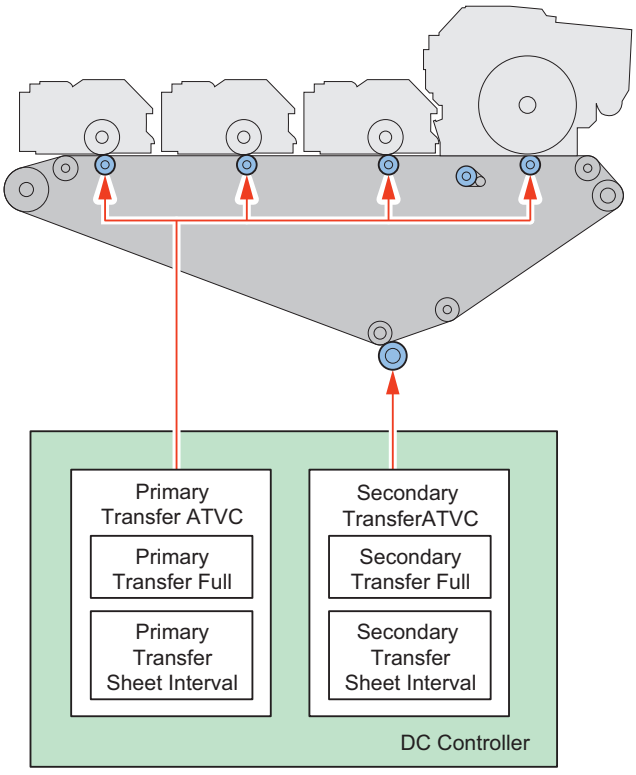
<Bk Drum Unit / Developing Unit>



<Color Drum Unit / Developing Unit>



<Transfer>



● Timing of Automatic Controls

Execution items for image stabilization control differ according to the environment and condition of image formation parts. Following shows the control items at each sequence and estimated downtime.

imagePRESS C850

Timing	Conditions for execution	Time required (sec.)	Type of control										
			Primary Charging Wire Cleaning	ITB cleaning	Potential Control	D-max PASCAL	Gradation PASCAL	Real-time multiple tone control	Image Position Correction	Primary Transfer ATVC	Patch Sensor Adjustment	Drum Idle Rotation	ATR (patch formation)

● D-max PASCAL Control

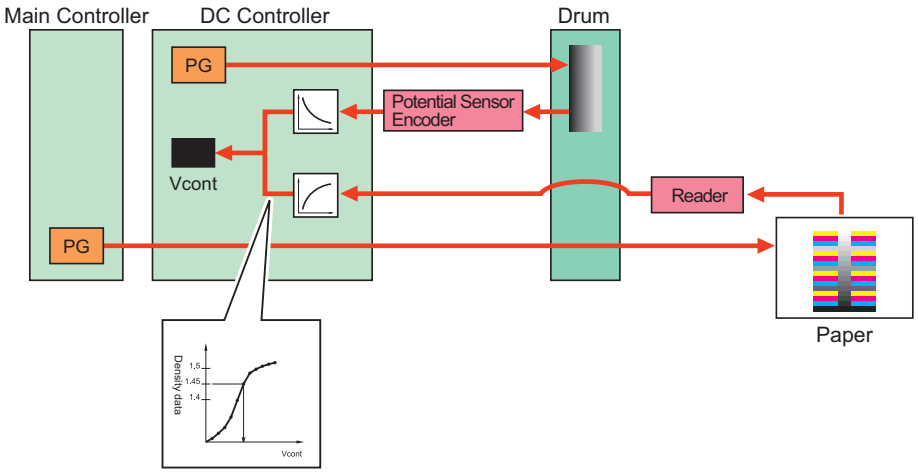
Overview

the D-max control target density is corrected.

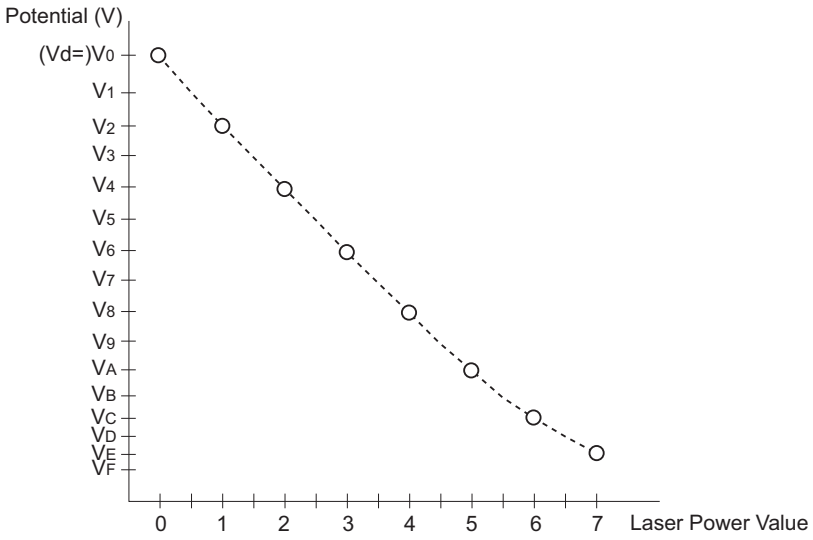
Execution timing

At PASCAL control (the first sheet of test print)

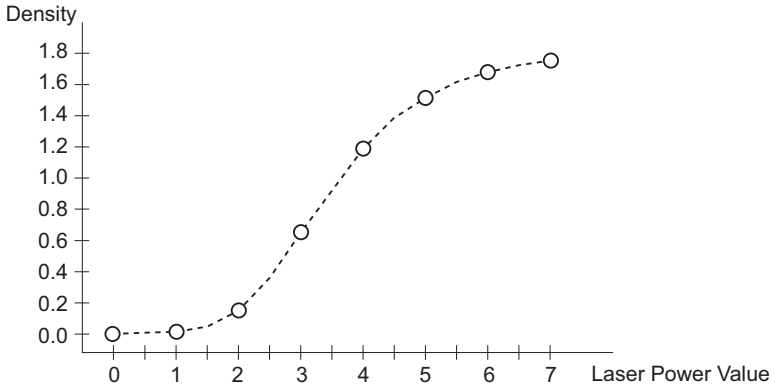
In case of Description of Control_Bk



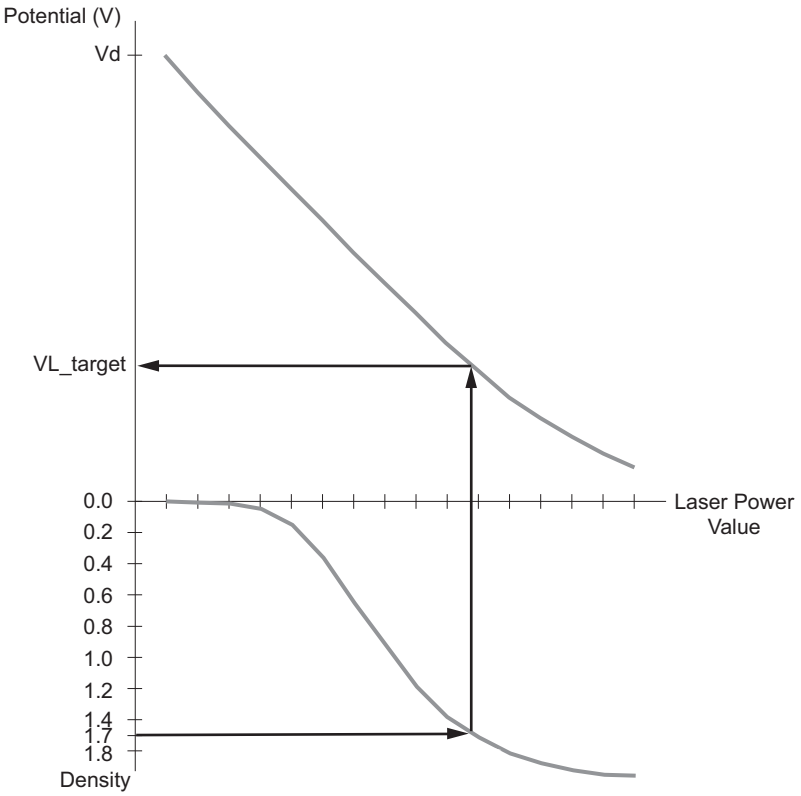
1. Measurement of the bright area potential
   A solid image (test print) generated by the DC Controller is formed on the Photosensitive Drum.
   While changing the laser intensity at each pixel in 8 levels (halftone), the potential in the bright area is measured by the Potential Sensor.
   Based on the measurement results, the DC Controller calculates the characteristic between the laser light intensity and the bright area potential (VL).



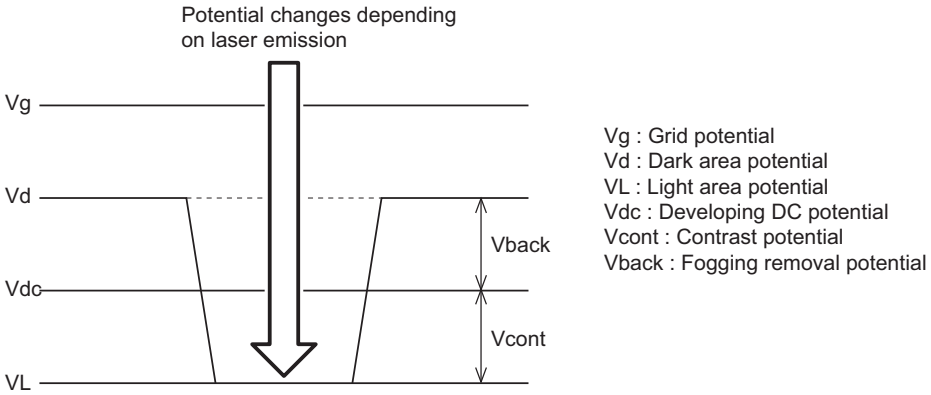
2. Measurement of the patch density
   The solid image (test print) generated by the Main Controller is printed.
   While changing the laser intensity at each pixel in 8 levels (halftone), a halftone image is created.
   The halftone image is read by the Reader or the Auto Gradation Sensor and is reported to the DC Controller.
   The DC Controller calculates the light-emitting amount of the laser and the density characteristics.



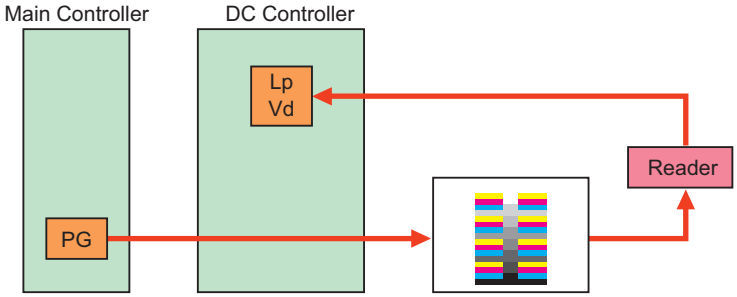
3. Determination of the D-max control target density Vcont
   The bright area potential VL_target, which is necessary to obtain the target density from the two characteristics calculated above, is calculated.



The D-max control target density Vcont is calculated from VL_target.
Vcont=Vd-VL_target-Vback
Vd: Dark area potential
Vback: Voltage necessary to remove for removing fogging when copying



In case of Description of Control_color



1. Measurement of the patch density
   The solid image (test print) generated by the Main Controller is printed. The solid image is read by the Reader or the Auto Gradation Sensor and is reported to the DC Controller.
   The DC Controller determines the laser power and the charging DC bias to make the density level to be 1.7.

   Test Print
   At auto gradation adjustment, three sheets of test print are output. Dmax-Pascal Control is executed with one of the three sheets.

● Potential Control (Bk)

Overview

The surface potential of the Photosensitive Drum changes due to static latent image factorial effects such as Photosensitive Drum sensitivity deterioration and environmental changes, even when the same voltage is applied.
Changes due to static latent image factorial effects can be corrected by potential control to ensure stable printing.
During potential control, the surface of the Photosensitive Drum is uniformly charged, and then the potential is measured while adjusting Laser Power (Lp) to determine Laser Power at which the target contrast potential (Vcont) is output.

Execution timing

- At auto gradation adjustment
- At warm-up rotation auto adjustment (at power-on)

Control description

1. Determination of grid bias (Vg_target)
   The grid bias is set to Vg_target to set the target surface potential of the drum (approx. 650V) to Vd_target. Vd_target changes depending on the environment and process speed.
   The measurement result with the Potential Sensor is set to Vd_rgh when Vg_rgh=Vg_target-100 (V) is applied to the Primary Grid Plate.
   Determine grid bias Vg_target based on this measurement result and target potential ratio.
   Vg: Vd=Vg_target: Vd_target=Vg_rgh: Vd_rgh
   Vg_target=Vd_target*Vg_rgh/Vd_rgh
2. Determination of Laser Power (Lp)
   Laser is exposed while adjusting Laser Power (Lp) in 11 levels (H40 to HD9) to measure the bright area (VL) with the Potential Sensor.
   Laser Power (Lp) is determined to acquire contrast potential (Vcont).
   VL=Vd_target+(Vcont*+Vback*)
   * Auto gradation adjustment control and the environment table determine Laser Power (Lp).

● PASCAL Control

Overview

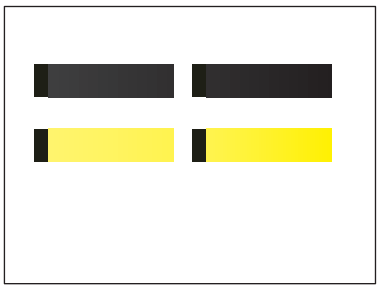
This machine carries out PASCAL control (gradation density correction control) to obtain ideal image characteristics.
There are 2 types of PASCAL controls: printer PASCAL and reader PASCAL.

Control description

1. Printer PASCAL
   The patch patterns on the test print are scanned by the Auto Gradation Sensor-A1 (option), and the image characteristics are corrected based on the results.
   Operation of this control is shown below.
   1. D-max PASCAL: Output a sheet of paper where 10 patch patterns for each color are contained.
   2. Gradation PASCAL: Output 8 sheets of paper in total where 22 patch patterns for each color are contained.
   3. Based on the results, the machine recreates the image characteristic table.

   D-max PASCAL patterns

   Gradation PASCAL patterns



2. Reader PASCAL
   The patch patterns on the test print are scanned by the Reader, and the image characteristics are corrected based on the results.
   Operation of this control is shown below.
   1. D-max PASCAL: Output a sheet of paper where 32 patch patterns for each color (Y, M, and C) and 8 patch patterns for Bk are contained.
   2. Gradation PASCAL: Output 2 sheets of paper in total where 60 patch patterns for each color are contained.
   3. Based on the results, the machine recreates the image characteristic table.

● Real-time Multiple Tone Control

Overview

After image patches for each color are formed on the ITB, gradation of the entire density area is corrected by scanning the patches with the Patch Sensor.
The two types of this control operate according to the situation determined by machine location.

1. Real-time Multiple Tone Correction (Full Adjustment)
2. Real-time multiple tone correction (quick adjustment)

Startup timing

1. Real-time Multiple Tone Correction (Full Adjustment)
   - At power-on
   - At recovery from sleep state (in the case that the fixing temperature is below 100 deg C)
2. Real-time multiple tone correction (quick adjustment)
   - At initial rotation (when switching process speed and when switching Bk/color mode)
   - At paper interval (approx. every 40 to 82 images on an accumulated basis) (see note 1)
   - At last rotation (approx. every 40 images on an accumulated basis)

Note 1: It differs depending on the process speed.

Number of patches

1. Real-time Multiple Tone Correction (Full Adjustment)
   160 patches (40 patches for each color)
2. Real-time multiple tone correction (quick adjustment)
   40 patches (10 patches for each color)

Control time

1. Real-time Multiple Tone Correction (Full Adjustment)
   Approx. 9 sec.
2. Real-time multiple tone correction (quick adjustment)
   Approx. 5 sec. to approx. 11 sec. (See Note 2)

Note 2: It differs depending on the process speed.

● Primary Charging Environment Control (CL)

Overview

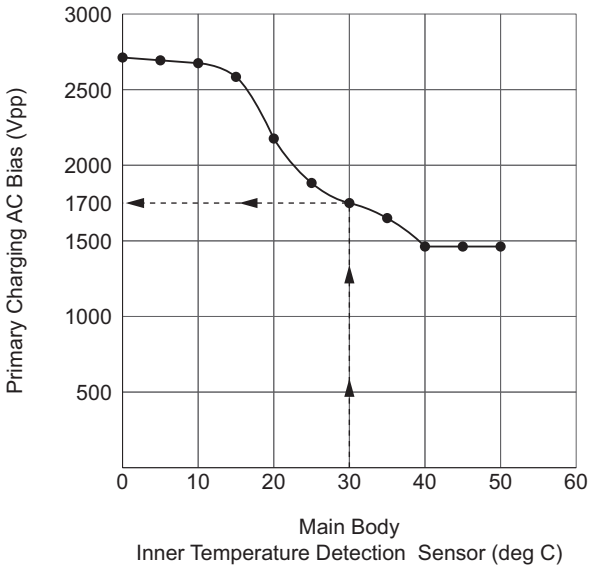
This machine carries out control for obtaining optimal primary charging bias in response to changes in temperature and humidity. Owing to this control, the primary charging AC bias is determined on the basis of the temperature information from the Main body Temperature Sensors (UN14 and 15) in order to stabilize the primary charging applied to the Drum.

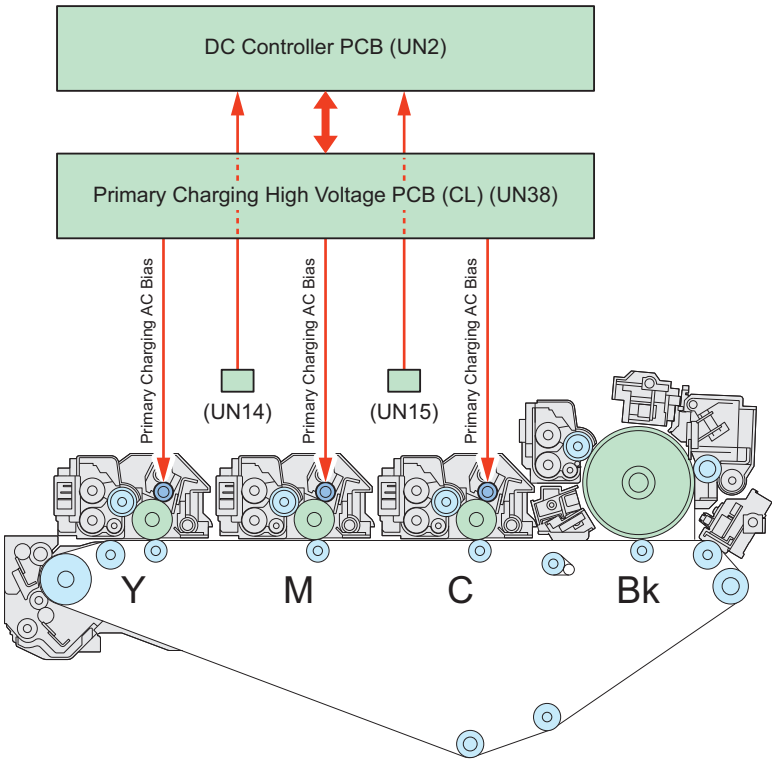
Timing of Execution

- At power-on
- At auto gradation adjustment
- Before printing the first sheet of each job
- Every 20 sheets printed in a job

Details of the Control

1. The Main body Temperature Sensors (UN14 and 15) detect the temperature of the Developing Assembly of each color.
2. The primary charging AC bias for each color is determined on the basis of the foregoing temperature information.





• ATR Control

Overview

Developer is supplied to make toner and carrier (TD ratio) in the assembly to meet at an ideal ratio.

Startup timing

a. Control of Detection by the Video Count: At printing, executed per sheet of paper.
b. Correction by Developing Assembly Toner: At printing, executed per sheet of paper.
c. Correction by the Patch Sensor.

- When the power supply is turned ON (the Fixing Belt temperature below 100 deg C)
- At Printing
- At real-time multiple tone control
- At low duty toner discharge

- Automatic last rotation adjustment (equivalent to 50 images on an accumulated basis or 8 sheets or more of A4 size solid images with the accumulation video count)
- Paper interval (equivalent to 200 images on an accumulated basis or 60 sheets or more of A4 size solid images with the accumulation video count)
- At interruption operation (equivalent to 400 images on an accumulated basis or 90 sheets or more of A4 size solid images with the accumulation video count)

Control description

Developer is supplied to the Developing Assembly to make the TD ratio to meet at an ideal ratio.
The DC Controller (UN2) determines toner supply amount by the following 3 data:

- Video counter
- Density Sensor
- Patch Sensor

The DC Controller (UN2) drives the Hopper Stirring/Supply Motor (M6/M9/M12/M15) and rotates the Toner Supply Screw to supply toner to the Developing Assembly when it determines that toner supply is necessary. The Toner Feed Screw Rotation Sensors (PS9/PS12/PS15/PS18) detect the screw revolution to determine toner supply amount.

● Image Position (Color Displacement) Correction

Overview

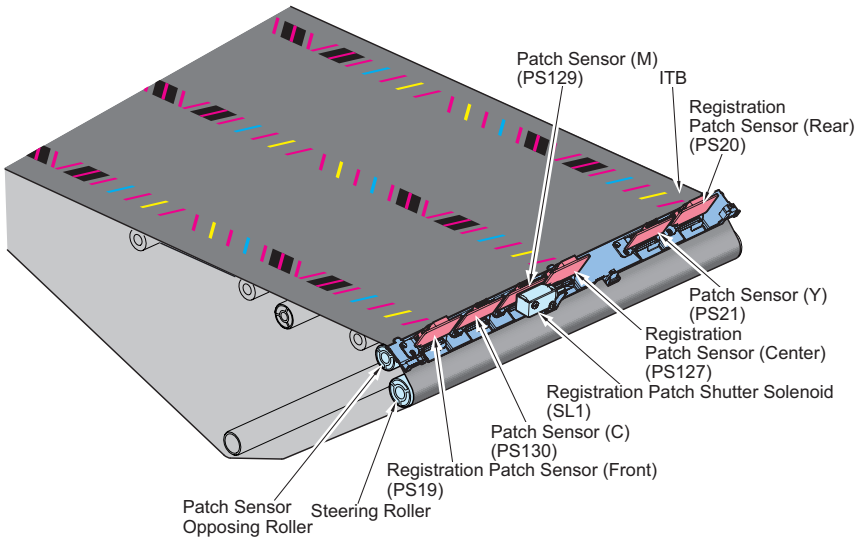
Color displacement caused by shift of the irradiation position of the Laser Scanner Unit is corrected.

Execution timing

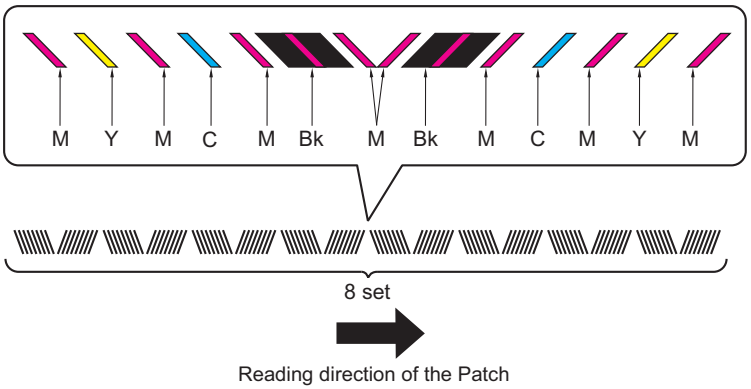
- At warm-up rotation
- Every 1,000 images
- When the temperature of the Laser Scanner Unit has changed by 2 deg C or more
- When the temperature measured by the Environment Sensor has changed by 2 deg C or more

Control description

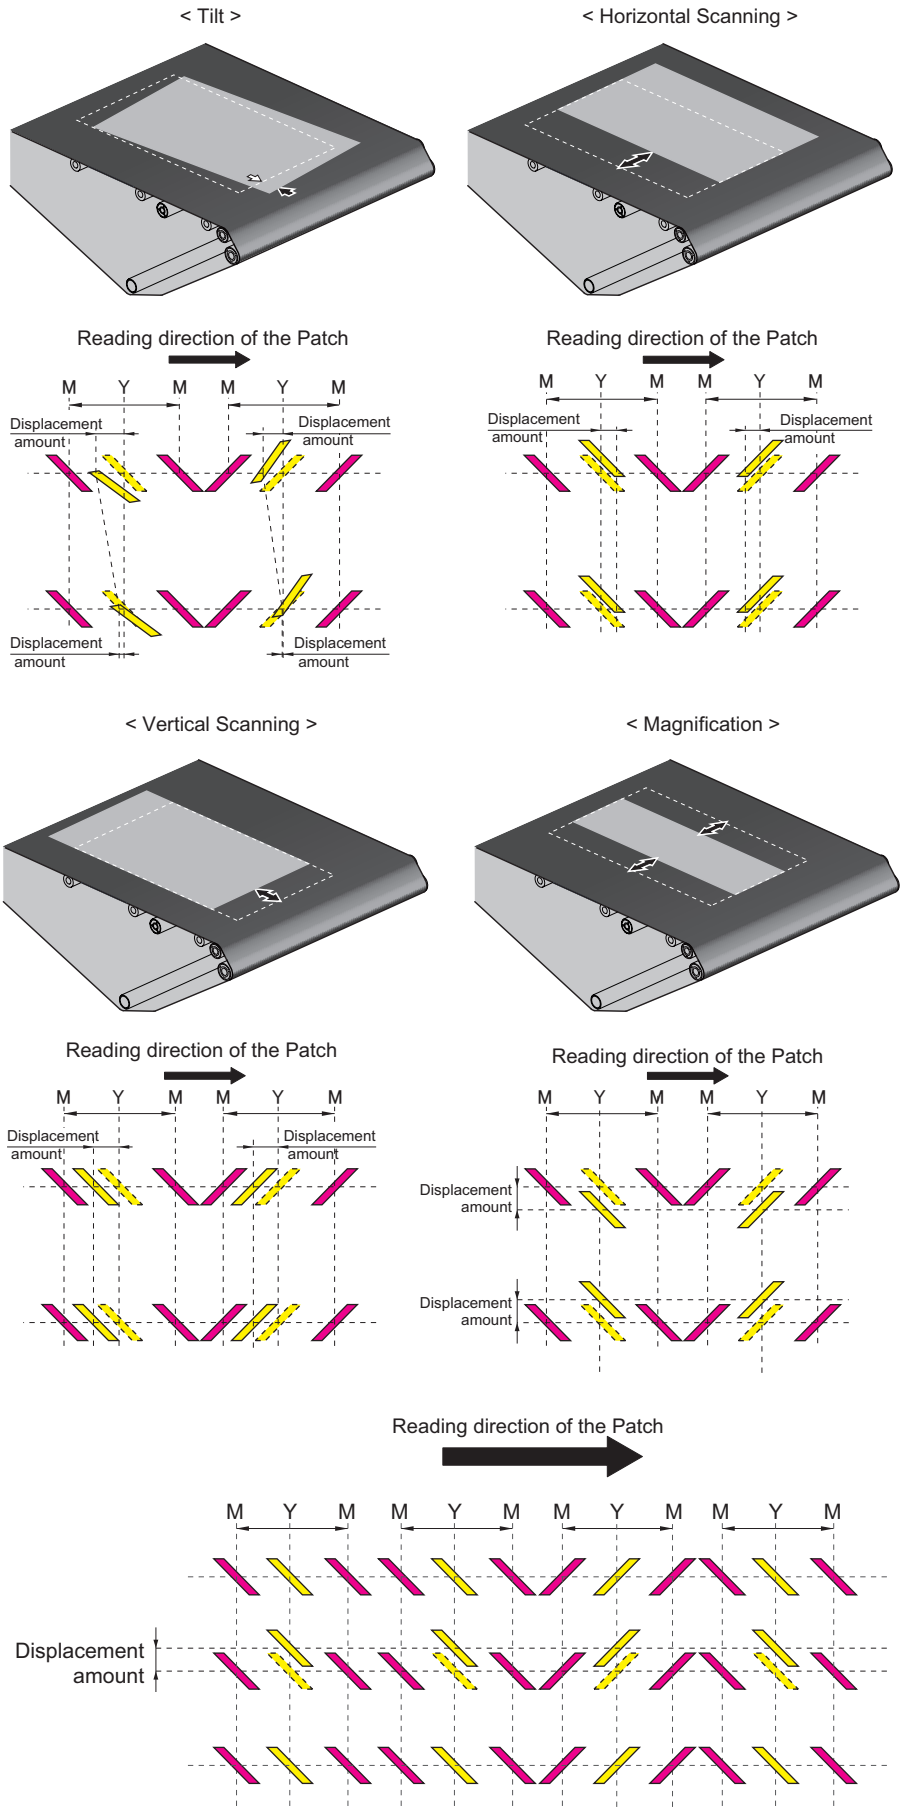
M pattern is used as the reference. The amount of displacement of the patch pattern of each color is detected, and the image position is corrected.



<Patch>



Type of control	Control description	Patch pattern position used
Correction of the write start position in the horizontal scanning direction	The laser write start timing is changed.	Rear/Front/Center
Correction of the write start position in the vertical scanning direction	The write start timing in the vertical scanning direction (TOP signal) is changed.	Rear/Front/Center
Image skew correction	The digital registration correction value is changed.	Rear/Front
Correction of the magnification ratio in the horizontal scanning direction	The overall number of pixels in the horizontal scanning direction is increased or de-creased.	Rear/Front
Correction of the half magnification ratio in the horizontal scanning direction	The number of pixels in the horizontal scan-ning direction is increased or decreased per part.	Rear/Front/Center



● Primary Transfer ATVC Control

This control is performed to determine an appropriate transfer bias to prevent a transfer failure caused by environmental changes and durability variation of the primary transfer roller.

Two types of primary transfer ATVC are performed. One is the primary transfer full ATVC, which is performed at the time of last rotation or initial rotation, and the other is the primary transfer paper interval ATVC, which is performed in paper interval.
Primary transfer FullATVC: to determine the primary transfer bias to run the target current
Primary transfer paper interval ATVC: transfer bias calculated by the primary transfer FullATVC is corrected at paper interval to run the target primary transfer current

● Primary Transfer Full ATVC

Execution timing

- Initial rotation auto adjustment (after 5 minutes or more from the completion of the last print)
- Auto adjustment of interruption operation during printing (when the transfer current sampled during primary transfer paper interval ATVC control deviates +/-25% or more from the target current)

Control description

The target current and target voltage are determined on the basis of temperature and humidity information obtained from the Environment Sensors (ENV1, UN14, and UN15).
This control is performed for each of the process speeds (348 mm/s, 248 mm/s, and 174 mm/s).

<Related service modes>

- COPIER > FUNCTION > MISC-P > 1ATVC-EX: Execution of primary transfer ATVC control

● Controlling the primary transfer paper interval ATVC

Execution timing

During printing

Control description

Sampling of transfer current at paper interval is performed during printing, and it will be corrected if this sampled transfer current deviates from the target transfer current.
This control is performed for each of the process speeds (348 mm/s, 248 mm/s, and 174 mm/s) to determine the transfer voltage.

Secondary transfer ATVC control

This control determines the best transfer bias in order to prevent transfer failure due to environmental changes or Secondary Transfer Roller durability variation.
Secondary Transfer DC bias is determined by the sum of the base voltage Vb determined by this control and the paper allotted voltage Vp, which depends on the paper type.
There are 2 types of Secondary Transfer ATVC: 1) secondary transfer FullAVTC performed at initial rotation, and 2) secondary transfer paper interval ATVC performed at paper interval.
Secondary transfer FullATVC: Determines the secondary transfer bias on things such as the flowing target current.
Secondary transfer paper interval ATVC: Corrects the transfer bias calculated by secondary transfer FullAVTC in paper intervals like the target flowing current of the secondary transfer.

- COPIER > DISPLAY > HV-STS > 2ATVC-M3
  : Display of the secondary transfer ATVC target current (B&W, 1/2 speed)

● Secondary transfer FullATVC control

Execution timing

At initial rotation

Control description

The control is the same as primary transfer FullATVC.
This control is performed for each of the process speeds (348 mm/s, 248 mm/s, and 174 mm/s) to determine the transfer voltage.

Execution timing

Paper interval
The voltage which is sum of the base voltage Vb and the paper allotted voltage Vp is applied to the first 3 sheets of the first set of 20 sheets being printed, and the transfer current at that moment is sampled.
The sampled transfer current value is used as the target current value.
From then on, if the sampled transfer current value of the first 3 sheets of every 20 sheets differs from the target transfer current value, the secondary transfer bias is corrected.

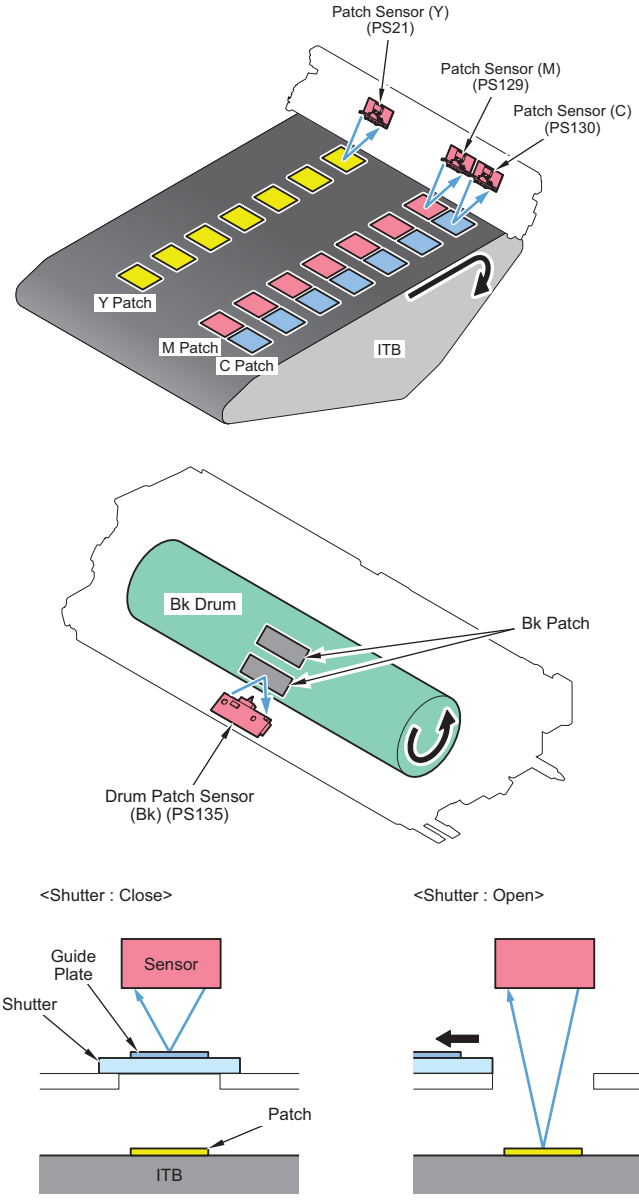
● Overview of Patch Sensor

With this machine, patch images of each color are read regularly by the Patch Sensors to perform halftone correction.
There are 2 types of Patch Sensors. (for color and for Bk)
As for the Patch Sensor for color printing, 3 sensors are arranged to read patches on the ITB. (PS21, PS129, PS130)
Since toner floats near the ITB, output of the light-emitting part may decrease due to soiling on the Patch Sensor. This can lower the output of the light-emitting part.
Because of this, the Guide Plate has been provided on the shutter surface, and the Patch Sensor emits light and receives reflecting light from the Guide Plate on a regular basis.
When output of the light-emitting part decreases due to soiling on the Patch Sensor, increase output of the sensor to always keep it steady.

Patch images cannot be read with the Patch Sensor for B&W printing because color of the ITB is black. Therefore, patch images are formed on the drum, and the sensor reads the images. Because of that, the sensor for B&W printing is located opposite to the drum. (PS135)



Sampling of the drum background (Bk)

To prevent uneven reflection from the drum, the background for a whole circumference of the drum is sampled by the Patch Sensor without forming patches.
When reading patch images, the sampling results of the drum background are corrected.

● Drum Idle Rotation

Overview

Foreign matters on the drum surface are removed.

Execution timing

At warm-up rotation auto adjustment (at power-on)
When "Clean Inside Main Unit" in user mode is executed
When absolute moisture content is the specified value or higher

Control description

The Drum is rotated with a high voltage applied to the Drum. The Drum Cleaning Blade sweeps foreign matters from the Drum.

● Low Duty Toner Ejection Sequence

Overview

To prevent decrease in density caused by increased charge amount of toner when low duty images are continuously output.

Execution timing

At last rotation or paper interval after a specified number of sheets* have been printed in a job whose average image duty is lower than the specified value (default: 1%)
* It varies depending on the average image duty.
When executing the ejection sequence for a color, if another color is close to the ejection execution condition, both of the colors are ejected at the same time.

Control description

If the foregoing conditions are met, after toner of the color is ejected to the Photosensitive Drum, toner is collected by the Photosensitive Drum Cleaner.

<Related service modes>

- COPIER > OPTION > IMG-DEV > DEVL-PTH
  : Setting of the total value of image duty for low duty toner ejection

Fixing System

Overview

Adoption of a high output IH Heater and a Fixing Belt method

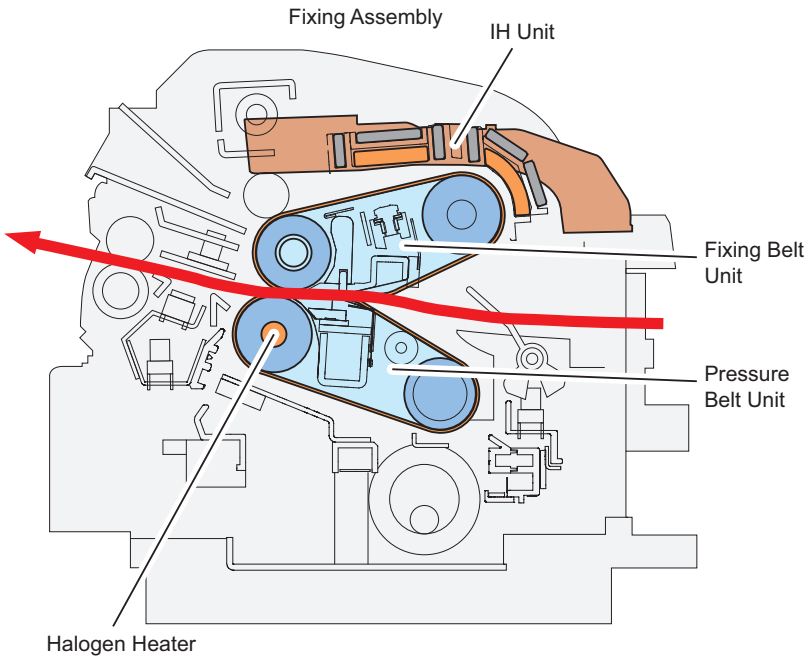
A high-output IH Heater (Induction Heating) and Fixing Belt method was adopted. This enables a highly reproducible fixing performance even for heavy paper and coated paper because the nip time is longer than the previous roller method.

Addition of a cooling function to the Fixing Belt

When a print job is switched from that on heavy paper to that on thin paper, the surface temperature of the Fixing Belt needs to be lowered in a short period of time because the belt temperature has become high.
Therefore, a cooling function has been installed for the Fixing Belt in this machine so that an optimum temperature can be achieved in a short period of time even under the above printing conditions.

Addition of a Refresh Roller

During the continuous printing of coated paper, the end of the coated paper comes into contact with the Fixing Belt, causing small damages to the surface of the belt.
For this reason, a Refresh Roller has been installed in this machine to regularly even out the surface of the Fixing Belt and minimize the damages.



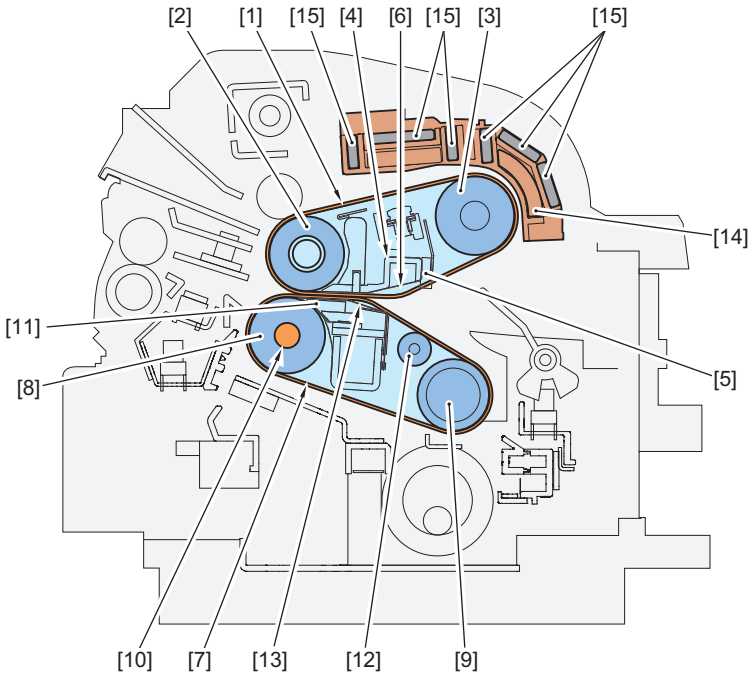
■ Specifications

Item		Function/Method
Fixing method		Twin Belt fixing
Fixing speed		• 348 mm/sec • 248 mm/sec • 174 mm/sec • 35 mm/sec (in standby)
Fixing Heater	Fixing Belt	IH Heater
	Pressure Belt	Halogen Heater (1 unit)
Control temperature	Fixing Belt	Fixing temperature: 145 to 195 deg C
	Pressure Belt	80 to 95 deg C
Electric power for heating	Fixing Belt	200 V: 2050 W (max.), 100 V: 1400 W (max.)
	Pressure Belt	300 W
Thermistor	Fixing Belt	Main Thermistor (contact), Sub Thermistor 1 (contact), Sub Thermistor 2 (contact)
	Pressure Belt	Main Thermistor (non-contact), Sub Thermistor 1 (contact), Sub Thermistor 2 (contact)
Thermoswitch	Fixing Belt	1 pc. (contact type)

Item		Function/Method
Thermoswitch	Pressure Belt	1 pc. (non-contact type)
Separation mechanism	Fixing Belt	Separation Plate (non-contact)
	Pressure Belt	Separation Claw (non-contact)
Disengagement mechanism		Yes (Pressure Belt)
Cleaning mechanism		No
Paper Wrapping Prevention Control		Yes
Controls belt displacement		Yes
Control to prevent temperature rise at the edge		Yes
Fixing Belt refresh control		Yes
Down sequence		Yes
Fixing Arch Control		No
Protection function		Yes (detection by the Thermistor and the Thermal Switch)

■ Parts Configuration

● Cross Section View



Parts name		Function/Method
Fixing Belt Unit		
1	Fixing Belt	dia. 55 mm (Ni + silicone rubber + PFA tube)
2	Fixing Roller	21.8 mm in diameter
3	Fixing Belt Tension Roller	Center: dia. 22.03 mm, edge: dia. 21.43 mm
4	Fixing pad	To form nip surface
5	Fixing Cleaning Felt	To prevent ingress of refuse trash between the Fixing Belt and Sliding Sheet.
6	Fixing Sliding Sheet	To reduce friction between the Fixing Belt and Fixing Pad.
Pressure Belt Unit		
7	Pressure Belt	dia. 55 mm (Ni + silicone rubber + PFA tube)
8	Pressure Roller	Center: dia. 23.4 mm, edge: dia. 22.63 mm
9	Pressure Tension Roller	Center: dia. 22.03 mm, edge: dia. 21.43 mm
10	Pressure Heater	Halogen Heater: 300 W
11	Pressure Pad	To form nip surface
12	Pressure Belt Oil Coating Roller	To prevent friction inside the Pressure Belt
13	Pressure Sliding Sheet	To reduce friction between the Pressure Belt and Pressure Pad.

Parts name		Function/Method
IH Unit		
14	IH Coil	To heat the Fixing Belt
15	Ferrite Core

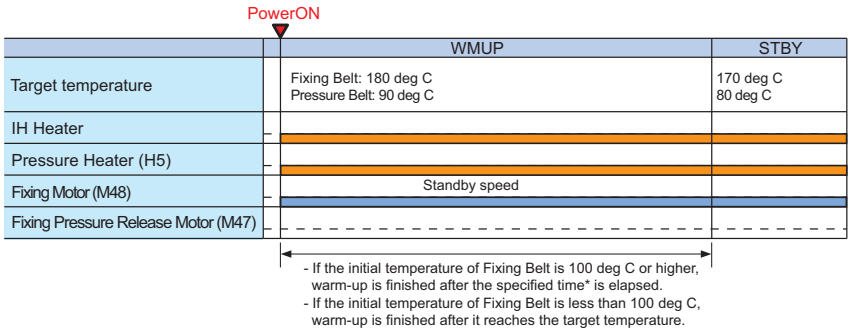
PS120	Refresh Engagement/Disengagement HP Sensor	Refresh Roller position detection

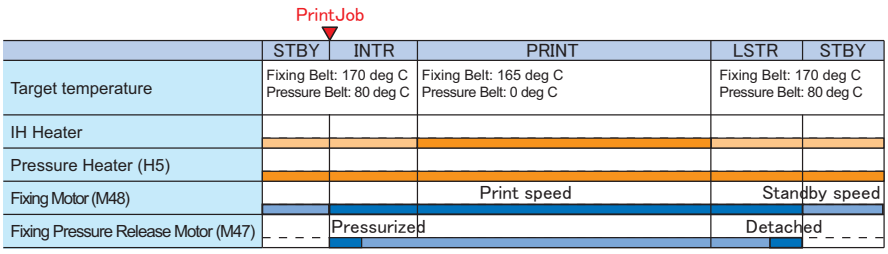
■ Basic Sequence

When the power supply is turned ON



Interval	Interval definition
Startup (When the power supply is turned ON, the Fixing Belt temperature below 100 deg C)	When each belt reaches the target temperature and predefined time has passed since the power supply was turned ON, enters Standby. • Fixing Belt temperature: 180 deg C • Pressure Belt temperature: 90 deg C • Fixing Motor: Standby speed • Pressure Belt: Disengagement
Recovery (When the power supply is turned ON, the Fixing Belt temperature above 100 deg C)	When each belt reaches the target temperature, enters Standby. • Fixing Belt temperature: 180 deg C • Pressure Belt temperature: 90 deg C • Fixing Motor: Standby speed • Pressure Belt: Disengagement
Standby	Continues the following status. • Fixing Belt temperature: 170 deg C • Pressure Belt temperature: 80 deg C • Fixing Motor: Standby speed • Pressure Belt: Disengagement

During printing (plain paper1, A4, normal mode)



Print (A4, plain paper)

Interval	Interval definition
Initial rotation	The interval from when the print request signal is received until the image signal is sent • Fixing Belt temperature: 170 deg C • Pressure Belt temperature: 80 deg C • Fixing Motor: Standby speed • Pressure Belt: Disengagement
Print	The interval from when image formation starts until paper is delivered • Fixing Belt temperature: 165 deg C* • Pressure Belt temperature: 0 deg C • Fixing Motor: Print speed • Pressure Belt: Pressure * The fixing temperature varies depending on the paper type, paper weight, installation environment and productivity setting.

Interval	Interval definition
Last rotation	The interval from when the trailing edge of the last sheet of paper passes the Fixing Inner Delivery Sensor (PS75) until the Pressure Belt disengages. • Fixing Belt temperature: 170 deg C • Pressure Belt temperature: 80 deg C • Fixing Motor: Standby speed • Pressure Belt: Disengagement After the Pressure Belt disengages, enters Standby.

Controls

■ Overview

No.	Control/Function	Overview
1	Fixing Temperature Control	It controls the Fixing Belt and Pressure Belt temperature to prevent fixing error.
2	Control to prevent temperature rise at the edge	To prevent the occurrence of down time caused by temperature rise at the edge, it keeps the edge temperature at or below the standard temperature during printing.
3	Down Sequence Control	If the difference between the target temperature and the detected temperature becomes significant when printing starts or during printing, the productivity is lowered to prevent fixing failures and image failures.
4	Fixing Belt cooling control	In order to reduce the down time and productivity decline caused by high temperature of the Fixing Belt, the temperature of the Fixing Belt is lowered to a target temperature.
5	Pressure Belt cooling control	It lowers the Pressure Belt temperature to the target temperature to prevent image failure caused by the high temperature of the Pressure Belt.
6	Paper Wrapping Prevention Control	This control prevents failure of the Fixing Assembly caused by paper wrapping around the Fixing Belt and the Pressure Belt.
7	Fixing Belt / Pressure Belt Displacement Control	The displacement of the Fixing Belt / Pressure Belt is adjusted to prevent damage to the belts.
8	Pressure Belt Engagement / Disengagement Control	Engages / disengages the Fixing Belt and Pressure Belt to improve jam removability and prevent the temperature of the Pressure Belt rising.
9	Fixing Belt refresh control	A Fixing Belt refresh mechanism has been implemented to engage/disengage the Refresh Roller for prevention of scratches on the Fixing Belt.
10	Fixing Assembly life detection	The life of the Fixing Assembly is detected to prevent fixing errors due to the Fixing Assembly having reached the end of life.
11	Protection function	Stops power distribution to the heater when the fixing temperature is abnormally high. The Host Machine stops when the Fixing Belt / Pressure Belt breaks.

■ Heat Control

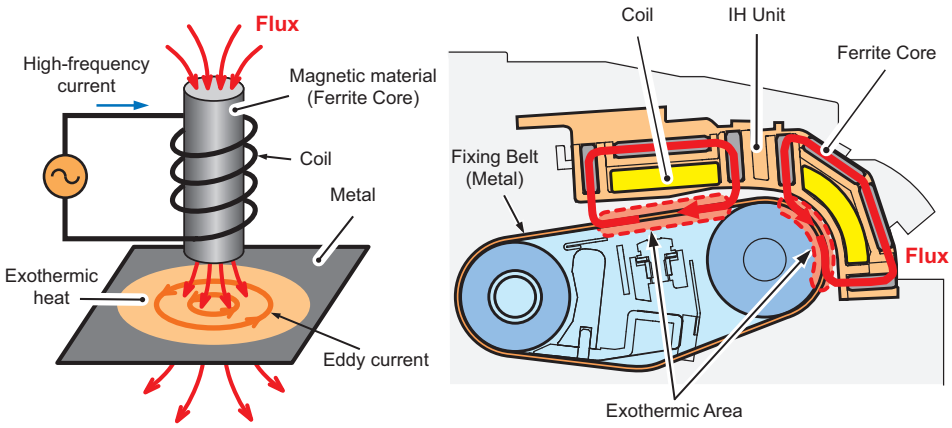
● Overview

On this machine, the following heating method is adopted to realize the high-speed full-color print in office machine size.

- Fixing Belt: IH (induction heating) method
- Pressure Belt: heat roller method (halogen heater)

● IH (Induction Heating) method

This method makes metals heat themselves by using electromagnetic induction.
When alternating current is applied to the coil, magnetic flux is generated around it and when this magnetic flux is passed through a metal, eddy current will be passed through the metal. When the current is passed through a metal, heat (Joule heat) is generated at the metal. This is called as Induction Heating.
Material of the fixing belt on this machine is metal and this induction heating method is used to make the Fixing Belt and the Steering Roller heat themselves.



■ Fixing Temperature Control

● Overview

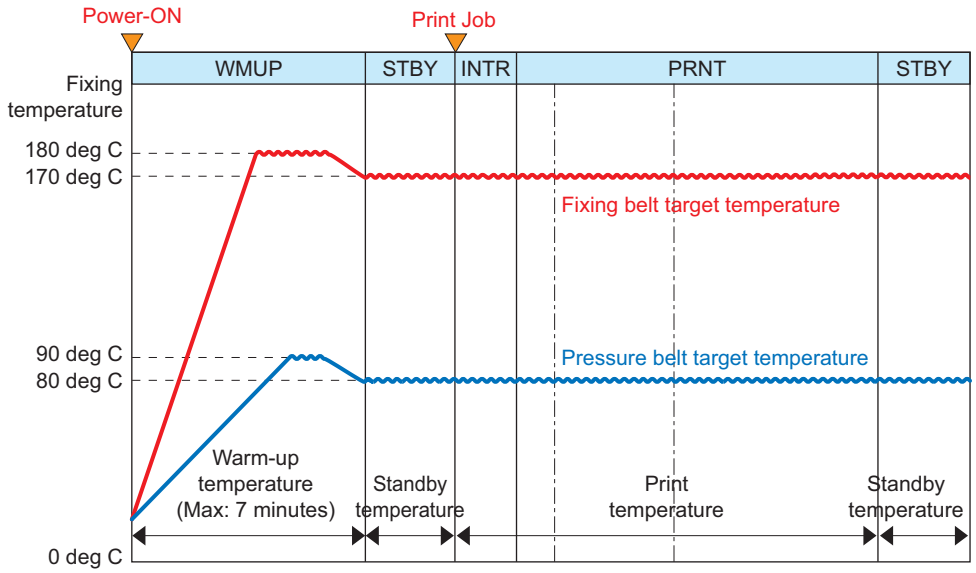
To prevent the fixing failure and downtime, temperature of Fixing Belt and Pressure Belt is adjusted.

● Control description

Temperature control is performed in accordance with the temperature control table determined by paper size and type for each of the following timings.

No.	Item	Description
1	Startup temperature control	Temperature is controlled to reach the standby temperature, which is then kept for a specified period of time. (When the Fixing Belt temperature is less than 100 deg C)
2	Recovery temperature control	Temperature is controlled to reach the standby temperature. (When the Fixing Belt temperature is more than 100 deg C)
3	Standby temperature control	To control temperature so that printing can be performed immediately after receiving the print request signal.
4	Print temperature control	To control temperature by the temperature table according to the paper type and the paper basis weight.

Default (Priority on productivity) / normal temperature environment



Startup temperature control

- Fixing Belt: 180 deg C
- Pressure Belt: 90 deg C

NOTE:
If the Fixing Belt temperature is less than 100 deg C when the power is ON, it will not shift to standby until a specified period of time has passed since power was turned ON, even though the Fixing Belt and Pressure Belt have reached the target temperature.

Recovery temperature control

- Fixing Belt: 180 deg C
- Pressure Belt: 90 deg C

NOTE:
If the Fixing Belt temperature is more than 100 deg C when the power is ON, it will shift to standby when the Fixing Belt and Pressure Belt have reached the target temperature.

Standby temperature control

- Fixing Belt: 170 deg C
- Pressure Belt: 80 deg C

NOTE:
If the Pressure Belt temperature is hot straight after printing, the Pressure Belt Cooling Fan (FM15, FM16) will lower the Belt's temperature until it reaches the standby temperature. (See “Pressure Belt Cooling Control” on page 153 for more details.)

Other Temperature Controls

- At recovery from sleep mode
  - Fixing Belt temperature is less than 100 deg C -> Startup temperature control
  - Fixing Belt temperature is more than 100 deg C -> Recovery temperature control
- In Low power/Energy saver mode
  This device has a low power mode and energy saver mode for energy saving.
  Each mode saves power by lowering the target value of the Fixing Belt temperature and turning OFF the Pressure Heater.

■ Edge Heat Rising Prevention Control

● Overview

To prevent the fixing failure, temperature of Fixing Belt and Pressure Belt is adjusted.

● Control description

The sub thermistors of the Fixing Belt and Pressure Belt monitor the temperature at the edge of the belt and reduces or turns OFF the supply to the heater when temperature rising at the edge of the belt is detected.

Fixing Belt

	Remarks
Temperature 1 to change the IH power upper limit	When the temperature of the Fixing Sub Thermistor becomes less than 225 deg C, IH power is returned to normal.
Temperature 2 to change the IH power upper limit	When the temperature of the Fixing Sub Thermistor becomes less than 228 deg C, IH power is returned to the temperature 1 to change the IH power upper limit.

Pressure Belt

	Remarks
Temperature to forcibly turn OFF the pressure heater	When the temperature of the Fixing Sub Thermistor becomes less than 228 deg C, the pressure heater is turned ON.

NOTE:
If the temperature of either of two sub thermistors located at each belt reaches the specified value, this control is performed.

■ Down Sequence Control

● Overview

If the difference between the target temperature and the detected temperature becomes significant during printing, the productivity is lowered to prevent fixing failures and image failures.

● Execution timing

- During printing

● Control Description

When the Fixing Main Thermistor detects a temperature lower than the down sequence criterion temperature, the print job start time is delayed to lower the productivity.
There are three types of down sequences shown below.

- Level 1
  If the temperature becomes lower than the down sequence criterion temperature, start of the job is delayed for 3 seconds. This control is executed only once during a job, and is not executed after that.
- Level 2
  If the temperature becomes lower than the down sequence criterion temperature, the paper interval time is prolonged to lower the productivity. Once this control is implemented, the down sequence is not canceled during the job even if the temperature becomes higher than the criterion temperature.
- Level 3
  If the temperature becomes lower than the down sequence criterion temperature, the paper interval time is prolonged to lower the productivity. Once this control is implemented, the down sequence is not canceled during the job even if the temperature becomes higher than the criterion temperature.

< Down sequence criterion temperature table>

imagePRESS C650 / C65

Paper type	Level 1	Level 2	Level 3
Plain paper 1	137 deg C	134 deg C	131 deg C
Heavy paper 1	165 deg C	162 deg C	159 deg C
Coated paper 1	165 deg C	162 deg C	159 deg C

imagePRESS C850 / C750

■ Fixing Belt Cooling Control

● Overview

- When temperature shift of the Fixing Belt is required (when the paper type is changed), the Fixing Belt is cooled by the fan to reduce the downtime.
- The temperature at the edge of the Fixing Belt is lowered by the fan to reduce productivity decline caused by temperature rising at the edge of the Fixing Belt.

● Execution timing

- During standby
- During printing

● Control Description

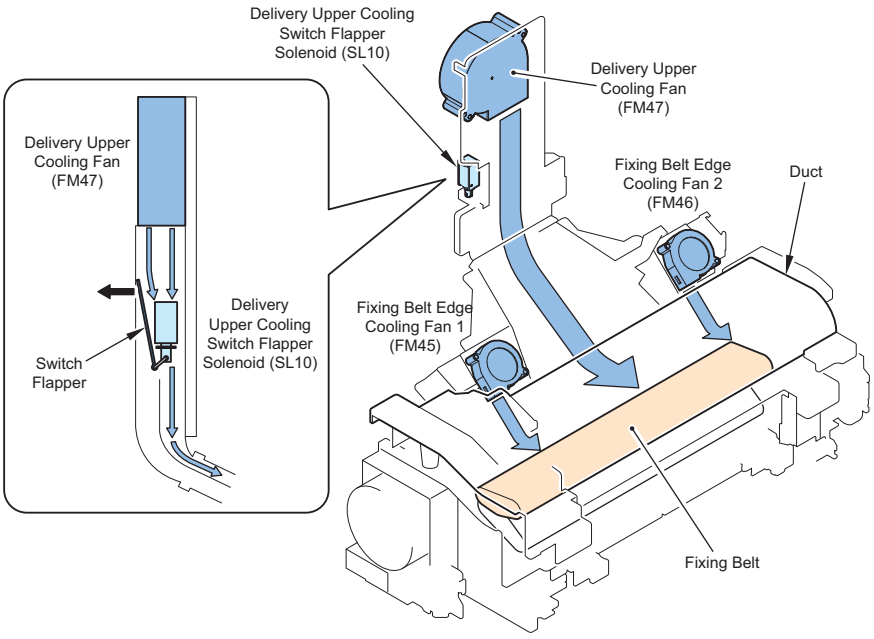
Cooling of the center of the Fixing Belt

The Fixing Belt is aired and cooled by turning ON the Delivery Upper Cooling Fan (FM47) and changing the airflow by the Delivery Upper Cooling Switch Flapper Solenoid (SL10).

NOTE:
The Delivery Upper Cooling Fan (FM47) is also used to cool paper fed to the Reverse Delivery Unit by changing the air flow by the Delivery Upper Cooling Switch Flapper Solenoid (SL10).

Cooling of the edge of the Fixing Belt

The Fixing Belt is aired and cooled by air sent through the duct by turning ON the Fixing Belt Edge Cooling Fan 1 (FM45) and the Fixing Belt Edge Cooling Fan 2 (FM46).



Conditions when the fan is turned ON

Cooling of the center of the Fixing Belt

The fixing control temperature is higher than the print control temperature when a job is started.
The fixing control temperature is higher than the standby control temperature after completion of a job.

Cooling of the edge of the Fixing Belt

ON (full speed), ON (half speed), or OFF of the fan is controlled according to the paper type and size during a job.
The correlation between the paper type/size and ON (full speed)/ON (half speed)/OFF is shown below.

	Paper width in the longitudinal direction		
Paper type	**Over 305 mm**	**220 to 305 mm**	**Less than 220 mm**
Plain paper 1	OFF	OFF	OFF
Heavy paper 1	OFF	ON (half speed)	ON (full speed)
Coated paper 1	OFF	ON (full speed)	ON (full speed)

■ Pressure Belt Cooling Control

● Overview

Temperature of the Pressure Belt is reduced during standby to prevent image fault due to high temperature of the Pressure Belt.

● Execution timing

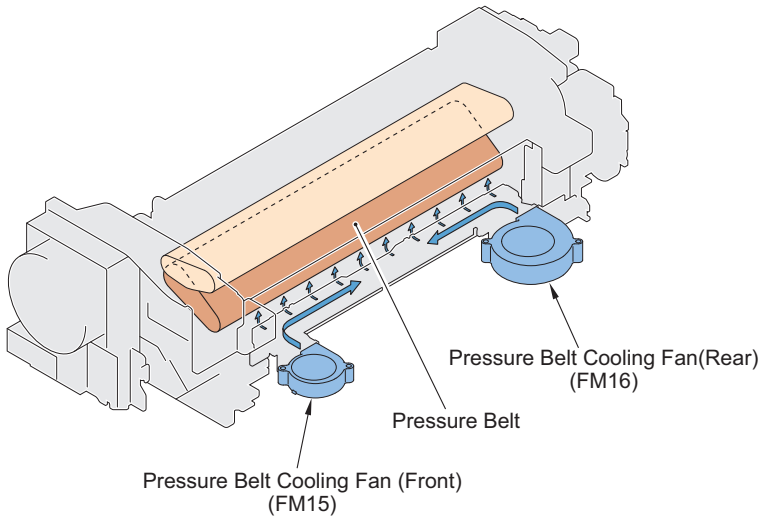
It is executed at the following timing:

- At the start of a job (when the Pressure Belt temperature is specified temperature or higher)
- During a job (when the paper type is plain paper or thin paper)

- At the time of waiting before the Pressure Belt shifts to applying pressure/disengaging during a job (when an interrupt action of 4 or more seconds occurs)
- After a job (when the Pressure Belt temperature is specified temperature or higher upon shifting to standby)

● Control Description

Turn ON the Pressure Cooling Belt Fan 1 (FM15), Pressure Belt Cooling Fan 2 (FM16) to apply wind to the Pressure Belt and cool it. Turn OFF the fan when the temperature of the Pressure Belt cools to the prescribed temperature.



Conditions under which the fan is turned ON

- Pressure Belt center: 95 deg C or more
- Pressure Belt side: 115 deg C or more

Conditions under which the fan is turned OFF

- Pressure Belt both sides: 80 deg C or less (turns ON forcibly for 30 sec. period from starting control)
- Start printing.
- Interruption control end (interruption operation exceeding the specified time)

● Related Service Mode

- COPIER > OPTION > IMG-FIX > FX-FAN2
  Changes the temperature to stop the fan in standby. (-6 to +6 deg C)

■ Paper Wrapping Detection

● Overview

To prevent the breakdown of Fixing Assembly due to paper wrapping over the Fixing Belt and the Pressure Belt, paper wrapping over each belt is detected.

● Control detail

Whether the paper is wrapping over each belt is detected by 2 sensors according to the wrapping status.

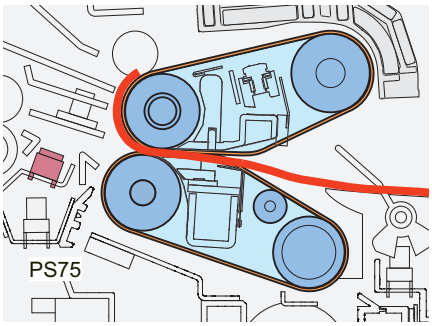
Sensor	Status	Condition
Fixing Inner Delivery Sensor (PS75)	Paper leading edge sticks and wraps over the Fixing Belt or the Pressure Belt.	Paper feed delay -> PS75 detection
Fixing Wrap Sensor (PS74)	Paper leading edge is trapped on the delivery assembly and the paper is folded in center and wrapped over the Fixing Belt.	Due to the paper folding, the Delivery Guide is pushed. -> PS74 detection

After the paper wrapping is detected, DC Controller performs the following operations.

1. Brakes the Fixing Motor and stops it immediately (to minimize the paper wrapping).
2. Detaches the Fixing Belt from the Fixing Belt.

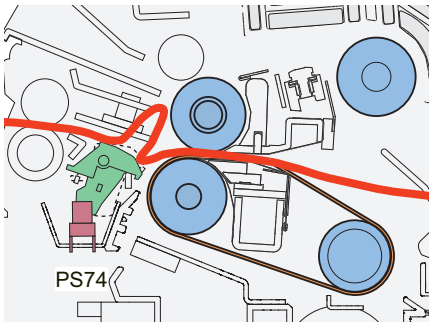
3. Jam display. (Jam code: PS74=0110, PS75=020F)

< Wrapped paper jam 1>



Jam code = 0110

< Wrapped paper jam 2>

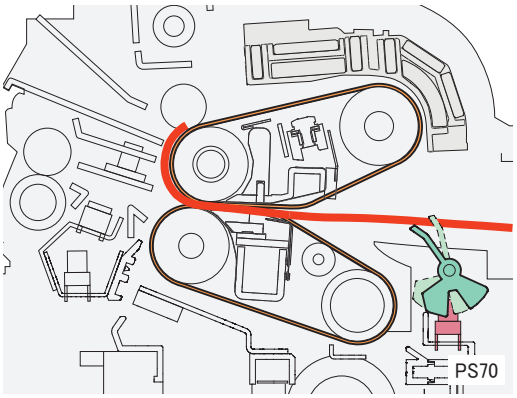


Jam code = 0110

● Residue paper detection

When recovering from fixing paper wrapping jam handling, to prevent to forget to remove the wrapped paper, the Fixing Inlet Sensor (PS70) performs the residue paper detection. (Jam code: 0A0E)

< Residual paper jam >



Jam code = 0A0E

■ Fixing/Pressure Belt Displacement Control

● Overview

To prevent the belt breakage due to displacement of Fixing/Pressure Belt, displacement of each belt is corrected.

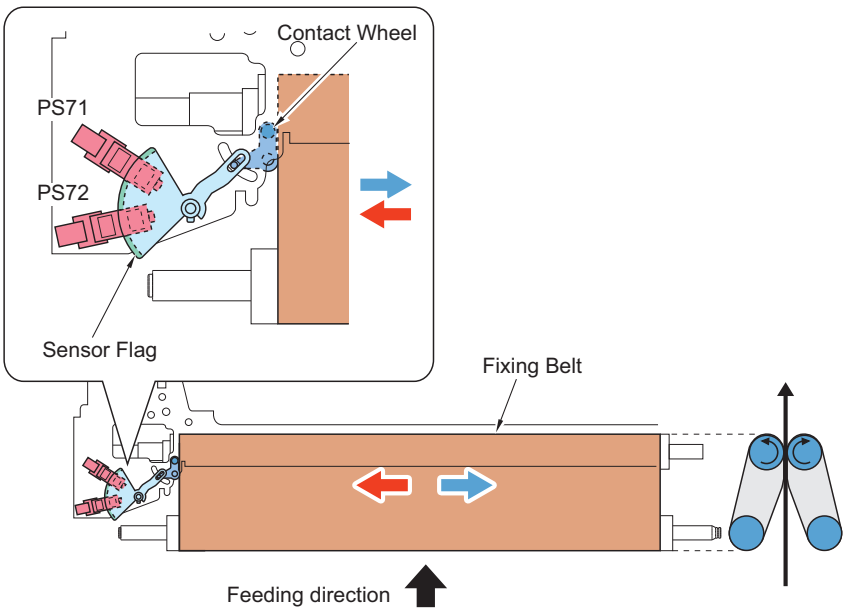
● Execution timing

When the Fixing/Pressure Belt is rotating.

● Basic Configuration

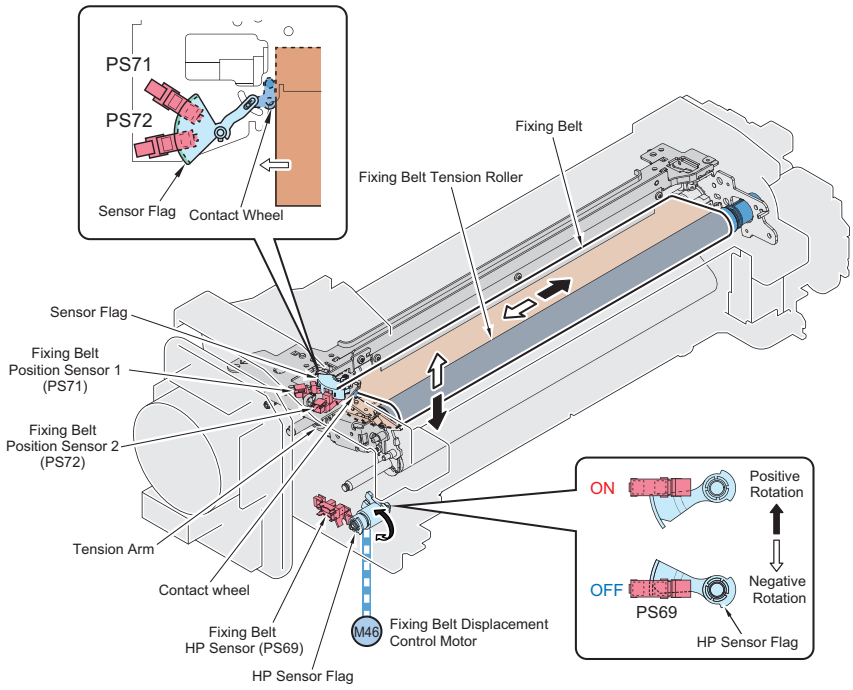
Displacement detection

Displacement detection is performed by 2 belt position sensors (fixing belt: PS71/72; pressure belt: PS76/77).
When the Fixing/Pressure Belts rotate, the belts moves towards either the near or far edge side. There is a contact roller in the belt edge and when it moves together with the belt, the sensor flag moves and the Fixing Belt Position Sensors 1 and 2 (PS71, PS72) turn ON/OFF.
Combining the ON/OFF of these 2 sensors, detects belt displacement. (See the separate page about the sensor combination)
“Control Description” on page 156



Displacement behavior

Displacement operation is performed by rotating the belt tracking control motor (Fixing Belt: M46; Pressure Belt: M49) in a clockwise/counterclockwise direction. The belt will shift toward the front or rear due to the tension roller being moved up and down by the drive of the Motor.



● Control Description

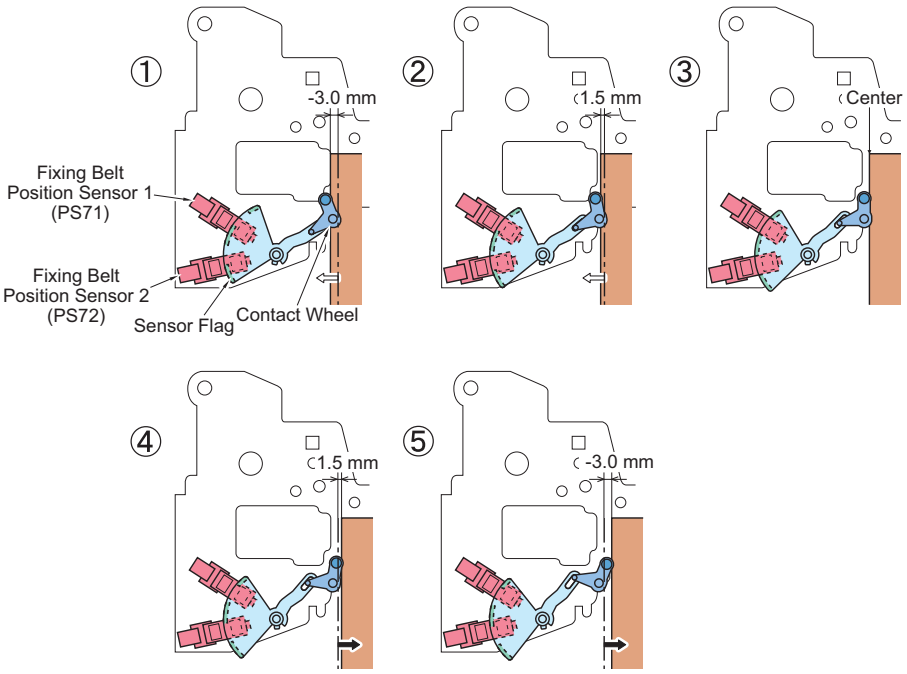
The Fixing Belt Displacement Correction Control differs between the Fixing Belt and Pressure Belt.

Fixing Belt

1. **When the DC Controller detects that the Fixing Belt is displaced to the near edge side (is in the Front 1 status), it rotates the Fixing Displacement Control Motor (M46) clockwise to lower the near edge side of the Tension Roller to the specified level.**
2. **Once the Tension Roller is lowered, the Fixing Belt moves to the far edge side.**
   When the belt is still displaced to the near edge side (becomes in the Front 2 status), an error (E007) occurs.
3. **When the belt is displaced to the far edge side (becomes in the Rear 2 status) this time as a result that the Fixing Belt has moved to the far edge side, M64 is rotated counterclockwise to raise the near edge side of the Tension Roller to the specified level. This makes the Fixing Belt move to the near edge side.**
4. **Repeat steps 2 and 3 above from this point on.**

Belt position		Front 2	Front 1	Center	Rear 1	Rear 2
		-3.0 mm	-1.5 mm	0 mm	1.5 mm	3.0 mm
Belt position	Fixing Belt Position Sensor 1 (PS71)	OFF	ON	ON	OFF	OFF
	Fixing Belt Position Sensor 2 (PS72)	OFF	OFF	-	ON	OFF
	Sensor position	1	2	3	4	5
Status after the belt position is detected	Tension Roller HP Sensor (PS69)	-	ON	-	OFF	-
	Displacement Control Motor (M46)	-	Clockwise rotation	-	Counter-clockwise rotation	-
	Tension Roller angle	-	2 degrees	0	-2 degrees	-

ON = light transmission, OFF = light blocking



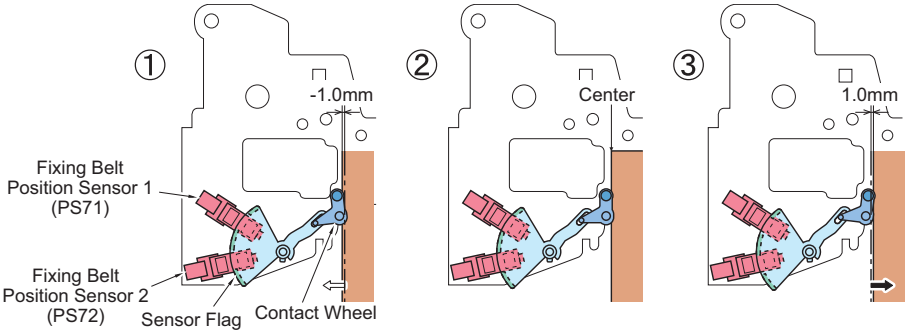
Pressure Belt

1. **DC Controller rotates the Pressure Displacement Control Motor (M49) and raises the front of the Tension Roller by a specified amount when it detects that the pressure belt is displaced toward the front side (front 1 status).**
2. **When the Tension Roller rises, the Pressure Belt moves to the rear side.**
   If the belt is stationary (does not return to the rear side) at the front side even when the Tension Roller is raised, it will move to the belt displacement recover mode (see below).
3. **If it is displaced toward the rear side (rear 1 status) as a result of the Fixing Belt moving to the rear side, the M49 is rotated clockwise and the front side of the Tension Roller is lowered by a specified amount. This causes the Fixing Belt to move to the front side.**

4. **Repeat the above steps 2) to 3) to perform control.**

Belt position		Front 1	Center	Back 1
		-1.0 mm	0 mm	1.0 mm
Belt position	Fixing Belt Position Sensor 1 (PS71)	ON	ON	OFF
	Fixing Belt Position Sensor 2 (PS72)	OFF	-	ON
	Sensor position	1	2	3
State after belt position detection	Tension Roller HP Sensor (PS69)	ON	-	OFF
	Displacement Control Motor (M46)	Counterclockwise rotation	-	Clockwise rotation
	Tension Roller angle	-3.7 degrees	0	3.7 degrees

ON = transmission; OFF = lightproof



● Belt displacement recovery mode (Pressure Belt only)

Overview

When the Pressure Belt is fully displaced to one side even if belt displacement is corrected, this machine eventually displays E007 (displacement error) and stops operating. When this machine stops, down time occurs. Because of this, this machine executes this mode to prevent a displacement error from occurring as much as possible.

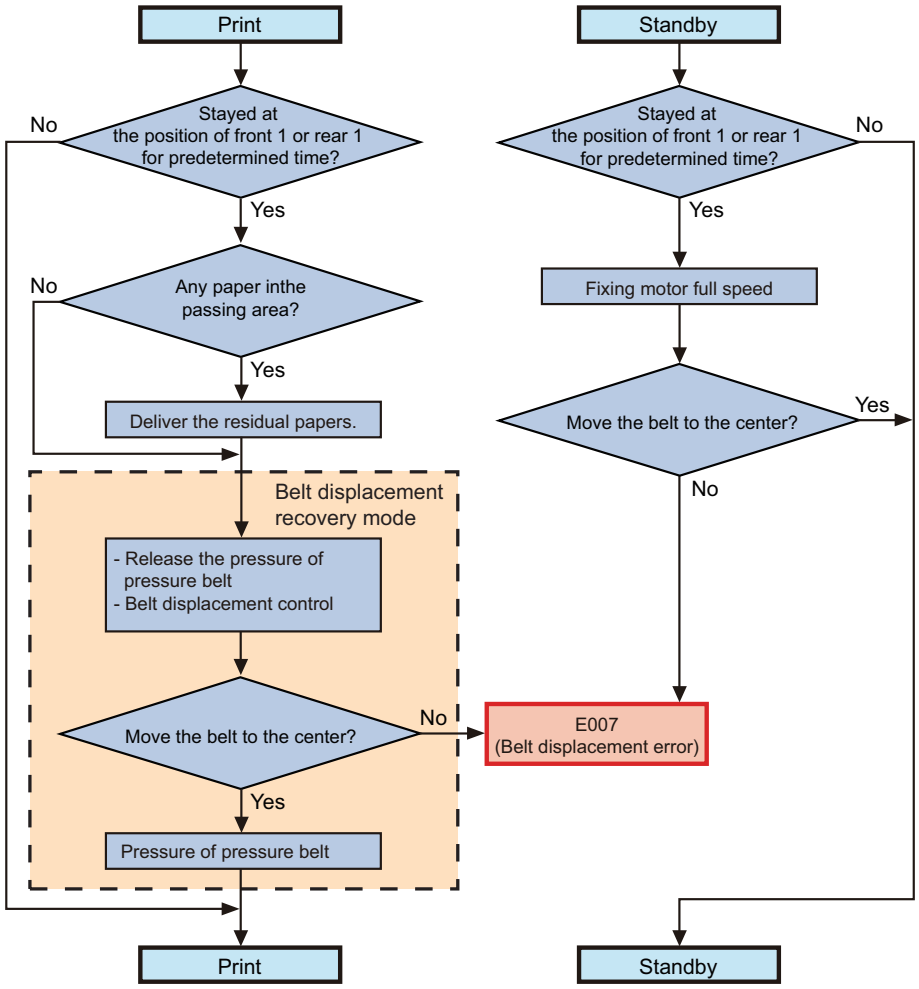
Execution timing

- During printing: When the edge of the belt stays at Front 1 or Rear 1 for a certain period of time.
- During standby: When the edge of the belt stays at Front 1 or Rear 1 for a certain period of time.

Control description

1. Printing stops, sheets of paper are ejected from the inside of this machine, and then the pressure on the Pressure Belt is released.
   "Preparing printer" is displayed on the Control Panel.
2. When pressure is released, the belt moves to the center.* 1
3. When the Pressure Belt is fully displaced to one side even if pressure is released, this machine eventually displays E007 (displacement error) and stops operating.

4. When the belt returns to the center position, the startup sequence is executed to pressure the Pressure Belt and resume the print operation.
   *1 The displacement force of the belt is the strongest under pressure. When displacement occurs during printing, the pressure on the belt is released to weaken the displacement force.



● Related Error Code

■ Pressure Belt Pressurizing Control

● Overview

The Fixing Belt and the Pressure Belt are engaged or disengaged as needed basis to keep long life of the Fixing (Pressure) Belt and improve jam recovery performance.

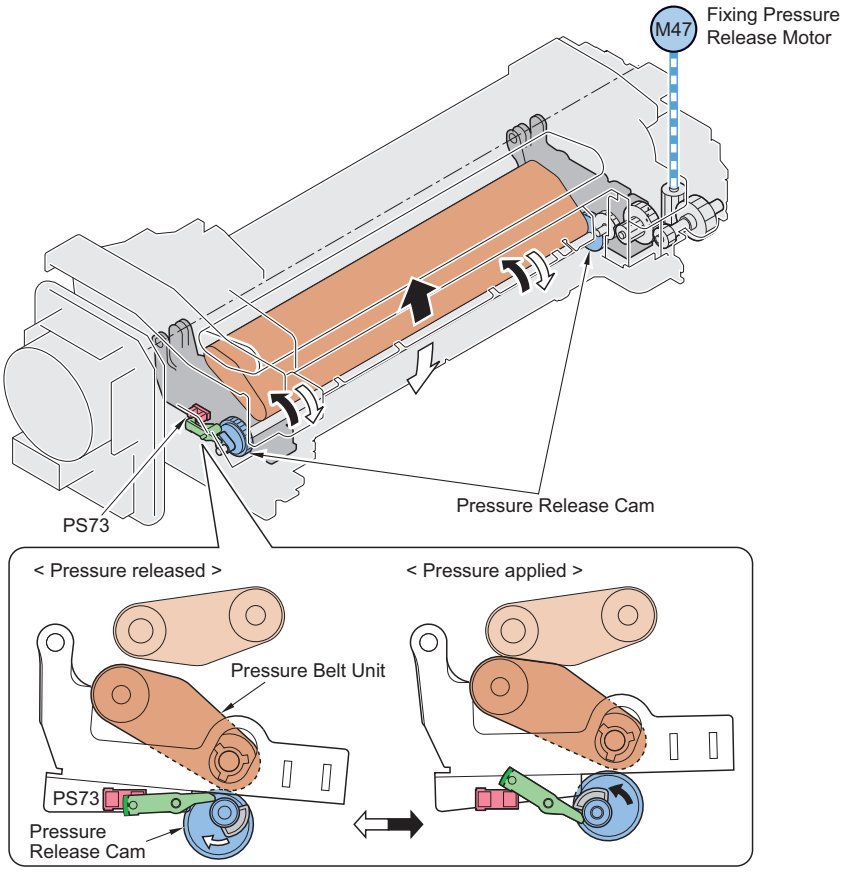
● Execution Timing

- Applying pressure: Printing
- Disengagement: Warm-up, standby, jam occurrence rate, interruption control at or more than the standard time

● Control Description

The Pressure Belt is pressured/released by the drive of the Fixing Pressure Release Motor (M47).

1. **When the Fixing Pressure Release Motor (M47) rotates clockwise, the drive of the Motor rotates the Pressure Cam.**
2. **Rotation of the Pressure Cam lifts the Pressure Belt Unit.**
3. **Lifting of the Pressure Belt Unit causes the Pressure Belt to apply pressure to the Fixing Belt.**



There are 8 states of pressure strength, and the pressure power is switched depending on the stop position of the cam.

● Pressurized/detached detection

Print Whether the Pressure Belt is pressurized or detached is detected by the Fixing Pressure Release Sensor (PS73).

NOTE:
To maintain the life of Fixing/Pressure Belt, pressure is applied only when the paper passes through the fixing nip.

● Related Error Code

■ Refresh Pressure Control

● Overview

The surface nature of the Fixing Belt is maintained/recovered by pressing the Refresh Roller against the Fixing Belt when necessary.

● Execution timing

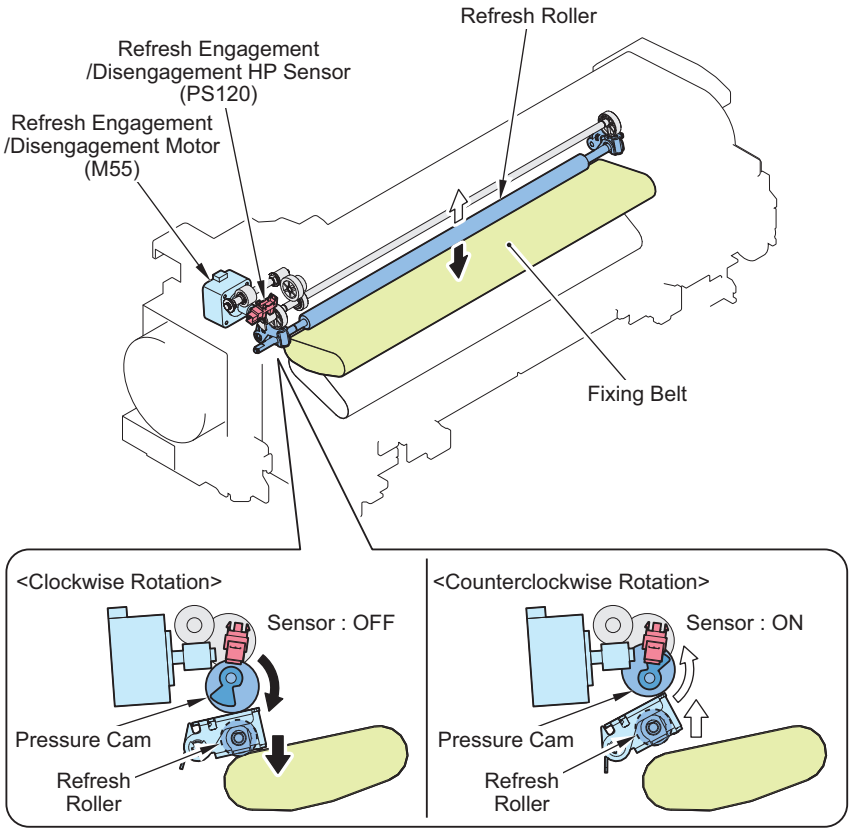
- Application of pressure: At automatic control after a job or manual control

● Control detail

The Refresh Engagement/Disengagement Motor (M55) drives the Refresh Roller to apply/release pressure.

1. **When the Refresh Engagement/Disengagement Motor (M55) rotates clockwise, the motor drives the Pressure Cam to rotate.**
2. **Rotation of the Pressure Cam lowers the Refresh Roller.**

3. **The lowered Refresh Roller applies pressure to the Fixing Belt.**



● Pressurized/detached detection

Engagement and disengagement of the Refresh Roller is detected by the Refresh Engagement/Disengagement HP Sensor (PS120).

● Specifications of Refresh Operation

This machine has two means for refreshing the Fixing Belt; "automatic refresh" executed after a job when the accumulated number of sheets has reached a specific number and "manual refresh" executed by the user as needed.
A refresh operation sequence consists of several times of engagement with the belt for approximately 3 seconds at a time.

- A. In the case of automatic refresh, the default setting value for the number of times of engagement is "0": 6 times. (Reference: In the case of manual refresh, the number of times of engagement is 12.)
- B. Automatic refresh is executed at last rotation of a job when the refresh counter has reached 3,000 (if the refresh level is "0").
- C. Automatic/manual refresh is performed after raising the fixing control temperature to 185 deg C. (The fixing control temperature during standby is 170 deg C.)

In COPIER > FUNCTION > CLEANING > FX-CL-FQ, the parameters of A, B, and C can be changed.

- A. When the setting value (0 to 3) of the number of times of engagement is increased by 1, the number of times of engagement during automatic refresh is increased by 1.
  When the setting value is set to +3, the number of times of engagement becomes 9.
- B. The frequency setting (300 to 30,000) is used to change the threshold value of the counter for starting automatic refresh.
  When the setting value is set to "300", automatic refresh is started ten times more frequently than the default setting "3,000".
- C. The temperature control setting (0 to 4) is used to specify the fixing control temperature at automatic/manual refresh.
  As the fixing control temperature is raised higher, the effect of refresh improves slightly, but this increases the risk of getting scratches on the belt caused by foreign matters.
  The setting values 0 to 3 are not practical, so the value should be changed to "4" when using this setting. (When the setting value is set to "4", the fixing control temperature becomes 190 deg C.)
- D. There are 7 refresh counter tables, each for different paper width, and even in the same table, the count up amount varies depending on the paper type and paper length.
  The count up amount per sheet increases as the paper width is shorter, the paper length is longer, or the paper thickness is increased.
  In each table, when the accumulated value of the refresh counter reaches the setting value of B., automatic refresh is executed at last rotation of the job.
  After the refresh operation, the accumulated values of the refresh counters of all the tables are cleared and changed to "0".

Fixing Roller Auto Refresh Level in user mode (FX-CLNVL in service mode)

- COPIER > OPTION > USER > FX-CLNLV
  When this level is set to a positive value, the refresh counter per sheet of D. is multiplied by a coefficient based on the refresh level, and the count up amount per sheet increases.
  When the level is set to +1 to +2, the coefficient remains 1.0, so it is recommended to set it to +3 to +5 for practical usage.
  Example: In the case of plain paper of less than 105 gsm, the coefficient is 1.5 when the refresh level is 3, 2.0 when the level is 4, and 3.0 when the level is 5.
  <Reference information> When the refresh level is set to "-5", refresh operation is not performed.

■ Fixing Assembly life Detection

● Overview

To prevent the fixing failure due to the end of life of Fixing Assembly loads, the life of Fixing Assembly is detected.

● Control description

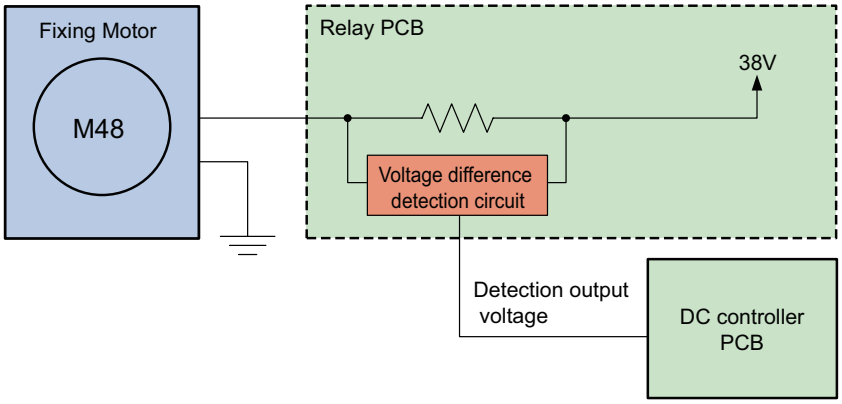
The life of the Fixing unit is determined based on the following two values:

- The current value (Torque) of the Fixing Motor (M48)
- The total rotation time of Fixing Belt

The current value (Torque) flowing through the Fixing Motor

The current value flowing through the Fixing Motor (M48) is monitored to detect the life of the Pressure Belt Unit.

As the Pressure Belt is close to the end of life, the oil level of the inner surface of the Pressure Belt decreases, and the friction force of the inner surface of the belt increases. As the friction force increases, the torque of the Fixing Motor for rotating the Drive Roller increases. Because of this, the current level of the Fixing Motor increases. This current level is monitored, and when it reaches the specified value (a warning level), an alert message is displayed on the Control Panel. When the Pressure Belt is further closer to the end of life, the current level reaches the specified value (an error level), and E008-0001 (Pressure Belt Unit life detection error) is displayed. For reference, a decrease in the oil level, which is the factor of the life of the Fixing/ Pressure Belts, occurs when 600,000 sheets of paper passed over the Pressure Belt.



CAUTION:
When E008-0001 occurs, and is handled without replacement of the Pressure Belt Unit, be sure to clear the log of the Fixing Motor current values in service mode. Otherwise, E008-0001 occurs again.
COPIER > FUNCTION > CLEAR > FX-L-CLR

NOTE:
1. The estimated number of sheets from a warning to an error is approximately 10,000 sheets.
2. You can estimate the timing of this warning and error to some extent by checking the accumulated number of sheets in service mode (COPIER > COUNTER > DRBL-1 > FX-BLT-L).

The total rotation time of Fixing Unit

Rotating the belt at low speed for a long time while the Pressure Belt is disengaged can cause the Thermistor and Thermoswitch of the Fixing Belt to reach their life; therefore, the total rotation time is also considered as a condition for the life of the Fixing Belt Unit.
Total rotation time is the total time of rotation at standby (the Pressure Belt Unit is disengaged) and at printing (the Pressure Belt Unit is engaged), and a warning message is displayed on the Control Panel when the total time reaches 150,000 hours, and then E008-0002 (Fixing Belt Unit life detection error) is displayed when it reaches 155,000 hours.

  * To be displayed as it is updated even during standby and job

Displaying the Fixing Motor current value log
- COPIER > DISPLAY > FIXING > FX-MTR2
- COPIER > DISPLAY > FIXING > FX-MTR3
- COPIER > DISPLAY > FIXING > FX-MTR4
- COPIER > DISPLAY > FIXING > FX-MTR5
  * To be displayed based on the process speed (348, 248, 174, 35 mm/sec)

- Clearing the Fixing Motor current value log
- COPIER > FUNCTION > CLEAR > FX-L-CLR
  * The Fixing Motor current value log displayed by DISPLAY > FIXING > FX-MTR2 to 5 is cleared.

Displaying the total number of sheets fed through the Fixing/Pressure Belt Unit
- COPIER > COUNTER > DRBL-1 > FX-BLT-U
- COPIER > COUNTER > DRBL-1 > FX-BLT-L
  * The accumulated number of sheet fed (converted into small-size sheet) is displayed.

Displaying the rotation time equivalent to the time when the Fixing/Pressure Belt Unit is at standby
- COPIER > DISPLAY > FIXING > FX-U-TM1
- COPIER > DISPLAY > FIXING > FX-U-TM2

- COPIER > DISPLAY > FIXING > FX-U-TM3
- COPIER > DISPLAY > FIXING > FX-U-TM4
- COPIER > DISPLAY > FIXING > FX-U-TM5
- COPIER > DISPLAY > FIXING > FX-U-TM6
- COPIER > DISPLAY > FIXING > FX-L-TM1
- COPIER > DISPLAY > FIXING > FX-L-TM2
- COPIER > DISPLAY > FIXING > FX-L-TM3
- COPIER > DISPLAY > FIXING > FX-L-TM4
- COPIER > DISPLAY > FIXING > FX-L-TM5
- COPIER > DISPLAY > FIXING > FX-L-TM6

  * TM1 to TM6 apply to (Total, 348 mm/sec engagement, 248 mm/sec engagement, 174 mm/sec engagement, 35 mm/sec disengagement and 174 mm/sec disengagement) respectively.

Displaying the accumulated number of sheets fed through the Fixing Unit

- COPIER > COUNTER > FIXING > FX-CNT

  * The accumulated number of sheet fed (converted into small-size sheet) is displayed.

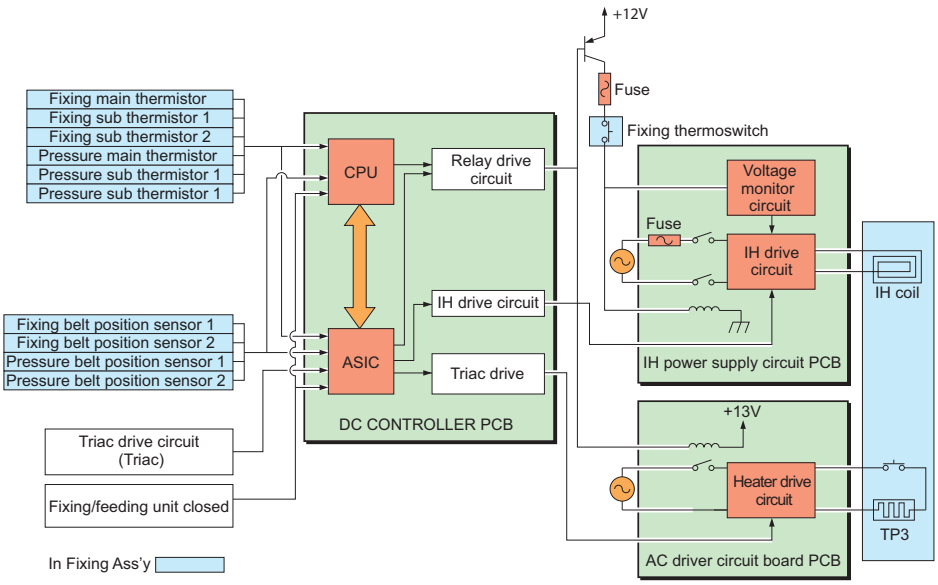
■ Protective Function

● Overview

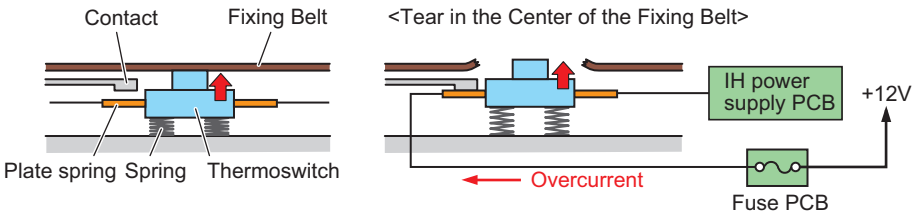
The protection function of this machine prevents damage to the machine caused by the following 2 factors.

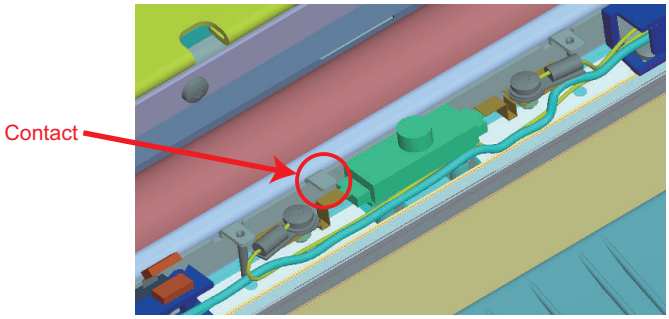
- Fixing/Pressure Belt Abnormal Temperature Rising
- Fixing/Pressure Belt tear

No.	Code	Description
Abnormal temperature rising		
1	Power shutdown by CPU	• Relay drive OFF => DC12V power shutdown
2	Power shutdown by ASIC	• Relay drive OFF => +12V shutdown • IH drive I/F OFF => IH drive circuit OFF • Triac drive I/F OFF => Heater drive circuit OFF
3	Power shutdown by the Thermos-witch operation	• Fixing Thermoswitch OFF (253 deg C) => DC12V power shutdown • Pressure Thermoswitch OFF (170 deg C) => AC power shutdown
Fixing Belt tear		
4	Detection by Thermoswitch (The center/edge of the Fixing Belt)	• Fuse PCB short => DC 12V power shutdown due to DC 12V power line over-current

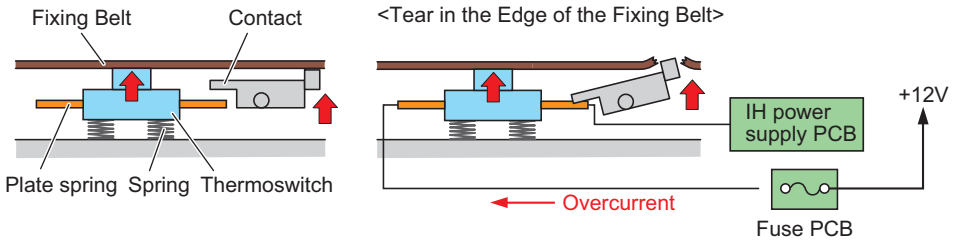


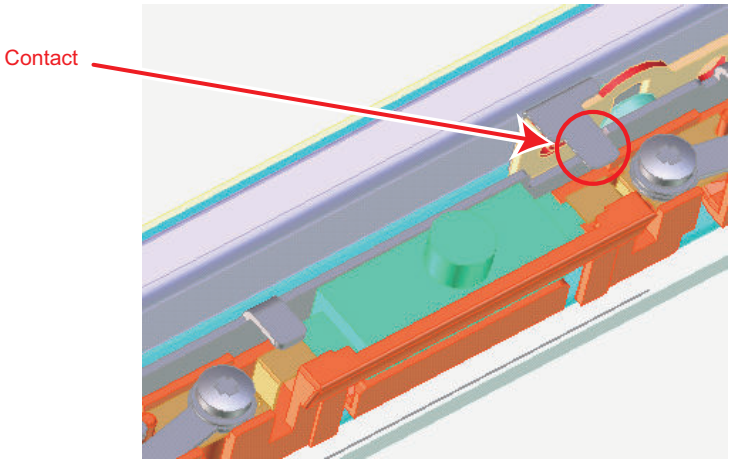
• Ripping at the center of Fixing Belt





• Tear in the Edge of the Fixing Belt





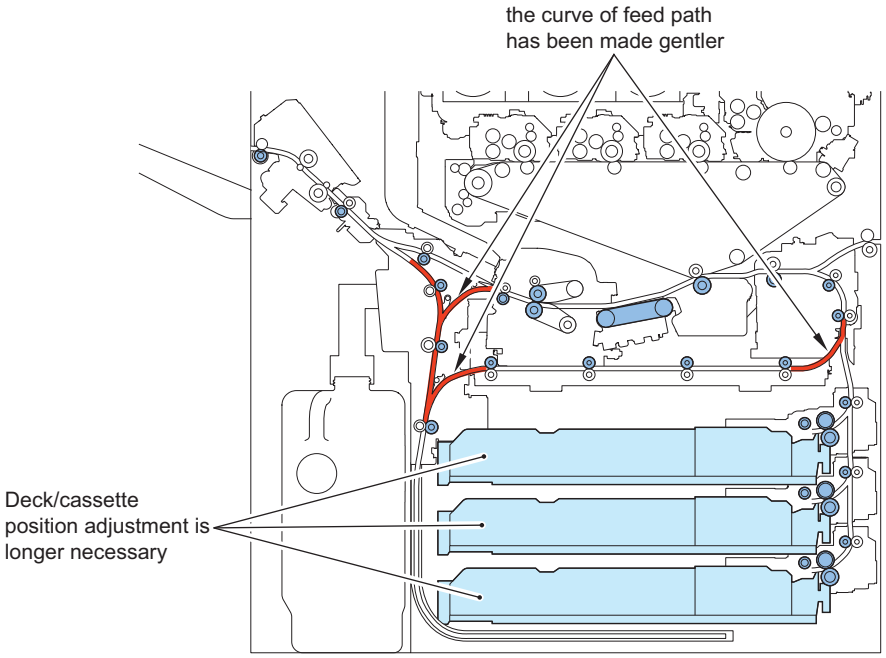
• Related Error Code

- E004-0001: IH power supply relay error
- E004-0101: Triac short-circuit error
- E004-0201: Fixing Belt temperature difference error 1
- E004-0202: Fixing Belt temperature difference error 2
- E004-0203: Fixing Belt temperature difference error 3
- E004-0204: Pressure Belt temperature difference error
- E004-0301: IH overcurrent detection error
- E004-0302: IH undercurrent detection error
- E004-0401: 12V abnormal error
- E004-0501: Connection error of Fixing Main Thermistor and Fixing Sub Thermistor 1/2 in the Fixing Assembly (circuit error)
- E004-0502: Connection error of Pressure Sub Thermistor 1/2 in the Fixing Assembly (circuit error)

Pickup / Feed System

Overview

- Paper position control utilizing new registration technology
- Life extension of the Pickup/Feed/Separation Rollers by changing the materials.
- With gentle curve of the feeding path, face-down delivery and duplex print can be done with the following paper types.
  - facedown delivery: 300 g/m^2 or less
  - 2-sided printing: 300 g/m^2 or less



■ Specifications

Item		Function/Method
Paper storage method		Front-loading method
Pickup method		Separation retard method
Paper feed reference		Center
Stacking capacity	Cassette 1/2/3	550 sheets (plain paper: 80 g/m^2, height: 60.5 mm)
	Multi-purpose Tray Pick-up Tray*6	100 sheets (plain paper: 80 g/m^2, height: 11.0 mm)
Paper size	Cassette 1/2/3	• A3, A4, A4R, B4, B5, B5R, A5R, 11" x 17", LDR, LGL, LTR, LTRR, STMTR, EXE, K8, K16, K16-R, Postcard, Reply Postcard, 4 on 1 Postcard, Envelope (*1) 304.8 x 457.2mm (12" x 18") , 320 x 450 mm (SRA3), 330.2 x 482.6 mm (13" x 19") 304.8 x 487.7 mm (12" x 19.2") • Custom paper size (100×148mm to 330.2×487.7mm) • Standard envelope size: Nagagata 3, Yougatanaga 3, Kakugata 2, COM10 No.10, ISO-C5, DL, Monarch (*1) • Custom envelope size: 6" x 9", 9" x 12", 10" x 13" (*1)
	Multi-purpose Tray Pick-up Tray*6	Cassette stackable sizes and custom sizes (100 x 148 mm to 330.2 x 487.7 mm) Paper length up to 762 mm can be fed by switching in service mode (2*) Limitations are separately set on sizes from 630 mm to 762 mm (*5).
Paper type	Cassette 1/2/3	Thin paper, Plain paper, Color paper, Transparency, Heavy paper, Bond paper, Recycled paper, Tab paper, Envelope, Postcard, Vellum paper, Pre-punched paper, Label paper
	Multi-purpose Tray Pick-up Tray*6	Thin paper, Plain paper, Color paper, Transparency, Heavy paper, Bond paper, Recycled paper, Texture paper (1 sheet feed), Envelope, Label paper, Postcard, Vellum paper, Pre-punched paper, Tab paper, Coated paper (1 sheet feed), Tracing paper, Long length paper (enabled in service mode) (1 sheet feed)

Item	Function/Method	
Paper weight	Cassette 1/2/3	52 g/m2 to 220 g/m2 (*3)
	Multi-purpose Tray Pick-up Tray*6	52 g/m^2 to 300 g/m^2 (*3) (coated paper: 100 to 300 g/m^2)
	2-sided	52 g/m^2 to 300 g/m^2 (*3) (coated paper: 100 to 300 g/m^2)
Paper size switching	Cassette 1/2/3	Auto size detection B5/EXEC and A5R/STMTR are switched in Settings/Registration or service mode (*4).
	Multi-purpose Tray Pick-up Tray*6	Loaded by the user
2-sided print method		Through path
Transparency detection		Yes

*1: Kakugata 2, ISO-C5, 9" x 12" and 10" x 13" can be used without installing the Envelope Feeder Attachment-F1.
*2: Display/hide of the Long Original button (service mode: Lv.2)
- COPIER > OPTION > USER > MF-LG-ST
  Setting value 0: Hide, 1: Display

*3: 52 g/m^2 corresponds to CS-520 (OK Prince High Quality (brand name) manufactured by Oji Paper Co., Ltd.).
*4: Refer to the section of Paper Size Detection (“Paper Size Detection” on page 174).
*5: Refer to the section of Support for long length paper (“Supports long length paper” on page 181).
*6: Options

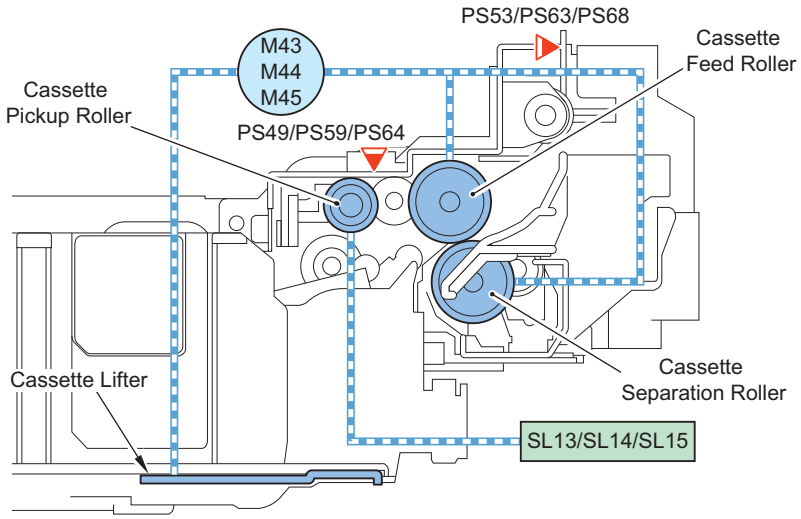
Cassette Pickup Unit

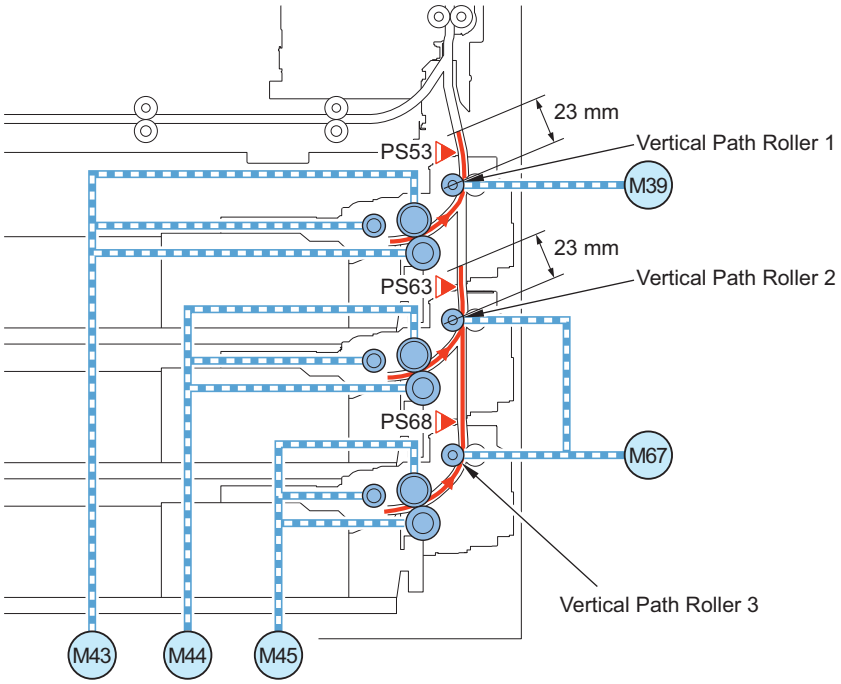
■ Overview



Control name	Overview	Reference
Pre-registration Control	Variation in pickup operation is corrected before registration control.	“Pre-registration Control” on page 173
Cassette detection / Paper size detection	Presence of the cassette and the paper size are automatically detected.	“Paper Size detection / Cassette detection” on page 174
Paper level detection / Paper detection	Detection of paper level/presence	“Paper Level Detection / Paper Detection” on page 178
Lifter Control	Control for lifting paper to the pickup position by the Lifter	“Lifter Control” on page 178
Cassette Heater control	To prevent paper in the Cassette from absorbing moisture.	“Cassette Heater Control” on page 179

■ Pre-registration Control

During registration control, in order to prevent the succeeding sheet from interfering with the preceding sheet, variation in pickup operation caused by the paper type, size, and environment is corrected.
Pickup operation varies depending on external causes such as the paper type, size, and environment, therefore paper is fed and stopped at the position from which paper can be fed reliably and stably.
This control is performed from the second sheet to be fed.
The stop position of each Cassette is shown below.



Position	Sensor	Motor	Stop Position
Cassette 1	Vertical Path Sensor 1 (PS53)	Cassette 1 Pickup Motor (M43) Cassette 1 Vertical Path Motor (M39)	23 mm upstream of the Cassette 1 Vertical Path Roller.
Cassette 2	Vertical Path Sensor 2 (PS63)	Cassette 2 Pickup Motor (M44) Cassette 2/3 Vertical Path Motor (M67)	23 mm upstream of the Cassette 2 Vertical Path Roller.
Cassette 3	Vertical Path Sensor 3 (PS68)	Cassette 3 Pickup Motor (M45) Cassette 2/3 Vertical Path Motor (M67)	

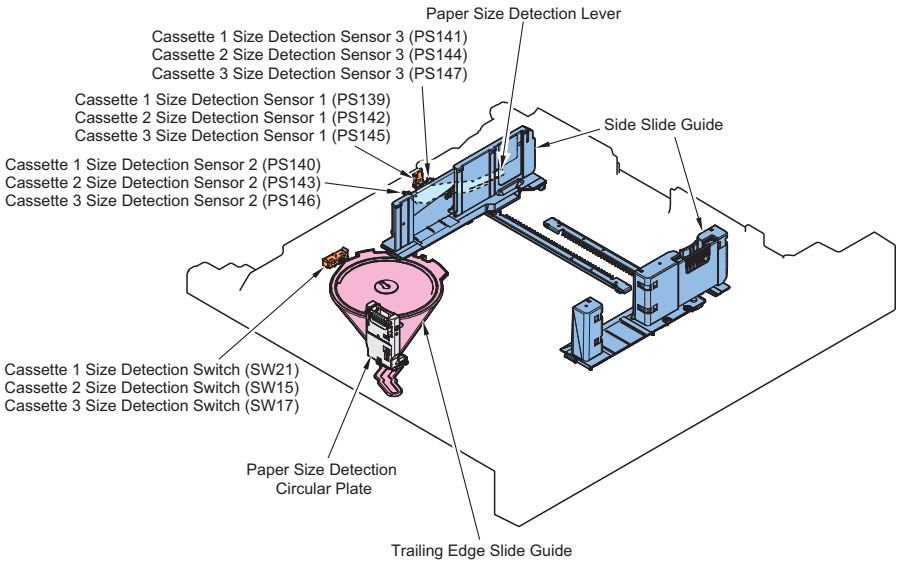
■ Paper Size detection / Cassette detection

● Cassette detection

Cassette is detected by Paper Size Detection Switch and Size Detection Sensor 1/2/3.
When all actuators of the Paper Size Detection Switch (SW15/SW17/SW21) and Size Detection Sensor (PS139 to PS147) are not pressed, it is detected as no cassette installed.

● Paper Size Detection

Paper size in cassette 1/2/3 is each detected by Size Detection Switch and 3 Size Detection Sensors.
ON/OFF of the Size Detection Switch (4 actuators) on the host machine side is changed according to the positions of the Paper Size Detection Circular Plate interlocked with the Side Slide Guide and the Paper Size Detection Lever interlocked with the Trailing Edge Slide Guide.



● Conbination of Size Switch / Sensor

Standard Size Paper

Size	Width (mm)	Length (mm)	Width (PS139 to PS147)			Length (SW21/SW15/SW17)			
			1	2	3	A	B	C	D
B5	257.0	182.0	-	-	ON	ON	ON	ON	ON

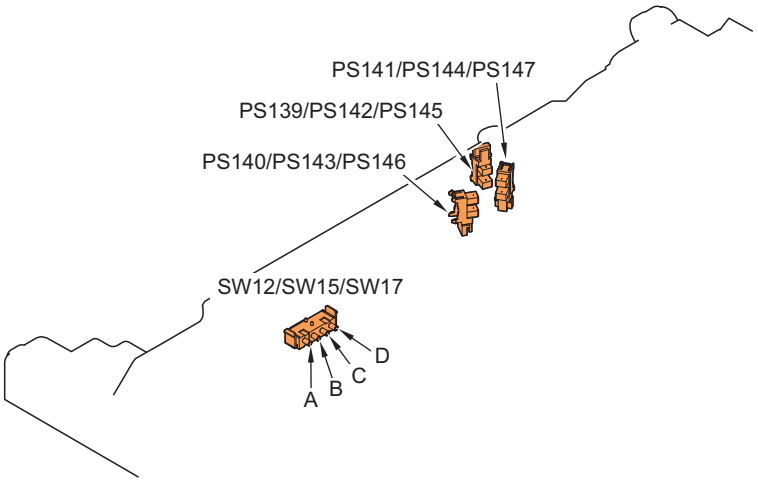
NOTE:
Because ON/OFF of the switch does not become clear as for the particular area fixed form paper, there is a case to have plural combinations.



NOTE:
- Related Settings/registration
  Settings/registration > Preferences > Paper Settings > A5R/STMTR Original Selection
  Setting value Cassette 1/2/3: A5R, STMTR
  Settings/registration > Preferences > Paper Settings > B5/EXEC Original Selection
  Setting value : Cassette 1/2/3: B5, EXEC
  Settings/registration > Preferences > Paper Settings > Register Custom Size
  Setting value X: 148.0 to 630.0 mm, Y: 100.0 to 330.2 mm (Maximum 5 pieces)
- Related Service Mode
  (Lv.1) COPIER > OPTION > CST
  > CSTx-P1 (Cassette 1/2/3 paper size setting (A5R/STMTR))
  Setting value 0: A5R, 1: STMTR
  > CSTx-P2 (Cassette 1/2/3 paper size setting (B5/EXEC))
  Setting value 0: B5, 1: EXEC

● Method of setting specific region custom size paper

Service mode
- COPIER > OPTION > CST > CSTx-Uy > Setting number
- COPIER > OPTION > CST > Uy-NAME
  x indicates the cassette number, and y indicates the size category. (1 to 7 are input for x and 1 and 3 for y)

X = Cassette No.	Applicable Paper Source
1	Cassette 1
2	Cassette 2
3	Cassette 3
4	POD Deck Lite
5	Multi Deck Upper
6	Multi Deck Middle
7	Multi Deck Lower

Size category	
U1	FLSP, A-FLSP, OFI, E-OFI, B-OFI, A-LTRR, G-LTRR, G-LGL, A-OFI, M-OFI, FA4
U3	A-LTR, G-LTR

Setting No.	Size	LUI display	
		Ux-NAME = 0	Ux-NAME = 1
24	FLSP	U1	FLSC
25	A-FLS		
26	OFI		OFI
27	E-OFI		
28	B-OFI		
29	A-LTR	U3	LTR
30	A-LTRR	U1	LTRR
31	G-LTR	U3	LTR
32	G-LTRR	U1	LTRR
34	G-LGL		LGL
36	A-OFI		OFI
37	M-OFI		
42	FA4		F4A

NOTE:
Example: When setting G-LTR to Cassette 2
COPIER > OPTION > CST > CST2-U3 > 31

■ Paper Level Detection / Paper Detection

● Paper Level Detection

The paper level is judged by the rotation amount (pulse count) when the Pickup Motor is rotated in the direction opposite to the direction of pickup operation.
When the Cassette is open, "no paper" is displayed.
Open/close of the Cassette is detected by the Paper Size Detection Switch (SW15/SW17/SW21) while the host machine is ON.

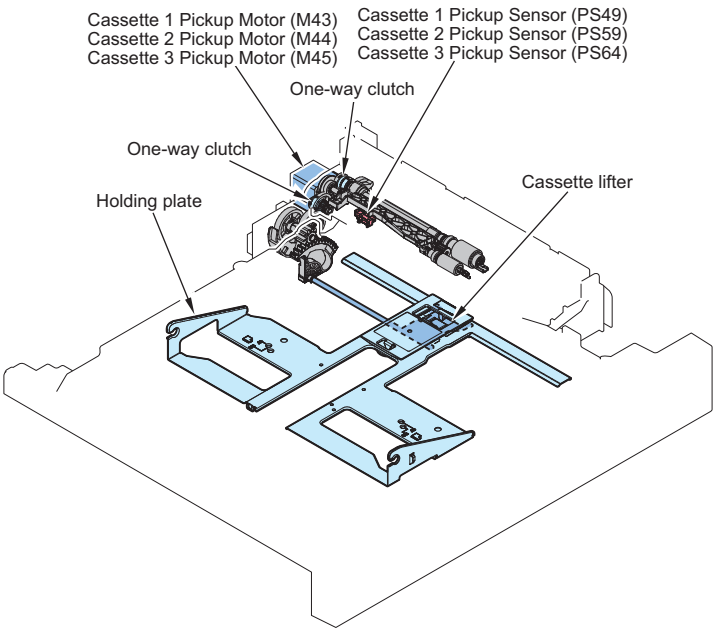
● Paper Detection

If there is paper, the Detection Lever is pushed up when the Lifter ascends, and the Paper Sensor is turned OFF.
When paper runs out, the Detection Lever gets into the hole in the Lifter, and the Paper Sensor is turned ON.

	Control Panel Screen Display
Full (100% to 50%)	
Half (50% to 25%)	
Few (25% or less)	

■ Lifter Control

Paper is lifted to the pickup position by the Lifter.
The Pickup Motor is driven in the opposite direction from the pickup operation to raise the Lifter so that the height of paper is the same with the pickup position. The Lifter is raised even when the Paper Sensor went OFF during the pickup operation.
The One-way Clutch is installed on the shafts of both the Lifter and Pickup Roller on the driving sides. This prevents the Pickup Roller from operating when the Lifter operates.
The One-way Clutch is installed on the shaft of this machine so that the Lifter is lowered when a cassette is pulled out.



<Related service modes>

The height of paper is adjusted in the following service modes (Lv.2) when a double feed or paper pickup error occurs.

- COPIER > ADJUST > FEED-ADJ > CT1-PKLV
  : Cassette 1
- COPIER > ADJUST > FEED-ADJ > CT2-PKLV
  : Cassette 2
- COPIER > ADJUST > FEED-ADJ > CT3-PKLV
  : Cassette 3
- COPIER > ADJUST > FEED-ADJ > DK1-PKLV
  : POD Deck Lite

● Lifter Error Detection

In case the Lifter does not stop ascending after the Paper Height Sensor (PS42, PS46, or PS67) is turned ON for some reason, the machine has an upper limiter mechanism to prevent breakage due to excessive ascent.
If Paper Height Sensor (PS42, PS46, or PS67) and Upper Limit Sensor do not detect an error within a specified time after the Lifter starts to ascend, the ascent operation is repeated. At the third error detection, the paper source is displayed as "no paper" and an alarm is issued.

Alarm Codes	Description
04-0001	Cassette 1 Lifter error
04-0002	Cassette 2 Lifter error
04-0003	Cassette 3 Lifter error

■ Cassette Heater Control

To prevent paper in the Cassette from absorbing moisture, this machine has a Cassette Heater at the bottom of the Cassette 3.

- Timing when the Cassette Heater is turned ON

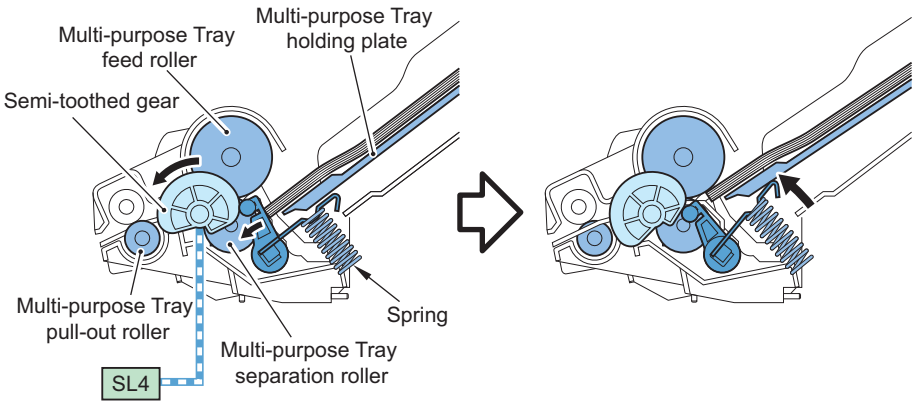
If the Environment Switch is ON, the Cassette Heater is always ON regardless of ON/OFF of the machine power or sleep state.

Power	Cassette Heater SW	
	ON	OFF
ON	ON	OFF
OFF	ON	OFF

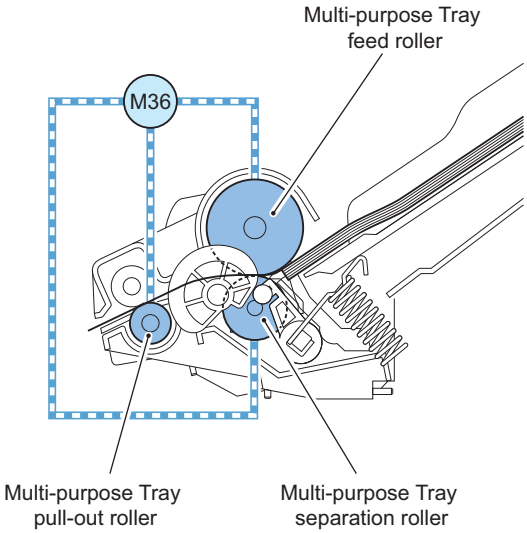
Multi-purpose Tray Pickup Unit

■ Basic Movement

1. **If the Multi-purpose Pickup Solenoid (SL4) is turned ON, the semi-toothed gear will rotate.**
2. **The holding plate Fixing Members will be released and the holding plate will ascend.**

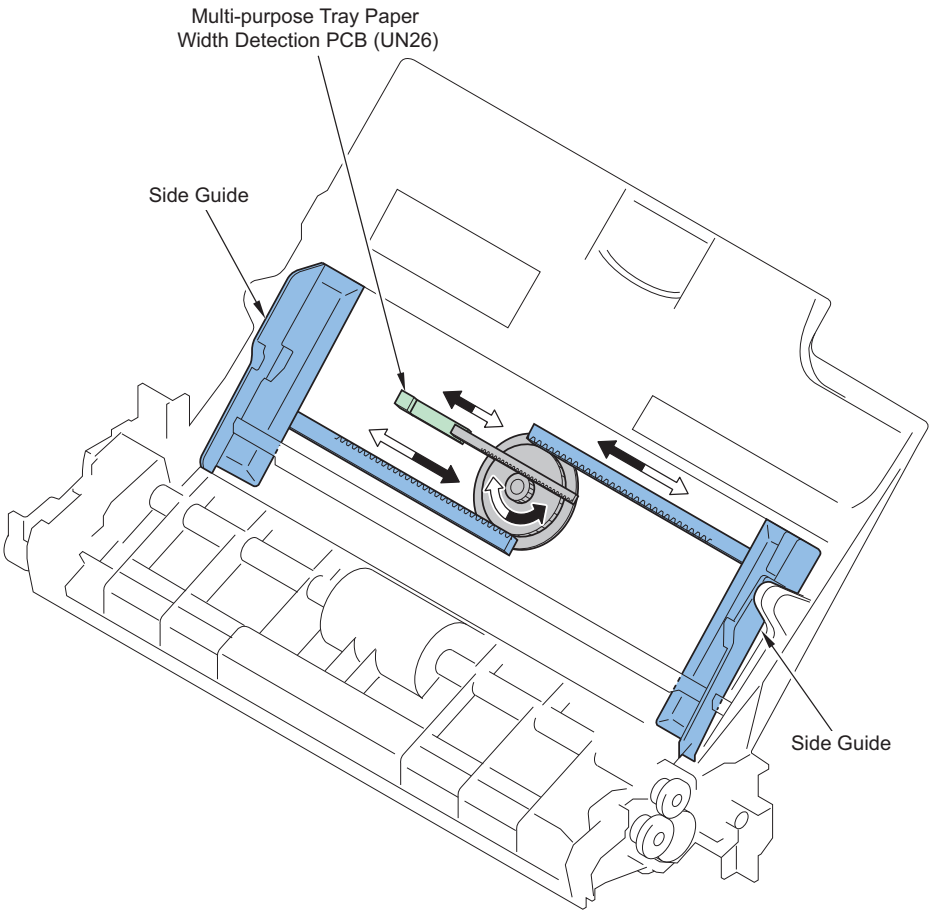


3. **When the Pre-registration Multi-purpose Tray Drive Motor drives, the Multi-purpose Pull Out Roller and the Multi-purpose Feed Roller/Multi-purpose Separation Roller will rotate, and only 1 sheet of paper will be picked up/fed.**

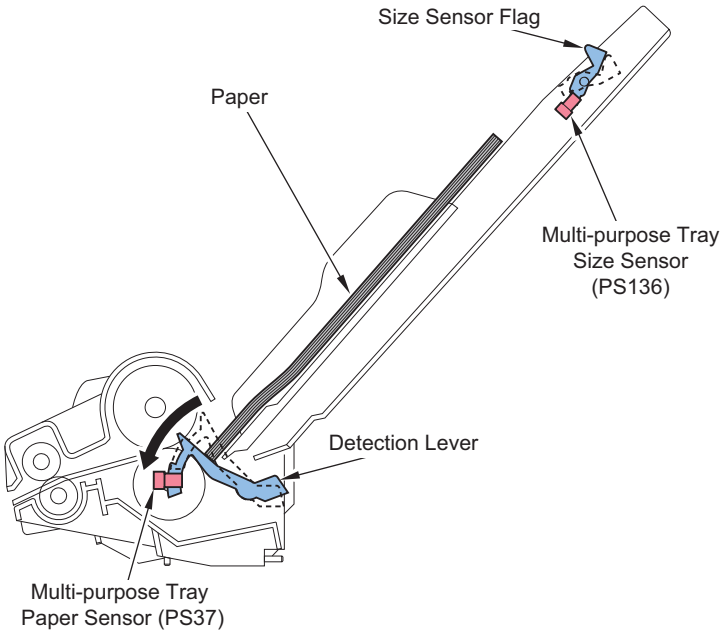


■ Paper Size Detection / Paper Detection

The setting is performed the Side Guide Plate and size code setting (or irregular size setting assignment) by and the Control Panel Unit.
Paper width is detected by the outputted value from the Variable Resistor Assembly (Multi-purpose Tray Paper Width Detection PCB (UN26)) which is linked to movement of the Side Guide Plate.
Paper length is detected by the Multi-purpose Tray Size Sensor (PS136).
Setting of the Side Guide Plate on the Multi-purpose Pickup Tray is executed by users after paper is set.



When paper is set, Paper Presence Detection Lever will be pushed, and the Multi-purpose Tray Paper Sensor (PS37) will turn ON.



■ Supports long length paper

This product supports long length paper.
Long length paper with 487.7 to 762 mm in length can be used in the Multi-purpose Tray pickup by setting service mode.

- Maximum paper size: 330 x 762 mm
- Resolution: 600 dpi (* job is canceled when printing in 1200 dpi)

Parts counter specifications

When counting the number of sheets, the count-up differs when 1 sheet is fed according to paper length.

- Small (324 mm or less): 1 Count-up
- Large (487.7 mm (19.2 inch) or less): 2 Count-up
- Long length paper (over 487.7 mm (19.2 inch) up to 648 mm): 3 Count-up
- Long length paper (long length paper exceeding 648 mm): 4 Count-up

● Limitations on Printing on Paper Whose Length Is 630 mm to 762 mm

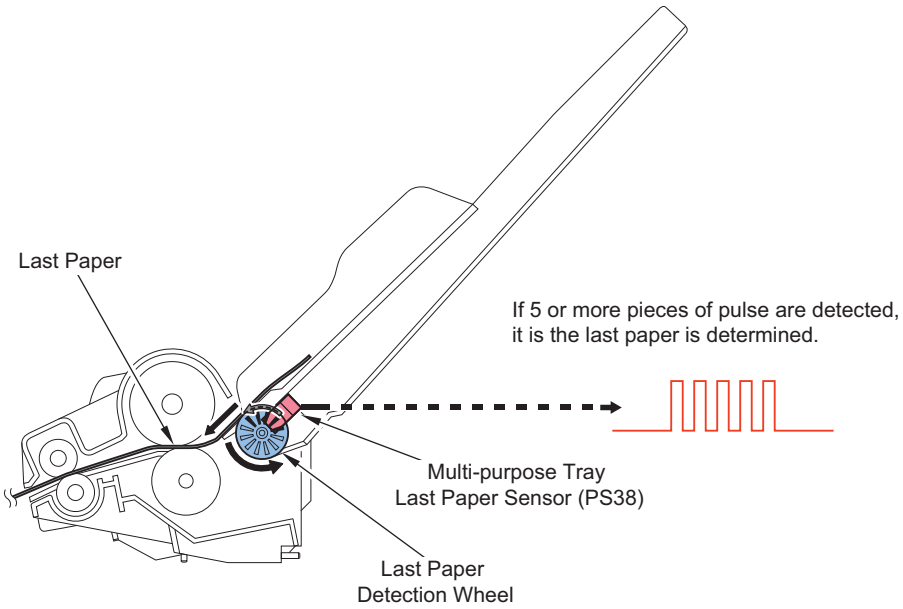
- When using long length paper, be sure to load sheets of paper one by one on the Multi-purpose Tray. (Paper pickup is not possible from pickup system options such as a Multi Deck)
- When using long length paper, install the Output Tray as a delivery destination, or paper is delivered to Finisher Middle Tray when the finisher is installed.
- When printing on paper whose length exceeds 630 mm, a print server needs to be connected.

	Versions which allow printing
Print server	imagePRESS server: V 1.1 or later
	PRISMAsync: 1.2 or later
Host machine version	MN-CON 30.52 or later

CAUTION:
If the firmware version is earlier than that shown above, up to 762 mm can be specified as the paper length in the custom size settings, but jobs with paper whose length exceeds 630 mm will be canceled. Caution is required.

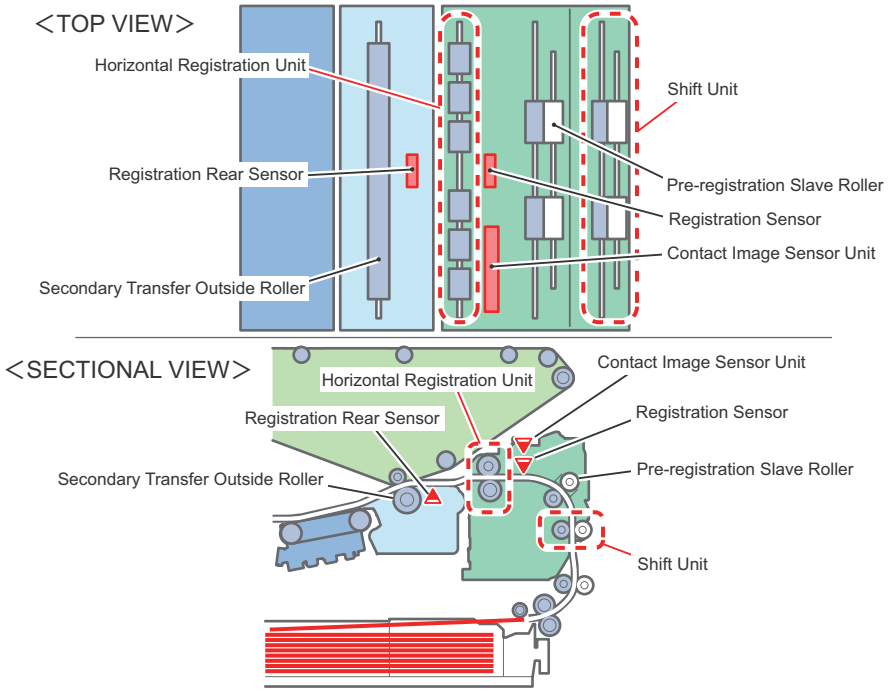
■ Last Paper Detection

After the Last Paper Detection Wheel rotates, the Multi-purpose Last Paper Sensor (PS38) will detect whether it is last paper or not.
Last Paper Detection Wheel only rotates when the last paper is picked up.
Since there is slit in the Last Paper Detection Wheel, the output of the Multi-purpose Tray Last Paper Sensor (PS38) is pulse shape. If 5 or more pieces of pulse are detected, it is the last paper is determined.



Registration Unit

■ Overview

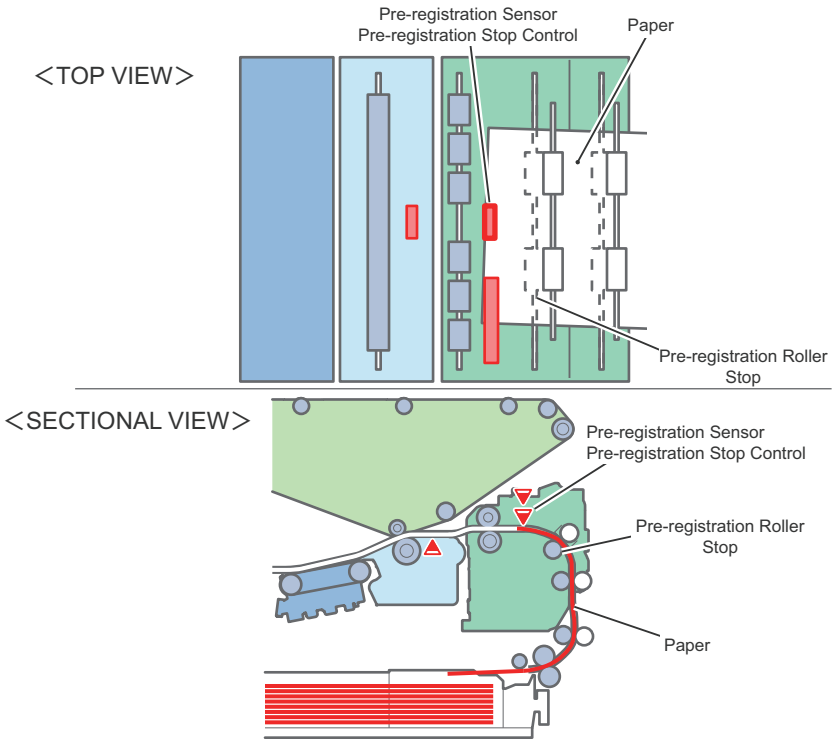


Control name	Overview	Reference
Pre-registration stop control	The Pre-registration Roller temporarily stops paper feed in order to reduce noise of paper fed to the Registration Roller.	“Pre-registration stop control” on page 183
Reverse registration correction control	To correct skew of paper.	“Reverse registration correction control” on page 184
Side registration correction control	Control for aligning the left edge of the image formed on the ITB with the left edge of the paper	“Side registration correction control” on page 185
Pre-registration Roller disengagement control	The Pre-registration Roller/Guide are disengaged to loosen paper being fed and form a registration arch.	“Pre-registration Roller disengagement control” on page 187
Leading edge registration control	Control for aligning the leading edge of the image formed on the ITB with the leading edge of paper	“Leading Edge Registration Control” on page 188
Transparency detection	To detect whether or not the fed paper is transparency.	“Transparency detection” on page 189

■ Pre-registration stop control

Overview of controls

Purpose: The Pre-registration Roller temporarily stops paper feed in order to reduce noise of paper fed to the Registration Roller. The Feed Motors are stopped immediately before the paper leading edge bumps against the Registration Roller. (At this moment, the paper leading edge has not reached the Registration Roller.) After a certain period of time, the motor is driven again.
Control timing: When paper is fed from the Pre-registration stop position to the Registration Roller



Related Service Mode

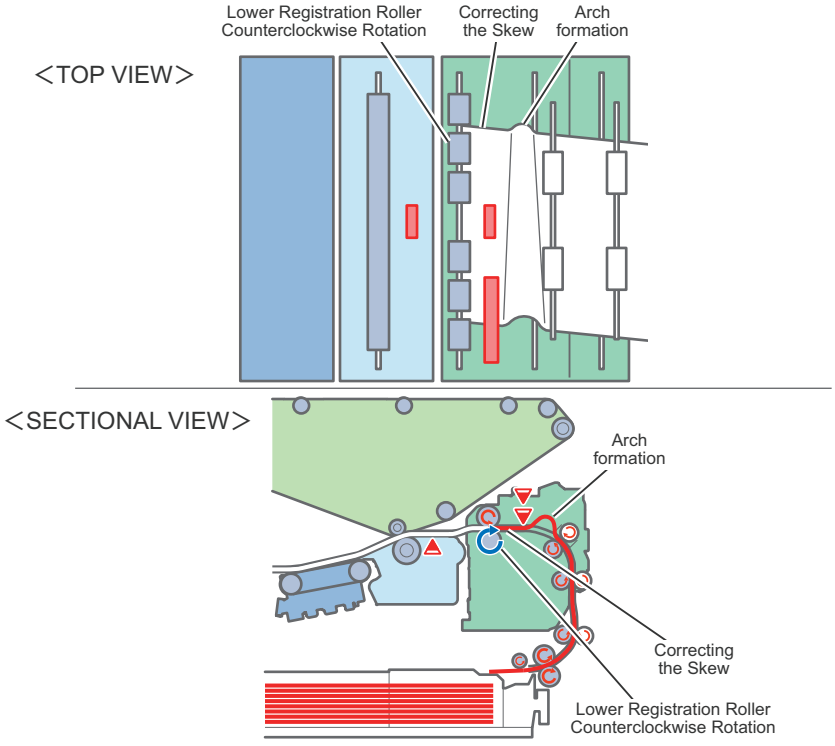
When the skew correction is insufficient, this is adjusted by the following Service Mode (Lv.2) after adjusting the Alignment Tray.
Adjustment of Pre-registration stop position

- COPIER > ADJUST > FEED-ADJ > REG-STOP

■ Reverse registration correction control

Overview of controls

Purpose: To correct skew of paper.
When the leading edge of paper reaches the Registration Roller, the Registration Roller rotates in the opposite direction to stop the paper feed and correct skew.
Control timing: When paper feed from the pre-registration to the Registration Roller is resumed by the pre-registration stop control.



Related Service Mode

When reverse registration correction control folds or flips over the leading edge of paper, adjustment should be made using the following service modes (Lv.2):

- COPIER > ADJUST > FEED-ADJ > REG-REV1
  : Adjustment of Registration Roller reverse level (1/1 speed)
- COPIER > ADJUST > FEED-ADJ > REG-REV2
  : Adjustment of Registration Roller reverse level (2/3 speed)
- COPIER > ADJUST > FEED-ADJ > REG-REV3
  : Adjustment of Registration Roller reverse level (1/2 speed)

■ Side registration correction control

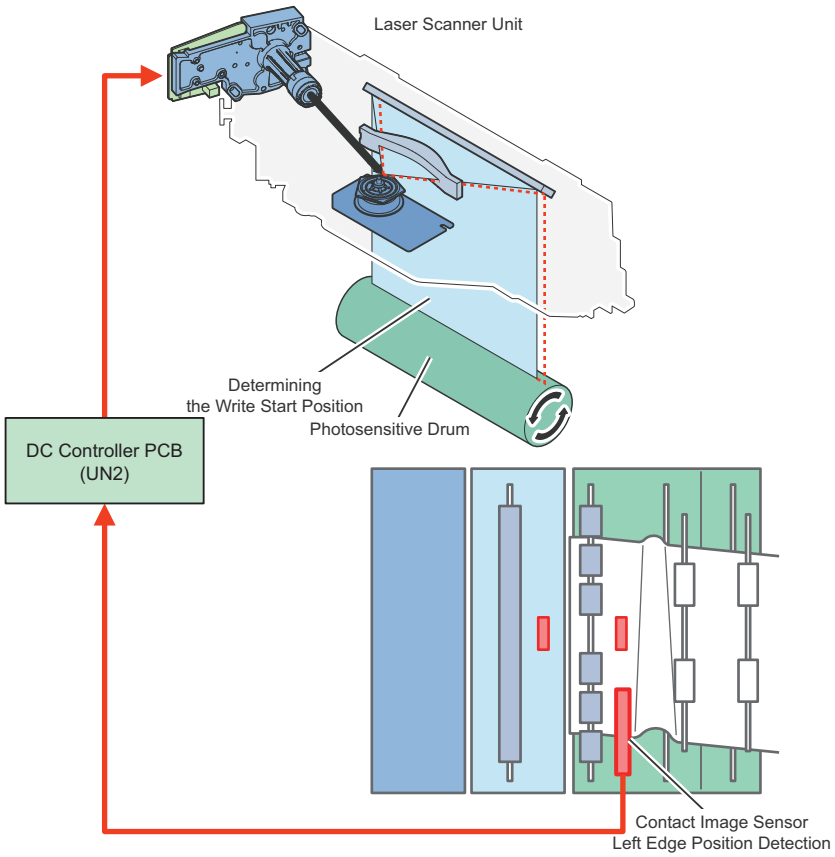
Overview of controls

Purpose: Control for aligning the left edge of the image formed on the ITB with the left edge of the paper
The side registration correction control consists of the following two controls.

	Overview of controls	Control timing
Control 1	Decision of the write-start position of laser in the horizontal scanning direction	When passing CIS
Control 2	Side shift of paper by the Registration Roller	When the leading edge of paper passes by the Registration Roller.

Steps of Side registration correction control

1. <Step 1>
   Decision of the write-start position of laser in the horizontal scanning direction
   The CIS (CIS1) detects the position of the left edge of the paper being fed.
   On the basis of this detected position and the paper size, the write-start position of laser in the horizontal scanning direction is decided.



- The first sheet
  An image is formed after detection of the left edge of the first sheet of paper.
  Creation of the image is started after the paper edge is detected by the CIS, and yet time is not pressing.
- The second sheet and later
  The write-start position of laser in the horizontal scanning direction is decided on the basis of the position of the previous 1st to 10th sheet of paper.
  The write start position is decided on the basis of the moving average of the previous 10 sheets of paper.

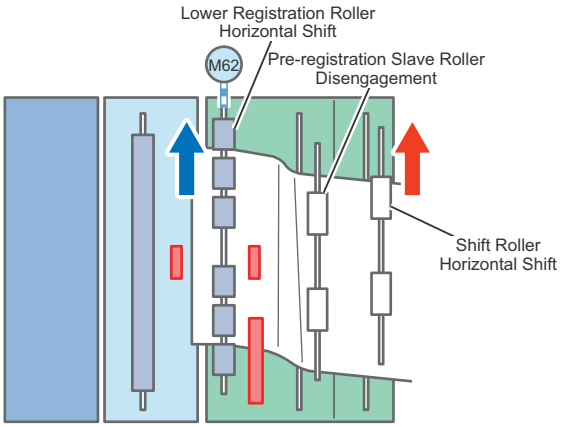
Related Service Mode

When changing the write-start position in the horizontal scanning direction by paper source

- COPIER > ADJUST > FEED-ADJ > ADJ-C1
  : Cassette 1
- COPIER > ADJUST > FEED-ADJ > ADJ-C2
  : Cassette 2
- COPIER > ADJUST > FEED-ADJ > ADJ-C3
  : Cassette 3
- COPIER > ADJUST > FEED-ADJ > ADJ-MF
  : Multi-purpose Tray
- COPIER > ADJUST > FEED-ADJ > ADJ-DK
  : Deck Lite
- COPIER > ADJUST > FEED-ADJ > ADJ-REFE
  : 2nd side
- COPIER > ADJUST > FEED-ADJ > ADJ-MDK1
  : Multi Deck (Upper)
- COPIER > ADJUST > FEED-ADJ > ADJ-MDK2
  : Multi Deck (Middle)
- COPIER > ADJUST > FEED-ADJ > ADJ-MDK3
  : Multi Deck (Lower)

2. <Step 2>
   Side shift of paper by the Registration Roller
   The result of Step 1 indicates the position of the image formed on the ITB.
   The CIS detects the left edge of the paper, and if the position is not correct, side registration of the Registration Roller is executed.

<TOP VIEW>



- Maximum shift amount: +/- 3 mm
- Minimum shift amount: 0.05 mm

NOTE:
- The maximum shift amount is 3 mm, but the paper may skew if the shift amount exceeds 1 mm because the purpose of this control is fine adjustment. It is necessary to adjust the paper position in the cassette to adjust shift amount to within 1 mm.

Related Service Mode

When changing the CIS adjustment method/light intensity/detection mode/threshold value, to use color paper/pre-printed paper, etc. (service mode: Lv.2)
- COPIER > OPTION > FEED-SW > CIS-LED
- COPIER > OPTION > FEED-SW > CIS-LV
- COPIER > OPTION > FEED-SW > CIS-SW
- COPIER > OPTION > FEED-SW > CIS-TH

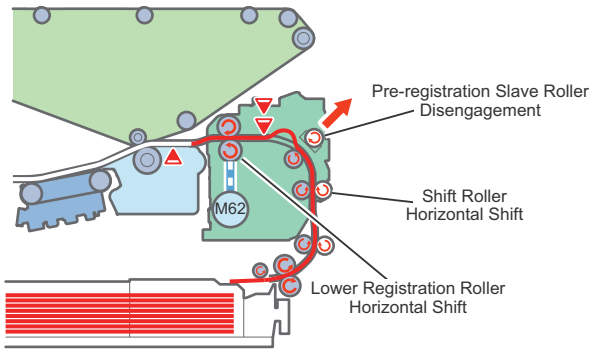
Adjustment of the position of left edge registration (service mode)
- COPIER > ADJUST > FEED-ADJ > REG-L

■ Pre-registration Roller disengagement control

Overview of controls

Purpose: The Pre-registration Roller and the Pre-registration Guide are disengaged to loosen paper being fed and form a registration arch.
Control timing: When the leading edge of paper passes by the Registration Roller.

<SECTIONAL VIEW>



Related Service Mode

When cross-feeds occur on the 1st side, they are adjusted in the following service modes:
- COPIER > ADJUST > FEED-ADJ > LP-CST
  : Adjustment of the pre-registration loop level (1st side, cassette)

- COPIER > ADJUST > FEED-ADJ > LP-DK
  : Adjustment of the pre-registration loop level (1st side, Deck Lite)
- COPIER > ADJUST > FEED-ADJ > LP-DUP
  : Adjustment of the pre-registration loop level (2nd side)
- COPIER > ADJUST > FEED-ADJ > LP-MDK
  : Adjustment of the pre-registration loop level (1st side, Multi Deck)
- COPIER > ADJUST > FEED-ADJ > LP-MF
  : Adjustment of the pre-registration loop level (1st side, Multi-purpose Tray)

■ Leading Edge Registration Control

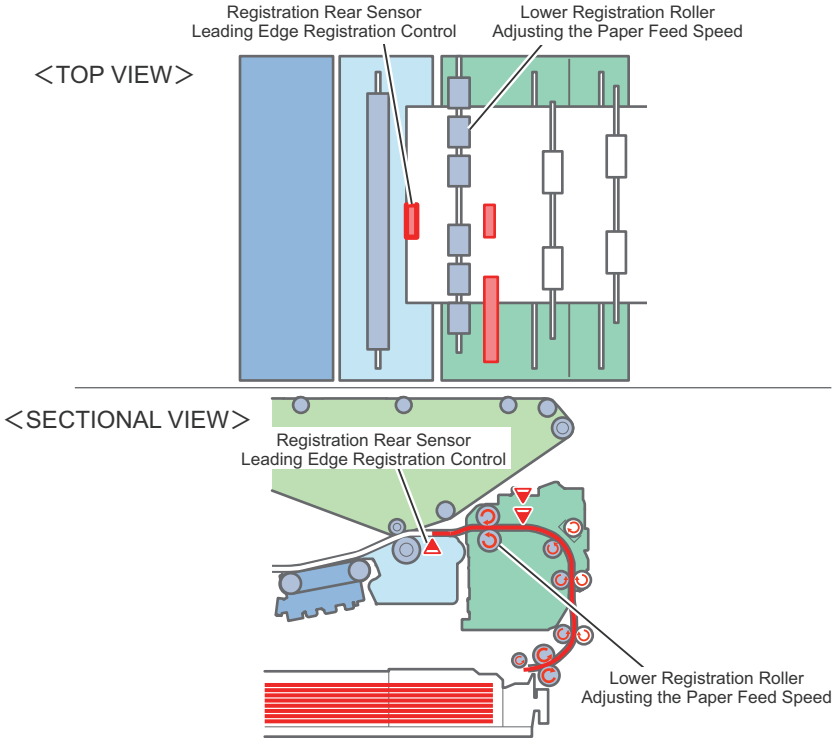
Overview of controls

Purpose: Control for aligning the leading edge of the image formed on the ITB with the leading edge of the paper (fine adjustment)
When driving the Registration Roller again, the timer is set to adjust the timing for decelerating the Registration Roller according to the time the leading edge of paper takes to reach the Post-registration Sensor (PS123).
Control timing: When the leading edge of paper reaches the Post-registration Sensor (PS123).

NOTE:
Transparency and vellum paper cannot be detected by the Post-registration Sensor (PS123), therefore the deceleration timing is fixed.

Steps of leading edge registration control

1. <Step 1>
   The time it took to feed paper after driving the Post-registration Sensor (PS123) again is detected, and the time it will take to feed the paper to the secondary transfer position is calculated.
2. <Step 2>
   On the basis of the time calculated in step 1, the timing for decelerating the Registration Roller is adjusted.



Related Service Mode

The timing for starting registration is adjusted in the following service modes:

- COPIER > ADJUST > FEED-ADJ > REG-1
  : Adjustment of registration start timing (1/1 speed, 1st side)
  COPIER > ADJUST > FEED-ADJ > REG-2
  : Adjustment of registration start timing (2/3 speed, 1st side)
  COPIER > ADJUST > FEED-ADJ > REG-3
  : Adjustment of registration start timing (1/2 speed, 1st side)
  COPIER > ADJUST > FEED-ADJ > REG-MF-1
  : Adjustment of registration start timing (1/1 speed, Multi-purpose Tray)
  COPIER > ADJUST > FEED-ADJ > REG-MF-2
  : Adjustment of registration start timing (2/3 speed, Multi-purpose Tray)
  COPIER > ADJUST > FEED-ADJ > REG-MF-3
  : Adjustment of registration start timing (1/2 speed, Multi-purpose Tray)

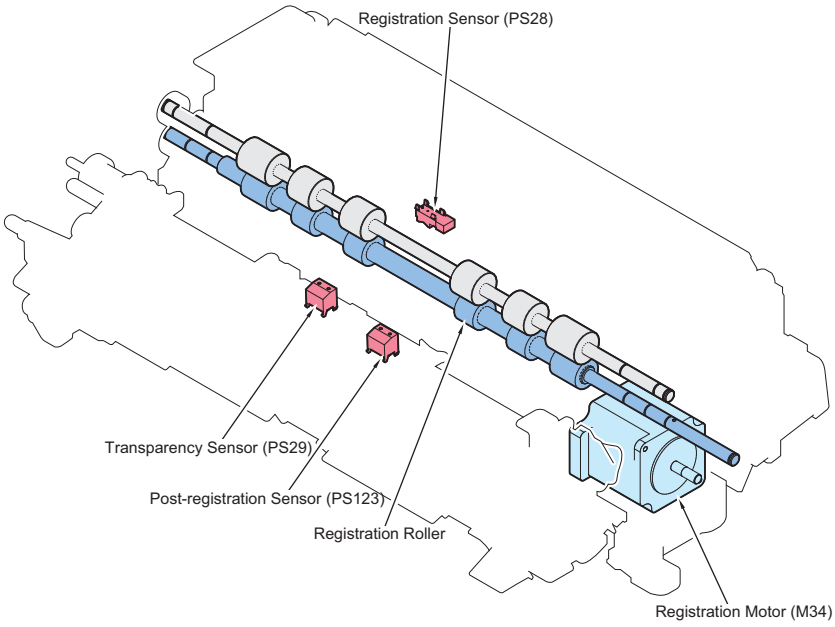
■ Transparency detection

To detect whether or not the fed paper is transparency. The Post-registration Sensor (PS123)/CIS performs detection.

- Post-registration Sensor (PS123): Detects whether or not transparency exists.
- CIS: Discriminates transparency on the basis of the transmittance of the fed paper.

In the case shown below, it is judged that wrong paper was fed and it is notified as a jam.

- Setting: Transparency
- Fed paper: Other than transparency
- Jam code: 0D92



NOTE:
The Transparency Sensor (PS29) only detects whether or not it is "CLC Transparency A4 CT-700".

■ Front/Back Registration Control at 2-sided Printing from the Multi-purpose Tray

Overview of controls

At 2-sided printing from the Multi-purpose Tray, the side registration position on the 1st side and that on the 2nd side are controlled in different ways.
1st side: Since the paper path length to the registration adjustment mechanism is short, the side registration position cannot be adjusted by shifting the paper.
2nd side: Since the paper path length to the registration adjustment mechanism is long, the side registration position can be adjusted by shifting the paper and disengaging it from the roller.
As a result, a symptom occurs where there is a large difference between the registration on the front side and that on the back side.

As a remedy, COPIER > OPTION > FEED-SW > CIS-MLT has been added so that a setting for using the detected side registration position entered (measured) for the 1st side as the side registration shift target for the 2nd side at pickup from the Multi-purpose Tray can be selected.
0: Always at a fixed position
1: Adjust the side registration position for the 2nd side to that for the 1st side (default setting)

Related service mode

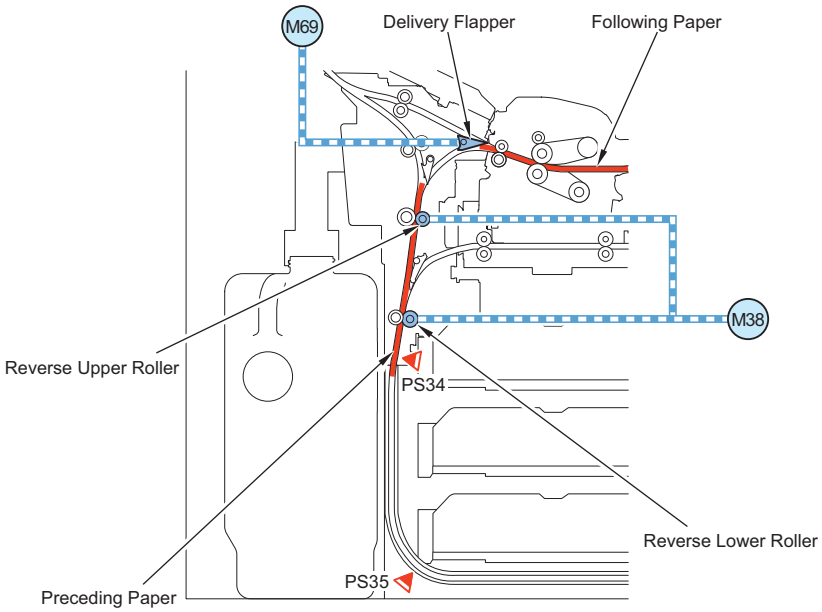
- COPIER > OPTION > FEED-SW > CIS-MLT
  : Setting of the side registration adjustment mode for the 2nd side at pickup from the Multi-purpose Tray (always fixed, 2nd side adjusted to the 1st side)

Reverse Unit

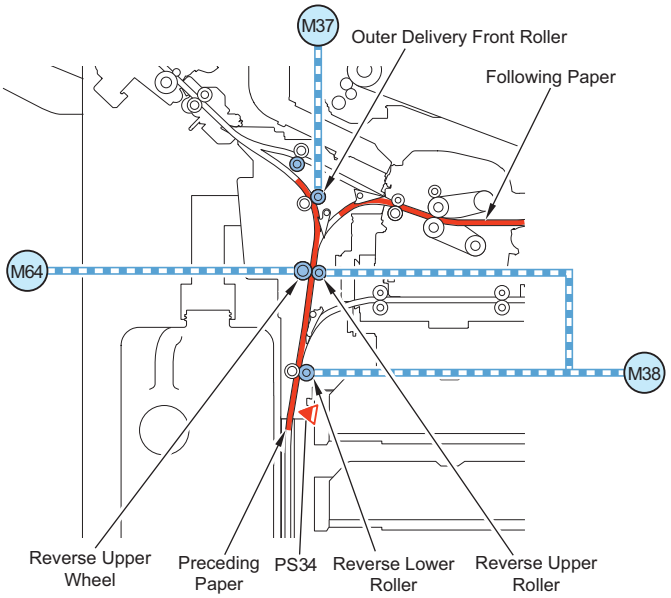
■ Basic operation

The Delivery Flapper Switch Motor (M69) switches the Delivery Flapper between delivery operation and reverse operation.

1. **After the specified period of time has passed since the Reverse Vertical Path Upper Sensor (PS34) (paper length: less than 43.7.7 mm) was turned ON, the Reverse Motor (M38) is stopped/rotated reversely when the trailing edge of paper reaches the reverse stop position (the Reverse Roller).**
   If the paper length is more than 43.7.7 mm, reverse operation is performed based on the Reverse Vertical Path Lower Sensor.



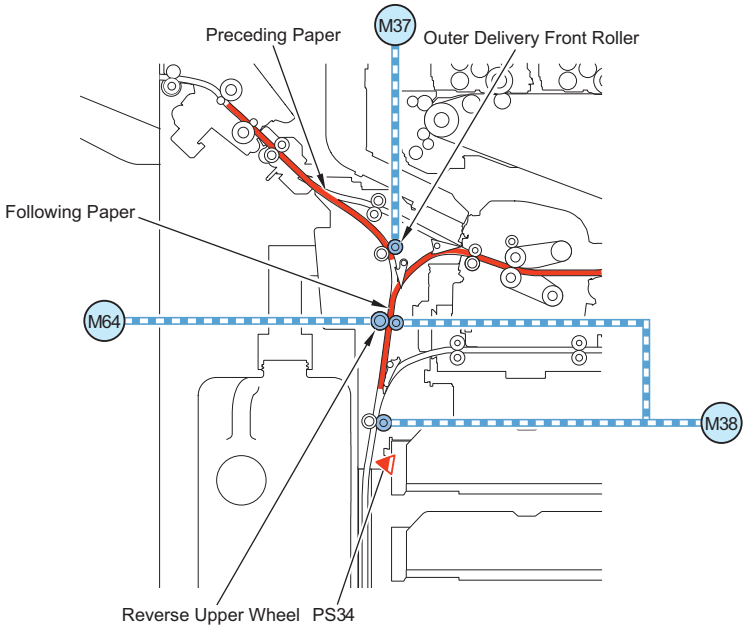
2. **When the leading edge of the preceding paper passed the Outer Delivery Front Roller, the Reverse Disengagement Motor (M64) is turned ON to be prepared for entry of the succeeding paper and make the Reverse Upper Roller disengaged.**



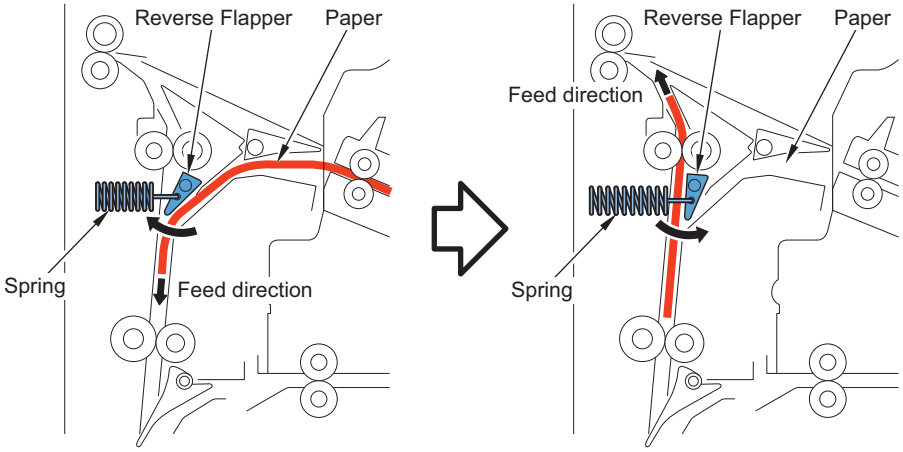
NOTE:
When the Reverse Roller is disengaged, the preceding paper and succeeding paper are crossed by the Reverse Upper Roller.

3. **The succeeding paper is fed in the direction of the Reverse Unit. This is to make the Reverse Motor (M38) stopped/ rotate normally.**

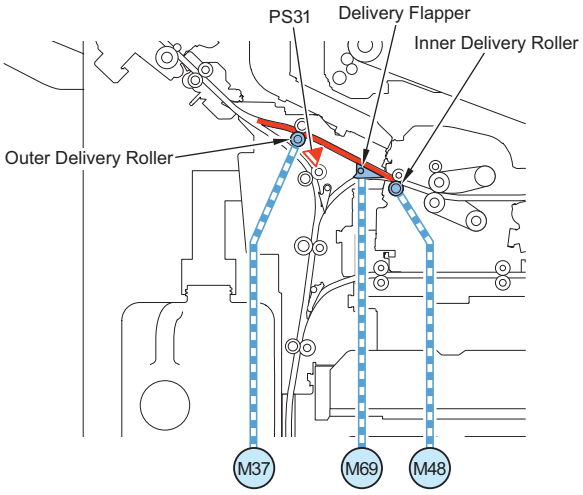
4. **When the leading edge of the preceding paper passed the Outer Delivery Front Roller, the Reverse Disengagement Motor (M64) is driven to engage the Reverse Upper Roller.**
   The succeeding paper is fed to the reverse stop position.



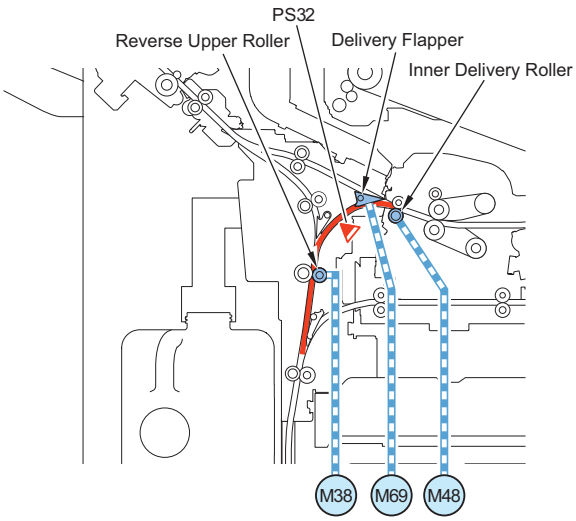
■ Reverse Flapper Movement



• Delivery of Face Up



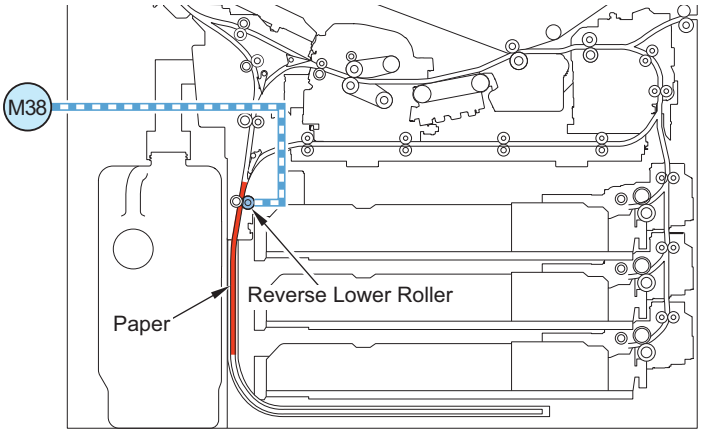
• Delivery of Face Down Up



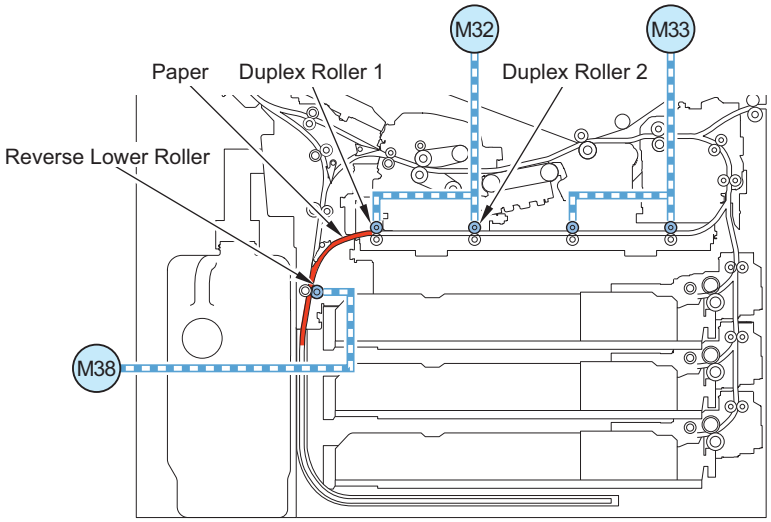
Duplex Unit

■ Basic Operation

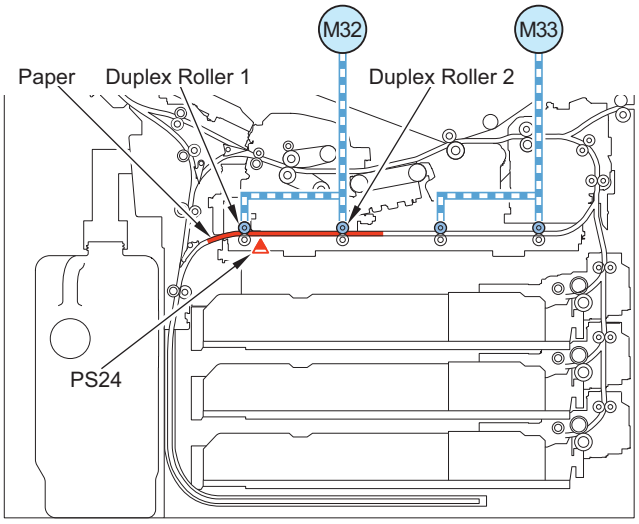
1. **When the trailing edge of paper reaches the duplex reverse position (Reverse Lower Roller), the Reverse Motor (M38) is stopped/reversed, and then the paper is fed to the Duplex Unit.**



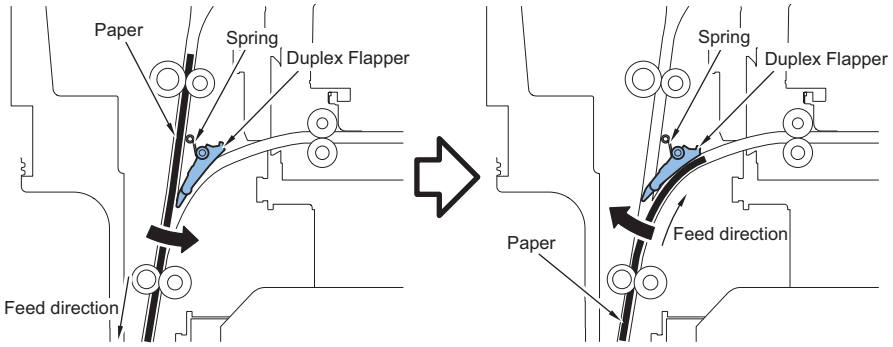
2. **Duplex Left Motor (M32)/ Duplex Right Motor (M33)/ Reverse Motor (M38) are driven to feed the paper to the duplex standby position.**



3. **Paper is stopped at the duplex standby position and is fed to the Registration Unit after the specified period of time.**



■ Duplex Flapper Movement



■ Number of Circulating Sheets

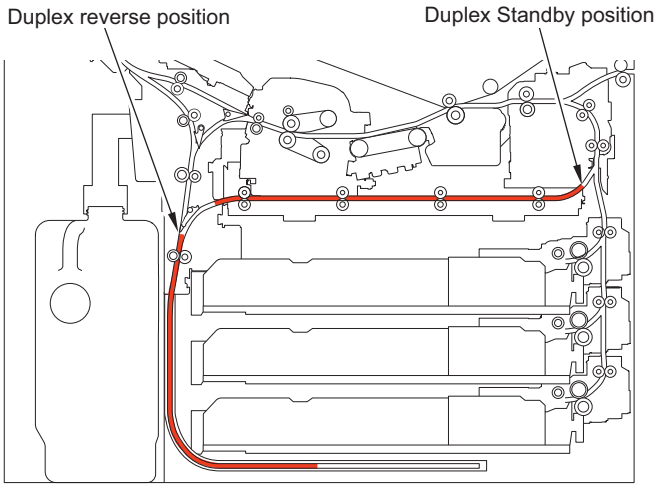
The number of circulating sheets when paper is picked up in duplexing mode varies depending on the length of paper and the process speed.

Paper length / process speed	1/1 speed (348 mm/s)	2/3 speed (248 mm/s)	1/2 speed (174 mm/s)
145 mm to 257 mm	5	5	5
257.1 mm to 297 mm	5	5	3
297.1 mm to 521 mm	3	3	3
521.1 mm to 762 mm	1	1	1

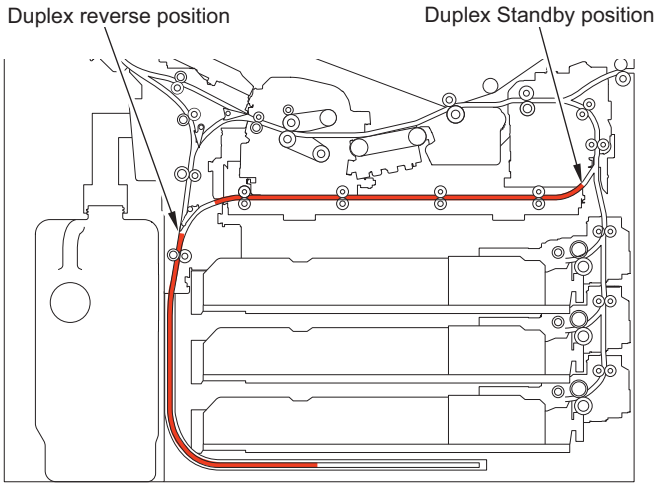
■ Duplex Standby Control

The standby position for duplex reverse is shown below.

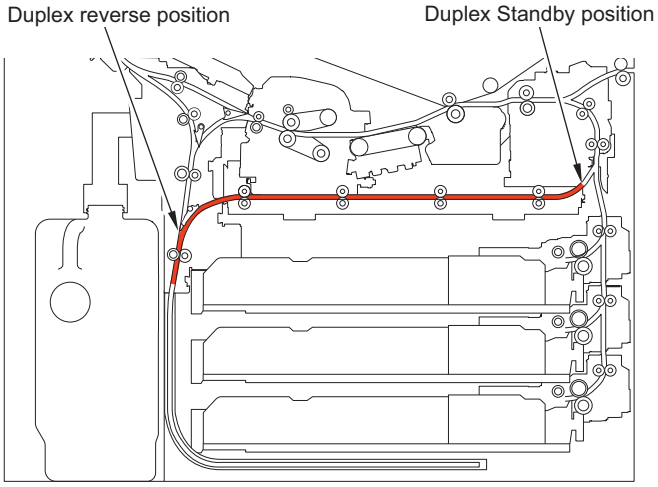
● Less than 297.1 mm in size/5 sheets in circulation.



● Size greater than 297.1 mm and smaller than 521 mm, 3-sheet circulation



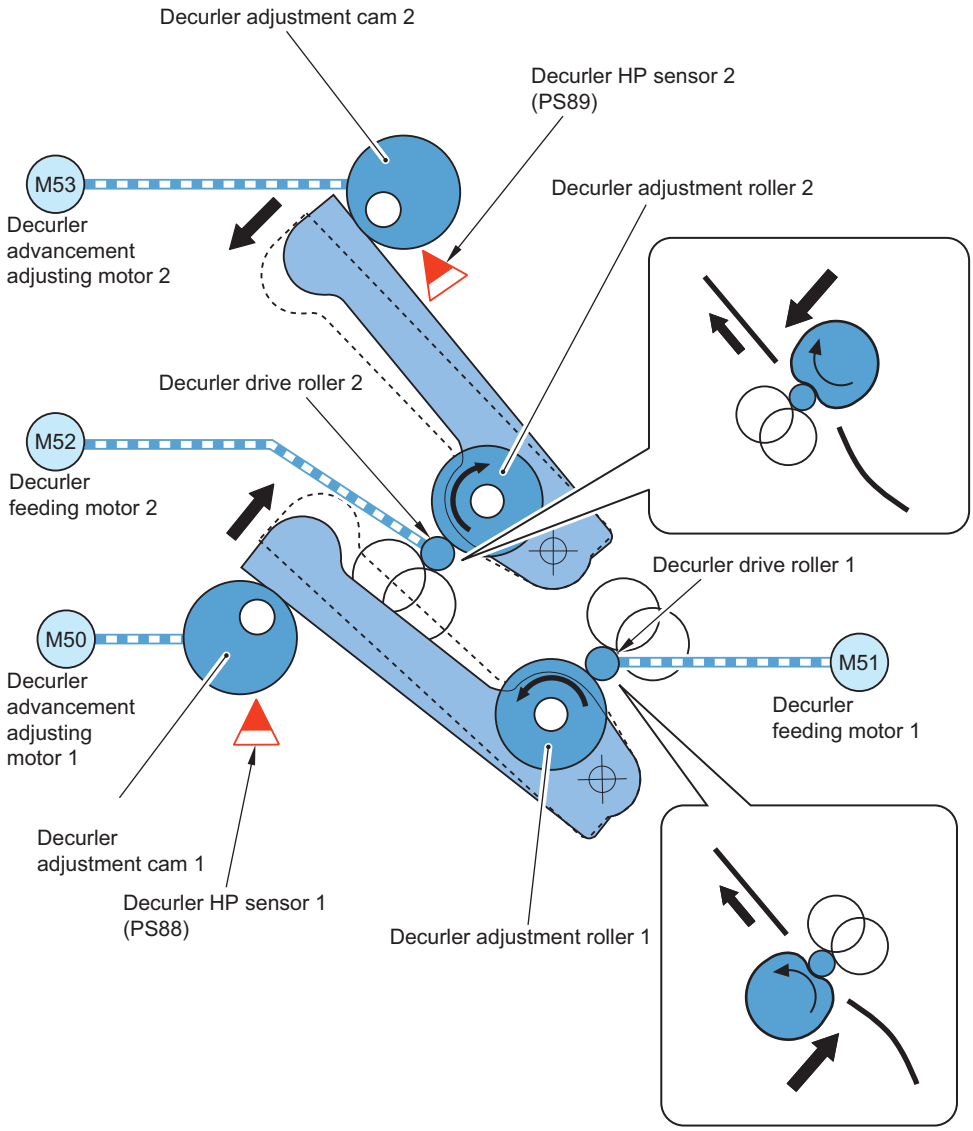
● Size greater than 521.1 mm and smaller than 762 mm, 1-sheet circulation



Delivery Unit

■ Decurler Control

Purpose: To correct paper arc
The decurler pressure switches depending on the image density and paper type.



Related Error Code

Decurler/Compression distance control error

- E015-0001: There was no change in the Decurler HP Sensor 1 although a specified period of time has passed since the Decurler Compression Distance Adjustment 1 Motor was driven.
- E015-0002: There was no change in the Decurler HP Sensor 2 although a specified period of time has passed since the Decurler Compression Distance Adjustment 2 Motor was driven.

Related Setting Registration modes

The pressure of the Decurler can be switched.

- Settings/Registration > Adjustment/Maintenance > Operation Adjustment > Curl correction per paper cassette
  Setting value
  - When outputting face-up: -10 to 10
  - When outputting face-down: -10 to 10

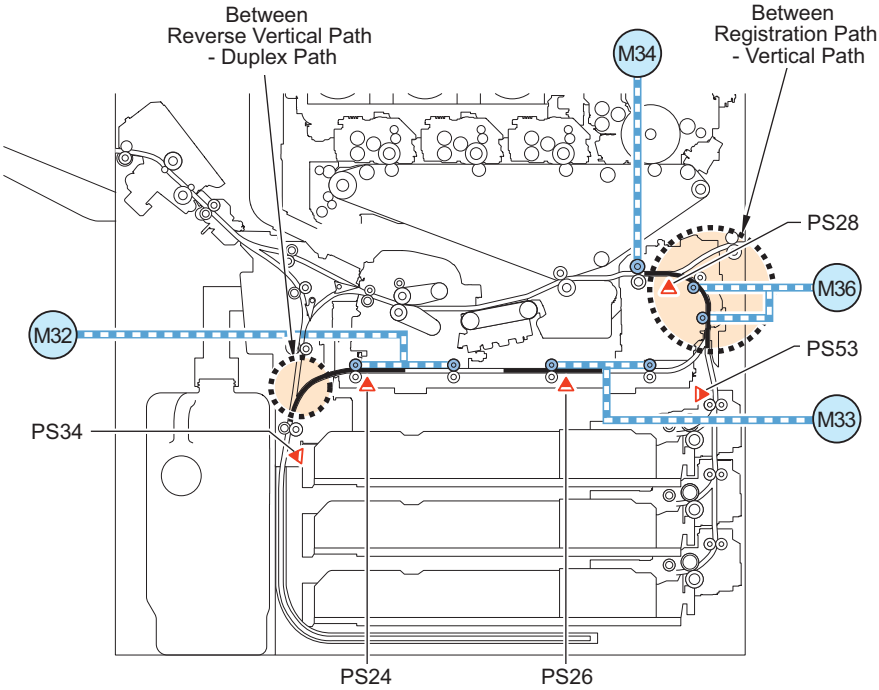
■ Forcible paper feed control

In order to prevent paper from remaining in the machine due to breakage of paper during jam removal, when a jam is detected, the paper is forcibly fed to a position where it is easier to remove the jammed paper.



Item		Description
Between the Registration Path and Vertical Path		
	Condition	If PS53 is OFF when the operation is stopped due to a jam, and PS125 is ON
	Drive Motor	Registration Motor (M34)/Pre-registration Motor (M36)

Item		Description
	Remarks	-
Pickup from Multi-purpose Tray		
	Condition	A jam during Multi-purpose Tray pickup
	Drive Motor	Multi-purpose Tray Motor (M65)
	Remarks	The paper is fed to move the drive parts to their correct positions, not to prevent breakage of paper.
Between the reverse path and the duplex path		
	Condition	The Reverse Vertical Path Upper Sensor (PS34) is OFF when the operation is stopped due to a jam, and the Duplex Sensor 1 (PS24) is ON.
	Drive Motor	Duplex Left Motor (M32)
	Remarks	If paper of 258 to 297 mm in size (A4R) is staying at the duplex standby position, regardless of ON/OFF of the sensor, the paper staying at the duplex standby position is fed.

External and Controls

Counter Control

■ Overview

This machine has software counters which count the number of prints/copies according to the job type. Various counters are displayed by pressing the Check Counter key on the Control Panel. The counters for each country (model) are listed below.
Type1: The value of COPIER > OPTION > USER > CNT-SW is 0.
Type2: The value of COPIER > OPTION > USER > CNT-SW is 1.

Target	Number displayed for each counter (in service mode)/Item								Location code
	Counter 1	Counter 2	Counter 3	Counter 4	Counter 5	Counter 6	Counter 7	Counter 8

<Description of symbols>

- Large: Large size paper (when paper length exceeds 364 mm in paper feed direction)
- Small: Small size paper (when paper length is 364 mm or less in paper feed direction)
- Total: When a sheet of paper is delivered, the counter is advanced by 1
- 2-Sided: The counter is advanced by 1 for paper delivered in 2-sided mode
- Change the country code of CONFIG in COPIER>OPTION>FNC-SW>CONFIG
- Three-digit number in the counter column shows the setting value of the following service mode items.
  COPIER > OPTION > USER > COUNTER1 to 8
- COUNTER 2 to 8 can be changed in service mode (COPIER> OPTION> USER).
- For 2-color printing or copy, switch the item to count up in the following service mode:
  COPIER > OPTION > USER > 2C-CT-SW (Level 2)
  0: "Single Color" counter is advanced
  1: "Full Color" counter is advanced
  [Default]
  Japan: 0, Others: 1

*1: Hidden by default. Can be changed in service mode.

■ Count-up Timing

Count-up timing differs depending on the following conditions:

- Print mode (1-sided/2nd side of 2-sided print, 1st side of 2-sided print)
- Delivery position (Finisher)

Delivery position			Print mode	
			1-sided print/2nd side of 2-sided print	1st side of 2-sided print
			Count-up timing	
1	When the machine configuration consists of the Host Machine only		Reference Sensor: Outer Delivery Sensor (PS31)	Reference Sensor: Duplex Sensor 1 (PS24)
2	Finisher Saddle Finisher (W1)	Tray A (Upper tray)	Reference Sensor: Upper Delivery Sensor (PS5)	
		Tray B (Lower tray)	Reference Sensor: Lower Delivery Sensor (PS6)	
		Saddle area	Reference Sensor: Saddle Inlet Sensor (PS101)	
3	Finisher Saddle Finisher (T1)	Tray	Reference Sensor: Delivery Sensor (PI11)	
		Saddle area	Reference Sensor: Saddle Inlet Sensor (PI22)	
4	Trimmer		Reference Sensor: Saddle Inlet Sensor (PS101/PI22)	
5	Stacker	Delivery Tray	Reference Sensor: Upper Tray Delivery Sensor (PS62)	
6		Stack part	Reference Sensor: Paper Inlet Sensor 1 (PS11)	
7	Perfect Binder		Reference Sensor: Timing Sensor (S5)

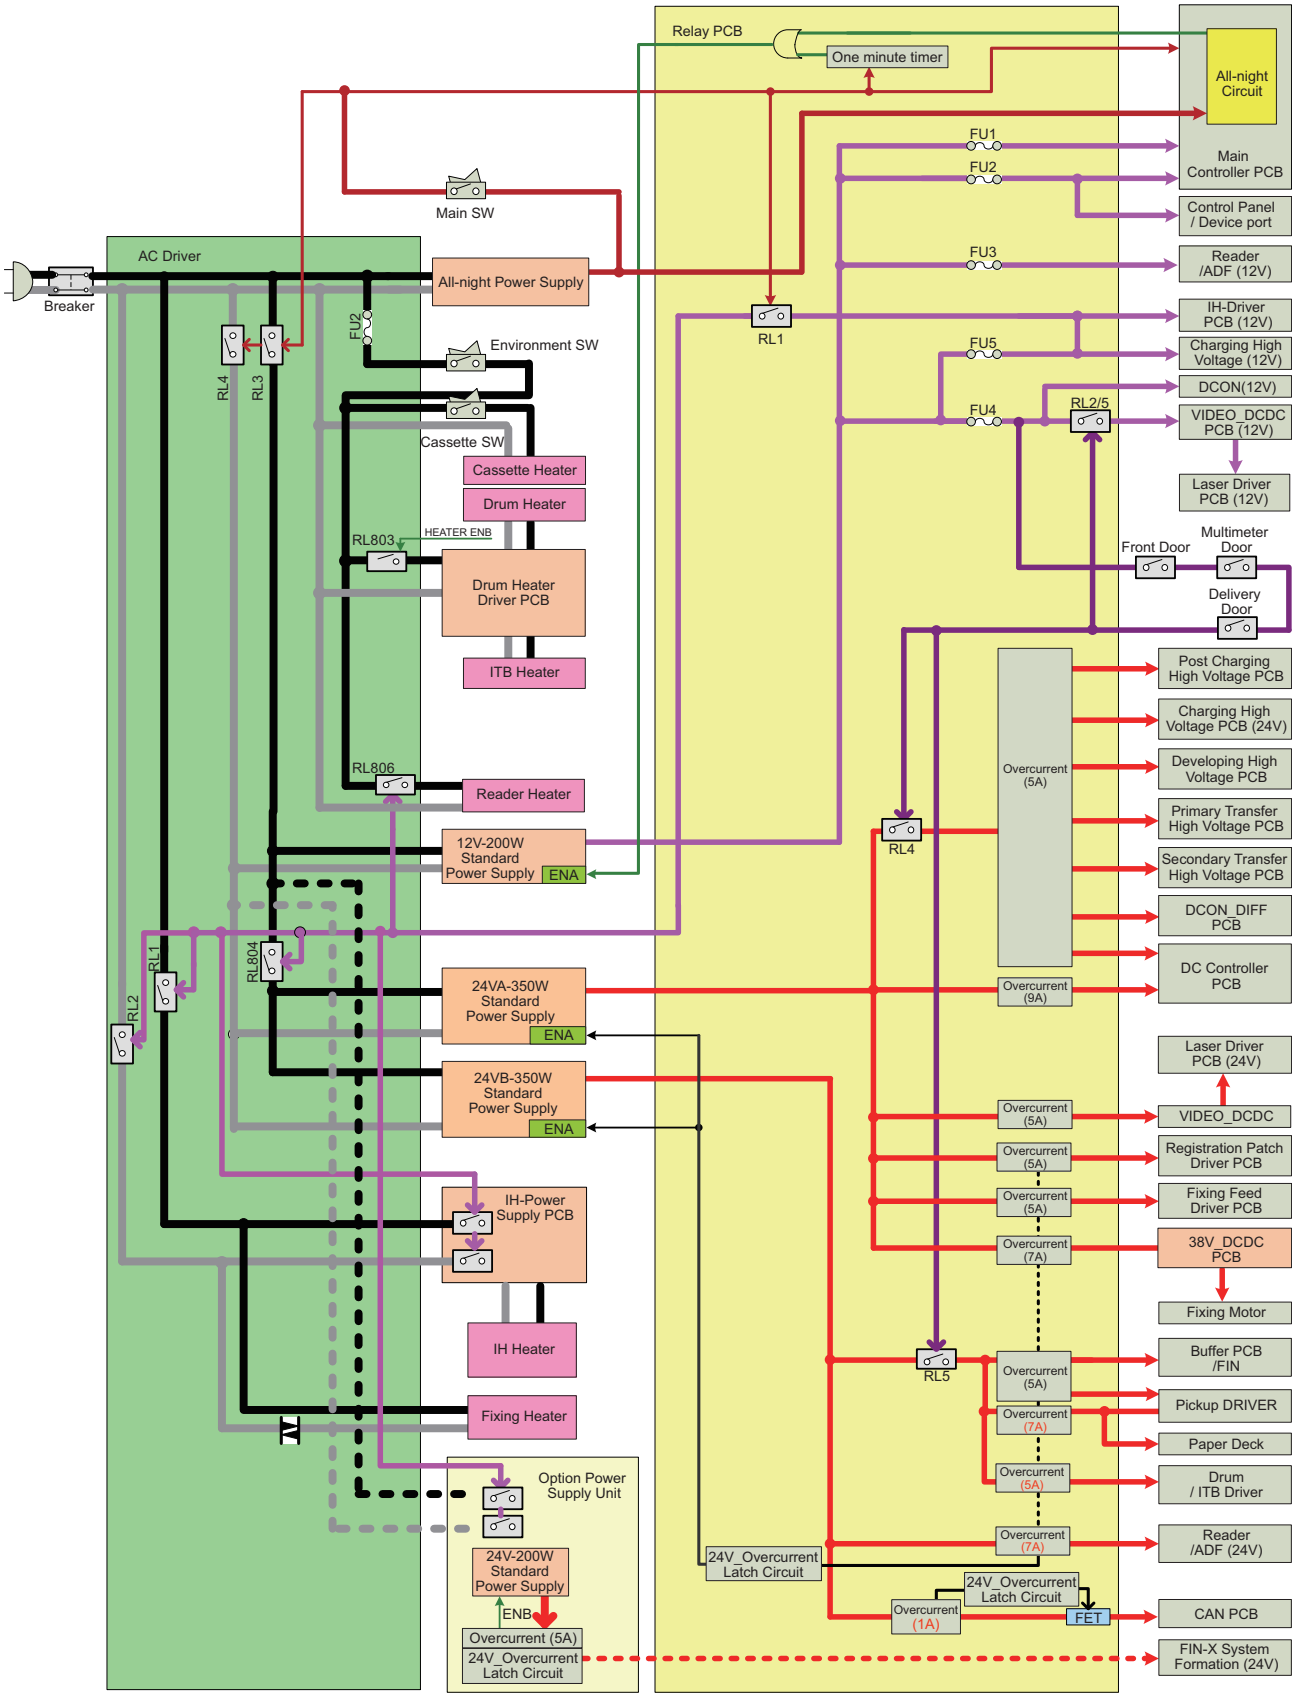
208V: 1 cable (North America)



■ Effects of Spanning Tree-supported Hub

If you set the network as a loop, data keeps staying in this loop and efficiency of data transfer might be decreased. In order to prevent this symptom, some hubs have the function called “spanning tree”. If this function is enabled, the device newly connected to the hub can make data communication with network 10 to 50 seconds (time changes due to the conditions) after the connection. When the machine enters Deep sleep mode and restores from the sleep mode, the machine electrically disconnects with the

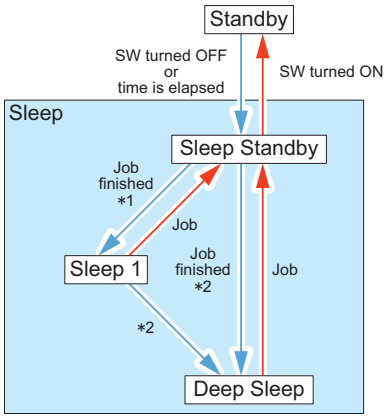
network once. Therefore, if the machine connects with the spanning tree-installed hub, the machine cannot communicate with network for approximately 1 minute at a maximum after restoring from the Deep sleep mode.
For this reason, right after restoring from the Deep sleep mode, the following symptoms might occur: Device status cannot be collected, printing cannot be made, and login using a login application cannot be made. If such symptoms become any problems, perform the following operations.

- Using user mode, set not to enter the Deep sleep mode.
  Preferences > Timer/Energy Settings > Sleep Mode Energy Use > High
- Disable the spanning tree function of hub.
- Request users to use the hub which supports Rapid Spanning-Tree Protocol (RSTP) that resolved such problems.

Protective Function

DC power PCB of the host machine and the power PCB of options have the overcurrent protective function and the abnormal high voltage protective function to prevent the power circuit brokerage by stopping the output voltage automatically when overcurrent or abnormal high voltage occur due to the problems such as short circuit etc on each load.
When an error occurs on 3VB (all-night power), all the power will be stopped.
An error occurs on the power other than above, all the power will be stopped except for 3VB (all-night power).
When an error occurs with 3 VB (all-night power supply), be sure to turn OFF the main power switch of the Printer Assembly, eliminate the cause which made the protection circuit active, and then replace the All-night Power Supply PCB.

Power-saving Function



Standby

The mode that the machine is running or is ready to start operation. All power is supplied in this mode.

Sleep Mode

Power-saving mode. Depending on the active controller, it is classified into the following 3 modes:

Sleep Standby	The Control Panel is OFF. Other power supply states are the same as those in the standby mode.
Sleep1	• Almost all the power supplies of engine system: OFF • HDD: ON • Main Controller PCB 1, 2: ON • All-night Power Supply PCB: ON
Deep Sleep	The state that only 3V on the All-night Power Supply PCB is supplied.

■ Conditions for Not Moving to Deep Sleep

When the following conditions are met, the machine does not move to Deep Sleep.

Settings of Settings/Registration

- Preferences > Timer/Energy Settings
  - Sleep Mode Energy Use > High
  - Within the time specified in Auto Sleep Time

- Preferences > Network
  - TCP/IP Settings> BMLinkS Settings> Use BMLinkS Settings > ON
  - NetWare Settings > Use NetWare > ON
  - AppleTalk Settings > Use AppleTalk > ON
  - IEEE 802.1X Settings > Use IEEE 802.1X > ON
- Function Settings > Receive/Forward
  - Fax Settings > Select RX Mode > Fax/Tel (Auto Switch)
  - Fax Settings > Remote RX > ON
  - An effective time is specified in "Common settings > Fax/I-Fax Inbox > Memory Lock Start Time/Memory Lock End Time" (*1)
- Function Settings > Send
  - Common Settings > Activity Report > Specify Print Time > ON (*1)
  - Fax Settings > Modem Dial-in Settings > Set Line > Line 1 to 4 > ON
  - Fax Settings > Fax Activity Report > Specify Print Time > ON (* 1)
  - When "E-Mail/I-Fax Settings > Communication Settings > Next > POP Interval" is set to be less than 10 minutes (excluding the case when the interval is set at "0")

*1: If the interval between operations is more than 10 minutes, it is possible to enter Deep Sleep.

Hardware status

- The Serial Coin Vendor is connected.
- The G4 Fax Board is installed.
- A USB device is connected to the host machine.
- The iSlot Extension Card is connected.

System Performance Status

- An application is communicating via a CPCA network (when a CPCA-dedicated port has a TCP connection, or within 15 seconds after reception of UDP).
- Either of SNTP, DHCP, DHCP6 or eRDS communication is in progress
- A job is being executed/in standby (Print/Copy/Send/Fax/Report/Forwarding/Storage processing, etc.)
- A FAX / IFAX communication is in progress.
- A phone communication is in progress.
- The delivery of device information is in progress.
- RUI is being imported/exported.
- During execution of an Meap application which prohibits entering Deep Sleep
- During Box backup
- During opening (reading or writing) of a file in the Advanced Box (*Common with WebDAV and SMB)
- Machine is operating with the printer/scanner function stopped.
- During transition to Service Mode screen/download mode

During timer processing

- The sleep mode exit timer is running (for 15 seconds after exiting DEEP SLEEP).
- The network timer is running (for the number of seconds set by Service Mode).
  - COPIER > OPTION > NETWORK > WUEN-LIV
- The wake up timer is running (for 10 minutes after receiving a wake up packet).
- The hard disk drive protection timer is running (for 12 minutes after exiting from DEEP SLEEP and the hard disk drive is powered ON.
- However, this timer is disabled after a printing, scanning, and fax job is completed.)
- The timer is running after link-up (for 1 minute after the machine is powered ON and the communication with the network is started).
- The sleep notification timer is running (for 10 minutes after notifying the network module of entering DEEP SLEEP. However, when the network module responds, this timer is disabled).

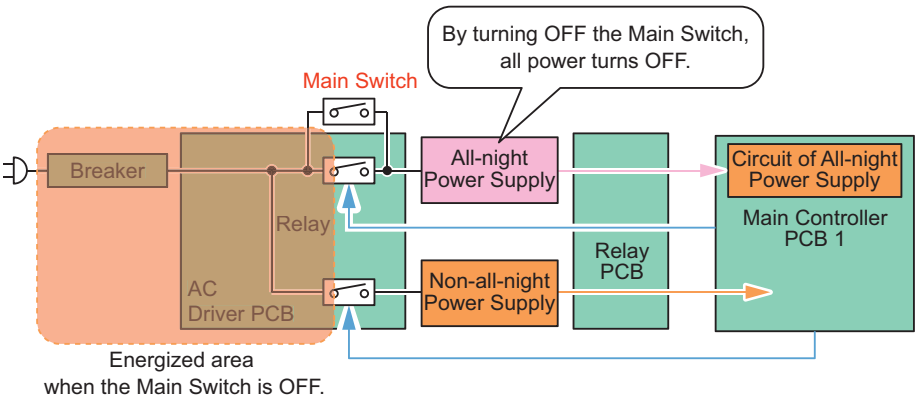
Quick Startup

To realize faster startup, power configuration has been changed to always supply power to the All-night Power Supply PCB. As a result, the time taken to display the main menu from turning ON the Main Power Switch is shortened, reducing the amount of time it takes for users to operate the screen.
Even when the Main Power Supply Switch is OFF, power is supplied to the following PCBs:

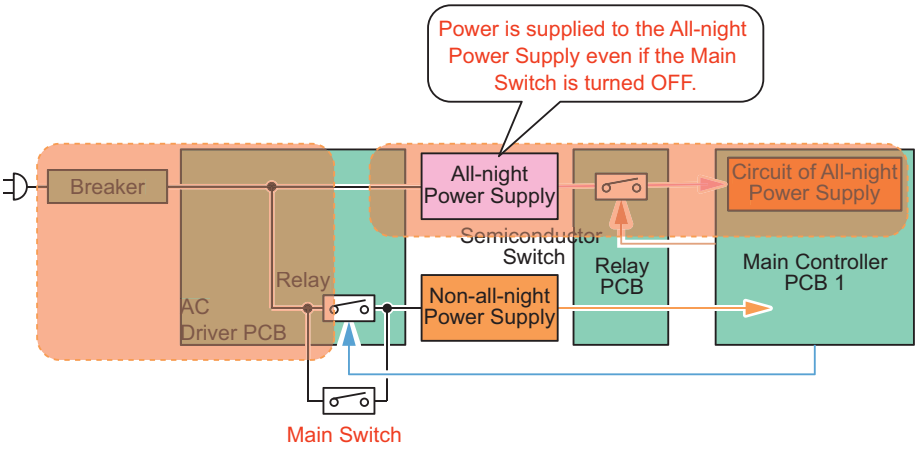
- AC Driver PCB
- All-night Power Supply PCB
- Relay PCB
- Main Controller PCB 1

NOTE:
The quick startup function can be set from "Settings/Registration".
- Settings/Registration > Preferences > Timer/Energy Settings > Quick Startup Settings for Main Power
  [ON]: Quick startup is executed
  [OFF]: Quick startup is not executed (default)

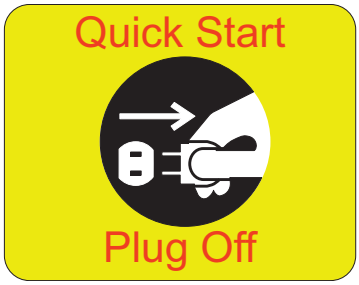
When Quick Startup Settings for Main Power is OFF



When Quick Startup Settings for Main Power is ON



Disconnect the plug from the outlet or turn OFF the Breaker when performing work that may come in contact with the PCBs above. If a conductive material comes in contact with the PCB, short circuit may occur in the PCB, and may cause damage on it. The following illustration is used at the place requiring attention. When the following label is affixed, be sure to disconnect the plug from outlet or turn OFF the Breaker.



In addition, quick startup is not performed under the following conditions.

At initial startup after inserting the AC power plug into a power supply outlet, the machine always starts up normally (even if quick startup is ON) under the following conditions (settings).

- Either of the following devices is connected:
  - PS Controller
  - Serial I/F coin vendor

- Either of the following network settings is set to "ON".
  - RARP
  - BOOTP
  - IPsec
  - IPv6
  - NetWare

Right after the machine is shut down under any of the following conditions, it will start up in normal mode (even if quick startup is ON).

- FAX-related information
  - There is a fax transmission reservation.
  - Within a specified period of time from disconnection of a fax line.
  - Within a specified period of time from non-detection of reception from a fax line.
  - Within a specified period of time from putting down the fax sub device or handset.
- MEAP-related Information
  - During execution of an MEAP application which prohibits entering Deep Sleep.
- Job processing-related information
  - A print job is being processed
  - During SEND job processing
  - During I-Fax communication/job processing
  - During report job processing
  - During forward send job/receive job processing
  - During save job processing (including processing to save in the Advanced Box or other storages)
  - During fax communication/phone communication
  - During distribution of device information
  - During Box backup
  - During export/import by RUI
  - During opening/reading/writing file of Advanced Box (common with SMR/WebDAV)

Others

- When the accumulated time during which the machine is powered ON as well as powered OFF (with quick startup turned ON) is 110 hours or more.
  -> At the time of shutdown, it will be normal shutdown.
  * This is to prevent a risk of UI freeze caused by memory leak.
- Within a specified period of time (20 seconds) from turning OFF the Main Power Supply Switch.
  -> In such a case, the machine reboots and then starts up normally at startup. Therefore, it will take a few more seconds than the normal startup.
  * This is for starting up the machine normally at the time of failure (UI freeze, etc.).
- After entering service mode or Settings/Registration screen of the RUI.
- After changing an item in Settings/Registrations that requires restart.
- The machine is shut down from RUI.
- When an error occurs.
- When resource downloader is active.
- When the printer/scanner enters limited function mode.
- When a login application is switched by SMS.
- A license has been registered.
- Startup by pressing the Control Panel Key.

MEAP

Preparation for Using SSO-H

■ Outline

When using Single Sign-On H (hereinafter referred to as SSO-H) for the login service, required system environments are different in server authentication or local device authentication.
See the following for system requirements in each of authentication methods:

■ Server authentication management

The system requirements necessary when using server authentication by SSO-H vary depending on the authentication server. The system requirements for using each authentication server are shown below.

● Active Directory authentication

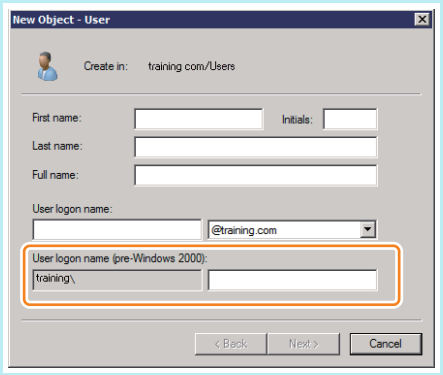
In order to use Active Directory authentication in SSO-H, the following system environments are required.

1. Authentication server (Active Directory : Windows server)
   - Active Directory and Domain Name System (DNS) should be installed.
   - A group named "Canon Peripheral Admins" should be created on the Active Directory.
   - The OS should be one of the followings.
     - Microsoft Windows Server 2003 SP2 *
     - Microsoft Windows Server 2003 R2 SP2 *
     - Microsoft Windows Server 2008 SP2 *
     - Microsoft Windows Server 2008 R2 SP1
     - Microsoft Windows Server 2012

     * 64-bit version is not supported.
2. Users accessing the authentication server (Active Directory: Windows Server)
   - The user should belong to the "Canon Peripheral Admins" group on the Active Directory.
   - The user name should contain only single-byte alphanumeric characters, - (hyphen), _ (low line), and % (percent).

NOTE:
The difference in time setting between the authentication server (Active Directory) and the machine (and the computer for login) should be within 5 minutes. (If the difference in time setting is 5 minutes or longer, an error will occur at the time of login for the server authentication.)

NOTE:
As for the user name for logging into the machine, use the name registered as "User logon name (pre-Windows 2000)" in the Active Directory.
An example of the user registration screen (Windows Server 2003)



● LDAP authentication

When using LDAP authentication by SSO-H, the following conditions need to be satisfied.

1. LDAP server
   - Novell eDirectory V8.8 SP6 for Windows
   - Lotus Domino V8.5 for Windows
2. OS where the LDAP server runs
   - It should comply with the specifications of the LDAP server product.

   Operation check has been conducted for the following OS.
   - Microsoft Windows Server 2003 Enterprise SP2
   - Microsoft Windows Server 2008 Enterprise

NOTE:
When an LDAP server other than the server shown above is used, SSO-H may not work properly.
Windows Active Directory works also as an LDAP server, but is not supported.

■ PC Environment of Administrator Users and General Users

The following environment is required to use this machine (managed by SSO-H) from a PC on the network.

● OS of the PC and Other Environments

Classification	Operating System	IPv6	Supported browser	Java Runtime Environment
Client OS	Windows XP Professional SP3	✓	Internet Explorer 7 Internet Explorer 8	JRE5.0/JRE6/JRE7 (Exclude JRE6 update4/5.)
	Windows Vista SP2	✓	Internet Explorer 7 Internet Explorer 8 Internet Explorer 9	
	Windows 7 SP1	✓	Internet Explorer 8 Internet Explorer 9	
	Windows 8	✓	Internet Explorer 10	
Server OS	Windows Server 2003 SP2 Windows Server 2003 R2 SP2	✓	Internet Explorer 7 Internet Explorer 8	
	Windows Server 2008 SP2	✓	Internet Explorer 7 Internet Explorer 8 Internet Explorer 9	
	Windows Server 2008 R2 SP1	✓	Internet Explorer 8 Internet Explorer 9	
Mac OS	Mac OS X v10.5		Safari 4.0.5 Safari 5.0.5	J2SE5.0 Java SE 6
	Mac OS X v10.6		Safari 4.0.5 Safari 5.0.5 Safari 5.1	Java SE 6
	Mac OS X Lion		Safari 5.1	Java SE 6 Java SE 7
	Mac OS X Mountain Lion		Safari 6.0	Java SE 7

JRE : Java Runtime Environment
J2SE : Java 2 Platform Standard Edition

NOTE:
common to browsers
- The browser should support Java. (The environment such as Modern UI version of Internet Explorer on Windows 8 in which Java add-on cannot be used is not applicable.)
- JavaScript should be enabled.
- Refer to the website of JAVA (http://java.com/) for how to obtain the Java environment.

NOTE:
Internet Exproler-related
- In order to use JRE6 Update24 with Internet Explorer 9/10, JRE6 Update24 or later is required.
- The ActiveX plug-in should be enabled in Internet Explorer.
- In Internet Explorer, if [Run ActiveX controls and plug-ins] is disabled in [Internet Options] > [Security] > [Custom level...], a warning message that JRE has not yet been installed is displayed.
- When using Windows XP in an IP v6 environment, IP v6 may need to be installed manually in some cases.

NOTE:
MacOS-related
- Java does not work in the case of combination of MacOS 10.6.8, Java SE 6 update6 (Java for MacOS X 10.6 Update 6) and Safari5.0.5. Either of the following measures needs to be taken to make it run.
- Not installing Java SE 6 update6 (Java for MacOS X 10.6 Update 6) (it is however not possible to uninstall it if it is already installed and running)
- Providing a symbolic link again using the command ofln -s /System/Library/Frameworks/JavaVM.framework/Resources/JavaPluginCocoa.bundle
- Upgrading Safari to version 5.1

● Network ports used

	Port No.	Application
Connecting	53	Communication with DNS server (fixed)
	88	Kerberos authentication with KDC (Key Distribution Center)
	1-65535 (default:389)	Communication with directory service using LDAP (default is 389, may be changed to any port on LDAP service side)
Listening	10000 - 10100	-

Preparation for Using SMS

To use SMS, a PC and browser used to access SMS are required, and the network settings need to be set up on the device.

■ Preparation of PC for Accessing SMS

● Checking of operation environment

In order to access SMS using password authentication, the PC and browser need to comply with the following system environment.
Combination of the Browser and the OS

Operating System	Supported browser
Windows XP Professional SP3	Internet Explorer 7 Internet Explorer 8
Windows Vista SP2	Internet Explorer 7 Internet Explorer 8 Internet Explorer 9
Windows 7 SP1	Internet Explorer 8 Internet Explorer 9
Windows 8	Internet Explorer 10
Mac OS X v10.5	Safari 4.0.5 Safari 5.0.5
Mac OS X v10.6	Safari 4.0.5 Safari 5.0.5 Safari 5.1
Mac OS X Lion	Safari 5.1
Mac OS X Mountain Lion	Safari 6.0

In order to access SMS using RLS authentication, the environment should comply with the environment for using SSO-H as the login service. (For details, refer to “PC Environment of Administrator Users and General Users” on page 215.)

● PC and Browser Settings

The PC and browser used to access SMS need to satisfy the following conditions.

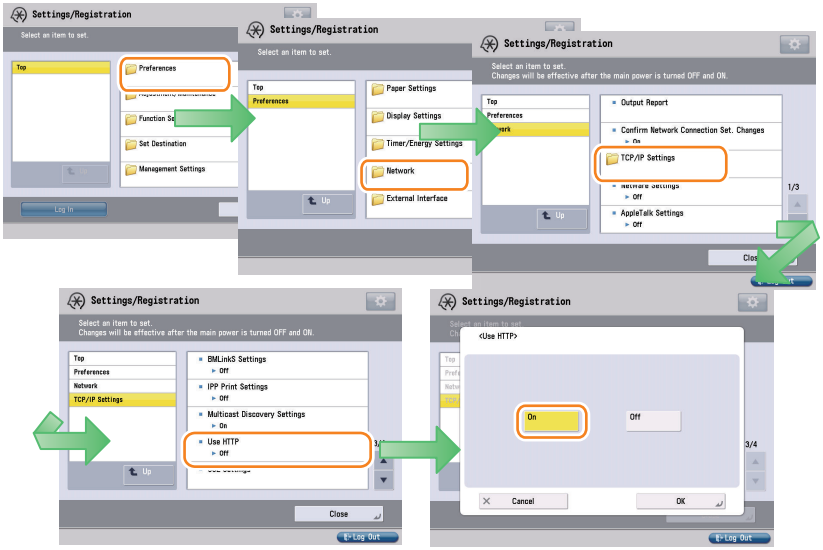
- The supported browser language should be the same with the language of the OS.
- Java Script should be enabled.
- The supported screen size should be 800 x 600 or larger (recommended size: 1024 x 768).
- Session cookie should be enabled.
- Only alphanumeric characters and some of the symbols ("-" or ".") should be used as the machine domain name and host name.
- If an invalid character string such as a low line ("_") is included in the host name, cookies cannot be enabled.

■ Settings on the Device Side

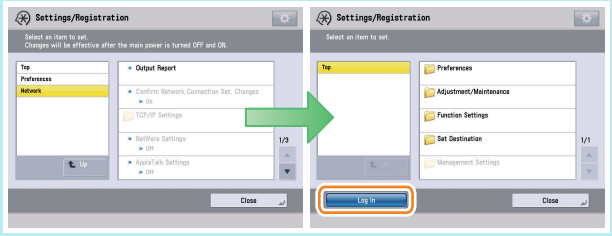
● Network setting procedure (enabling the network)

To provide support for this machine via a network such as SMS, it will be necessary to set the network from the machine's touch panel. ([ON] is specified at the time of shipment.)

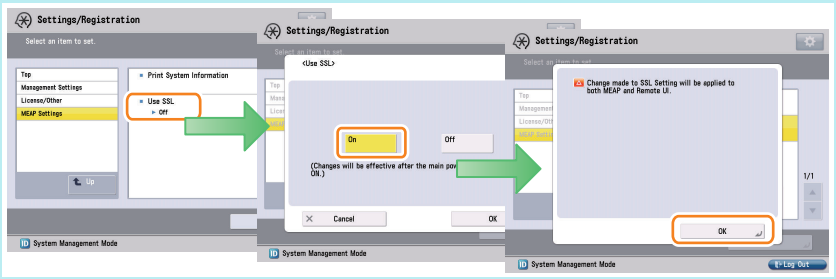
1. **Press [Settings/Registration], select [Preferences] > [Network] > [TCP/IP Settings] > [Use HTTP], and then press [ON].**



NOTE:
With this machine, the system administrator department ID and system administrator PIN are set by default, so items below [Network] cannot be pressed because they are grayed out.
Return to the top screen, and make settings after pressing [Login] at the lower left of the screen to login as the system administrator.
As to the default settings, the department ID is "7654321" and password is "7654321".



NOTE:
When using SSL, press [Settings/Registration], select [Management Settings] > [License/Other] > [MEAP Settings] > [Use SSL] and then press [ON]. (This setting also applies to RUI SSL settings. The same applies when SSL is ON in RUI.)
When [Use SSL] is set to ON, a message dialog box saying "SSL setting changes apply to both MEAP and RUI settings" will be displayed, so press [OK].



2. **Press [OK] to return to the basic screen.**
3. **Restart the machine.**

CAUTION:
- ON/OFF settings of [Use HTTP] will be enabled after the machine has been restarted.
- It is not possible to connect to this machine via a proxy server with a web browser. In an environment where you are using a proxy server, add the IP address of this machine to [Exception] (address not using the proxy) in the web browser's proxy server settings. (Settings differ depending on the network environment, so consult the network administrator.)
- SMS cannot be used if Cookies and JavaScript are disabled in your web browser.
- When entering characters from a web browser, use characters that can be entered from this machine's touch panel display. If other characters are used, they may not be correctly displayed or recognized by this machine.
- To set [Use SSL] to ON, it is necessary to set the key pair required for encrypted SSL communication and the server certificate in [Settings/Registration] ([Preferences] > [Network] > [TCP/IP Settings] > [SSL Settings]).

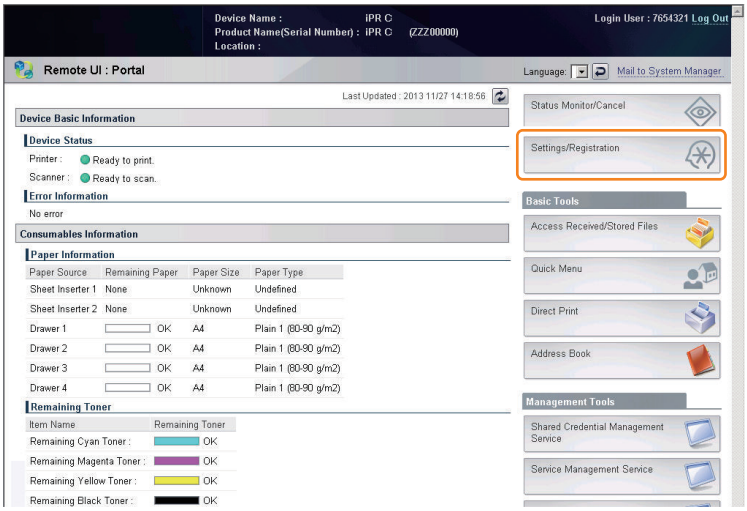
● Procedure for Setting Key Pair and Server Certificate when Using Encrypted SSL Communication

When using SMS over SSL connection, it is necessary to set the key pair and server certificate as the key to be used in advance. Note that the key (Default Key) which can be used for encrypted SSL communication is installed on the machine as standard. It is not necessary to set the key pair and server certificate in advance.
To use an encryption key other than the default key, refer to the procedure "Generating the Key Pair" below to set the key pair and server certificate required to perform encrypted SSL communication.

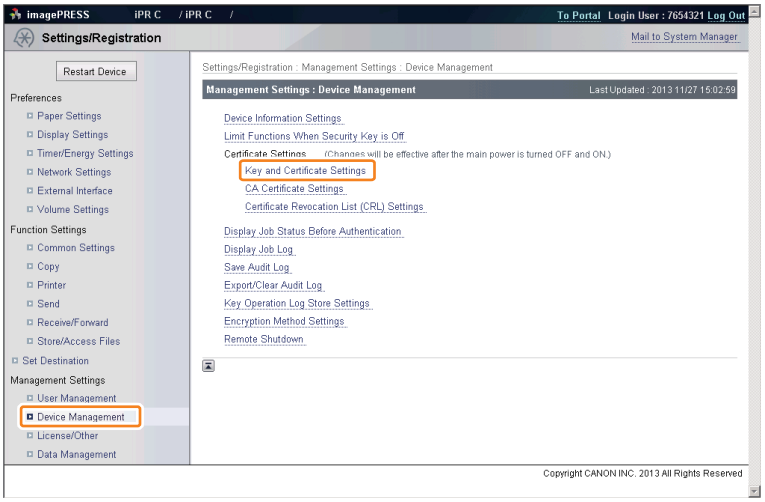
NOTE:
- The server certificate is installed on a Multi Functional Printer as standard.
- For the detailed procedure on setting the key to be used, refer to [Security] in the e-Manual.
- SMS always uses encrypted SSL communication by setting the key to be used, regardless of whether [Use SSL] is set to ON or OFF in [Settings/ Registration] > [Management Settings] > [License/Other] > [MEAP Settings].

Generating the Key Pair

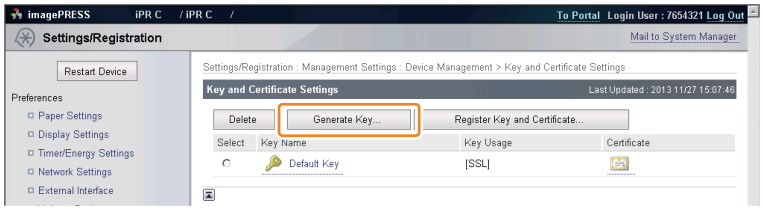
1. Access the remote UI portal page with the Web browser on a PC which is in the same network as the device, and select [Settings/ Registration] from the menu on the right side of the screen.
   Access URL: http://<device IP address>:8000/



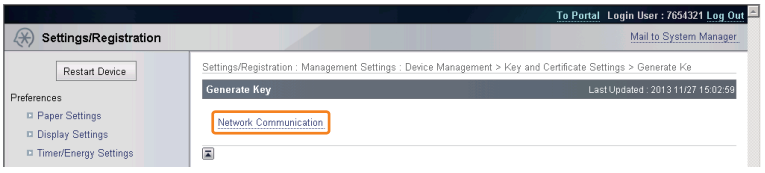
2. Click [Management Settings] > [Device Management] > [Certificate Settings] > [Key and Certificate Settings].



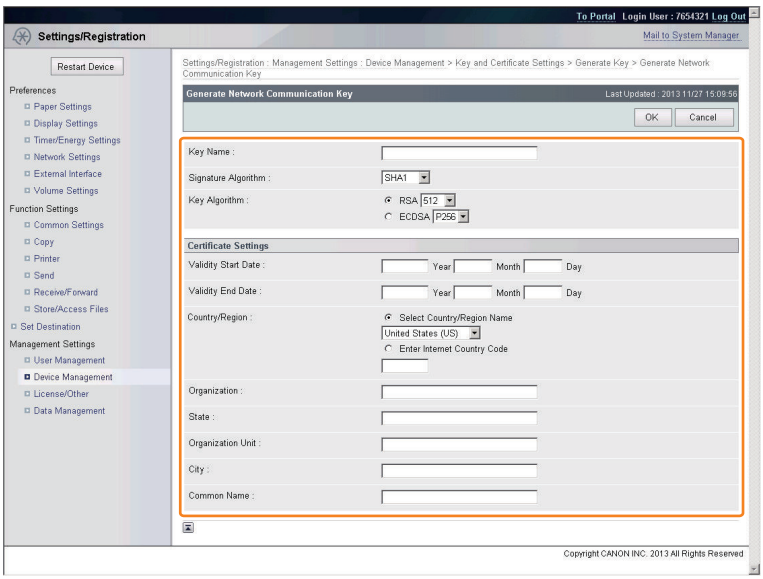
3. Click [Generate Key...].



4. Click [Network Communication].



5. Enter the required items, and click [OK].

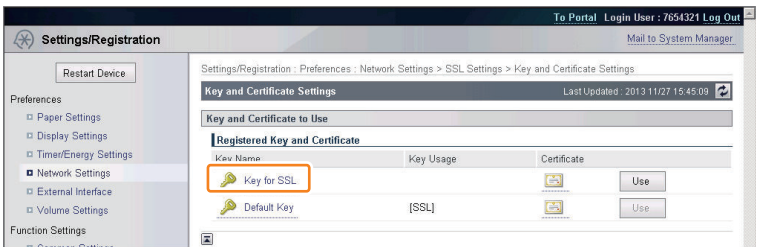


Entry example

Item name		Classification	Entry	Entry example
Key Settings				
	Key Name	Required	An arbitrary character string	Default Key
	Signature Algorithm	Required	Selected from: SHA1/SHA256/SHA384/ SHA512	SHA1
	Key Algorithm	Required	Selected from: RSA 512/ 1024/ 2048 4096 ECDSA P256/ P384/ P512	RSA1024
Certificate Settings				
	Validity Start Date	Required	Date	Dec. 24, 2013
	Validity End Date	Required	Date	Dec. 23, 2021
	Country/Region	Required	• Select by country/region name • Enter by Internet country code	JP
	Organization	Arbitrary	Organization name	-
	City	Arbitrary	City name	-
	Organization Unit	Arbitrary	Organization Unit	-
	Common Name	Arbitrary	Common name*	192.168.1.230

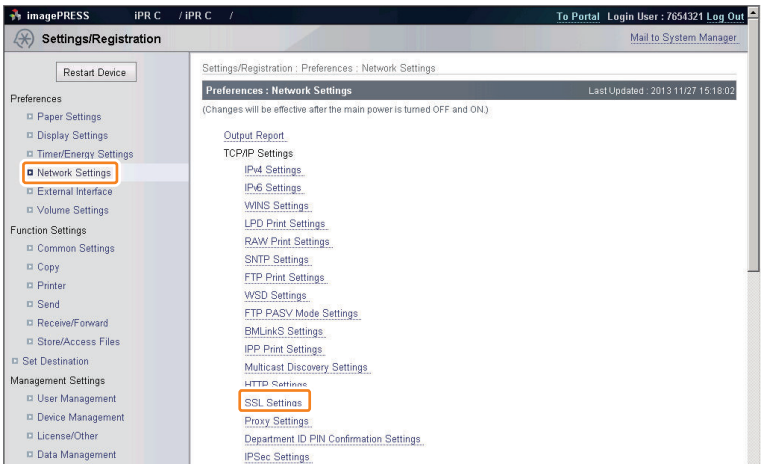
NOTE:
The IP address of the device (or the FQDN in environments where name resolution is enabled) can be entered in the [Common Name] column, and then the server certificate on the Web browser can be installed (refer to “Procedure for Setting Key Pair and Server Certificate when Using Encrypted SSL Communication” on page 218) to prevent the "Certificate Error" that is displayed when accessing with Internet Explorer 7 or later.

6. Confirm that the key generated in [Key and Certificate Settings] is displayed.

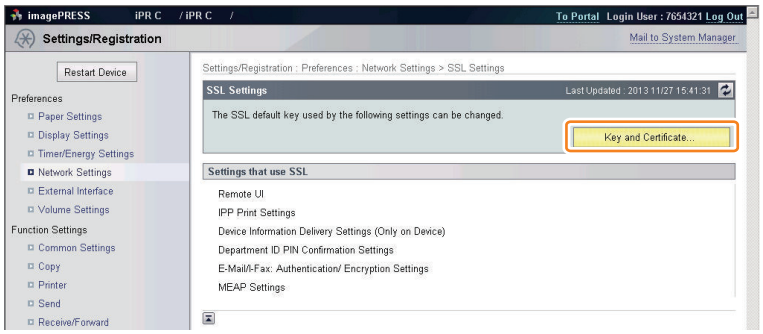


Registering the Key to be Used

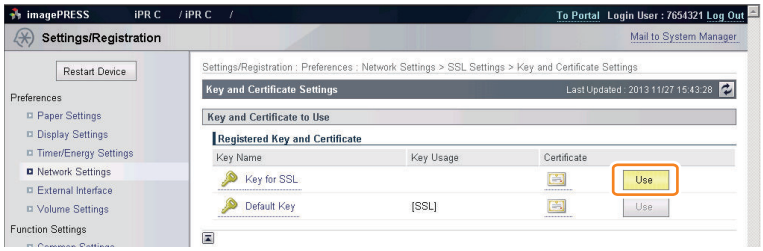
1. Click [Management Settings] > [Network] > [TCP/IP Settings] > [SSL Settings].



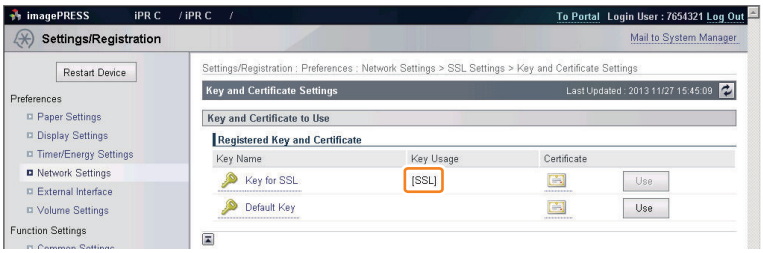
2. Click [Key and Certificate...].



3. Click [Use] for the generated key.



4. Check if [SSL] is displayed in the [Key Usage] column.



5. Log out from the remote UI, and restart the device.

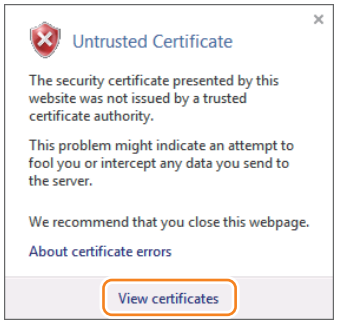
Installing the Server Certificate (Reference Information)

When accessing the device which sets the key installed as standard as the SSL key, the "Certificate Error" that is displayed when accessing with Internet Explorer 7 or later.
Error display example

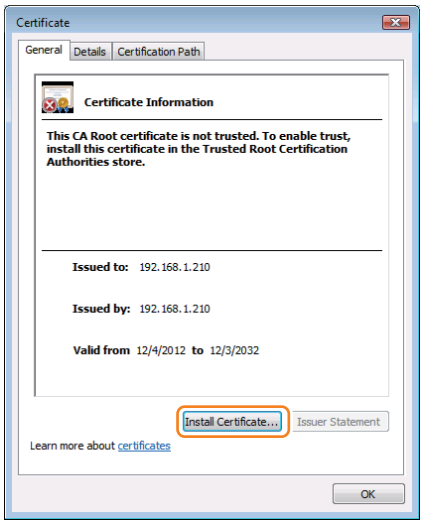
To prevent the "Certificate Error" from being displayed, this section describes below the procedure for setting the key generated in ""Procedure for Setting Key Pair and Server Certificate when Using Encrypted SSL Communication" on page 218" (the key for which the device IP address is entered as the common name) as the SSL key (when using Internet Explorer 8).

1. Access with the Web browser, and click "Certificate Error" in the URL entry column.

2. Click [View certificates].

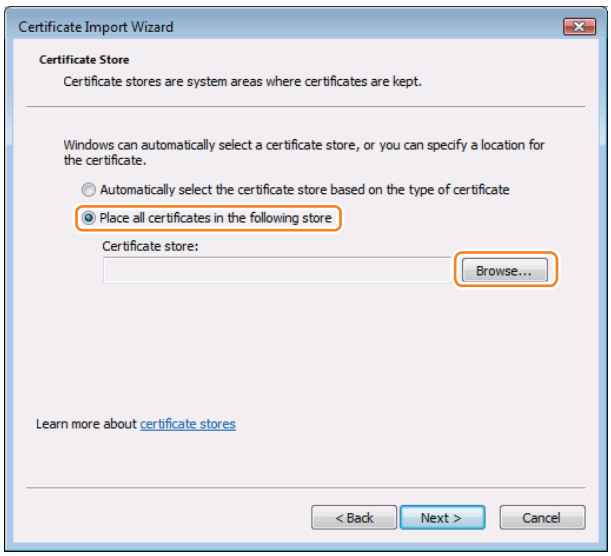


3. Click [Install Certificate...] on the [General] tab.

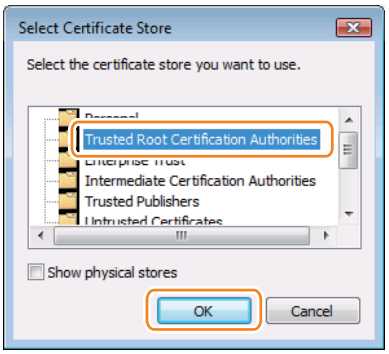


4. "Certificate Import Wizard" will appear. Click [Next].

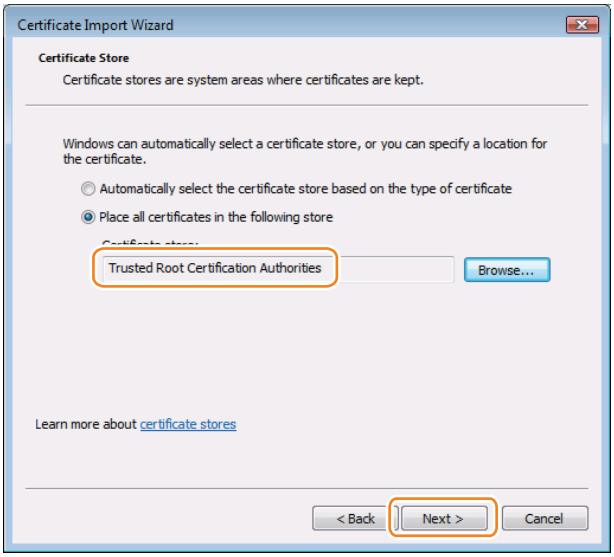
5. Check [Place all certificates in the following store] in [Certificate Store], and click [Browse].



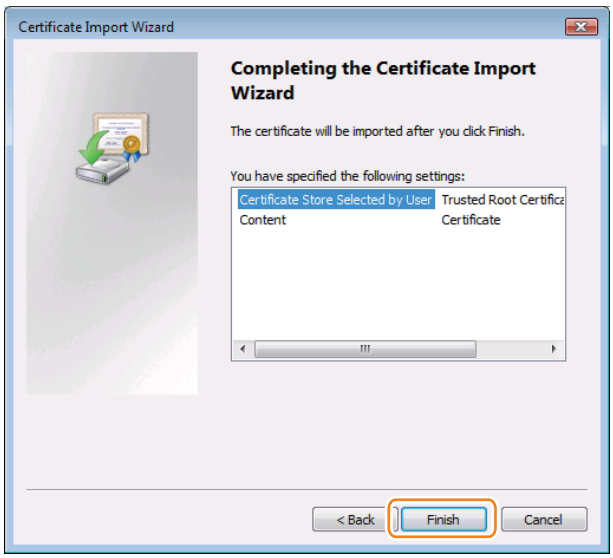
6. In [Select Certificate Store], select [Trusted Root Certification Authorities], and then click the [OK].



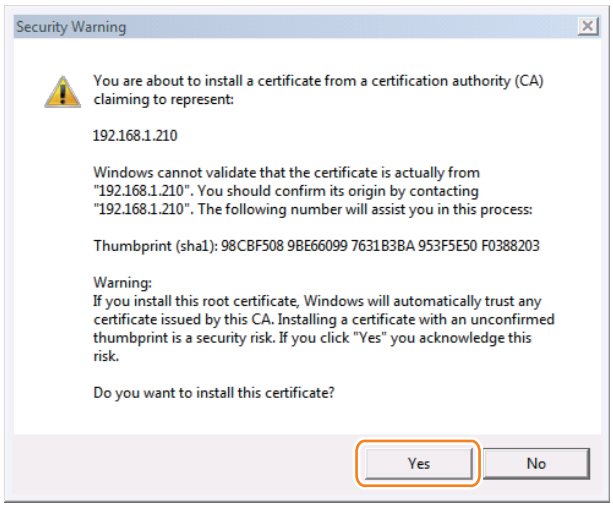
7. You will return to the [Certificate Store] dialog box. Check that "Trusted Root Certification Authorities" appears in [Certificate], and then click the [Next].



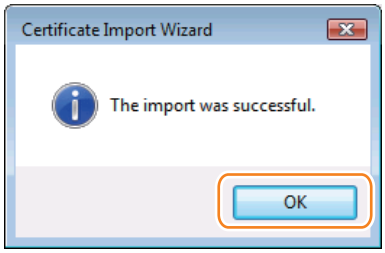
8. [Completing the Certificate Import Wizard] will appear. Click the [Finish].



9. If the [Security Warning] dialog box appears, click the [Yes]. (It does not appear when installing the same certificate again.)



10. The message indicating that the certificate has been imported successfully is displayed. Click [OK].

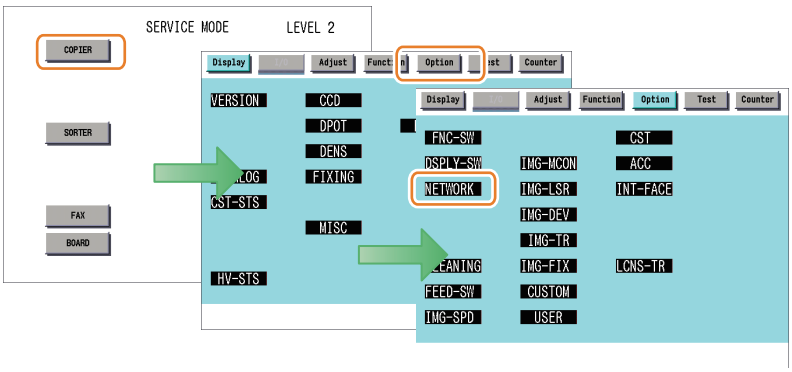


● Network Port Settings

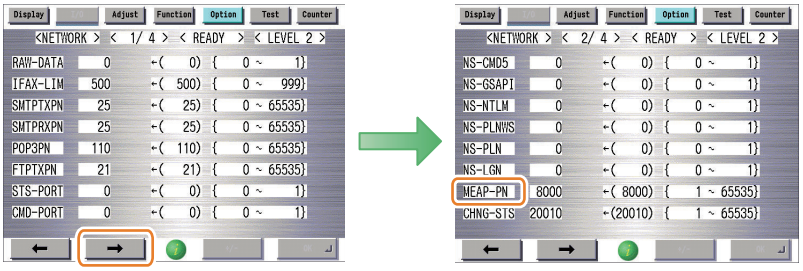
The default port of the HTTP server used for MEAP and MEAP applications to provide the servlet function is 8000, and the HTTPS server's default port is 8443. In the case that these ports have already used by the customer who is to introduce this application, the MEAP application cannot use the HTTP (or HTTPS) server(s).
By changing the following ports to use, however, the MEAP application can be used as well as the existing system.

1. **Start [SERVICE MODE] in Level 2.**

2. **Press [COPIER] > [Option] > [NETWORK].**



3. **To set up the HTTP server port, select [MEAP-PN]. To set up the HTTPS server port, select [MEAP-SSL].**



4. **Press the port number to specify on the control panel (the numerical value input in the field is displayed), and press [OK].**

NOTE:
A port number can be any integer from 0 to 65535. To avoid port numbers that are frequently used, do not use any integer from 0 to 1023.

Server	Setting value	Default value / Value after RAM clear
HTTP Server	1024 to 65535	8000
HTTPS Server	1024 to 65535	8443

NOTE:
- If Print Server is connected, do not specify port 8080. If port 8080 is specified, it is not possible to access the remote UI of the device where the MEAP authentication application is running. (Port 8080 is reserved to allow the PS Print Server Unit to redirect to the device.)
- As for port on HTTPS server, it only applies to the device that supports SSL function.

5. **Restart the device if the port number is set.**

■ How to Check the Serial Number

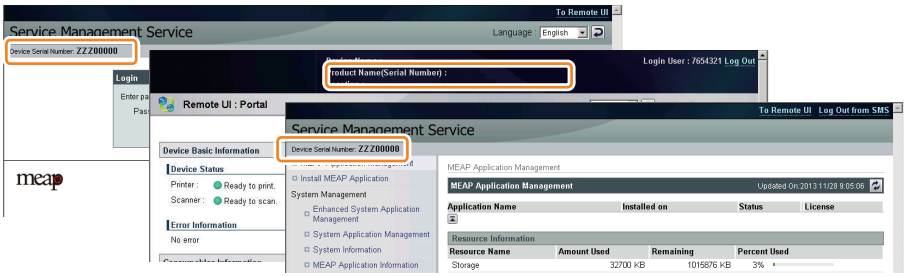
When performing MEAP device support, the serial number of the device is necessary in some cases.
Examples of where the serial number is necessary

- When initializing SMS login password (obtaining a switch license)
- When obtaining a MEAP application license from LMS
- When obtaining a transfer license of MEAP application
- When obtaining a special license for reinstalling MEAP application

If a problem occurs in the MEAP device and you want to contact the support department of the sales company, you need to provide the serial number. Perform the following procedure to get the serial number.

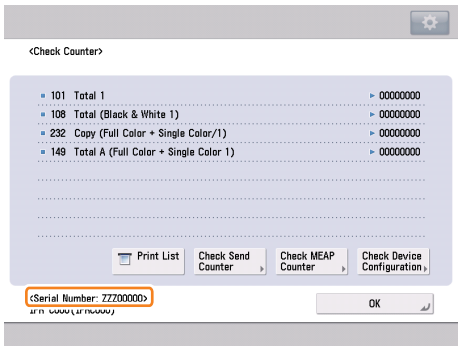
● Checking from the PC browser

The serial number of the device is displayed on the SMS login screen, SMS screen, and remote UI portal screen.



● Checking from the device's Touch Panel

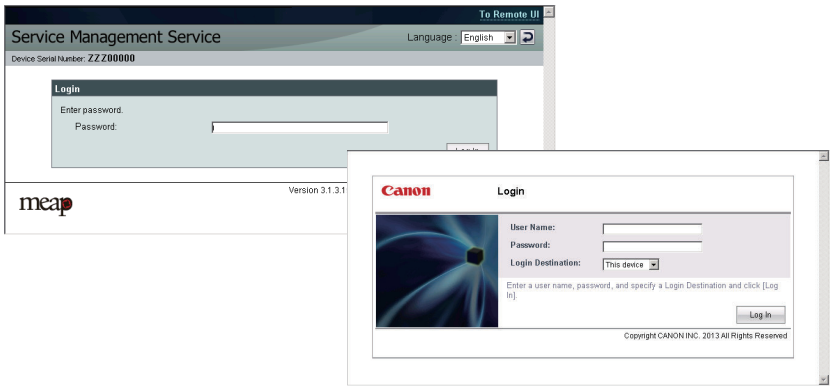
You can see the number by pressing the counter key on the Control Panel of the machine.



Login to SMS

■ Outline

SMS login may be done by entering a password for authentication, or by authentication via the Remote Login Service (RLS) login window (RLS authentication). Settings can be changed to allow either only one of these methods or both of them.
SMS login window (password auth) RLS login window (user name/ password auth)



Login method	Authentication method	Authentication service name	Users who may log in
Password authentication	Password authentication	SMS Installer Service (Password Authentication)	Users who know the SMS login password
RLS login	SSO-H	SMS Installer Service (Remote Login Service Authentication)	Users registered as administrators with SSO-H

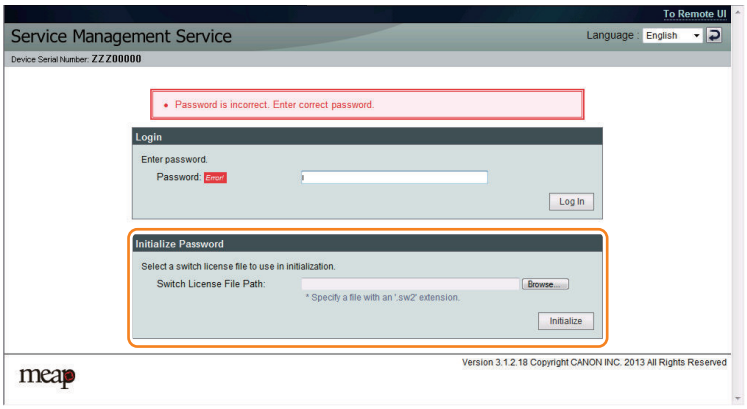
NOTE:
If Default Authentication is selected as the device authentication method, "RLS Authentication" is not selectable as SMS Login method. Also, if "RLS Authentication" is selected, the device authentication method (Default Authentication, SDL, SSO) cannot be changed.

■ When SMS Cannot Be Accessed

● If you forgot the password (SMS login password initialization)

After changing the default SMS login password, if you forgot the new password and cannot log in to SMS, you can use a switch license for password initialization to change the password back to the default value "MeapSmsLogin".
Note that there is no special password for service.

1. **Obtain a switch license file for password initialization.**
   Contact the person in charge of support at the sales company, give the device's serial number, and have a switch license file for password initialization issued.
2. **Load the switch license file.**
   With nothing entered, click the [Log in] to display the area for specifying a switch license file for password initialization.



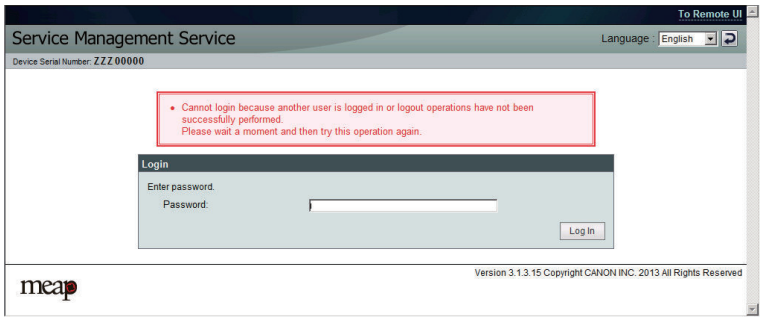
3. **Specify the switch license file.**
   Click the [Browse] and specify the switch license file.

4. **Initialize the login password.**
   Click the [Initialize] to display an initialization confirmation page, and click the [OK].

NOTE:
- The default password is "MeapSmsLogin." (The password is case-sensitive.)
- If you click [Cancel], the Login page opens without initializing the password.

● If login is not possible due to exclusive control

Since access to SMS is under exclusive control, you cannot log in if another user has already logged into the SMS of the same device.
An example of the exclusive control message



If you cannot log in due to exclusive control, you need to ask the other user to log out before you can try again.

NOTE:
If you close the browser without logging out, the session remains active. In that case, you cannot log in again.
If this problem occurs, you can wait for 5 minutes so that the session is disconnected. Or, you can restart the device to force the session to disconnect.

● If [Key and Certificate Settings] is not set

If [Key and Certificate Settings] is not set correctly, you cannot access the URL for SMS (https://<device's IP address>:8443/sms/). In that case, perform the following procedure.

1. **Go to http://<device's IP address>:8000/sms/, and check to see that "HTTP 500 Internal Server Error" appears.**
2. **If it appears, perform the procedure "Procedure for Setting Key Pair and Server Certificate when Using Encrypted SSL Communication" on page 218 in this chapter.**

NOTE:
In the case of SMS, by setting the key to be used, encrypted SSL communication is always executed regardless of the following setting: [Settings/Registration] > [Management Settings] > [License/Other] > [MEAP Settings] > [Use SSL] > ON/OFF.

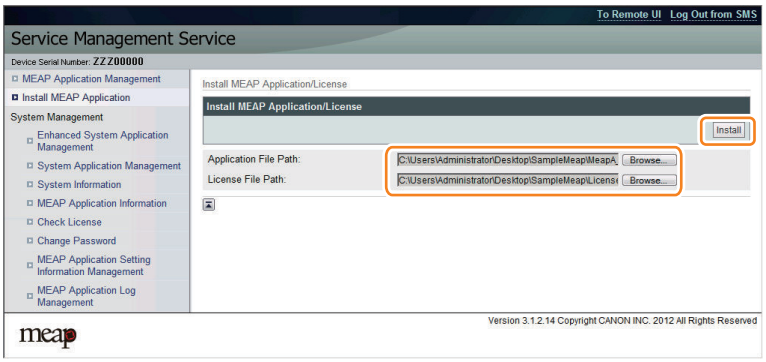
■ How to Deal with a Message "Certificate Error" That Appears at the Time of Access

When accessing from the browser to SMS, a message "Certificate Error" appears in some cases. In that case, perform the procedure "Installing the Server Certificate (Reference Information)" on page 221 in this chapter.

Installing an MEAP Application

■ Outline

From the MEAP application installation screen, you can install the MEAP application as well as the license file.



Before installing the MEAP application, be sure to check the following items.

● Device compatibility with the MEAP application

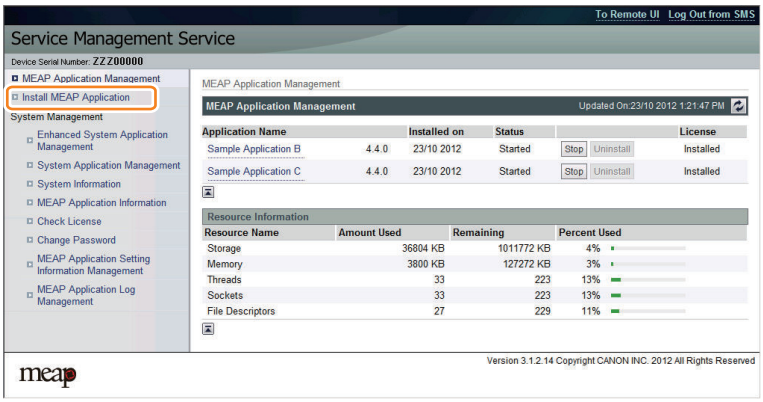
To find out whether the device is compatible with the MEAP application, check the devices supported by the MEAP application. Depending on the application, the device's firmware may require version upgrade.

● Resources availability (remaining amount)

The necessary resources (free storage space and free memory available) must be secured for an MEAP application to run; otherwise, you cannot install the MEAP application.
To check the resource information, see “Device's resources” on page 233 in this manual.

■ Procedure to install applications

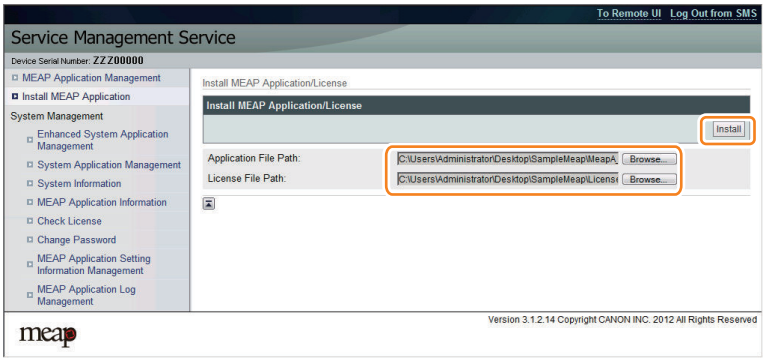
1. **Long on to SMS.**
2. **Click [Install MEAP Application] on the menu.**



3. **Check [Install MEAP Application/License]page appears.**

4. **Click [Browse..], and select the application file and the license file of the application; then, click [Install].**

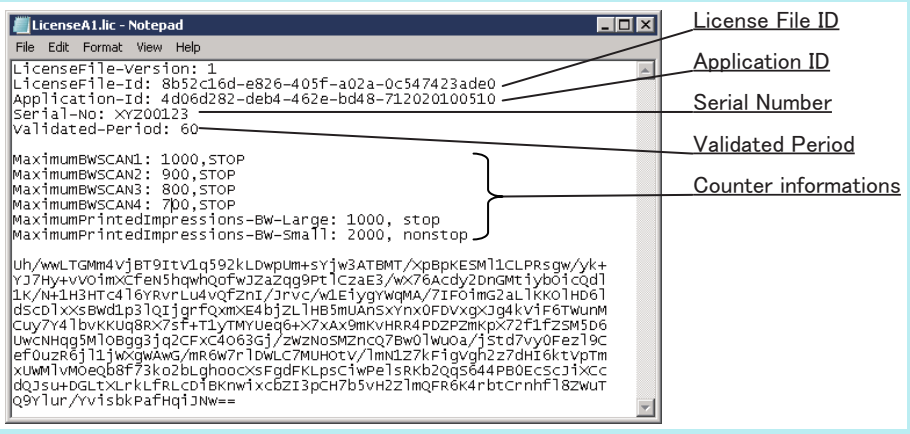
NOTE:
Application File: identified by the extension "jar".
License File: identified by the extension "lic".



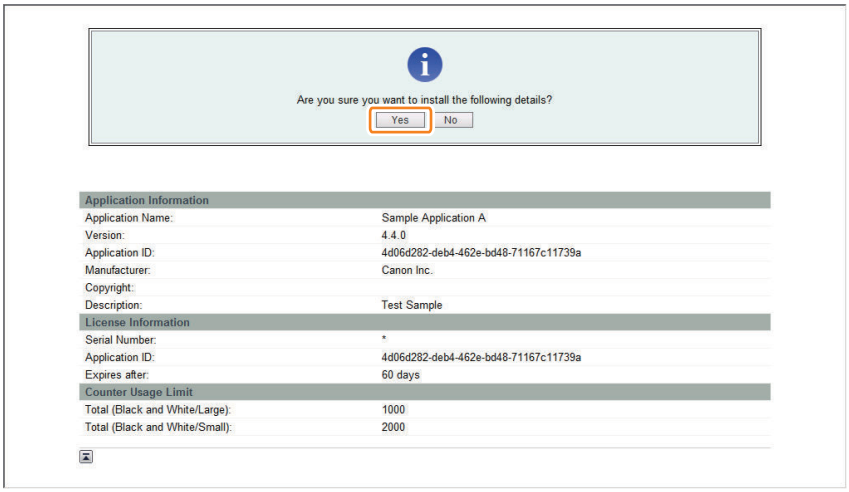
CAUTION:

- You cannot install only the license.
- You will not be able to install the application without using the appropriate license. Be sure to select its license file.
- If you are adding a license to an existing application, see "Procedure adding a license file" on page 238.
- If you are updating an existing application, stop the application; then, install the new application or its license file. You will not be able to update an application while it is running.

NOTE:
The license file is provided in text file format, enabling to view in a text editor. The application ID and device serial number shown in the file allow users to confirm which device to install with the license file.
Note that any changes added to the license file may disable installation. Cares should be taken when confirming the contents of the license file.
Sample file

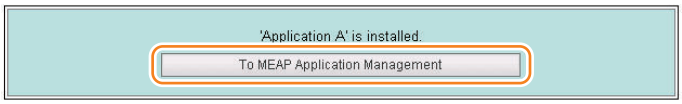


5. **Check the contents of the Confirm page; then, click [OK].**

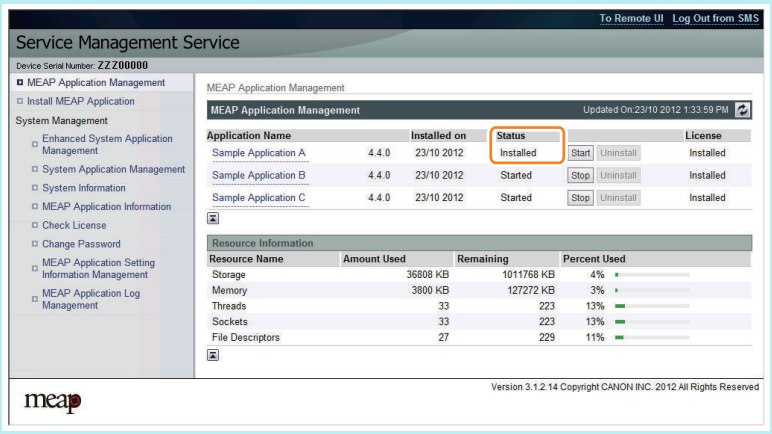


6. **Some applications show a screen to indicate the terms of agreement. Read the terms, and click [OK].**
7. **Check the message "Installing...Please wait." appears, beginning the installation.**

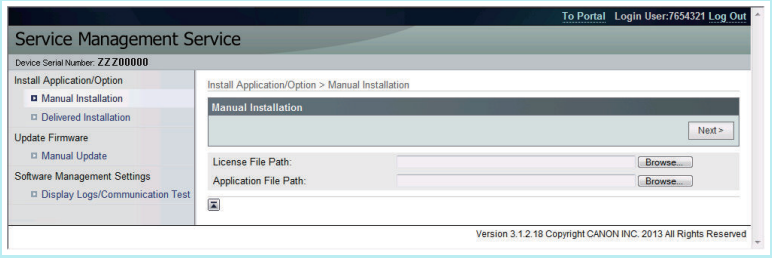
8. **Upon installation completed, click [To MEAP Application Management] shown on the screen to view MEAP Application Management page.**



NOTE:
As for an application that has just been installed, the status is "Installed". In order to use the application, it is necessary to click the [Start] to change the status to [Started].



NOTE:
There are two ways to install an MEAP application. You can install using SMS, or install using the [Register/Update Software] screen of the remote UI.
Screen example



[Register/Update Software] provides two types of installations. One is [Manual Installation] where you specify a jar file and a license file and then install. The other is [Delivered Installation] where you enter a license access number.
For details of the procedures, please refer to the e-Manual.

■ Resource Information

● Outline

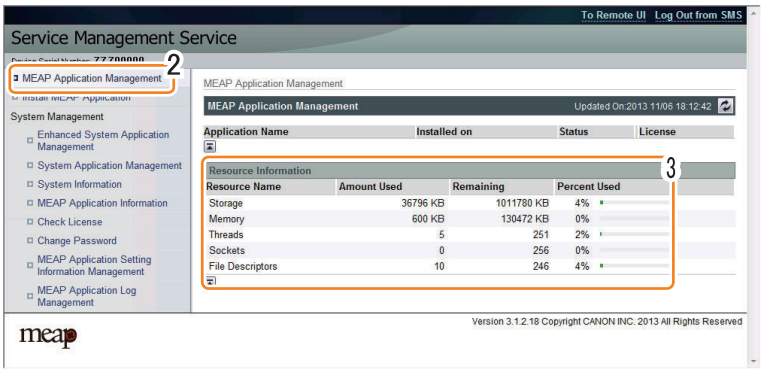
Application Management page shows [resource information] for information of the whole device resources including Amount Used, Remaining, and Percent Used.
This function enables users to judge the remaining resources before installing the additional application. Such resource information is shown based on the manifest header stated at the top of each application, which declares the resources required in the application. Therefore, the information does not necessarily show the resources actually in use.
The following resource information is shown:

- Storage
- Memory
- Thread
- Socket
- File Descriptor

If the hard disk does not have enough free space for the application, the application cannot be installed.
Moreover, if the free space of any of the resources (Memory, Thread, Socket, and File Descriptor) is insufficient, the application cannot be started.

The following procedure shows how to check the resource information.

1. Log in to SMS.
2. Click [MEAP Application Management].
3. Check [Resource Information] for information of the whole device resources.



● Device's resources

When 1 MEAP application operates, the resource volume allocated to each device is as follows (loaded resource list). Since the following value is an estimate, when installing the MEAP applications, it needs to check the available resource of SMS.
Since the indication of SMS resource volume fluctuates by the login service (authentication function) and configuration (future model), which the user selected, it may show a bigger value than the following values.
List of Available Resources

Item Name	Storage	Memory	Thread	Socket	File Description
Resource volume	1024MB	128MB	256	256	256

NOTE:

- Among the resources, the free space of Storage is checked when installing an application. For other resources, the free space is checked when the application is started.
- Some applications call for a specific set of conditions for installation. For details, see the User's Guide that comes with the individual applications.
- Maximum installable application is up to 20 even if the remaining resource is adequate. (However, the Send function consumes 1, it must be 19 in practice.) Authentication application is not included in this number.
- The MEAP application, which can be started simultaneously, is up to 19. (Authentication application is not included in this number.)

CAUTION:
To install an application, the user needs to use the following URL when accessing the license control system to obtain a license file. In doing so, he/she needs to register the license access number of the application and the serial number of the device.
http://www.canon.com/lms/license/

■ What is MEAP Specifications (MEAP Spec Version)?

MEAP Specifications is one of the information required to judge whether MEAP applications can be operated or not. With MEAP Specifications, you can prevent an application that uses a specific function of device from being installed onto the device that does not have the function.

● About Name

The displayed name for Meap Specifications differs depending on the screen or the location where the name is displayed.
In this document, it is referred to as "Meap Specifications".

The location where the name is displayed/shown	Displayed name
Platform Information : SMS > [System Management] > [System Information] > [Platform Information]	MEAP Specifications
System Information Print : Local UI [Settings/Registration] > [Management Settings] > [License/Other] > [MEAP Settings] > [System Information Print]	

The location where the name is displayed/shown	Displayed name
Manifest file of the MEAP application	MeapSpecVersion
SDK documents	

● System

The MEAP platform decides whether a MEAP application can operate on itself by referring to the following 2 pieces of information:

- Device Specification ID
- MEAP Specifications

The Device Specification ID represents functions such as print, scan and copy which a device originally has and information such as the maximum allowed number of copies which varies across models. The ID varies across models. (It is easy to readily identify each ID because of this.) A MEAP application declares one or more Device Specification IDs required for execution. When multiple IDs are declared, it means that the MEAP application can operate on all the declared models. When installing a MEAP application with SMS (Service Management Service) or MEAP Enterprise Service Manager, the MEAP platform on a device checks the Device Specification ID(s) for matching purposes. The device rejects installation if it supports no ID(s) declared by the application. This is how it works.

MEAP specifications represent information other than that specified by the above mentioned Device Specification ID. This version number does not necessarily vary across models.

A MEAP application declares one or more MEAP specifications required for execution. When multiple IDs are declared, it means that the MEAP application can operate in all declared environments. When installing a MEAP application with SMS (Service Management Service) or MEAP Enterprise Service Manager, the MEAP platform on a device checks the MEAP specifications for matching purposes. The device rejects installation if it supports no version(s) declared by the application. This is how it works.

MEAP specifications by model

Initial MEAPSpecVersion

5, 6, 7, 9, 10, 11, 13, 14, 15, 17, 18, 19, 25, 26, 27, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 44, 45, 46, 47, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 64, 65, 66, 67, 68, 69, 70, 71, 72, 74, 78, 79, 80, 82

List of MEAP specifications

Ver	Details of function
1	MEAP basic function
2	Functions supported by MEAP spec version 1 + SSL/TSL + Proxy
5	Functions supported by MEAP spec version 1 + CPCA V2 + ERS (Error Recovery Service) + new SSL/TSL
6	Reserved
7	Functions supported by MEAP spec version 5 + high compression searchable PDF + searchable PDF + USB-Host (buffering for transferring Interrupt)
9	Reserved
10	Functions supported by MEAP spec version 5 + USB-Host (Exception + ClearFeature + SetFeature + HotPlug) + WINS address acquired by MIBAgent + TimerService + SSL client authentication
11	Functions supported by MEAP spec version 5 + AMS
13	Functions supported by MEAP spec version 5 + J2ME1.1 support + encryption PDF + outline PDF + CTK2.0
14	Device signature PDF
15	IMI + ERS (addition of IMI API), IPv6 support, enhanced encryption (AES/RC4)
17	Direct image processing in the JPEG file format
18	XML document parsing processing (XML parser)
19	Enhanced IMI (IMI Version 1.2 series)
21	Reserved
25	Function to generate a key event from the keyboard device when using the HID system driver API capable of accessing the Mass Storage class device when using the Mass Storage system driver
26	Function to prioritize the use of the MEAP driver
27	Addition of a symbol which can be used for MibAgent (support for the symbol to acquire an IPv6 address)
29	Addition of the IMI API (support for IMI Version 1.2.1)
30	A broader type of address entries which can be imported into the Address Book (e-mail/group/fax/file)
31	Integrated ERS function
32	Enhanced imaging functions (functions to generate visible signature PDF/OOXML (PowerPoint))
33	Enhanced imageRUNNER ADVANCE Series functions (support for the Address Book, CKT and Top Menu API)
34	Enhanced IMI Box functions (v1.3.0)
35	Enhanced SIS functions (functions to check the status of a network cable and print server)

Ver	Details of function
36	Reserved
37	Addition of an API to support CLS (Contextual Login Service)
38	Support for imageRUNNER ADVANCE Series administrator privileges
39	Addition of MEAP specifications due to change in the Jcrypto API specifications
40	Addition of an imagingAPI (an API for creating visible signature PDF)
41	Reserved
42	Reserved
44	Support for imageRUNNER ADVANCE Series Remote Address and Remote Fax
45	Addition of an API capable of acquiring the USB attachment status (HID device)
46	Support for a multi-language USB keyboard for the system driver
47	Addition of an API for giving instructions to print IMI encryption PDF from a MEAP application
48	ID to represent scan features available with the imageRUNNER ADVANCE C2030/C2020 Series
49	Reserved
50	SecurityOptionalPackage
51	Enhanced IMI functions for imageRUNNER ADVANCE C5051 Series (Ver50.xx or later) onwards
52	Addition of an API to turn SSL communication On/Off per URL for imageRUNNER ADVANCE C5051 Series (Ver50.xx or later) onwards
53	Disclosure of functions to register and delete custom menus
54	Addition of a function to notify an event to the application when recovering from sleep
55	System account issue function
56	MEAP User Preference Service
57	MEAP Application Configuration Service
58	MEAP Application Log Service
59	Integrated authentication services
60	SFP basic functions
61	AVS for LBP (Lightweight Applet Viewer Service)
62	SIS for LBP (Lightweight System Interface Service)
63	LDT
64	Support for IMI solution businesses
65	Enhanced MEAP User Preference Service (Ver56) (application shared preferences)
66	Reserved
68	Addition of an API for generating word documents in the Office Open XML format
69	Enhanced encryption PDF functions (AES 128-bit/256-bit)
70	Addition of non-compressed searchable PDF and XPS/linealized searchable PDF formats
71	Reserved
72	Reserved
73	Original image orientation API with support for A4 scanners
74	Additional support for the CN verification function
75	Reserved
76	Addition of the SFP ExtendedTextInputView class
77	Reserved
78	Reserved
79	Reserved
80	Reserved
81	Reserved
82	Recovery API from Sleep 1

MEAP Application Management

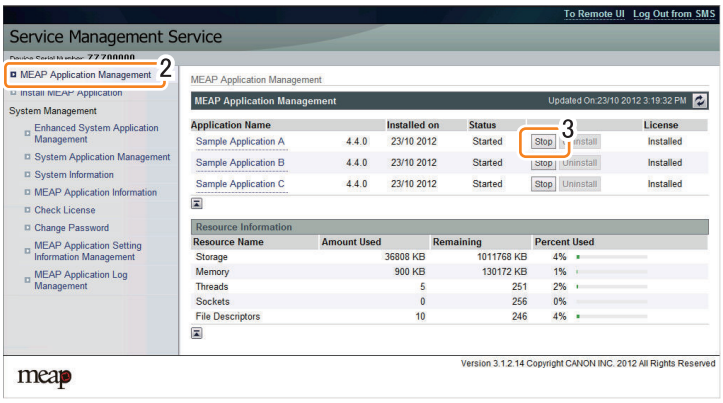
■ Outline

You can use the MEAP application management screen to perform basic management tasks of the MEAP application (start, stop, uninstall), or check the device's resource information.

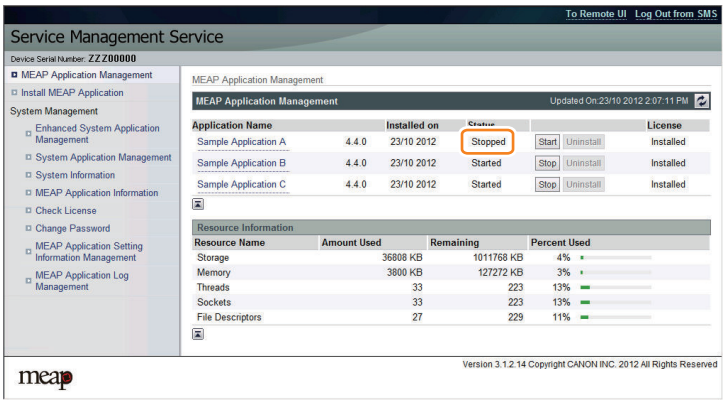
■ Starting, Stopping, or Uninstalling the MEAP Application

● Procedure to start and stop a MEAP application

1. **Log in to the SMS. (Refer to “Login to SMS” on page 226 in this manual.)**
2. **Click [MEAP Application Management].**
3. **Click [Start] or [Stop] shown for the MEAP application to be started or stopped.**



4. **Check to see that the status of the MEAP application in question is either [Started] or [Stopped].**



● If the MEAP application cannot be started

If the conditions to start the MEAP application are not satisfied, the MEAP application cannot be started.
If the MEAP application cannot be started, check the following items.

Is a valid license installed?

If the license has expired, you cannot start the application. If the license has already expired, obtain a new license and then update the license. (See “Managing the License File” on page 238 in this manual.)

Are the necessary resources available?

If the resources such as memory capacity or number of threads are not sufficient, the application also cannot be started. Delete any unnecessary data to secure sufficient resources.
If the application still cannot be started after checking the foregoing conditions, contact the support department of the sales company.

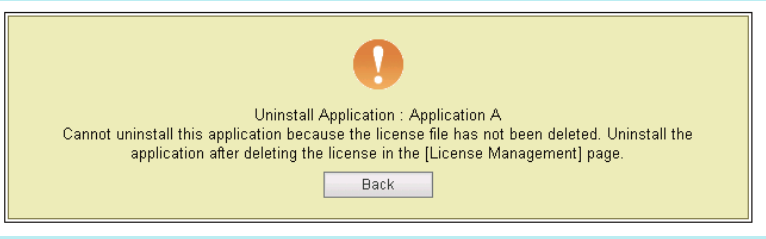
● Procedure to uninstall the MEAP application

Before uninstalling the MEAP application, check that the following conditions are met.

- The MEAP application has stopped.
- The license has been disabled or deleted. (The status is "Not Installed".)

For information on the procedure to stop the MEAP application, see the previous section “Procedure to start and stop a MEAP application” on page 236.
For information on the procedure to delete the license file, see the following section “Managing the License File” on page 238.

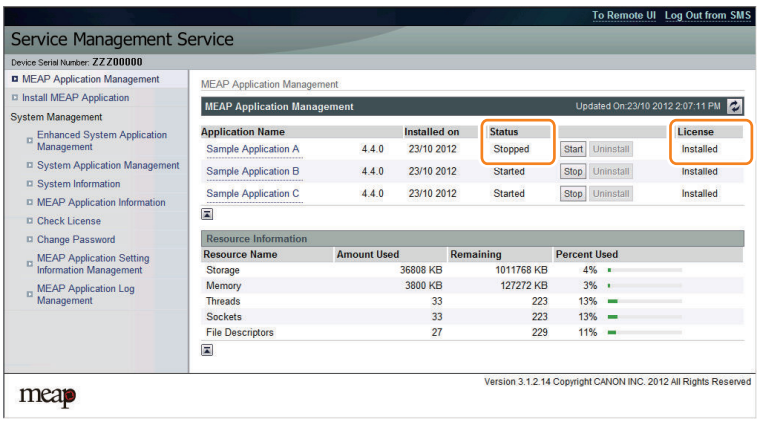
NOTE:
When a user tries to uninstall an application before deleting the license, the following message is shown.



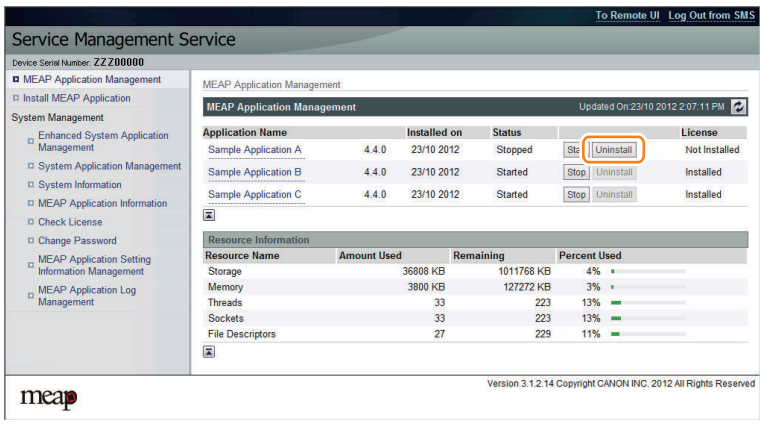
If the license file of the selected application cannot be deleted, the [Uninstall] is grayed out and therefore the application cannot be uninstalled.

CAUTION:
If the application you are uninstalling is associated with another application, a message will appear to indicate that the package exported by the application will no loner be available. Uninstalling such an application may also disable its associated applications.

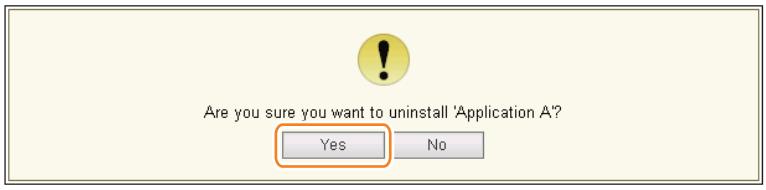
1. **Log in to SMS to click [MEAP Application Management] on the menu.**
2. **Check that the status of the application you want to uninstall is [Stop] and the license has been disabled. (The status is "Not Installed".)**



3. **Click [Uninstall] for the application to be uninstalled.**



4. **Check the application name to be uninstalled shown on the screen to click [Yes].**
   Upon [Yes] clicked, uninstallation process is started.



■ Managing the License File

● Outline

The license file management functions allow you to perform the following operations related to the license file necessary for the MEAP application to run.

- Update the license which has already expired.
- Disable or delete the license file in order to uninstall the MEAP application.

These license management functions can be performed from the [MEAP Application Management] screen.
The main license management functions are as follows:

Adding a license

When the license has expired, you can add a license file.

Disabling a License File

Before uninstalling the MEAP application, the license needs to be deleted. In that case, you must first disable the license file because a license file which has not been disabled cannot be downloaded or deleted.

Downloading / Removing an Invalidated License File

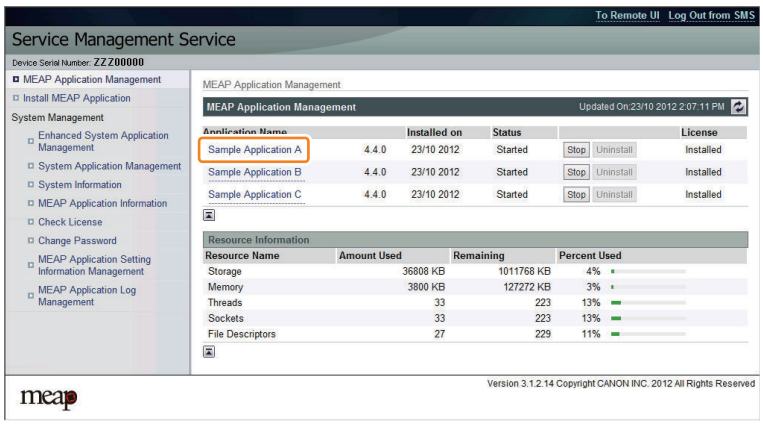
Before uninstalling the MEAP application, you need to delete its license file which has already been disabled.
By downloading the license file to your PC before it is deleted, you can use it when installing the application again to the same device.

CAUTION:
After deleting the license file which has been disabled, you can no longer download the license file.

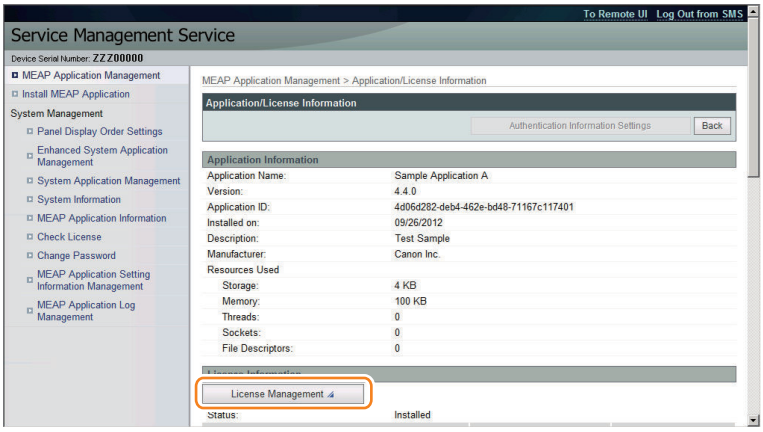
● Procedure adding a license file

1. **Log on to SMS.**

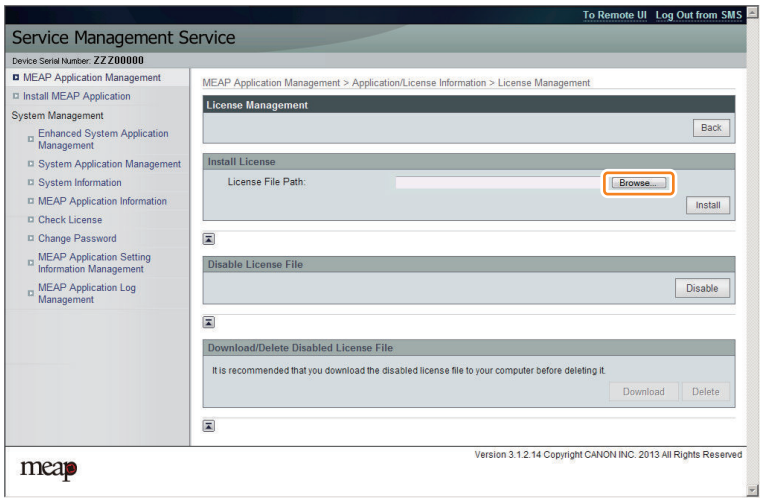
2. **On MEAP Application Management, click the name of the application to which you want to add a license file.**



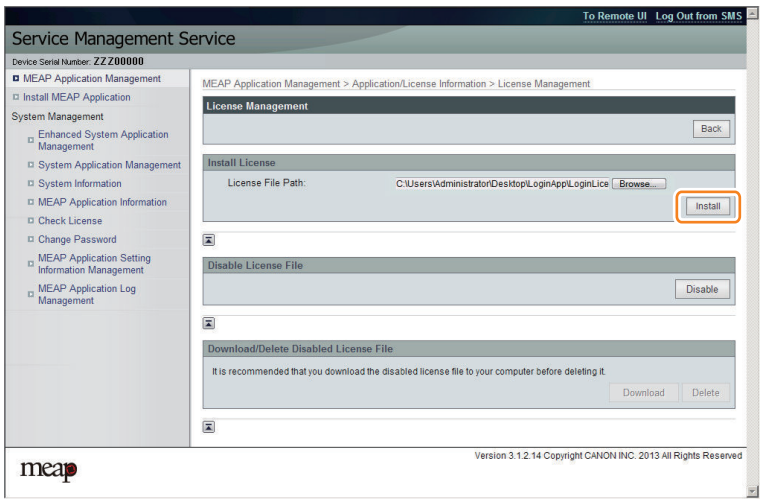
3. **In [Application / License Information] page shown on the screen, click [License Management].**



4. **Click [Browse], and select the license file you want to install.**



5. **Click [Install].**



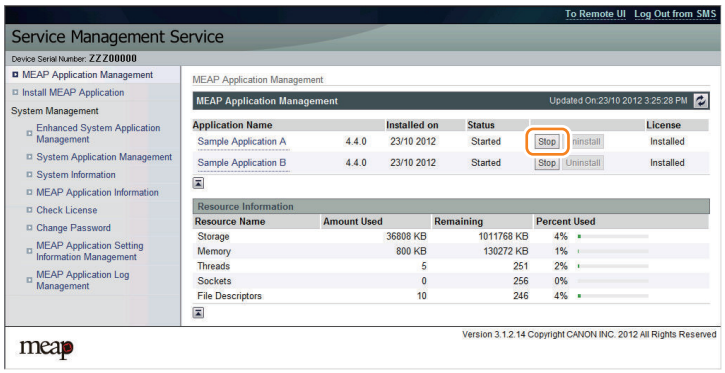
6. **Check the content of the confirmation page, and click [OK].**

● Procedure disabling a license file (suspending a license)

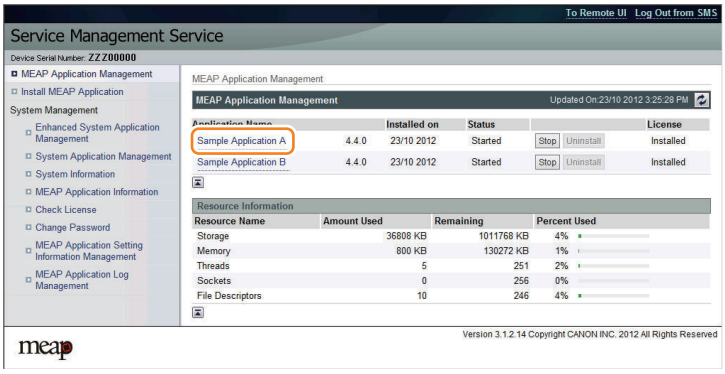
CAUTION:

- Since the license file cannot be disabled when the application is still running, the application needs to be stopped before disabling the license file.
- Once suspended, the status of the license will be "Not Installed", and its application will no longer be available for use.
- You can later restore a suspended license file as long as you are doing so on the same device, the device with the same device serial number.
- If the machine needs to be replaced due to a device failure, use the transfer license during the replacement. (See “License for forwarding” on page 243)

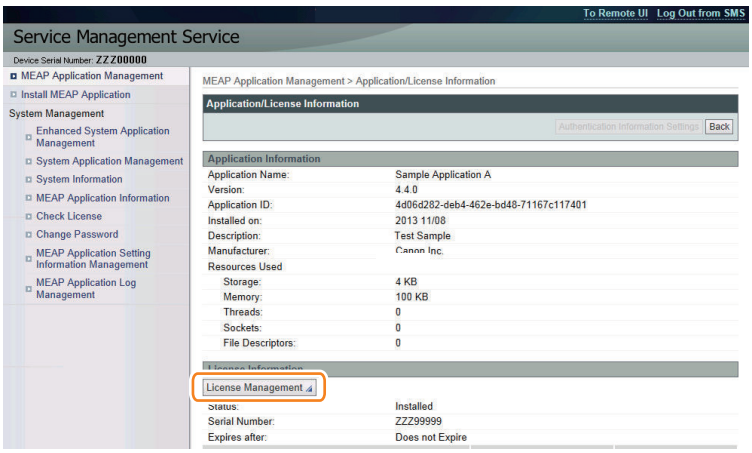
1. **Stop the application you want to uninstall on MEAP Application Management page.**



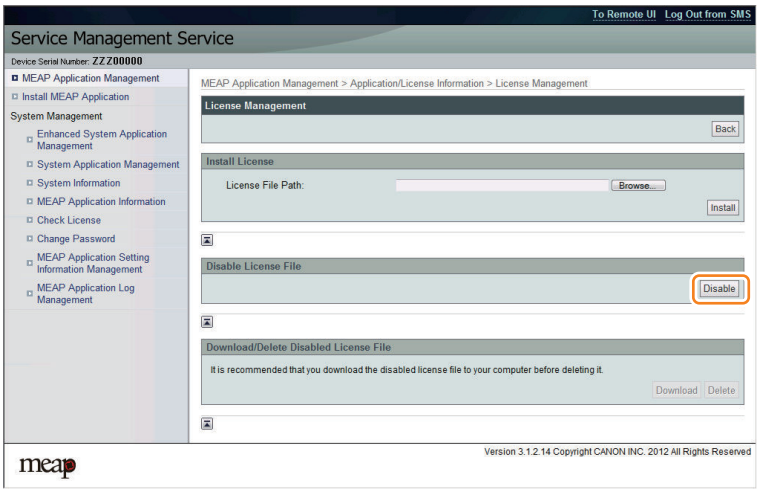
2. **Click the name of the application that you want to disable.**



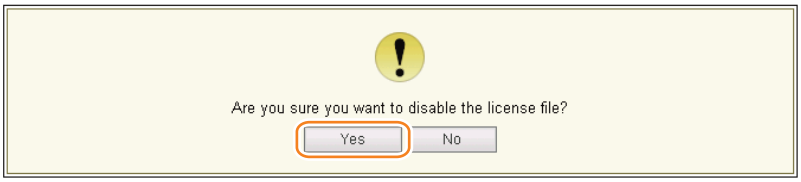
3. **On Application/ License Information page, click [License Management].**



4. **License Management page appears. Click [Disable].**



5. **Click [Yes].**

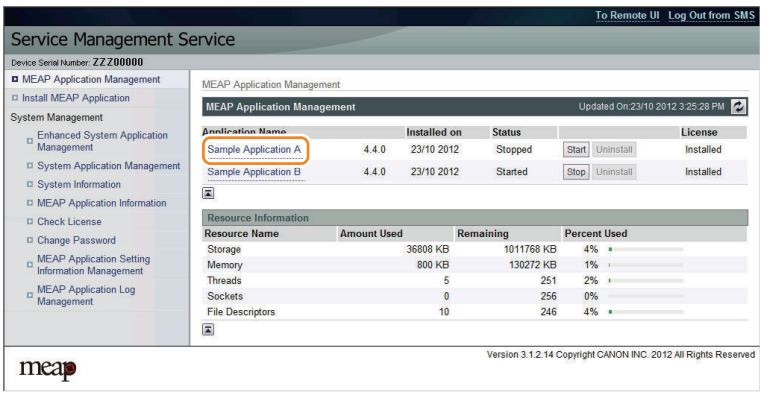


● Procedure downloading / removing an invalidated license file

NOTE:
The downloaded license file can be used for reinstallation only in the same device (with the same device serial number).

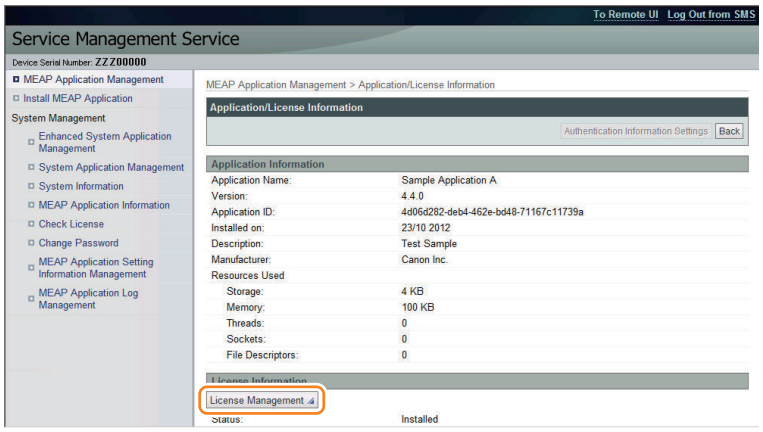
1. **Login to SMS. (See “Login to SMS” on page 226)**

2. **Application List page appears. On MEAP Application Management page , click the name of the application you want.**

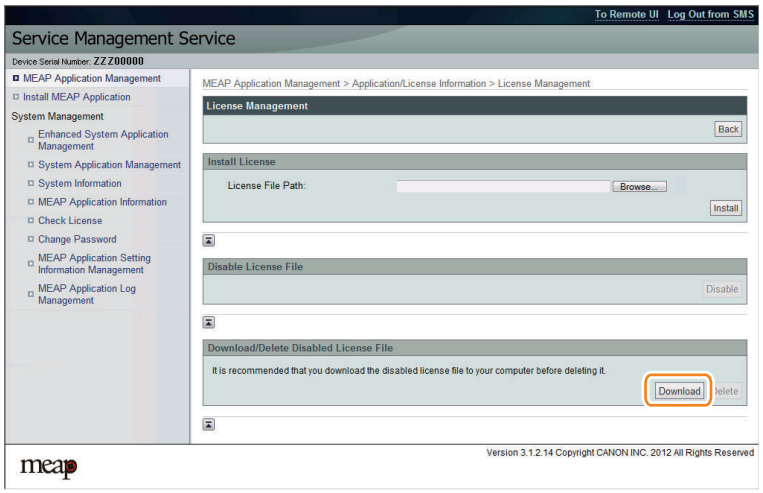


3. **Check Application/ License Information page appears.**

4. **On Application / License Information page, click [License Management].**

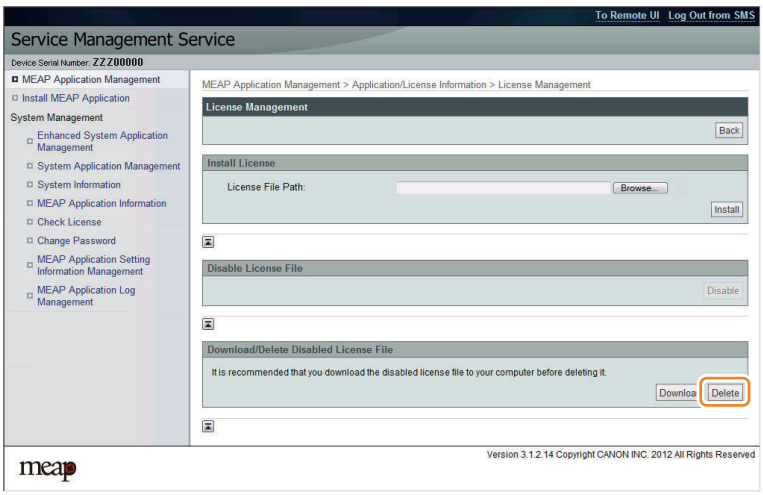


5. **License Management page appears. To download, click [Download].**

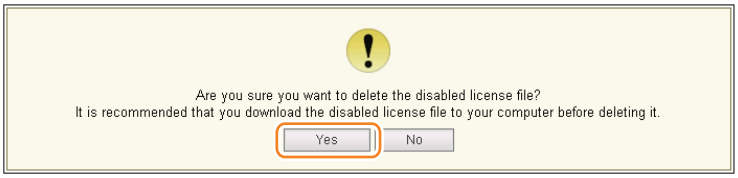


6. **When you have selected [Download], specify where you want to store the file by following the instructions on the screen.**

7. **To delete, click [Delete].**



8. **When the dialog to confirm deletion is shown, click [Yes].**



CAUTION:
Without the license file, an application cannot be reinstalled even to the MEAP device that the application had been installed last time. Download and save the license file before deleting the application.

■ Other License File Management Functions

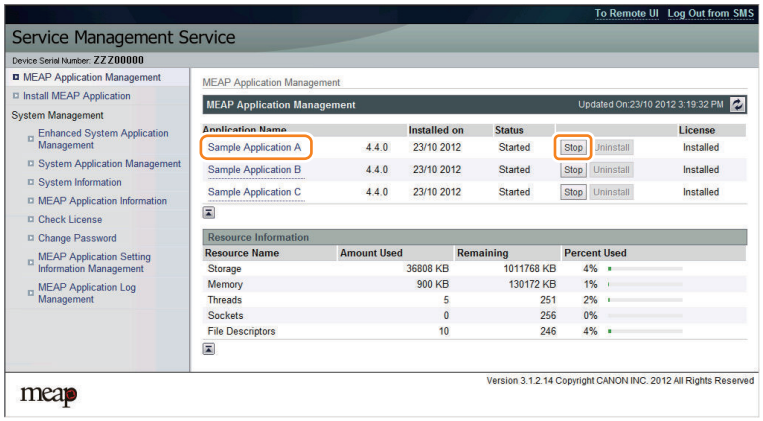
● Reusable license

When reinstalling, Disable License file should be downloaded (see “Procedure disabling a license file (suspending a license)” on page 240 and see “Procedure downloading / removing an invalidated license file” on page 241 in this manual) or a license for reinstallation should be obtained from LMS, before reinstallation.
This specification aims to prevent misuse of applications.
To increase convenience of users, only application with unlimited validity date and application counter (e.g. Portal Service, SDL, SSO) has been made to be able to install as many times as needed by the same license file. This kind of license is called "Reusable license".

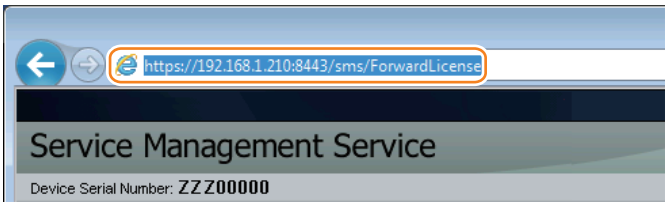
● License for forwarding

If the machine needs to be replaced due to a device failure, you can transfer the license information used in the MEAP application to the new machine and continue its usage. Service engineers are responsible for license transfer as this task requires the SMS hidden page (not open to users).
The procedure is shown below.

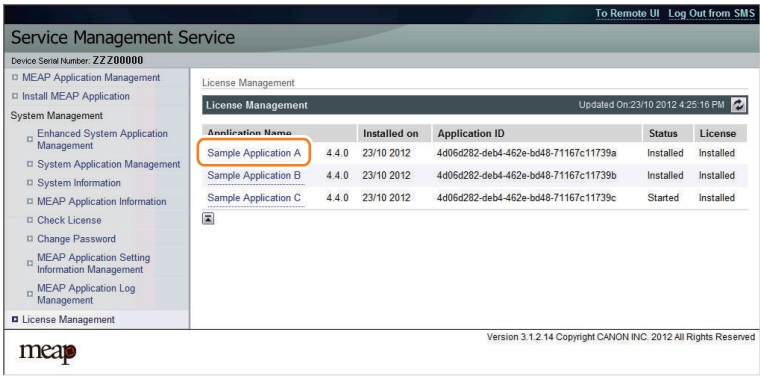
1. **Log in to SMS, stop the application to be forwarded. (see "Starting, Stopping, or Uninstalling the MEAP Application" on page 236.)**



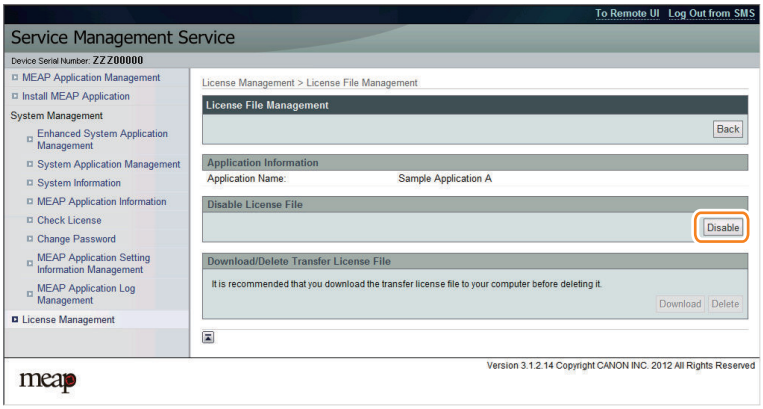
2. **Move to the download page of license forwarded for the device as sender (https:// IP address of device: 8443/sms/ForwardLicense).**



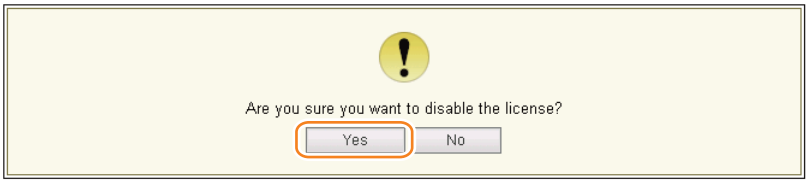
3. **Specify the application to be forwarded.**



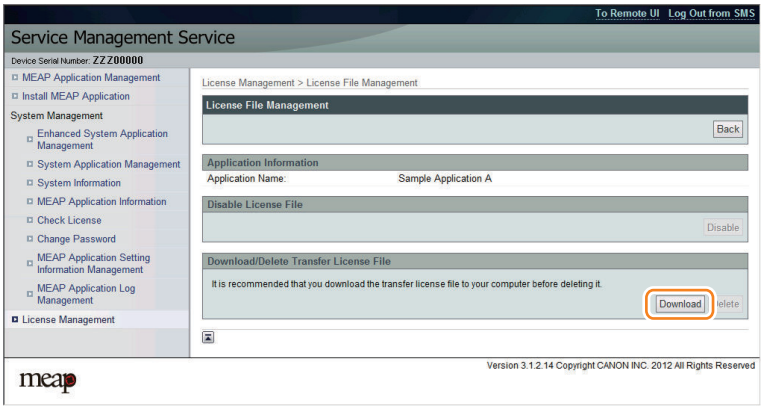
4. **Click [Disable] on the [Disable License File].**



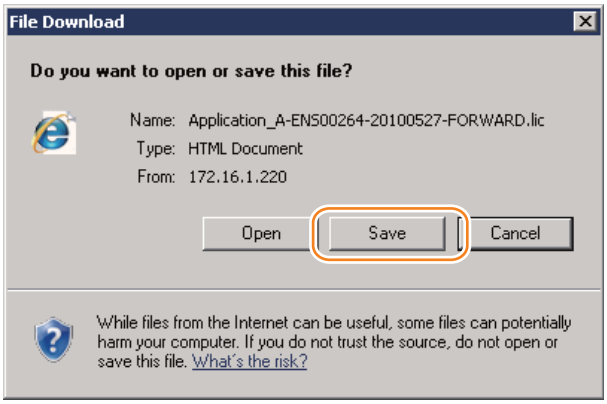
5. **The window to confirm whether to create a transfer licence will be displayed. Click [Yes].**



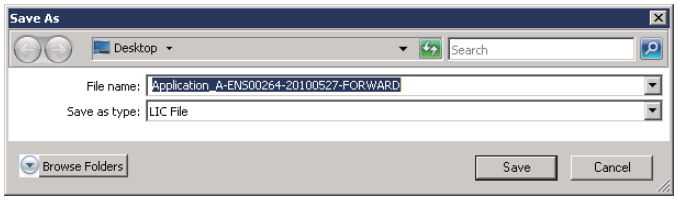
6. **When [Download] on the [Download / Delete Transfer License File] becomes effective, click [Download].**



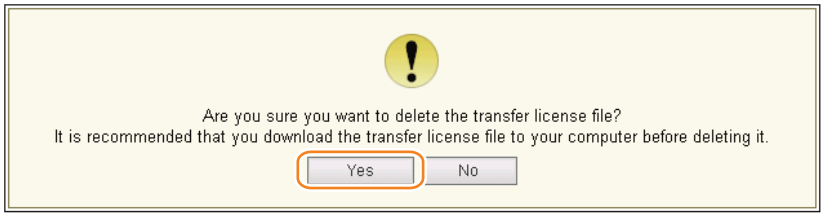
7. **The dialogue [File Download] is displayed. Click [Save].**



8. **Specify the download destination, click [Save].**



9. **After downloading the license file for forwarding, click [Delete] to display the confirmation screen and click [Yes] to delete the file (in consideration of breakage of license for forwarding, deleting disabled license can be executed after all steps have been completed).**



10. **Log out of SMS.**

11. **Since this downloaded transfer license is the file only to prove the license invalidation, it cannot be used for installation to the other device as it is. Send the transfer license to the service support contact of your nearest sales company to request issuance of the new license for installation in the new device.**

NOTE:
When requesting issuance of license for forwarding, inform the sales company of the name of product name and serial No. of the device as sender, and of the name of product name and serial No. of the forwarding destination.

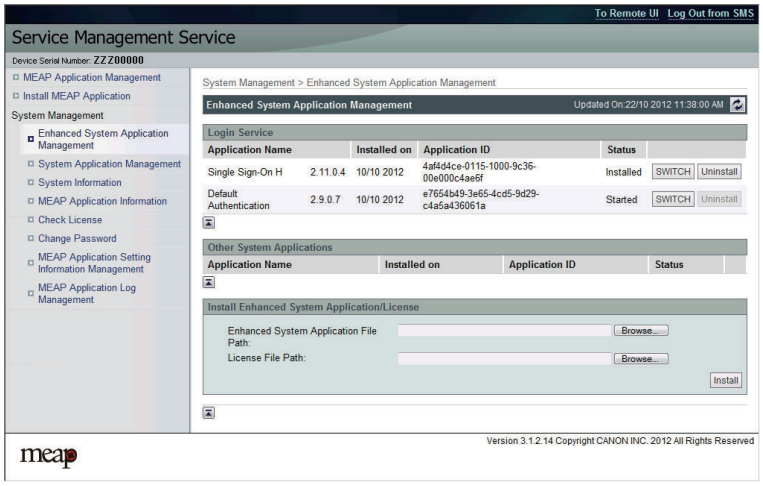
12. **Install application using the license for forwarding issued by the sales company.**

Enhanced System Application Management

■ Outline

[Enhanced System Application Management] mainly manages the login services for logging in to devices.

- Installing and uninstalling Enhanced System Application Management (login services, etc.)
- Switching login services (switching the method to log in to devices)
- Checking installation status of other System Applications



■ About Login Service

The login service is started up to authenticate the user when MEAP-enabled device is booted up. Login service changes and install/ uninstall are carried out from the [System Management] page.
The preinstalled login applications are Default Authentication and Single Sign On-H, and Default Authentication is enabled by default.

CAUTION:

- This device does not support SDL, conventional SSO and Security Agent.

■ Default Authentication overview

This login service is selected when the department ID management is enabled or no authentication function is set. Set the department ID management to [ON] on [Settings/Registration] of this device and register 7-digit ID and PIN by department. This setting restricts the use of this device only to users keying the registered ID and PIN. Department IDs/ and PINs can be registered on the touch panel of this device or Remote UI.

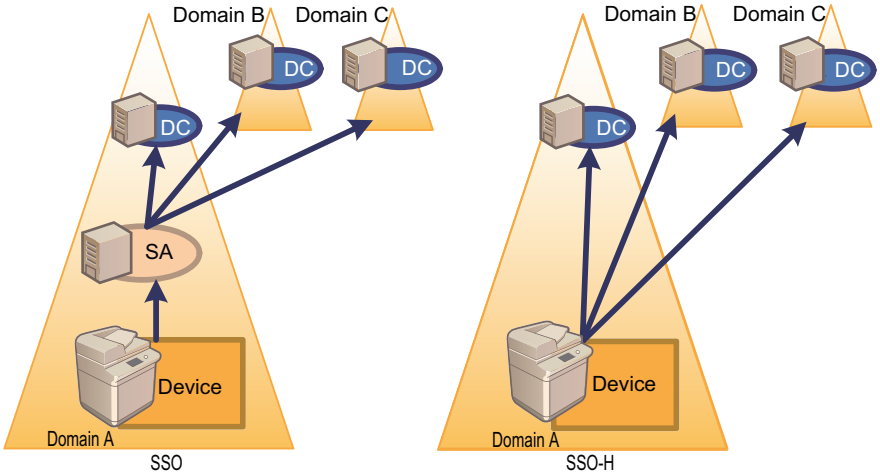
■ SSO-H (Single Sign-On-H) overview

This is a merger of the existing SDL and SSO login services and has the following features.

- The following three authentication methods may be selected from.
  - Server authentication
  - Server authentication and local authentication
  - Local device authentication

- Active Directory or LDAP can be used as the server for server authentication.
- It is not necessary to prepare a server for Security Agent (SA). (In the case of SSO, SA is necessary.)

Differences from conventional SSO



CAUTION:

- When the setting is SSO-H, the card reader for the option controller card cannot be used.
- When the setting is SSO-H, start up takes a little longer when compared to Default Authentication (because of the time required for object initialization).
- To use the SEND function when the setting is for SSO-H, when sending email, mail addresses need to be programmed against each user. If they are not, email cannot be sent. Note, however, that when sending i-Fax, the mail addresses set in the device are used.
- The system configuration is different from previous SSO, so individual management is required.
- Data porting of user information that was being used with the earlier SSO local device authentication and SDL can be done by exporting/ importing. However, application settings information cannot be ported.

● Environment confirmation

Refer to the section of “Preparation for Using SSO-H” on page 214 of this manual for system requirements needed in each login service.

● SSO-H specifications

Item		Specifications
Number of local device users		Max. 5,000 users
Upper limit of the number of domains		Active Directory: 200 domains (excluding "this device")
IPv6		△ (IPv6 authentication supports Windows Server 2008 AD (Active Directory)/ KDC (Key Distribution Center)/ DNS (Domain Name Server) only.)
Resource		Memory: 3600KB Hard disk: 27000KB File descriptor: 27 Threads: 33 Sockets: 33
Port	Connecting	88: KDC 53: DNS 1 to 65535 (default 389): LDAP
	Listening	10000 - 10100
Supported authentication server		Active Directory : Microsoft Windows Server 2003 SP2 * Microsoft Windows Server 2003 R2 SP2 * Microsoft Windows Server 2008 SP2 * Microsoft Windows Server 2008 R2 SP1 Microsoft Windows Server 2012 * 64-bit OS is not supported. LDAP: Novell eDirectory V8.8 SP6 for Windows Lotus Domino V8.5 for Windows

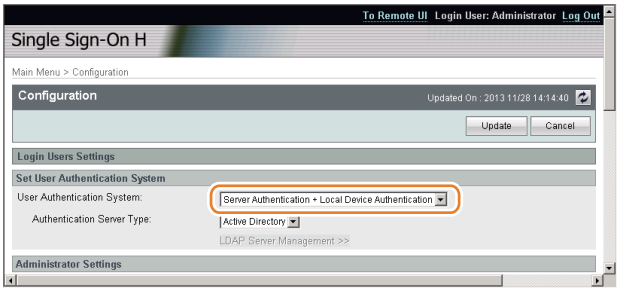
Item	Specifications
Linkage with department management	Available only for local authentication

Handling of SSO/SDL

This machine does not support SSO or SDL which was released previously.

● Setting the Authentication Method

In the case of SSO-H, it is possible to use a combination of multiple authentication methods. The combination can be changed from the SSO-H setting screen. (For details, refer to e-Manual > MEAP > Menu for Administrators > Setting the SSO-H > "Setting the User Authentication System".)



NOTE:
The default settings are shown below.
- User authentication method : "Server Authentication + Local Device Authentication"
- Type of authentication : "Active Directory"

CAUTION:
- To ensure the security, it is recommended to change the password and the user name of the Local Device Authentication administrator from those at the time of shipment immediately after you have started using SSO-H.
- Since department ID and password are not assigned to domain users, distributing setting information where the department ID is enabled to a device where the server authentication is enabled may make the device unable to be logged in. If the device has become unable to be logged in, follow “Remedy to Be Performed When the Device Has Become Unable to Be Logged in” on page 296 in this manual.

● Using an Accounting Product When SSO-H Is Used

SSO-H has collaborative linkage with NetSpot Accountant, imageWARE / iW Accounting Manager, imageWARE Enterprise Management Console / iW Management Console Access Management Plug-in, imageWARE Enterprise Management Console / iW Management Console Accounting Management Plug-in.
For details on the combination, refer to the User's Manual or Service Manual of the product.

● Conducting Department ID Management When SSO-H Is Used

Department ID Management can be conducted also when SSO-H is used for login service.

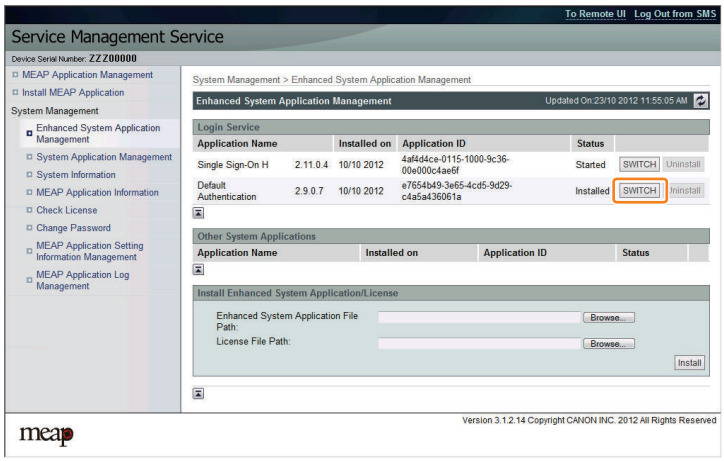
Usage Conditions

In order to allow coexistence of SSO-H and Department ID management, the following conditions need to be satisfied.
- Only "Local Device Authentication" can be used as the user authentication method.
- The department ID and password have been already set for the SSO-H login user before enabling department ID management.
- The information (the department ID and password) set for the login user coincides with the information registered in Department ID Management.

Setting Procedure

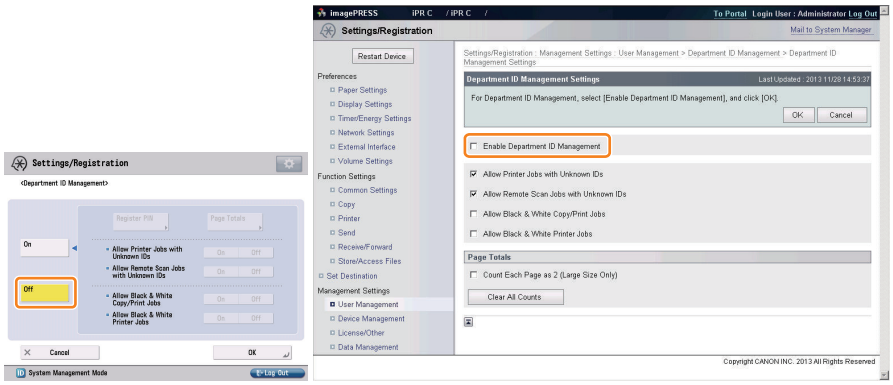
In order to allow coexistence of SSO-H and Department ID management, the following procedure needs to be performed to enable the setting.

1. **Change the authentication method to DA (Default Authentication).**
   Access SMS, and select [Default Authentication] in [Enhanced System Application Management] > [Login Service]. (How to log in to SMS can be found in “Login to SMS” on page 226.)

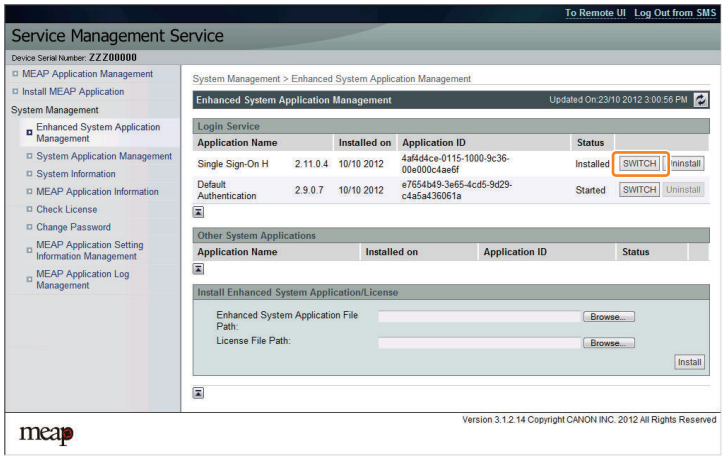


2. **Restart the device.**
   Restart the device in order to reflect the changes in login service.

3. **Disable Depart ID Management.**
   In [Settings/Registration], select [Management Settings] > [User Management] > [Department ID Management] > [OFF]. In the case of remote UI, access [Settings/ Registration] > [Management Settings] > [User Management] > [Department ID Management] > [Department ID Management Settings], and deselect [Enable Department ID Management].



4. **Change the authentication method back to SSO-H authentication.**
   Access SMS, and select [Single Sign-On H] in [Enhanced System Application Management] > [Login Service]. (How to log in to SMS can be found in “Login to SMS” on page 226.)

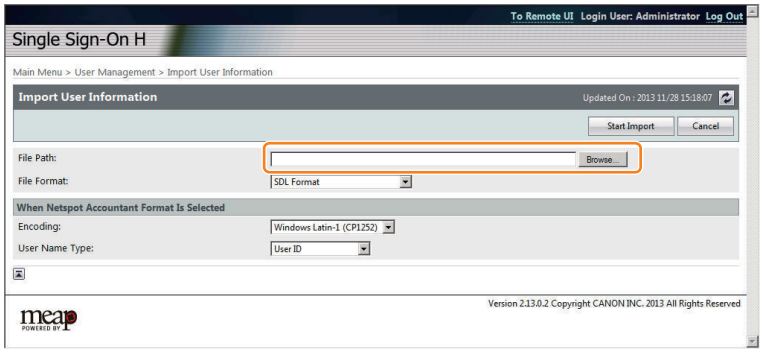


5. **Restart the device.**
   Restart the device in order to reflect the changes in login service.

6. **Change the user registration information of SSO-H.**

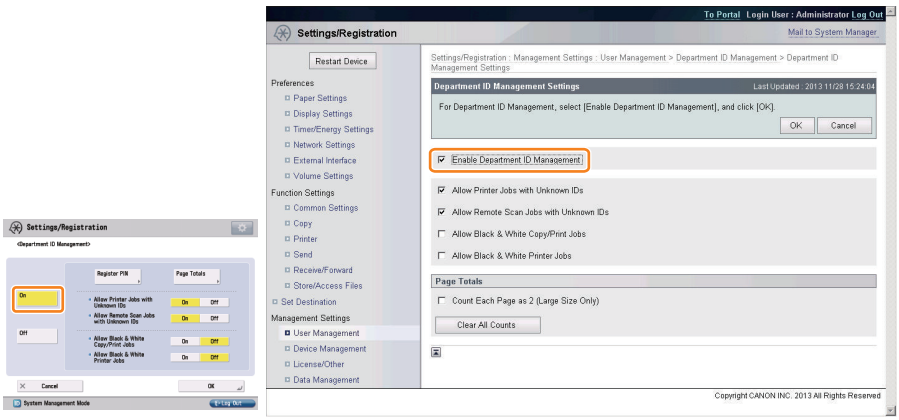
   Access the URL shown below, and change the content to the information registered in Department ID Management. Or, import the setting file whose content you want to use.
   SSO-H user registration information edition screen
   (SSO management screen [Main Menu] > [User Management] > [Edit User Information] or https://<IP address>:8443/sso/Edit).

   SSO-H user registration information import screen
   (SSO management screen [Main Menu] > [User Management] > [Import User Information] or (https://<IP address>:8443/sso/Import).

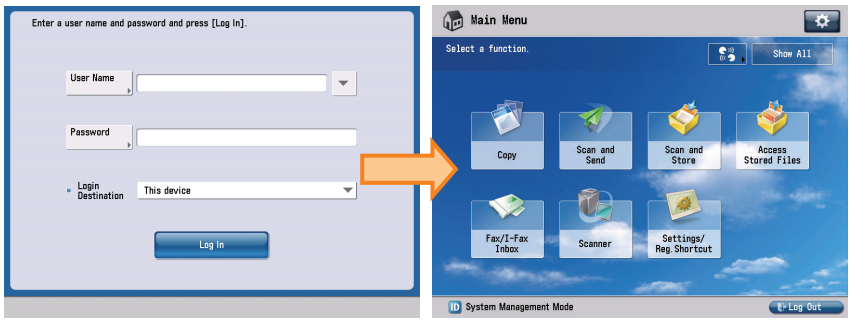


7. **Enable Depart ID Management.**

   In [Settings/Registration], select [Management Settings] > [User Management] > [Department ID Management] > [ON]. In the case of remote UI, access [Settings/ Registration] > [Management Settings] > [User Management] > [Department ID Management] > [Department ID Management Settings], and select [Enable Department ID Management].



8. **Check that the device can be logged in.**
   Log off and then log on to check that the device can be logged in with an environment where Local Device Authentication and Department ID Management are enabled.



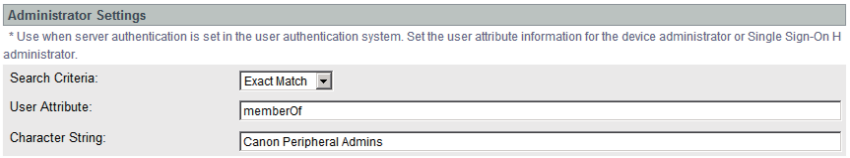
NOTE:
In the case of conventional SSO, department management can be conducted also when server authentication is used provided that iWAM/iW EMC account management is used, which is not supported by SSO-H.

● Setting the Administrator for Server Authentication

When using Server Authentication, the user who satisfies the specified conditions (user attribute and its match criteria) becomes the administrator (the device administrator and the SSO-H administrator).
The default user attribute and whether the setting value can be changed or not are shown below.

Item	Default value	Active Directory	LDAP
Search Criteria:	Exact Match	Not Available	Available
User Attribute:	memberOf	Not Available	Available
Character String:	Canon Peripheral Admins	Available	Available

The settings of the administrator can be changed on the following screen: remote UI > Single Sign-On H > Configuration (http://device's IP address:8000/sso/ActionSet)

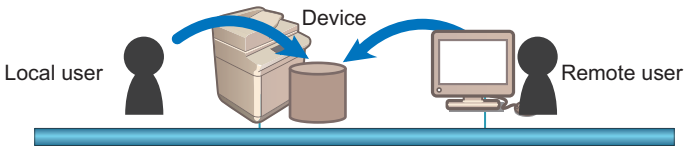


● System Manager Linkage (automatic ID allocation to SystemManagers)

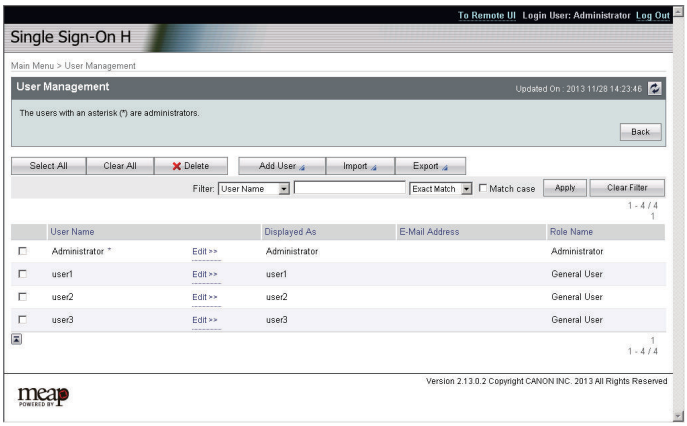
SSO provided the automated function conventionally on Security Agent (hereinafter "SA") to authenticate System Manager by allocating IDs set on SA to domain authentication managers (users belonging to Canon Peripheral Admins group). However, SSO-H does not support this function.

■ Local device authentication

This is one of SSO-H based user authentication methods and is implemented on a single device.



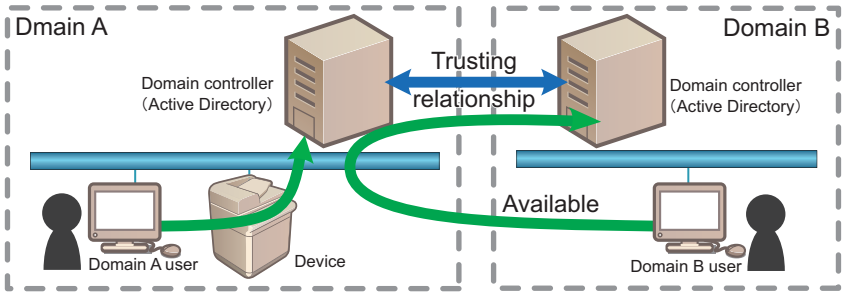
Users who are authenticated are registered in the database resident on this machine.
Users are managed from the User Management screen (http://this machine's IP address:8000/sso/) or from the imageWARE Enterprise Management Console. The login destination is [This device].
User Management screen



■ Server authentication (Active Directory authentication)

● Overview

It is an SSO-H user authentication system that performs user authentication in conjunction with the Domain Controller in the Active Directory network. This system authenticates domains in the network at the same time as logging into the device. In addition to users affiliated to the domain including the device, it can authenticate users affiliated with domains (multi-domain) that have a trust relationship with that domain. The domain name of the login destination is selected when the user logs-in.
By using the "imageWARE Enterprise Management Console" accounting management plug-in option, the device use status can be analyzed/managed.



The used protocol is detailed below.

- Kerberos: LLS/RLS/ILS
- NTLMV2: WLS (abbreviation of "Web Service Login Service")

It is necessary to access the Access Directory because user information is acquired by LDAP. An authentication error will be caused when LDAP connection fails.
The support domain count supports access to 200 sites (without changing from SSO).

CAUTION:

- When using server authentication (Active Directory authentication), it is necessary to synchronize time settings for the Active Directory server and this machine (and logged-in computers). A log-in error will occur if there is a difference of at least 5 minutes between the time settings. (The setting for time difference tolerance cannot be changed.)
- Since a department ID and password are not assigned to domain users, enabling department ID management with a device with enabled server authentication may make the device unable to be logged in. If the device is unable to be logged in, refer to “Remedy to Be Performed When the Device Has Become Unable to Be Logged in” on page 296 in this manual for a remedy.

● Access Mode in Sites

With SSO-H, access to Active Directory within site can be prioritized or restricted, so there is a setting called "Access Mode in Sites". Sites programmed in Active Directory comprise multiple subnets. In this mode, SSO-H uses site information to access the same site as the device, or the subnet Active Directory.

- The SSO-H default setting is with the site internal access mode OFF.
- Access Active Directory within same site only.
- If there is no Active Directory within the same site, or if connection fails, there will be an authentication error.
- Access another site if Active Directory within the same site cannot be located.

- If there is no Active Directory within the same site, or if connection fails, an Active Directory external to the site will be accessed.
- If all attempts to access Active Directory fail, there will be an authentication error.

The operating specifications of the site internal access mode are as described below.
When first logging in to the login service after booting device, the domain controller (DC) is obtained from the site list.
However, upon the first login, even if the site functionality is active, connection to DC is random. (This is because, if connection to DC should fail, the site to which the device belongs cannot be ascertained.)
If the device IP address or the domain name are changed, the site settings are acquired once more.
In this mode, at the first login (first authentication of domain to which the device belongs) LDAP-Bind is performed directly to DC and site information acquired by LDAP from DC.
From the acquired site list, the site to which the device subnet belongs is extracted and this becomes the site to which device belongs. Active Directory address is acquired (retrieved from DNS)

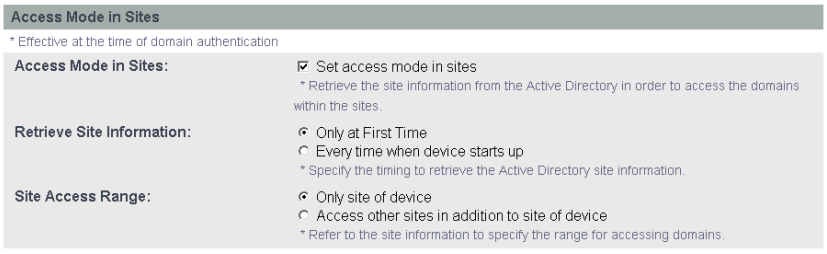
NOTE:
- The Active Directory subnet is assumed to be the same subnet as the device subnet.
- In the Active Directory addresses, the Active Directories of the same site are listed.
- Active Directories of the same subnet as the device are listed first.
- If there is no Active Directory with the same subnet as the device, Active Directories belonging to different subnets than the device are listed.
- The Active Directories within the same site are accessed in order. Note, however, that where there are multiple Active Directories within the same site, access to those Active Directories will be in the order in which the address list was obtained.
- If there is no Active Directory within the same site, if access outside of the site is programmed, Active Directories outside of the site will be accessed in the order in which the address list was obtained.

Site list acquisition

After booting up, upon the first login by LLS or ILS/ RLS, the site list is obtained from the Active Directory. In order to obtain the site list from the Active Directory, Active Directory needs to be accessed in LDAP, so SASL-Kerberos-Bind is used by the login user account. If authentication by Active Directory should fail, an authentication error will be generated and the site list will be acquired again from Active Directory upon the next login.
In SSO-H, the Active Directory to be accessed when acquiring the site list cannot be specified. In other words, if there is no site list, which site's Active Directory is accessed depends upon the order of the Active Directory addresses returned by DNS. Therefore, when acquiring the site list, LDAP may access the Active Di rectory of a different site. Therefore, in such cases, it is sometimes necessary to access across sites or subnets, which means that LDAP protocol needs to have continuity across sites (subnets) (normally, LDAP is port No. 389). Further, if connection with Active Directory fails when acquiring site information, another Active Directory will be accessed.
Site information, once it has been acquired, is cached within the device. The life settings of the cache can be set so that site information in the cache is updated upon the first login after the device boots up, or so that the cache is not updated once acquired.

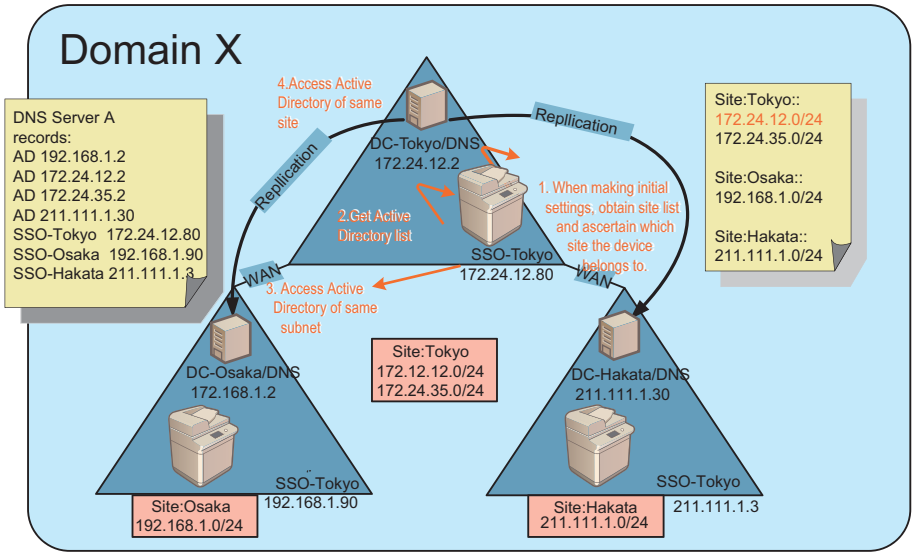
Settings for access mode in sites

Switching between site internal access mode/ non site internal access mode, as well as detailed mode settings, are done via DMS or iWEMC.
Site internal access mode settings window (DMS)



The figure below shows a sample of processing Access Mode in Sites.

Sample of Processing Access Mode in Sites



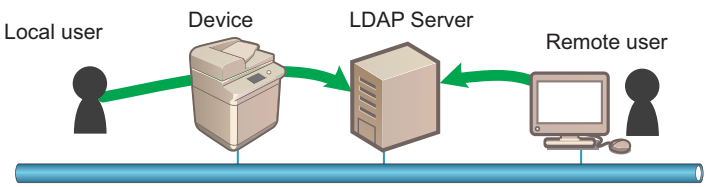
1. **SSO-Tokyo acquires site lists from Active Directories.**
   Note, however, that the Active Directories accessed in order to acquire site lists are in the order in which they were returned by DNS, so there is no guarantee that the same Active Directory will be accessed as in the initial settings (upon device settings or changes to NW settings, etc.).
   [Site subnet list]
   Site: Tokyo: = 172.24.12.0/24, 172.24.35.0/24
   Site: Osaka: = 192.168.1.0/24
   Site: Hakata: = 211.111.1.0/24
   As a result, since SSO-Tokyo is 172.24.12.80, the subnet is 172.24.12.0/24, and is judged as belonging to site Tokyo.
2. **The DNS server obtains its Active Directory list from the primary or secondary DNS, as set in the device.**
   [Active Directory]
   172.24.12.2, 172.24.35.2, 192.168.1.2, 211.111.1.30
3. **Of the Active Directories in 2), above, the ones that belong to the same site (Tokyo) are 172.24.12.2 and 172.24.35.2.**
   Of these, the Active Directory that is the same subnet as SS-Tokyo is 172.24.12.2.
   Therefore, this one will be accessed.
4. **If access fails at step 3), above, the other Active Directory of the same site, 172.24.35.2, will be accessed.**
5. **If access fails at step 4), above, also, SSO-Osaka and SSO-Hakata will be accessed (the order will depend on the order of the Active Directories in DNS). Note, however, that this is an optional operation.**

Logging into other domains at multi-domain

At multi-domain, if another domain is logged into, based on the site/ subnet information retrieved in the home domain, the Active Directories of the login destination domain/ KDC address list are computed. In the event that the domain controller IP addresses of other domains are outside of the site access range, and only the domain controller within the site is programmed for access, an error message will be displayed to the effect that the site information is incorrect.

■ Server authentication (LDAP authentication)

It is an SSO-H user authentication system that performs user authentication in conjunction with the LDAP server in the LDAP network.



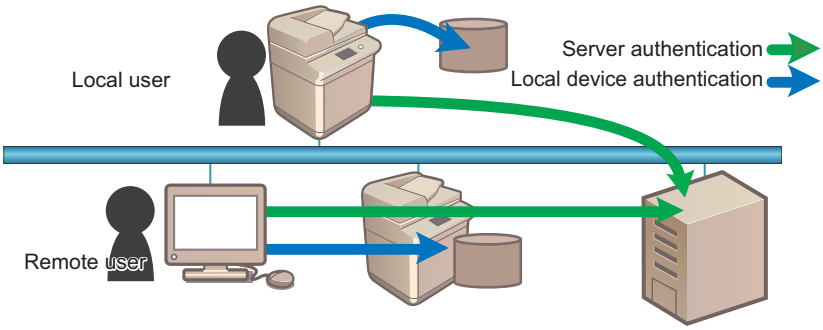
LDAP server authentication can be used by devices that support MEAP user information management services (MEAP Specification Ver.56) / MEAP application setting information management services (MEAP Specification Ver.57).

With models that do not support MEAP user information management services / MEAP application setting information management services, [LDAP Server] cannot be selected as an authentication server type in the LDAP Preferences page. It can also not be accessed in the LDAP Management screen and the server's additional screen.
"bind" (authentication) between SSO-H and LDAP server is performed by "simple bind" (non-encrypted password system). Therefore, connection should constantly be made by SSL from a security perspective.
The LDAP version only supports Ver. 3.
As to the SSL connection, ON/OFF can be set in the LDAP server management page. Additionally, the Connection timeout value is 60 sec.
When using LDAP server authentication, characters entered for the user name are not case sensitive, but characters entered for the password are.
Additionally, SSO-H authentication does not allow "* (asterisk)" to be used in the user name. If "* (asterisk)" is specified in the user name, this will lead to an authentication error.

CAUTION:
- Since department ID and password are not assigned to domain users, enabling department ID management with a device with enabled server authentication may make the device unable to be logged in. If the device is unable to be logged in, refer to “Remedy to Be Performed When the Device Has Become Unable to Be Logged in” on page 296 in this manual for a remedy.

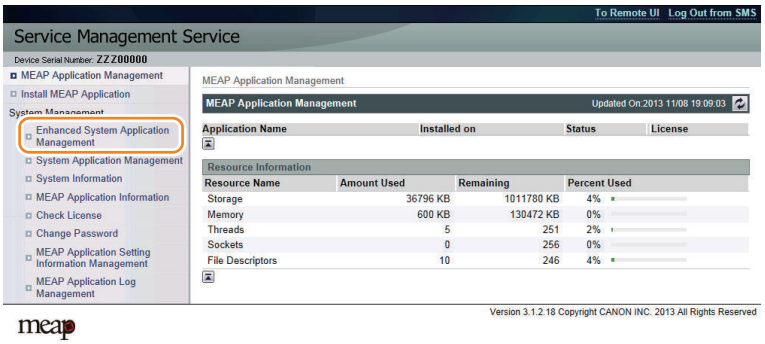
■ Server authentication + Local device authentication

This is a user authentication system equipped with both "Server authentication" and "Local device authentication" functions. An operation is possible in which Server Authentication is used to authenticate users registered in the authentication server at normal times while Local Device Authentication is used when it is necessary to temporarily authenticate users that cannot be added to the authentication server. Also, if a problem occurs with the authentication server, Local Device Authentication can be used until the server recovers.

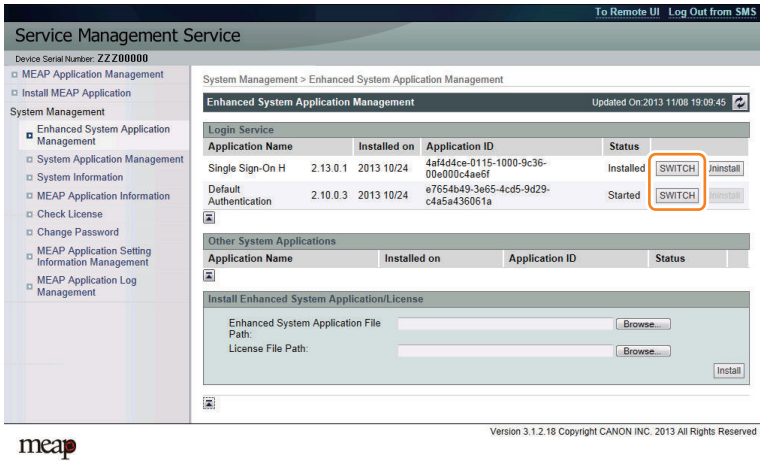


■ Steps to Change Login Services

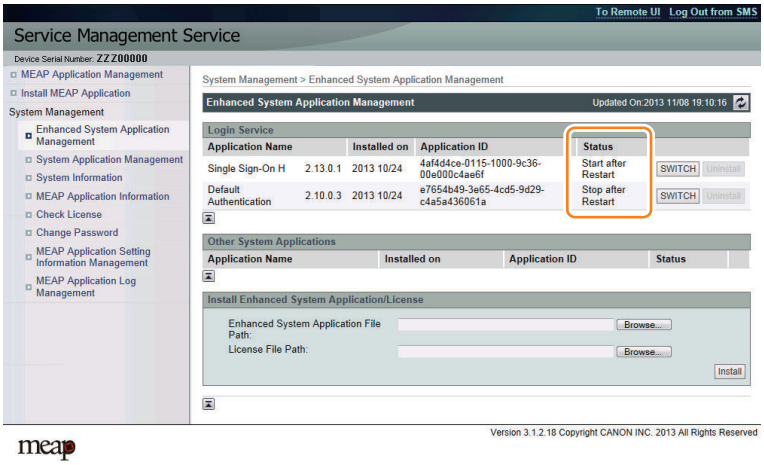
1. **Click [Enhanced System Application Management] on [System Management].**



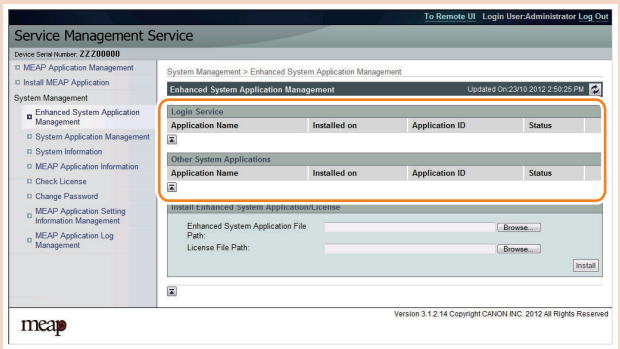
2. **A page will appear showing the various selections you can make for the login service. Click [SWITCH] for the login service to be used.**



3. **When login service application you have selected turns to Start after Restart, restart the device.**



CAUTION:
In case that the login method to a device is set to SSO-H, if you log in SMS with RLS authentication, no selection is displayed although it is the screen to change the login method.

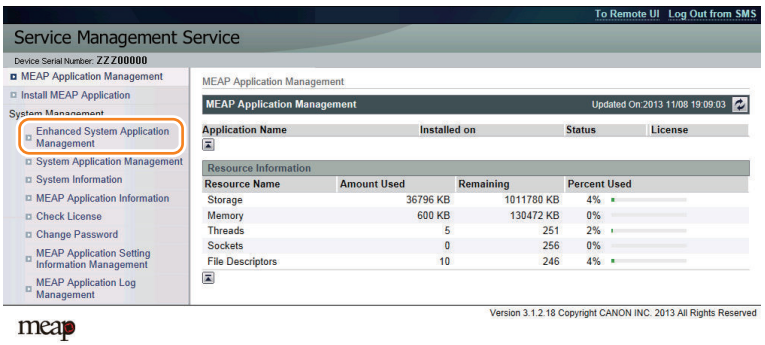


This is the specification to prevent the inconsistent setting which enables to stop SMS Installer Service (Password Authentication) by changing the login method to Default Authentication.
When you want to change the login method to a device, log in the SMS with the password authentication.

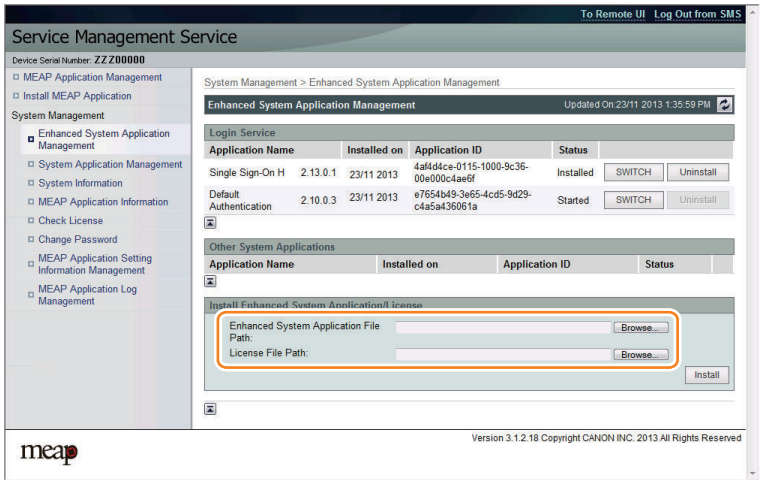
■ Login Service Installation Procedure

Follow the procedure show below to install login services.

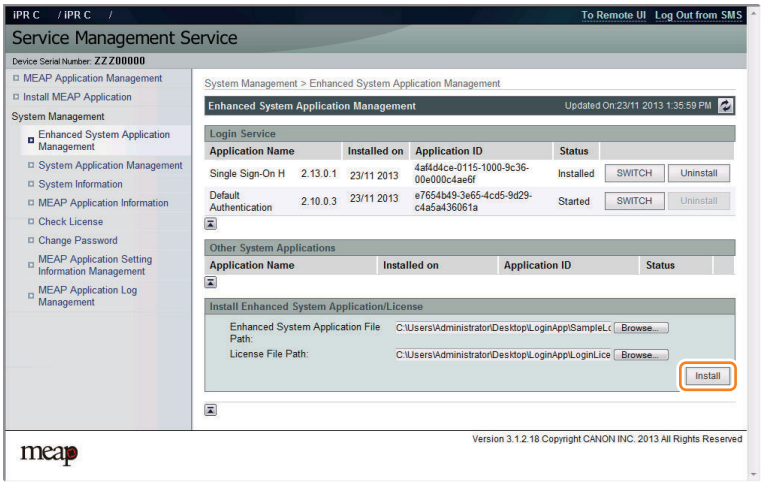
1. **Access SMS, and select [System Management] > [Enhanced System Application Management].**



2. **Click the [Browse], and specify the enhanced system application file and license file.**



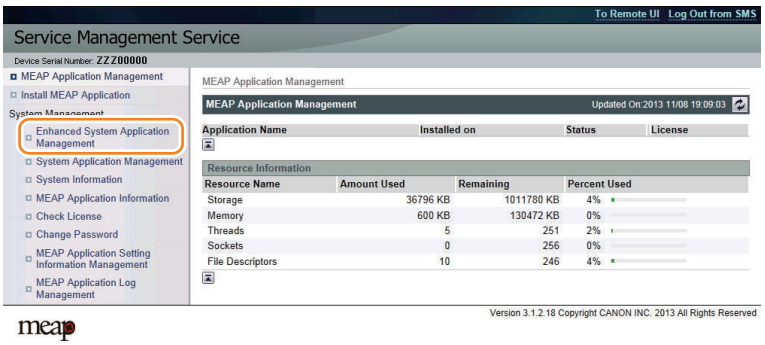
3. **Click [Install].**



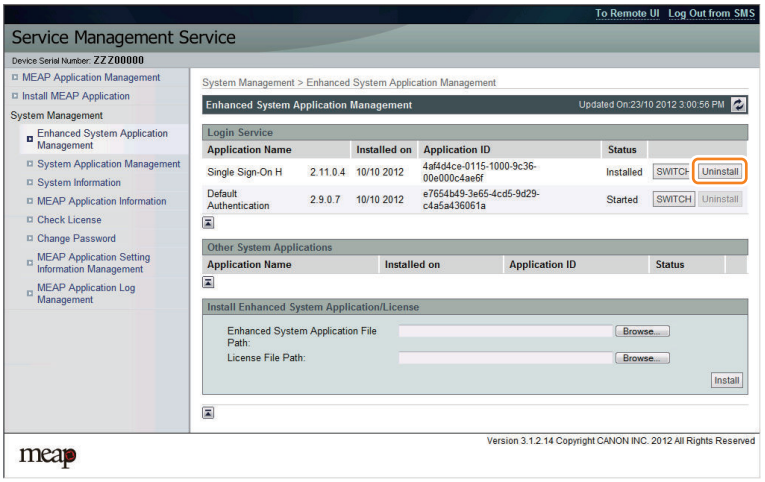
■ Login Service Uninstallation Procedure

Follow the procedure show below to uninstall login services.
In order to uninstall a login service, the service needs to be stopped ("Installed" status). Default Authentication cannot be uninstalled even when the service is stopped.

1. **Access SMS, and select [System Management] > [Enhanced System Application Management].**



2. **Click the [Uninstall] of the login service you want to uninstall.**



System Application Management

This function manages the login services for logging in to SMS.
There are two login methods: one is "password authentication" where you enter the password for SMS on the SMS login screen and log in, and the other is "RLS authentication" where you do not use the SMS login screen but enter the user ID and password on the RLS (Remote Login Service) screen for authentication.

■ Password authentication

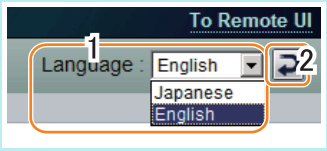
Enter the password on the SMS login screen for authentication. Only one password can be set for SMS.
The login procedure is shown below.

1. **Access SMS from the browser of a PC on the same network as the MEAP device. The URL is as follows.**
   URL: https://<IP address of MEAP device>:8443/sms/
   Ex.) https://172.16.188.240:8443/sms/

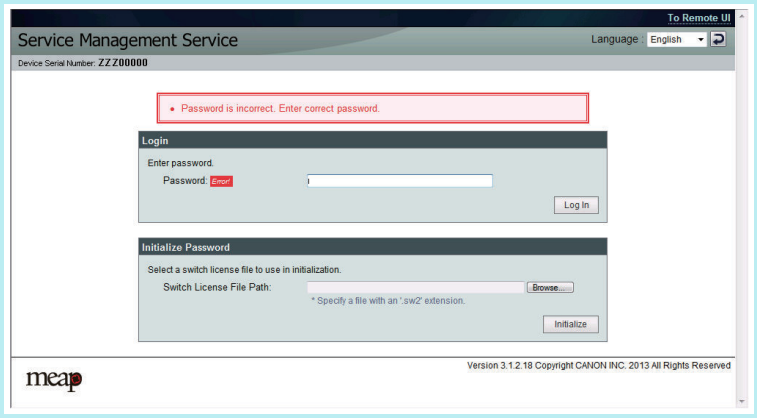
NOTE:
To encrypt the password information input when logging in, SSL of the login screen was made effective. However, it is redirected to new URL (effective SSL) even when accessing with URL (non-SSL) before.

2. **Enter the password in the password entry field, and click the [Log In]. The default password is "MeapSmsLogin." (The password is case-sensitive.)**

NOTE:
If you want to change the display language, select the language from the drop-down list of [Language] at the upper right of the login screen, and click the update.



NOTE:
If the wrong password is entered, the following window is displayed. The user's system administrator may have changed the password, so confirm the password with the system administrator. Note that there is no special password for service.



■ RLS Authentication

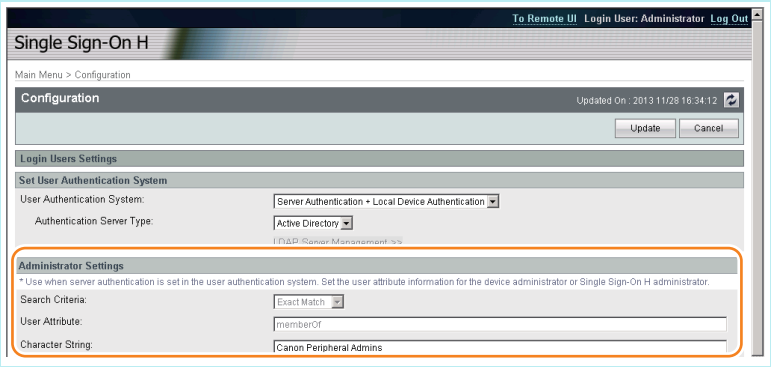
Login without using the SMS login window but by entering the user ID and password for authentication in the RLS (Remote Login Service) window. The user information (user name and password) used is the information for server authentication or local device authentication. The login procedures are as follows.

1. **Access SMS by RLS Authentication from the PC browser on the same network as the MEAP device.**
   URL: https://<IP address of MEAP device>:8443/sms/rls/
   Ex.) https://172.16.188.240:8443/sms/rls/

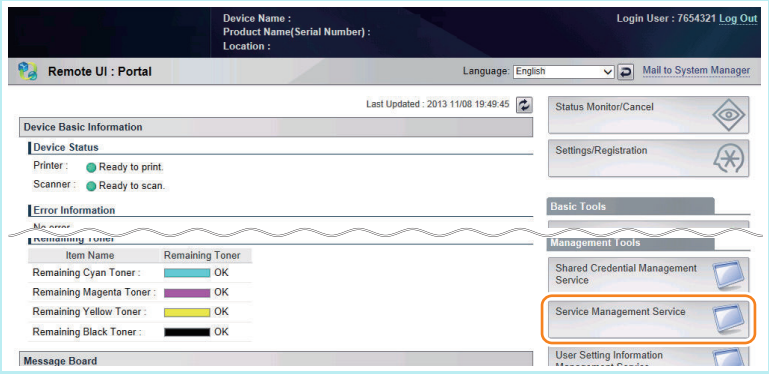
NOTE:
- To encrypt the password information input when logging in, SSL of the login screen was made effective. However, it is redirected to new URL (effective SSL) even when accessingwith URL (non-SSL) before.

NOTE:
- When the device authentication method used is server authentication, enter the user name, password and login destination registered with authentication server and then click "Log In".
- If the authentication method used is local device authentication, enter the user name, password and login destination registered in the device and click "Log In".
  The user information is set as below for local device authentication by default. Both are case sensitive.
  - User Name: Administrator
  - Password: password

NOTE:
Only the following users may us SMS via RLS.
- For local device authentication, users with Administrator or Device Admin authority.
- In the case of server authentication, the users who belong to the group (default: Canon Peripheral Admins) specified as the device administrator on the SSO-H Configuration screen.



NOTE:
SMS Access can be gained also from Remote UI.
Access Remote UI and click on SMS shortcut shown on the lower right of the screen to gain access to SMS.
When only the password authentication is enabled, the password authentication screen is shown.
When only the RLS authentication is enabled, no further authentication is needed to access SMS. This is because users have already authorized upon accessing to Remote UI.



■ Setting the method to login to SMS

Outline

The method to log into SMS can be specified by one of the following methods.

- If you want to change the password authentication settings: Use RLS authentication to log in, and change the settings.
- If you want to change the RLS authentication settings: Use password authentication to log in, and change the settings.

The following table shows the start/stop combinations of the two login methods.
Combination of Login Methods

	Start RLS Authentication	Stop RLS Authentication
Start Password Authentication	Login available with either method	Login available only with
Stop Password Authentication	Login available only with RLS Authentication	Setting unavailable

CAUTION:
If only login via RLS is programmed, login may be disabled for the following reasons.

- Authentication server is down
- Network problem, no communication with authentication server
  In the event of either of these cases, try the following.
  1. If local device authentication is active, try logging in with local device authentication.
  2. If only server authentication is active, launch in MEAP safe mode from the device service mode.

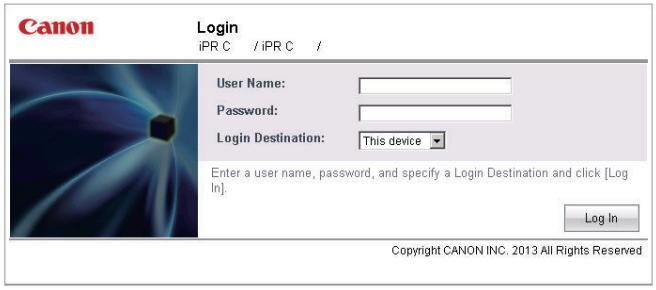
After launching in MEAP safe mode, the Default Authentication will become active, and you will be able to login to SMS with password authentication. After logging into SMS, set the password authentication login to ON (active) and restore the device from MEAP safe mode to normal mode. Until the problem blocking authentication is resolved, log into SMS with password authentication.

● Setting for login by Password Authentication

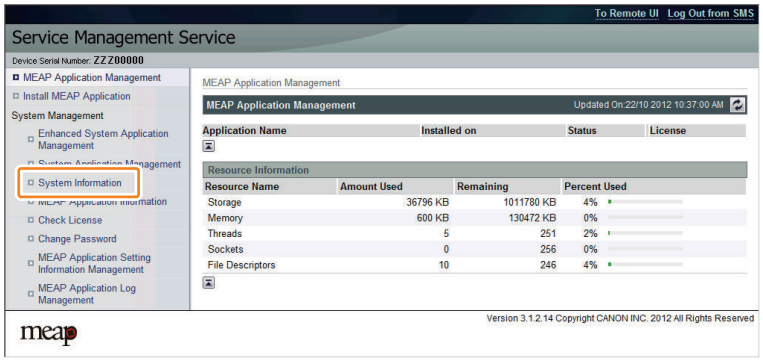
The procedures for changing the password authentication Start/ stop settings are as follows.

1. **Access SMS login screen by RLS Authentication from the PC browser on the same network as the MEAP device.**
   URL: https://<IP address of MEAP device>:8443/sms/rls/
   Ex.) https://172.16.188.240:8443/sms/rls

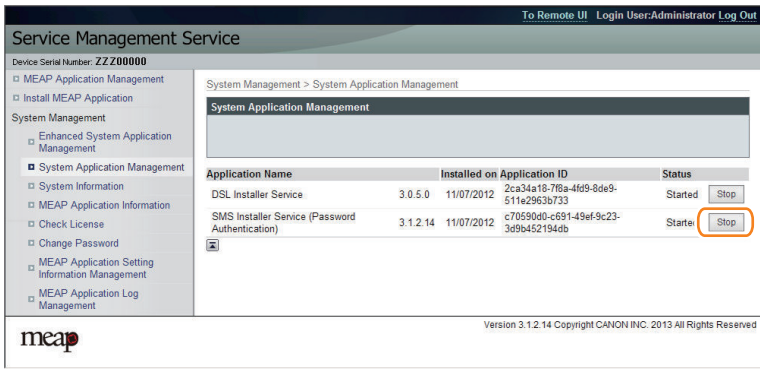
2. **Enter the user name and the password of the user registered as an administrator, select the login destination, and then click the [Log In].**
   Login screen (In case authentication method is SSO-H)



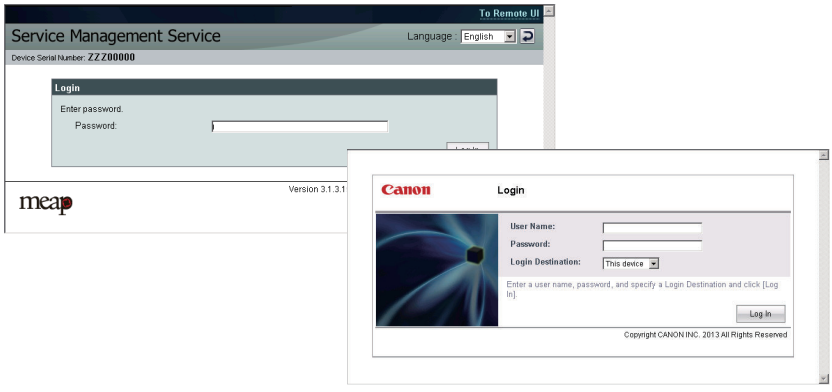
3. **Select [System Application Management]**



4. **Click [Start] or [Stop] shown in Status field of SMS Installer Service (Password Authentication) to check if the status is changed.**



5. **Logout once and login again to check to see that the setting is applied properly.**
   When clicking [Stop] to change the status to [Start], another password authentication login screen is firstly shown. When trying to access the password authentication screen after clicking [Start] to change the status to [Stop], the user is automatically redirected to RLS authentication screen.
   Password authentication started screen and Password authentication stopped screen



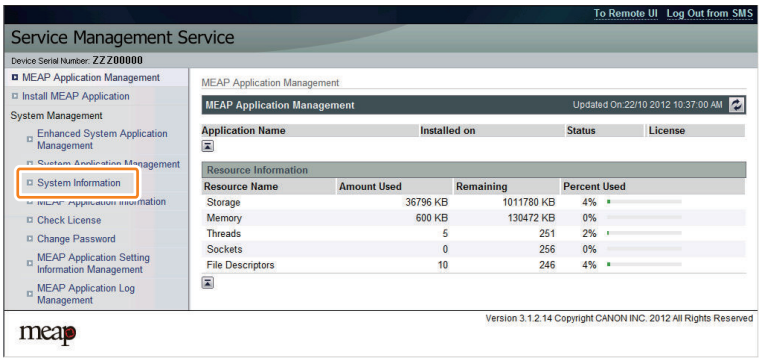
● Setting for login by RLS Authentication

The procedures for changing the RLS authentication Start/ Stop settings are as follows.

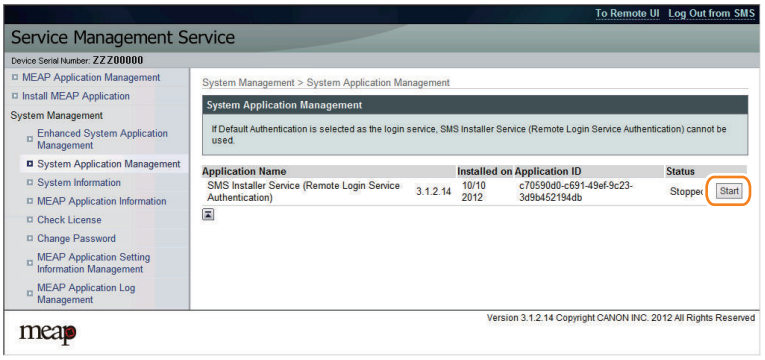
1. **Access the SMS login screen using the normal method (password authentication). The URL is shown below.**
   URL: https://<IP address of MEAP device>:8443/sms/rls/
   Ex.) https://172.16.188.240:8443/sms/rls

2. **Enter the password in the password entry field, and click the [Log In]. The default password is "MeapSmsLogin". (Case sensitive)**
   Login screen by Password Authentication

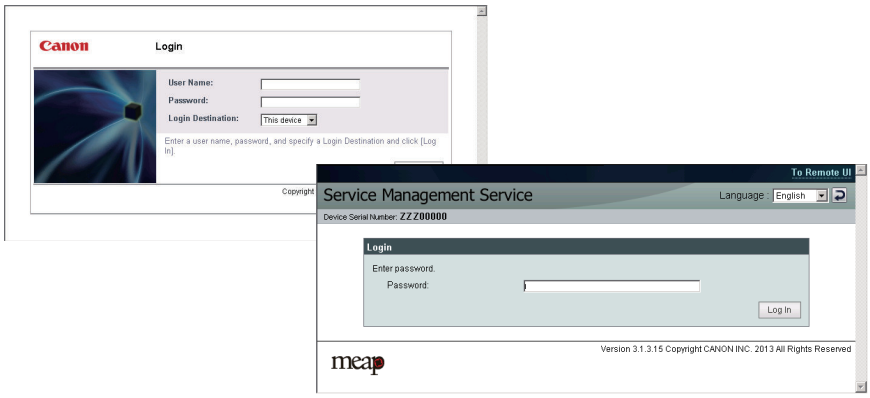
3. **Select [System Application Management] on System Management menu.**



4. **Click on [Start] or [Stop] shown on Status field of SMS Installer Service (Remote Login Service Authentication) to check if the status is changed.**

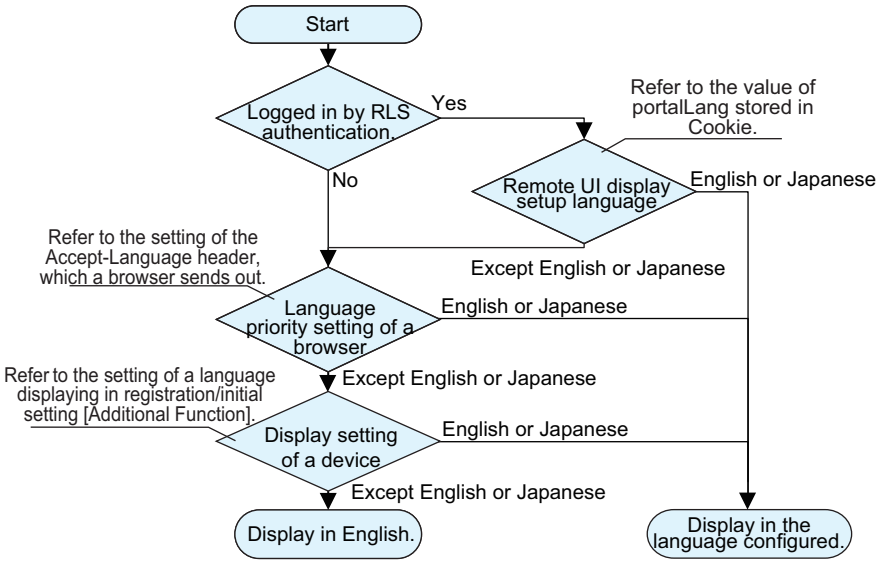


5. **Log out and then log in again and access via the RLS authentication login window.**
   When RLS authentication is set to [Start], another RLS login screen is firstly shown. When accessing to RLS status screen with the setting of [Stop], the user will be redirected to the password authentication screen.
   RLS authentication started screen and RLS authentication stopped screen



■ Initial Display Languages of SMS

SMS supports English and Japanese. Display language can be changed with selecting by the drop down list on a login page. The initial display language at the time of accessing SMS depends on the setting.



● When accessing by SMS Installer Service (Password Authentication)

It is referred in order of the language priority (setting of the Accept-Language header which a browser sends out) and the display-language setting in the [Settings/Registration]. When the language setup is other than English or Japanese, it is displayed in English.

● When accessing by SMS Installer Service (Remote Login Service Authentication).

Initial display language is set by the language setting (value of portalLang storing in Cookie) selected by the remote UI screen. When the setting is other than English or Japanese, Selection of display language is performed in a similar way with the SMS Installer Service (Password Authentication) mentioned above.

MEAP Application System Information

■ Outline

You can check the device's platform information and the MEAP application's system information.

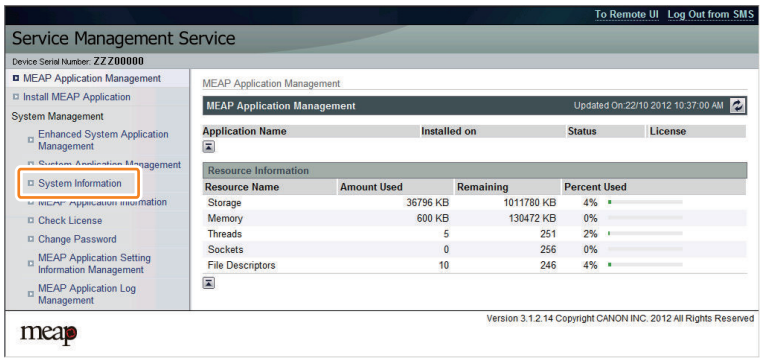
■ Checking the System Information

System information that can be checked from the screen

- MEAP Specifications version (MEAP Spec Ver)
  - MEAP Contents version
  - Java Virtual Machine version
  - System application information
- The name of the installed system application
  - The installation date of the installed system application
  - Application ID of the installed system application
  - The status of the installed system application

The checking procedure is shown below.

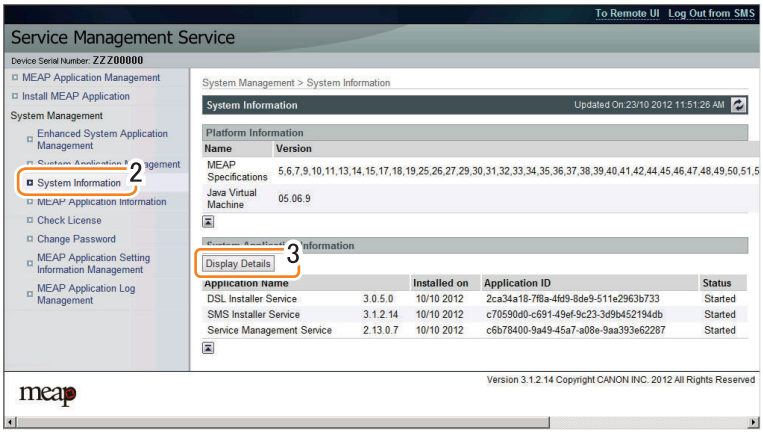
1. **Log in to SMS.**
2. **Select [System Management] > [System Information] on System Management menu.**



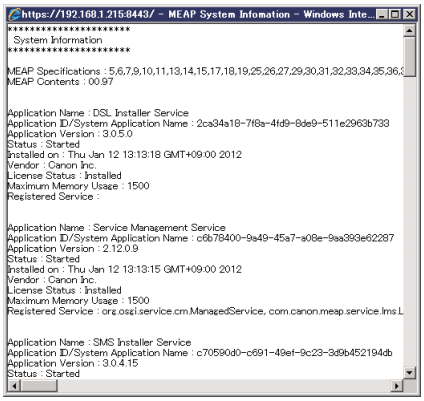
■ Display of System Information Details

The system information details can be displayed to check more than one pieces of information all at the same time: platform information, system application information, information on the installed MEAP applications, etc.

1. **Log in to SMS.**
2. **Select [System Info] on System Management menu.**
3. **Click [Display Details].**



4. **System information of each application (including system applications) is shown in an additional window. Copy and paste all the information in a file to attach to AR reports as text information. This function is useful to check status information of each application.**



■ Printing the System Information of a MEAP Application

MEAP system information can be printed out with device for confirmation.

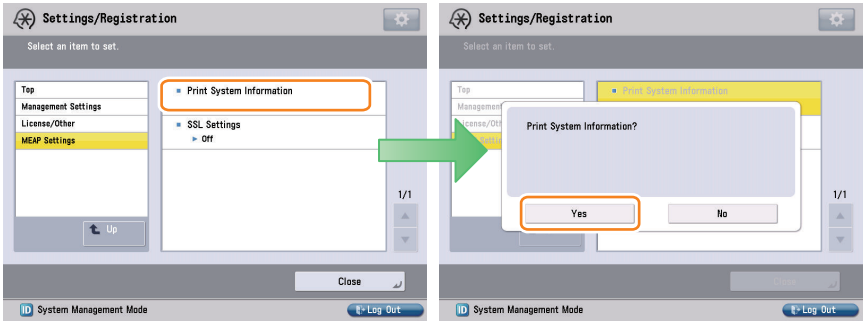
NOTE:
The system information of the MEAP application that you checked in the previous section is exactly the same as the system information of the MEAP application that is output.

Follow the steps below when confirming information:

1. **Select [Settings/ Registration] > [Management Settings] > [License/ Other] > [MEAP Settings] > [Print System Information] .**

NOTE:
When System Manager ID and PIN are set, go to Top screen and log in as System Manager to continue jobs.

2. **Press[Yes].**



NOTE:
MEAP system information was printed out in PDL format conventionally. However, the information has been printed out in text format instead of PDL format, enabling devices without PDL installation to print out information (iR C3220 and later).

■ MEAP System Information Content

Display examples of MEAP System Information Content

```
Application Name: Application A
Application ID/System Application Name: c9f8d37e-010d-1000-a8e3-00e000c4ae6f
Application Version: 2.0.0
Status: Active
Installed on: Thu Feb 19 10:56:38 GMT 2009
Vendor: Canon Inc.
License Status: Installed
Maximum Memory Usage: 8192
Registered Service:
```

Item	Description
Application Name	Application name Names (bundle-name) declared in the application program declaration are printed. This does not necessarily match the product name.
Application ID/System Application Name	Application IDs (application-id) declared in the application program declaration are printed.
Application Version	Application version Names (bandleversion) declared in the application program declaration are printed.
Status	Application activity state is printed. Installed Active Resolved
Installed on	Installation date of application
Vender	Name of application development vender Names (bandle-vender) declared in the application program declaration are printed.
License Status	Status of license file is printed. The types of license file status are as follows. None Not Installed Installed Invalid Overlimit
License Expires After	Deadline of license file is printed. Status of license file is not printed if "None".
License Upper Limit	The maximum number of sheets per Counter is printed. Status of license file is not printed if "None".
Counter Value	The current value per Counter is printed. Status of license file is not printed if "None".
Maximum Memory Usage	Maximum memory usage of applications Usage (maximum memory usage) declared in the application program declaration is printed. The unit is "KByte".
Registered Service	Services in which the application is registered to the MEAP framework are printed. Some do not have data that should be printed for this item.

MEAP Application Information

■ Outline

You can check the MEAP application installed on the device.
The following information can be checked on the MEAP application information screen.
Application Information

- Application Name
- Description
- Version
- Export Package
- Application ID
- Manufacturer
- Copyright
- Export Service
- Installed on
- ContactAddress
- Applet-Name
- Import Package
- Applet Number
- Category
- URL

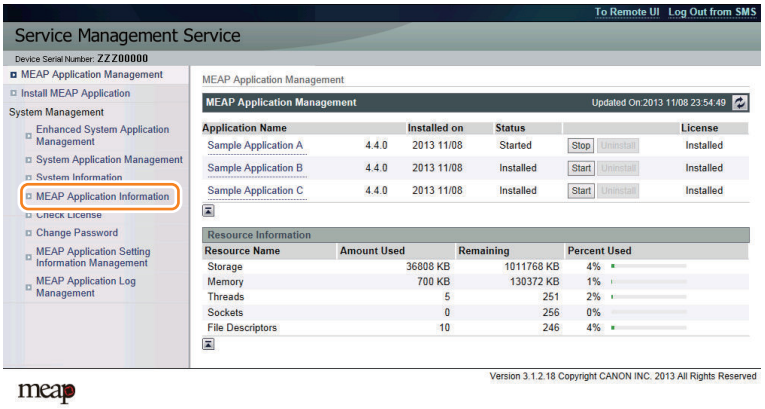
- Import Service
- Resources Used (Storage, Memory, Threads, Sockets, File Descriptors)

License Information

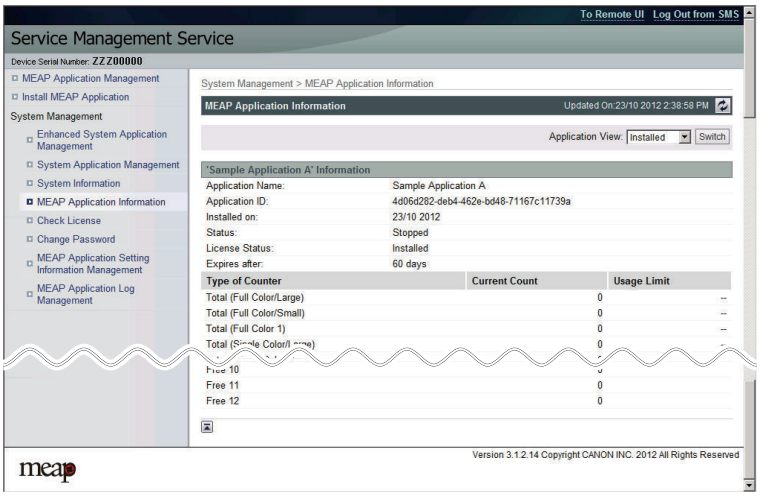
- Status
- Serial Number
- Expires after

■ Procedure to Check MEAP Application Information

1. **Log in to SMS.**
2. **Select [System Management] > [MEAP Application Information] on System Management menu.**



3. **The MEAP application information screen appears. Scroll the screen and check the information of the target application.**



Check License

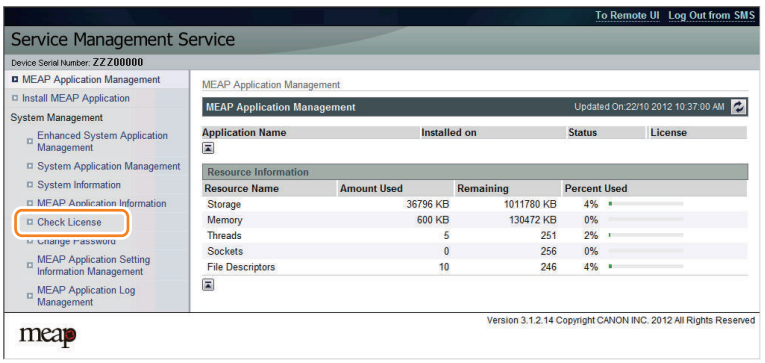
■ Outline

You can check the contents of the license file.

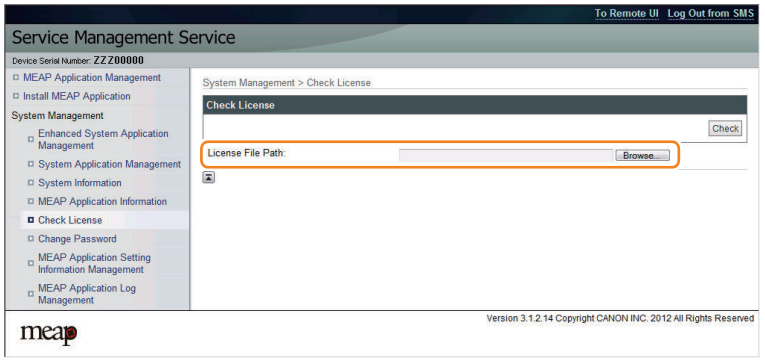
■ Procedure to Check the License File

1. **Log in to SMS.**

2. **Select [System Management] > [Check License] on System Management menu.**



3. **Click the [Browse..], specify a license file, and click the [Check].**



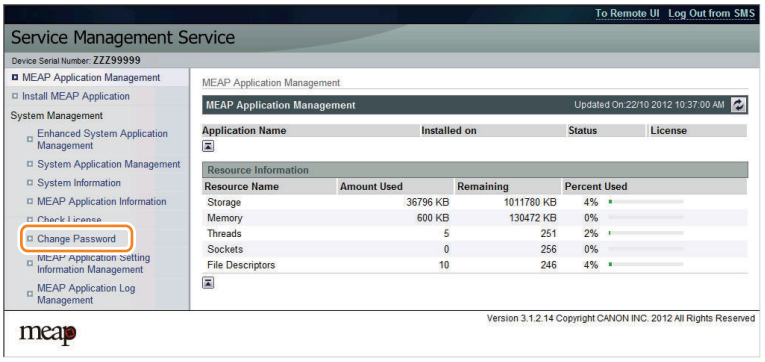
Changing SMS Login Password

■ Outline

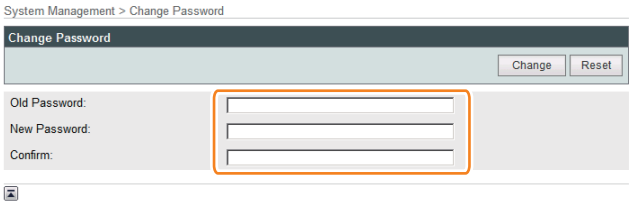
You can change the password for logging into SMS.
If you forgot the login password and you want to change the password back to the default value (MeapSmsLogin), see “If you forgot the password (SMS login password initialization)” on page 227 in this chapter.

■ Procedure to Change the SMS Login Password

1. **Log in to SMS.**
2. **Select [System Management] > [Chage Password] on System Management menu.**



3. **Enter the current password and a new password, and then click the [Change].**

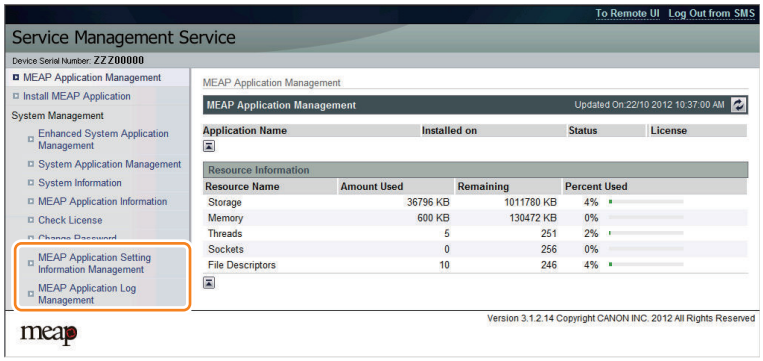


NOTE:
The [Reset] on the [Change Password] screen is used to clear the value entered in the text field. It is not a for changing the SMS login password back to the default value.

MEAP Application Setting Information Management and Log Management

■ Outline

The MEAP Application Setting Information Management page and the MEAP Application Log Management page provide menu related to "MEAP Application Configuration Service" for managing MEAP application setting information and menu related to "MEAP Application Log Service" for managing log information respectively.



● MEAP Application Configuration Service

This service is used to manage the MEAP application setting information. It has functions such as saving setting information to the MEAP area. Ver 57 of MEAP Specifications supports this service.

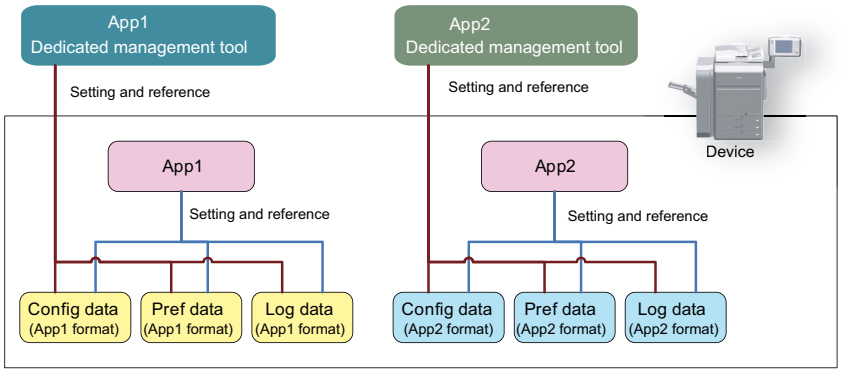
● MEAP Application Log Service

This service is used to collect MEAP application logs (debug logs and authentication logs).
Ver 58 of MEAP Specifications supports this service.
The collected logs can be downloaded or deleted in Remote UI.
The settings such as the log level to be saved cannot be made from SMS.
These settings depend on the MEAP application. For detailed information, refer to the manual for the application.

■ Advantages Obtained When Using the Services

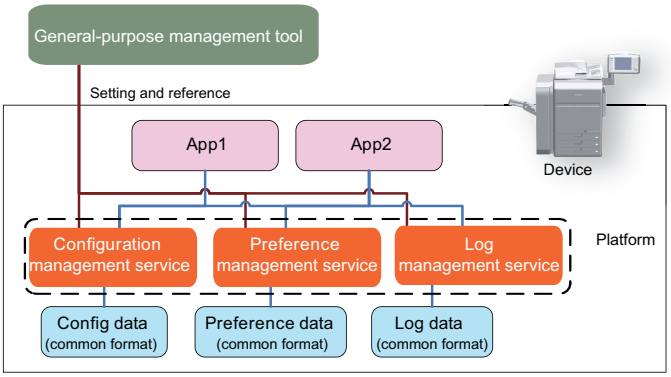
By using MEAP Application Setting Information Management and MEAP Application Log Service, as long as the MEAP application supports these services, you can collectively perform data management tasks.

● Devices and MEAP applications which do not support new functions



As for devices and MEAP applications that do not support the service, the setting information and log data are managed on an application-by-application basis.

● Devices and MEAP applications which support new functions

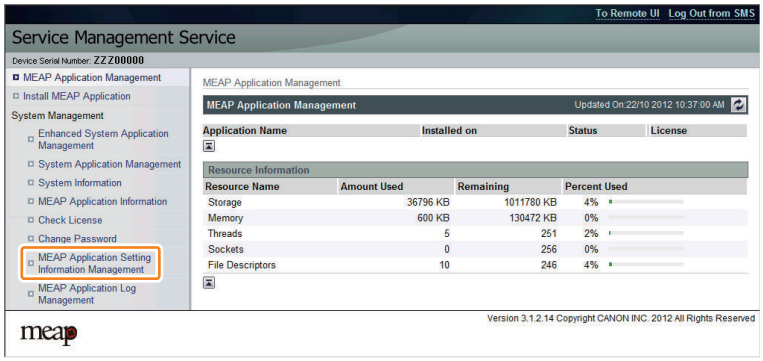


As for devices and MEAP applications that support the service, information can be collectively managed.

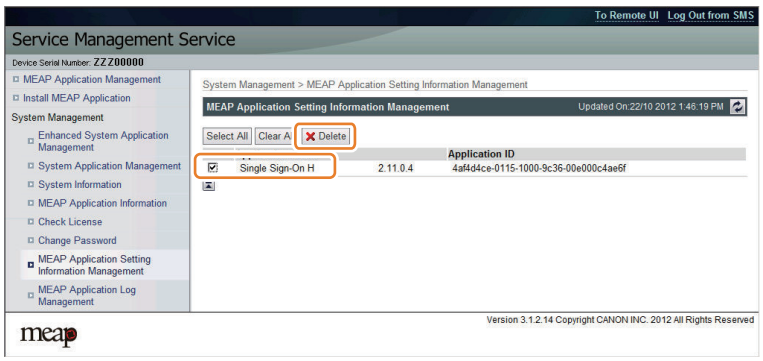
■ MEAP Application Setting Information Management

The setting data (stored on the device) of the MEAP applications which support MEAP Application Setting Information Management can be deleted. The procedure is shown below.

1. **Log in to SMS.**
2. **Select [System Management] > [MEAP Application Setting Information Management] on System Management menu.**



3. **Select an application you want to delete, and click the [Delete].**

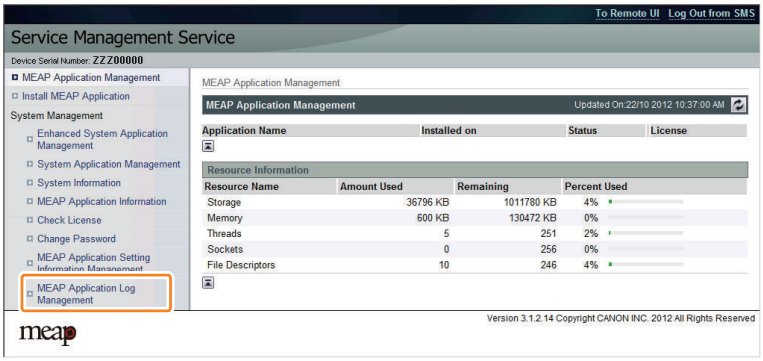


NOTE:
If a MEAP application that contains setting data which can be shared (not dedicated to the application) is installed, the application name [Shared Setting Information of Applications] is displayed.

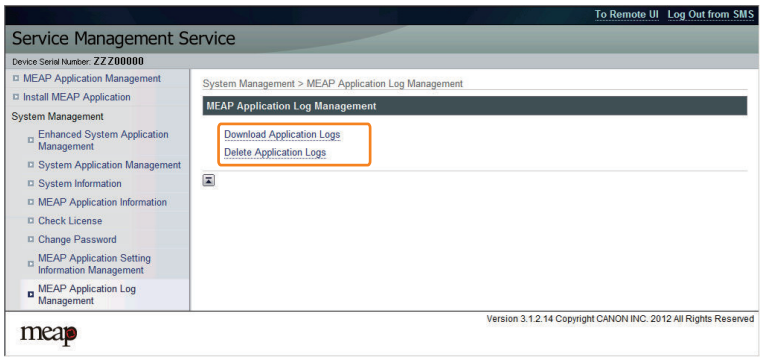
■ MEAP Application Log Management

The log data (stored on the device) of the MEAP applications which support MEAP Application Log Service can be downloaded or deleted. The procedure is shown below.

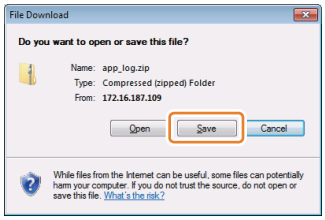
1. **Log in to SMS.**
2. **Select [System Management] > [MEAP Application Log Management] on System Management menu.**



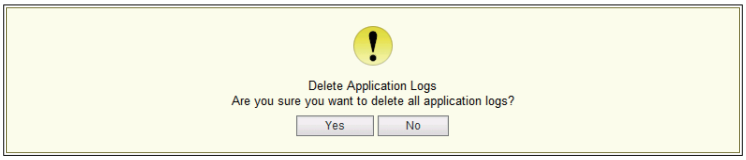
3. **Select [Download Application Logs] or [Delete Application Logs].**



4. **To download the logs**
   The file save dialog for the log file will appear. Specify the destination and save the file.



5. **To delete the logs**
   The confirmation screen will appear to prompt you to delete the logs. Click the [Yes] to delete the logs.



Maintenance

■ Backup of the MEAP Application Area and Recovery of the Backup Data Using SST

● Outline

When replacing or formatting the HDD, the data in the MEAP application area needs to be temporarily saved to your PC.
This chapter describes information on backing up the data in the MEAP application area and recovering the backup data.
In the case of MEAP-installed devices, the application is license-managed, so the application needs to be reinstalled and reconfigured when replacing or formatting the HDD.
In that case, a license for reinstallation needs to be downloaded and the customer data and configuration information need to be recovered, and these procedures pose heavy burdens on the service technician.
The area used for the MEAP application can be easily saved/recovered by using the backup function of SST (Service Support Tool).
This greatly reduces the work burden on the service technician.
Please note that the application cannot be illegally copied because the backup data can be recovered only when the device has the same serial number.

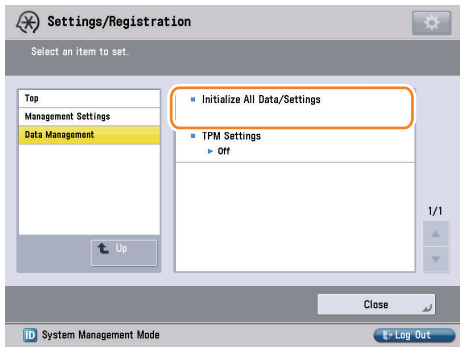
CAUTION:
- You must not perform any other work (including checking operation) until the HDD has been backed up. This arrangement is to prevent a mismatch of MEAP counter readings and the HDD contents, and any fault in operation arising as the result of failure to observe this will not be covered by the guarantee of operation.
- Do not disable the license during the period from backup using SST to restoration of data. It is not necessary to reinstall the license file when restoring the backup data.

● Backup Item Automatically Copied

The following data are backed up using SST:

The following data are backed up (saved as Meapbackup.bin) using SST.
- MEAP applications.
- Setup data generated by MEAP applications (Note that image data stored in BOX will not be saved for MEAP applications using BOX function).
- User information data registered for local device authentication in SSO-H
- SMS password

CAUTION:
Do not execute [Initialize All Data/Settings] in [Settings/Registration] during the period from backup using SST to recovery of the data.



When [Initialize All Data/Settings] is executed, the key used to decrypt encrypted backup data (SMS password, etc.) is initialized, which makes it impossible to decrypt the data.
It means that SMS cannot be accessed even when the backup data has been recovered using SST.
If you inadvertently executed [Initialize All Data/Settings] and can no longer access SMS, the SMS login password needs to be initialized by following the procedure shown in “When SMS Cannot Be Accessed” on page 227 in “Login to SMS” on page 226 in this manual.

Data backed up using SST

In the case of this machine, menus are implemented as MEAP application. Therefore the following items can be also backed up (stored as Meapbackup.bin).

- Setting items of each menu in the main menu (Copy, Scan and Send, Fax, Scan and Store, Access Stored Files, Fax/I-Fax Inbox,).
  - Favorite settings
  - Default settings
  - Settings of option shortcuts
  - Previous settings
- Settings of quick menu
  - Button size information
  - Wallpaper settings
  - Quick menu button information
  - Restrict quick menu use

● Requirements for Backup Using the SST

The following conditions must be met for use of the function:

1. **Device Firmware Version**

   Device Firmware Version for SST (Ver4.2x)

	Boot ROM	System	SST
iR-ADV C2030/C2020 series iR-ADV C2230/C2220 series iR-ADV 500 series	Boot ROM is not equipped.	Already supported since the 1st version.	The version supporting the corresponding devices.
iPR / iR-ADV series other than above	Already supported since the 1st version.	Already supported since the 1st version.	The version supporting the corresponding devices.

2. **SST Version**

   Version 4.2.x or later. An earlier version will not permit the use of the function. If needed, upgrade the SST.

3. **Space for backup**

   To back up the HDD of the device, the PC must have approx 1024MB of free space at maximum. Sizes of backup files depend on actual data capacities to be backed up.

● Procedure for backing up the MEAP application area using SST

1. **Switching Login Service / Backup of Login User Information**

   If SSO-H is used for the login service, switch to default authentication before backing up the user information. Although SST will back up local device user information, it is recommended to export the user information just in case. For local device user information backup, go to User Management page of SSO-H site and export the data. (The SSO-H login page opens with the URL "https://<device IP address>:8443/sso/").

CAUTION:

- If a HDD of a system that uses SSO-H is formatted without changing the login service to the default authentication, the error message "The login service must be set again with SMS" appears and the system cannot start up when you attempt to restart the system after formatting.
- If this problem occurs, change the login service to SSO-H with SMS. If you cannot access to SMS since you do not have the IP address of the device, start the system with FIXIP mode -hold down the numeric keys 1 and 7 and turn the power switch on. The IP address "172.16.1.100" will be automatically assigned for the device. Then log in to SMS specifying the address.

2. **Starting the device in Download Mode**

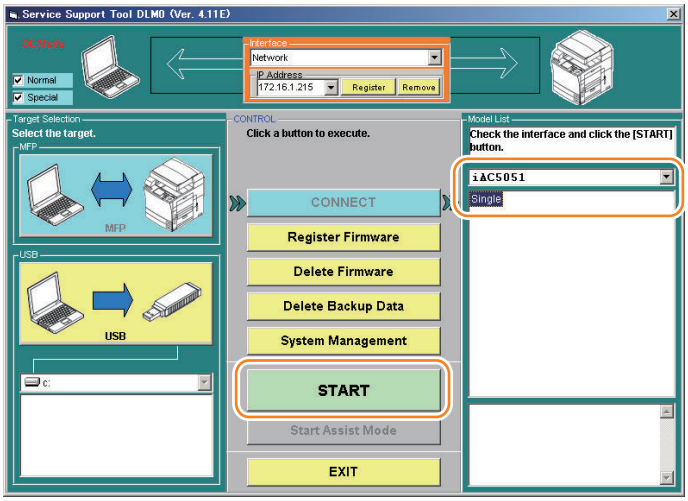
   Press [2] and [8] buttons at the same time on the control panel and turn on the main power switch to start the device in Download Mode. Note that SST backup function is enabled only in Download Mode.

3. **Connecting the main unit to the PC to start SST**

   Connect the main unit to the PC with SST installed using the crossing cable and the like to start SST on the PC.

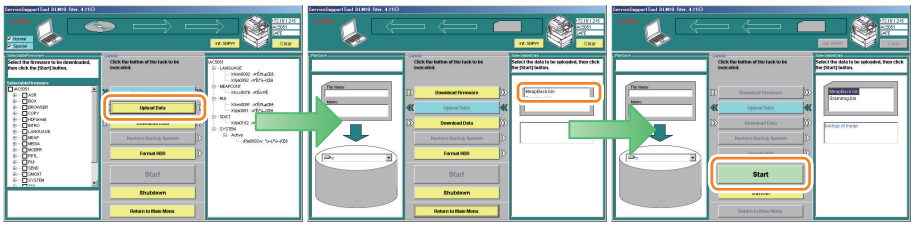
4. **Connecting the device using SST**

   When starting SST, select the target device type as Single and click [Start].

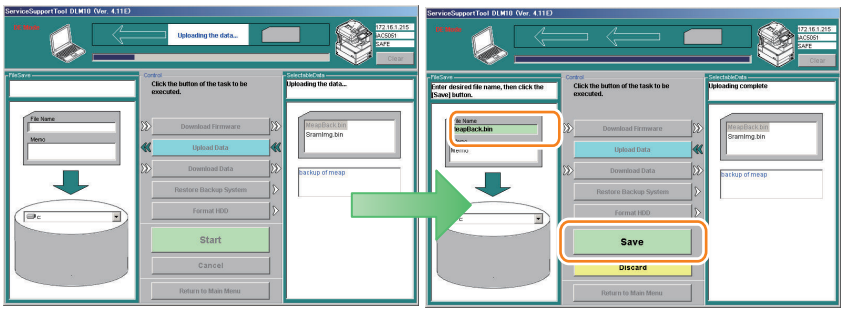


5. **Generating backup data to transfer it to the PC (uploading)**

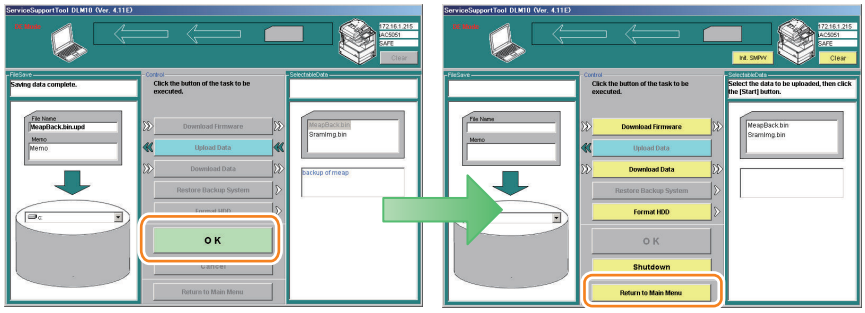
   Click [Upload Data] of SST and select "Meapback.bin" as the item to be backed up to click [Start].



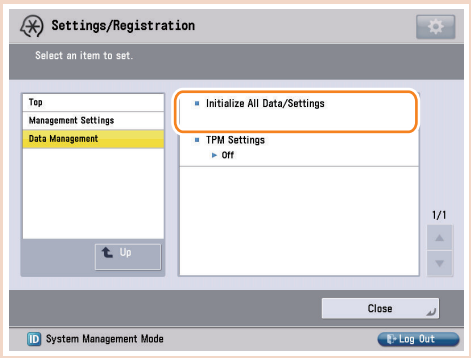
6. **Saving backup data**
   Upon the backup data transferred to the PC, enter an appropriate file name and click [OK] to save the backup data on the PC.



7. **When the file is successfully saved, click [OK], and then click [Return to Menu].**



CAUTION:
Do not execute [Initialize All Data/Settings] in Settings/Registration during the period from backup using SST to recovery of the data.

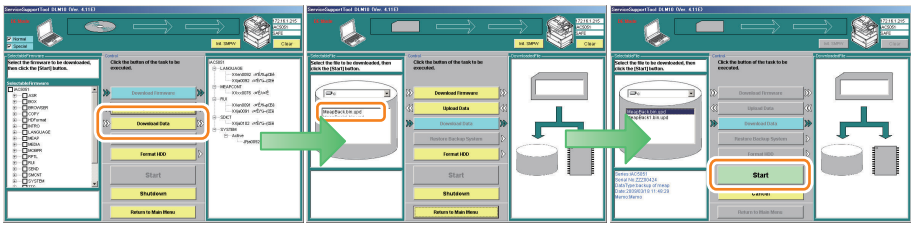


When [Initialize All Data/Settings] is executed, the key used to decrypt encrypted backup data (SMS password, etc.) is initialized, which makes it impossible to decrypt the data.
It means that SMS cannot be accessed even when the backup data has been recovered using SST.
If you inadvertently executed [Initialize All Data/Settings] and can no longer access SMS, the SMS login password needs to be initialized by following the procedure shown in “When SMS Cannot Be Accessed” on page 227 in “Login to SMS” on page 226 in this manual.

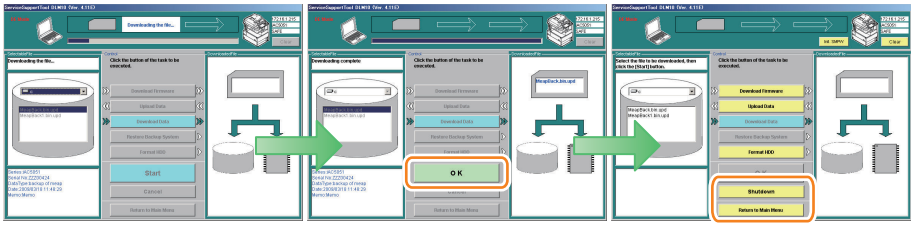
● Procedures to Restore Backup Data

1. **Connecting to the device**
   Connect the device using SST by following step 1 to step 4 of the “Procedure for backing up the MEAP application area using SST” on page 275.

2. **Restoring backup file**
   Click [Download Data] and select the data backed up in the previous step (Meapback.bin) to click [Start Restoring Data]. Note that the data backed up in a different version cannot be restored.



3. **Transferring Data**
   When the data is successfully transferred, click the [OK] shown on the screen. To continue other jobs, click [Return to Menu].



4. **Turn off and on the main power switch of the device to gain access in SMS to check that MEAP applications are surely restored.**
5. **Restore the backup data and setting saved. Note that the user information of the local device is included in the backup data, thus does not need to be restored.**

■ Formatting and Replacing the HDD

● Outline

If the HDD is broken or does not function correctly due to failure of the system (excluding the MEAP application), it needs to be formatted or replaced.
When the HDD is formatted or replaced, the files of the MEAP application stored in it will be lost, so make a backup of the MEAP application area according to “Procedure for backing up the MEAP application area using SST” on page 275 if possible. If a backup cannot be made, the MEAP application and the license files need to be reinstalled.
As for the MEAP counter information, it will not be lost because it is backed up just like the conventional counter.
If a backup cannot be made, a special license file (a license file for installation with the expiration date carried over from the current counter value) is required to reinstall the MEAP application. This special license file is treated as a service tool and cannot be obtained by a general user.
In order to obtain a special license file, a service technician needs to contact a person in charge of support of a sales company. When contacting the person in charge of support, the service technician also needs to provide the serial number of the device and the name of the MEAP application installed.
In the support departments of regional headquarters of Canon, all license files of the applications that have been issued are filed according to device serial numbers, enabling you to obtain a series of license files through a single screen as long as you can identify the serial number of the device in question.

NOTE:
The application that is installed with a reusable license can be reinstalled by using the same license.

● Formatting the HDD

Procedure to format the hard disk
Follow the following procedure to format the HDD.

1. **Connecting to the device**
   Connect the device using SST by following step 1 to step 4 of “Procedure for backing up the MEAP application area using SST” on page 275.

2. **Formatting the HDD**
   Select "Format HDD" from SST menu to format the HDD.

NOTE:
HDD can be formatted also by starting Download mode using the USB memory and executing formatting from the displayed menu.

• HDD replacement procedure

Outline

The procedure for replacing the HDD differs according to whether the HDD functions normally or not.

If the MEAP application area cannot be backed up

If the HDD does not function correctly due to failure or for other reason, the MEAP application area cannot be backed up. It is therefore necessary to reinstall the application after replacing the HDD. The procedure is shown below.

1. **Preparation for replacement**
   Copy a set of license files for reinstalling the MEAP application (special licenses and reusable licenses) to a laptop for service operation.
   Register a set of system files of a target product to SST. Or, prepare USB thumb drive of the System file transfer settlement.
2. **Replacing the drive**
   Prepare the necessary service parts of the HDD, and replace the drive.
3. **Formatting HDD**
   Format the HDD referring to “Formatting the HDD” on page 277.
4. **Reinstalling the MEAP application**
   When the device has started normally, obtain the jar files of the MEAP applications from the user, and install them using the license files for reinstallation.
   Installation method is the same as normal installation.
5. **Importing user information**
   As necessary, make login service selections and import user information.

NOTE:
When you replace the HDD without uninstalling MEAP applications, make sure to reinstall the previously installed applications. Unless reinstalling them, MEAP counter will not be released and the message "The number of applications that can be installed has exceeded the limit. Try to install this application after uninstalling other applications." is displayed so that the installation of new applications may not be accepted. If you want to install new applications in this case, once reinstall the applications installed before formatting and uninstall unnecessary applications.

If the MEAP application area can be backed up

If the MEAP application area can be backed up, it can be recovered after replacing the HDD, so it is not necessary to prepare the special licenses for reinstallation.

1. **Preparation for replacement**
   Back up the MEAP application area of the device according to the procedure for backing up the MEAP application area using SST.
2. **Replacing the drive**
   Prepare the necessary service parts of the HDD, and replace the drive.
3. **Formatting HDD**
   Format the HDD referring to “Formatting the HDD” on page 277.
4. **Restorering the backup file**
   Restore the backup data referring to the “Procedures to Restore Backup Data” on page 276.
5. **Importing user information**
   As necessary, make login service selections and import user information.

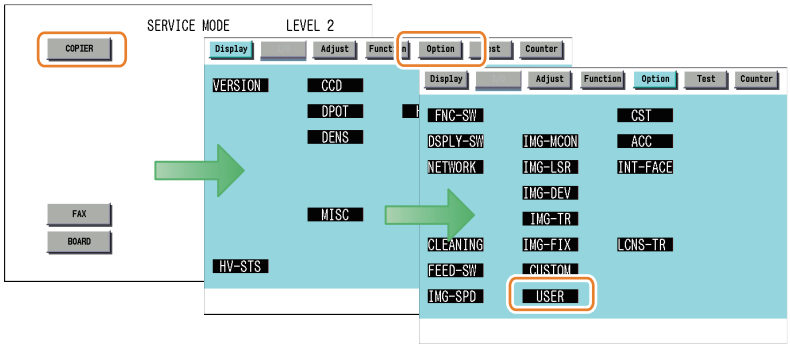
■ MEAP Safe Mode (level 2)

● Outline

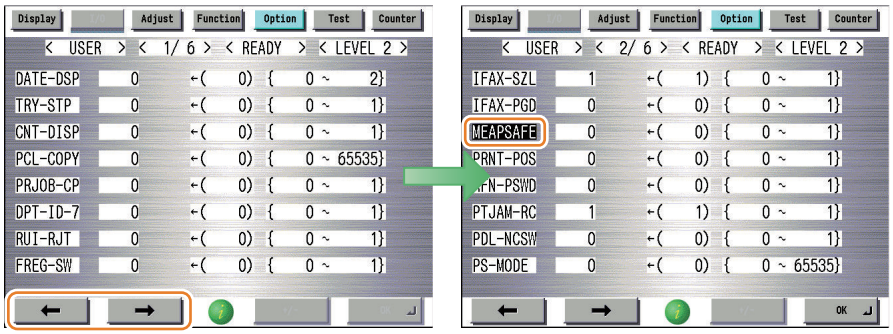
Use safe mode if you need to start up the system without worrying about extra applications. It will start up only those system software files (including SMS) that normally start up as default files while preventing MEAP applications and the like from starting up.
When you have made changes and restart the device, the control panel will indicate "MPSF" in its lower right corner. The MEAP applications that may have been active before you shut down the equipment will not start up on their own. Make use of safe mode when restoring the system software as when MEAP applications or services cause a fault as the result of a conflict or wrong sequence of registration/use. You can access to SMS in this condition so that you can take necessary measures, for example, you can stop application that may cause the trouble.
If default authentication has been selected, the mode of authentication remains valid; otherwise, the message "The login service must be set again with SMS" appears. Change the login service as necessary.

● Starting in Safe Mode

1. **Startup [SERVICE MODE] in level 2.**
2. **Press [COPIER] >[Option] > [USER].**

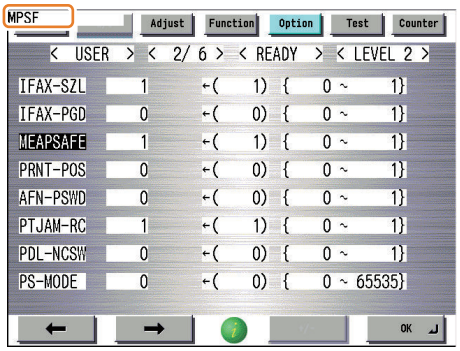


3. **Press ← or → for several times until [MEAPSAFE] is shown. Click [MEAPSAFE].**

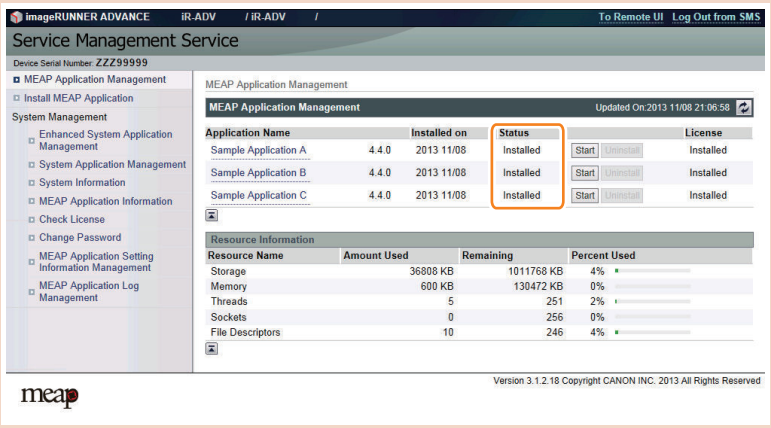


4. **Press the 1 key on the control panel keypad to change the setting to "1"; then, click [OK].**

5. **Check that the notation "MPSF" has appeared in the lower right corner of the screen; then, restart the device.**

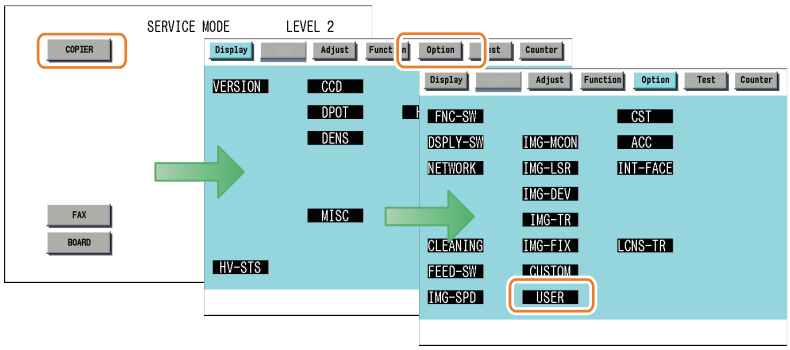


CAUTION:
If the device has been started in MEAP SAFE mode, all the MEAP applications stop and the status becomes "Installed". This status remains unchanged even if the MEAP SAFE mode is canceled and the device is started again in normal mode. It is therefore necessary to access SMS after normal startup and start the MEAP application.

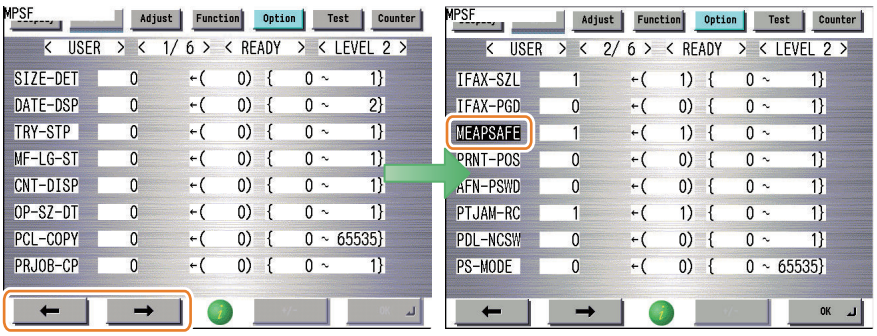


● How to cancel MEAP SAFE mode

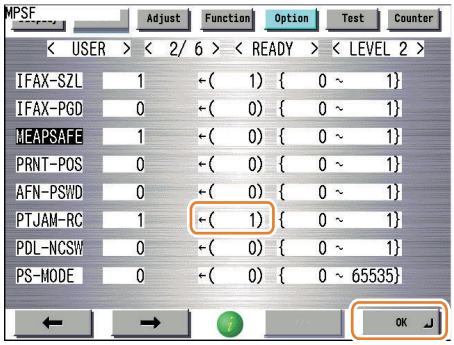
1. **Startup [SERVICE MODE] in level 2.**
2. **Press [COPIER] >[Option] > [USER].**



3. **Press ← or → for several times until [MEAPSAFE] is shown. Click [MEAPSAFE] .**



4. **Press the 0 key on the control panel keypad to change the setting to "0"; then, press [OK].**



5. **Start service mode again after rebooting the device, and check that the displayed setting value has changed to "0" and that [MPSF] is no longer displayed at the lower right of the screen.**

■ Collection of MEAP Console Logs

● Overview

When debugging a MEAP application, console logs need to be collected in some cases.
The following shows how to collect MEAP console logs using commercially available terminal software and service mode.

● What to Prepare

- PC connected with the same network as the device
- Commercially available terminal software

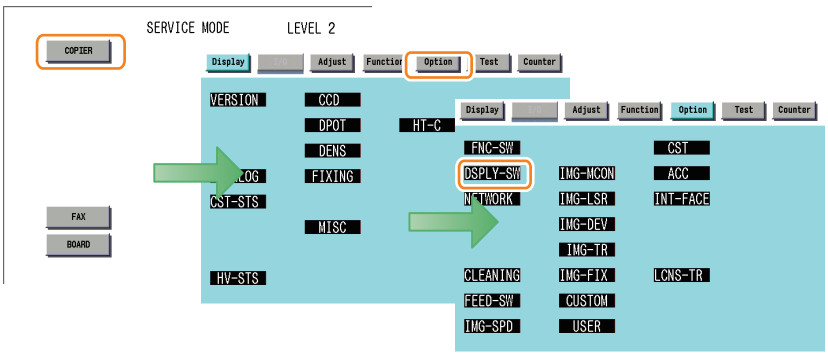
NOTE:
In the procedure shown in this manual, "Tera Term Pro" and "Hyper Terminal" are used as the terminal software.

● Work Procedure

Device Setting Procedure

1. **Start [SERVICE MODE] in Level 1.**

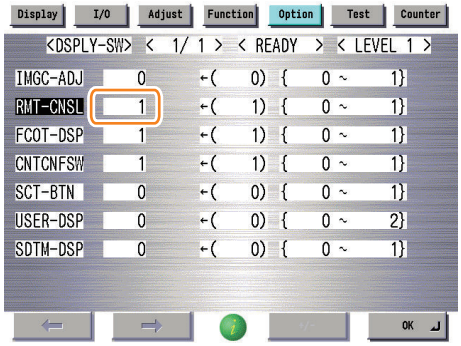
2. **Press [CER] > [Option] > [DSPLY-SW].**



3. **Press [RMT-CNSL].**

4. **Press either 1 (activate remote console function) on control panel (the numerical value input in the field is displayed), and press [OK].**

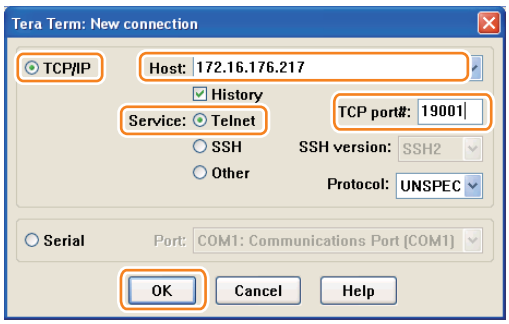
5. **Check to see that it is reflected in setting field, and restart the device.**



PC setting procedure (when Tera Term is used)

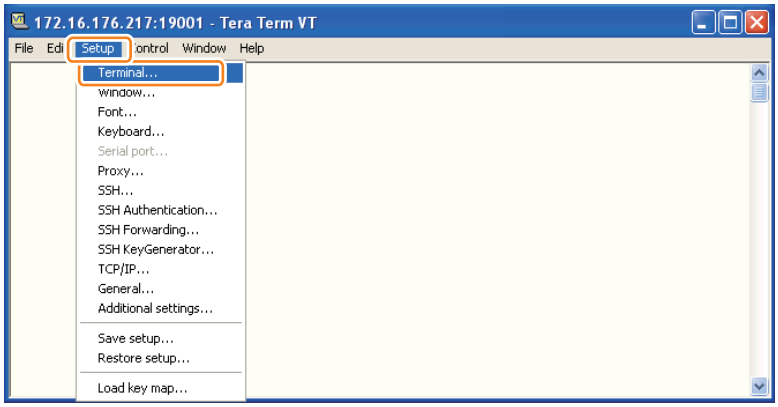
1. **Install the terminal software on the PC.**

2. **Start the terminal software, make the following settings, and then click the [OK].**

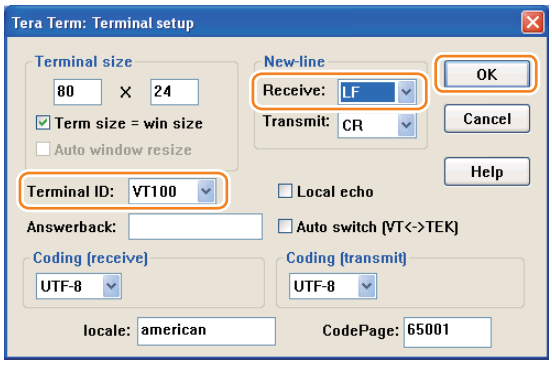


- Connection: Select [TCP/IP] (Default)
- Host: Device Host Name or IP Address
- Service: Select "Telnet"
- TCP port#: Enter 19001

3. **The connection window will open. Select [Terminal…] from the [Setup] menu.**

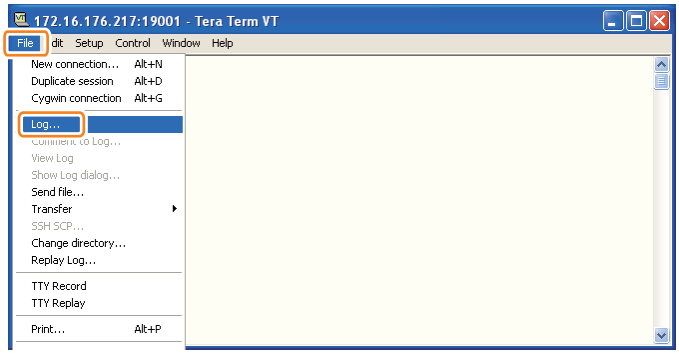


4. **The terminal setting screen will appear. Make the following settings, and then click the [OK].**

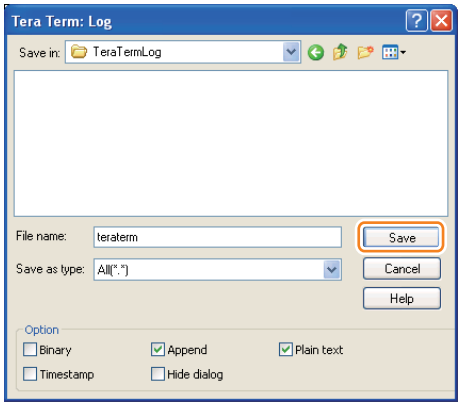


- Terminal ID: VT100
- New-line Receive: LF

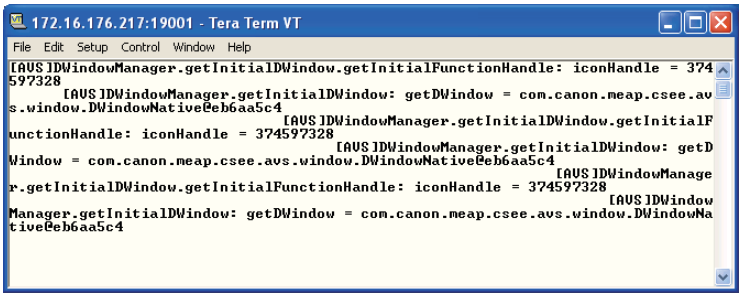
5. **Select [Log...] from the [File] menu.**



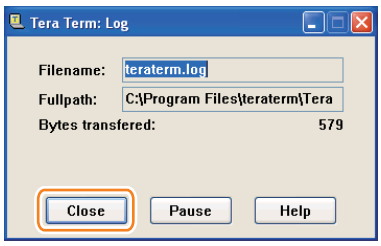
6. **The dialog for specifying the save destination of the log file will appear. Set the save destination path and the file name, and then click the [Save].**



7. **Perform the operation whose log you want to collect.**

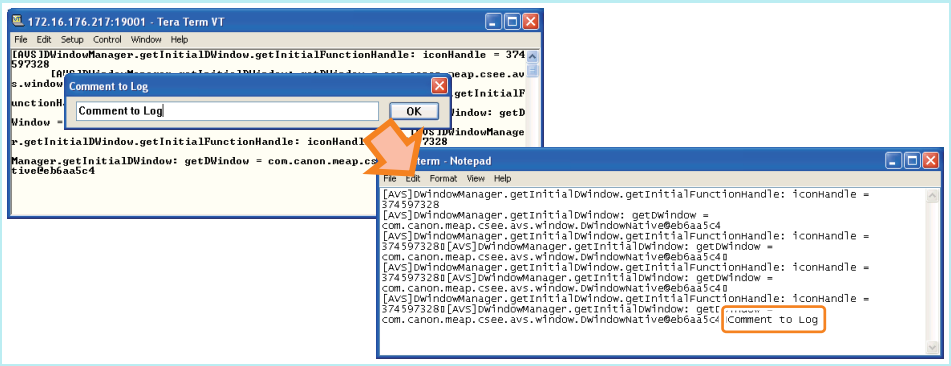


8. Click the [Close] in the log dialog.

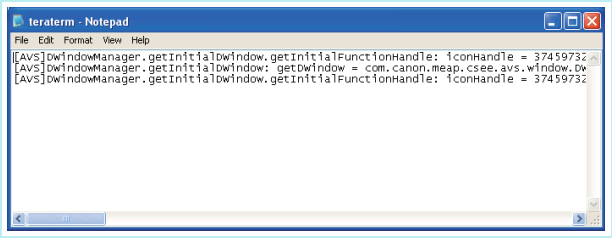


NOTE:
To suspend log collection, click the [Pause].

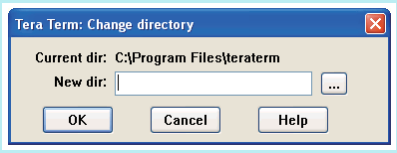
NOTE:
While collecting logs, the following operations are available from the [File] menu.
Comment to Log... :
You can add a comment to the log being collected. The added comment is reflected in the log file.



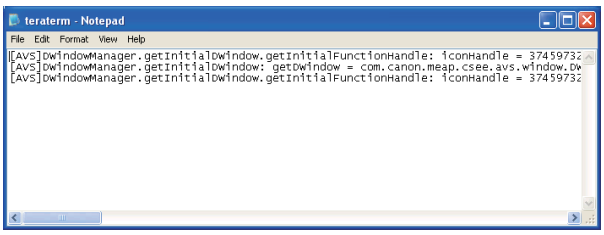
Show Log dialog... :
The logs that have been collected are pasted on Notepad and displayed.



Change directory... :
The preliminarily set save destination of the log file can be changed.



9. **Open the file saved in the save destination, and check that the logs are stored correctly.**

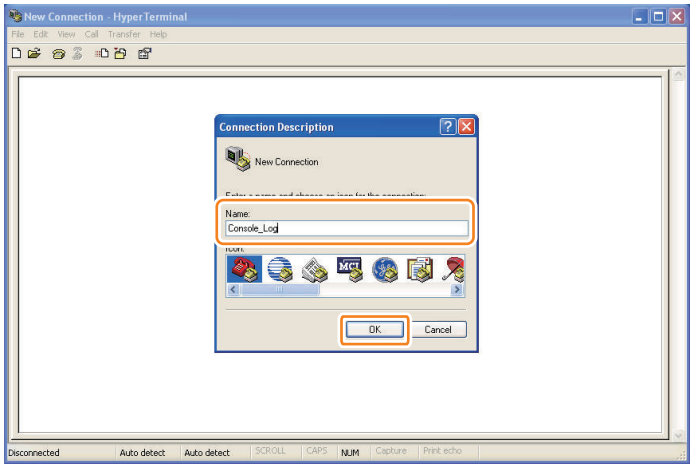


NOTE:
Depending on the MEAP application, the log output setting needs to be made in order to collect logs.

CAUTION:
After collecting logs, the remote console function of the device needs to be disabled (select [SERVICE MODE] LEVEL1 > [COPIER] > [Option] > [DSPLY-SW] > [RMT-CNSL] > 0, and restart the device).

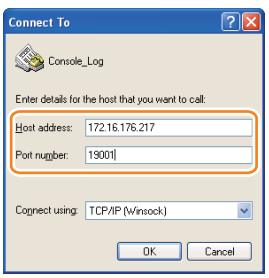
PC setting procedure (when Hyper Terminal is used)

1. **Start Hyper Terminal, set the connection name in the [Connect Description] dialog that appears on the screen, and then click the [OK].**

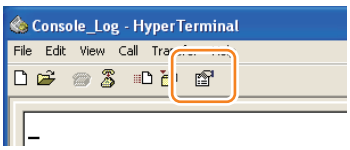


2. **Set [TCP/IP(Winsock)] for [Connect using].**

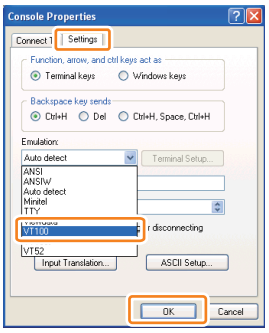
3. **Enter the IP address of the target device in [Host address], and enter "19001" (fixed) in [Port number].**



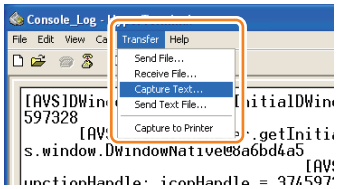
4. **Click the "Properties" icon on the Hyper Terminal screen.**



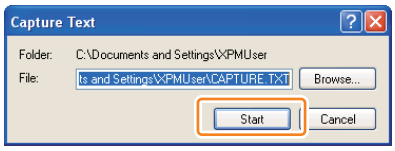
5. **The [Console Properties] dialog will appear. Select the [Settings] tab, select [VT100] for [Emulation], and then click the [OK].**



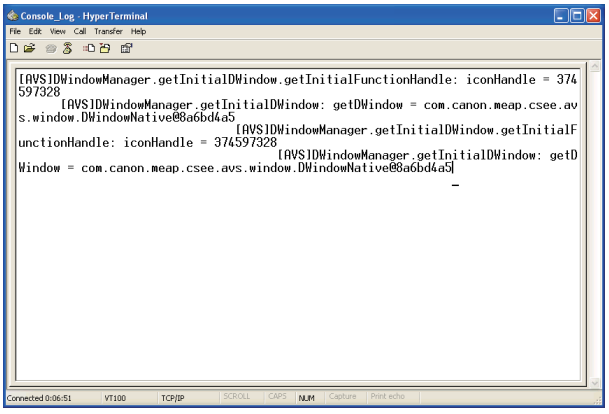
6. **Return to the Hyper Terminal window, and select [Transfer] > [Capture Text...] from the menu.**



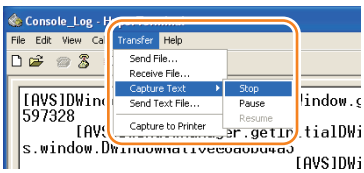
7. **The dialog for specifying the save destination of the log file will appear. Specify the save destination.**



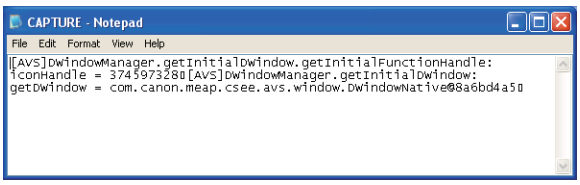
8. **Perform the operation whose log you want to collect.**



9. **Select [Transfer] > [Capture Text...] > [Stop] from the menu.**



10. Open the file saved in the save destination, and check that the logs are stored correctly.



NOTE:
Depending on the MEAP application, the log output setting needs to be made in order to collect logs.

CAUTION:
After collecting logs, the remote console function of the device needs to be disabled (select [SERVICE MODE] LEVEL1 > [COPIER] > [Option] > [DSPLY-SW] > [RMT-CNSL] > 0, and restart the device).

■ Using USB Devices

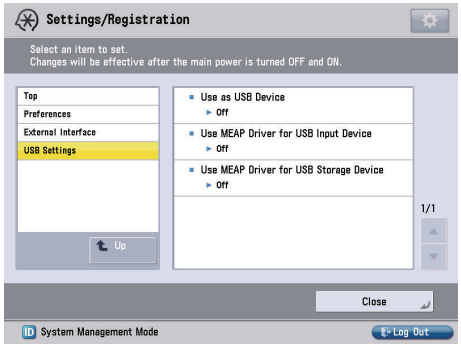
● USB Driver

Two types of USB drivers

While the USB driver that can be used in conventional devices is only the USB driver designed exclusively for MEAP application (hereinafter referred to as "MEAP driver"), not only MEAP driver but also USB system driver (hereinafter referred to as "system driver") can be used in this machine.
System driver and MEAP driver cannot be used together. When either of them is used, the other driver cannot be used.

USB driver setting

System driver is active by default in this machine.
The driver can be changed in [Settings/Registration].
Usually, It is not necessary to change the setting because it is specified in the MEAP application side.
Only in the case of a special MEAP application, it is necessary to change the USB driver setting.
For details, refer to specifications of MEAP application side.



Operating mode settings [Use MEAP driver as USB input device]	Conventional USB keyboard enabled MEAP application	Software keyboard application (System Driver/ MEAP Driver)	System driver supported MEAP application
ON * MEAP driver (conventional compatibility mode)	Can use USB keyboard. Can work only on the conventional applications that support the MEAP application driver.	Cannot use USB keyboards. (Device cannot be detected.)	Cannot use USB keyboards.
OFF (*default) * Native driver	Cannot use USB keyboards. (Device cannot be detected.)	Can use USB keyboards.	Can use USB keyboards. Via software keyboards only.

NOTE:
When any settings changes are made, the device must be restarted.

Setting the USB driver for each USB device (MEAP driver preference registration)

If it is set to use the system driver, the conventional applications that support the MEAP application driver cannot use the USB input device.
Therefore, for the USB drivers used by USB devices/MEAP applications, there is setting function (MEAP driver preference registration) to give priority to the MEAP driver.
If you register the ID of the USB device by using this function, the USB device can use the MEAP driver despite the Additional Function settings.
Using this function requires the conditions below:

- Supported MEAP SpecVer: 26
- Describe the idVendeor(VID) and idProdutc(PID) of USB device in the manifest or activate/ deactivate the VID and PID by calling API from MEAP applications.

The driver setting that is used in a manifest file is reflected in the following timing.
When registering from a manifest file.

- The registration will be enabled when an application is activated and device is restarted.
- The registration will be disabled when an application is stopped and device is restarted.

NOTE:
You can display/check the used driver setting at "USB device report print" described below regardless of whether it is registered from a manifest file or is registered from API.

Availability for MEAP application of the USB device A (either HID keyboard or Mass Storage) plugged to device

Registration status of USB device A	When the HID keyboard is installed > USB Settings: [Use MEAP Driver for USB Input Device] When the Mass Storage is installed > USB Settings: [Use MEAP Driver for External USB Device]	Native application	MEAP application		
			System driver supported application	System driver not supported/ conventional application	Application with VID/PID declared in Manifest for x
Not registered	OFF	YES	YES	NO	-
	ON	NO	NO	YES	-
Registered	OFF	NO	NO	YES	YES
	ON	NO	NO	YES	YES

YES: USB device available
NO: USB device not available
Availability for MEAP applications of USB devices B and C (either HID keyboard or Mass Storage) plugged to device

Registration status of USB device B	Setting to use MEAP driver (Additional Functions mode)	USB device	Native application	MEAP application		
				System driver supported application	System driver not supported / conventional application	Application with VID/PID declared in Manifest for B
Registered	Not used (Native driver to be used)	B	YES	YES	NO	-
		C	YES	YES	NO	-
	To be used	B	NO	NO	YES	-
		C	NO	NO	YES	-
Not registered	Not used (Native driver to be used)	B	NO	NO	YES	YES
		C	YES	YES	NO	NO
	To be used	B	NO	NO	YES	YES
		C	NO	NO	YES	YES

YES: USB device available
NO: USB device not available

Specifications for the use of USB keyboards

Characters that could be entered on the software keyboard displayed on the conventional control panel can be entered using a USB connected keyboard.

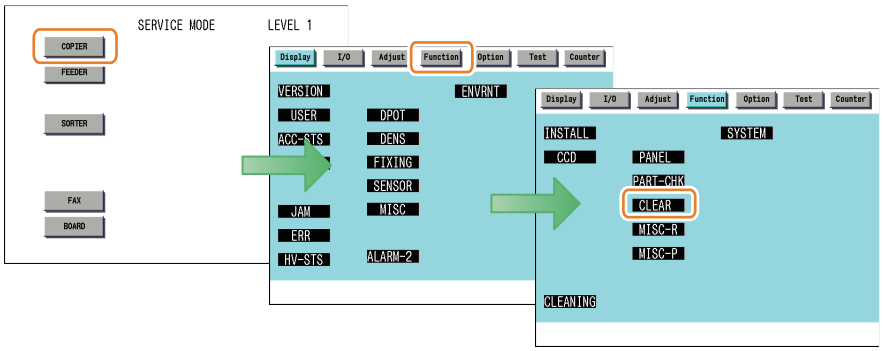
- When the software keyboard window is displayed, characters can be entered from the USB keyboard (in-line entry not possible).
- When the software keyboard window is not displayed, entered characters will not be remembered.
- The characters, which can be entered from a USB keyboard, is only a character, which can be entered from the software keyboard.
- Even if characters are entered from the USB keyboard, the software keyboard window will not change (the corresponding key does not invert or change color).
- Input from the USB keyboard can be accepted at the same time as input from the software keyboard or numeric keys.
- Since the device supports Plug and Play, the USB keyboard can be disconnected/ connected freely. However, do not disconnect and connect during in deep sleep (when in sleep with setting "low" at "the power consumption in sleep"). It is out of an operation guarantee to disconnect and connect the USB keyboard in deep sleep.
- When USB device is attached to device, devices do not shift to deep sleep mode.
- Keyboard layout changes according to the keyboard layout settings in the Settings/Registration screen. In addition, function keys and ten keys which are not displayed in the software keyboard cannot be used. (Keyboard which the operation check was conducted is 84-key Keyboard, but this does not mean that the operation of all 84-key Keyboards is guaranteed.)

NOTE:
The factory shipment default setting is to enable the use of native (main unit functionality) USB keyboards. Therefore, in order to use MEAP application keyboards, [Use MEAP driver for USB input device] under [System management settings (initial settings/ registration)] needs to be set to ON (factory shipment setting is OFF).
Operations change as described below in accordance with ON/ OFF settings.
ON: when using MEAP application keyboard
OFF: when using native (main unit functionality) keyboard (factory shipment default)

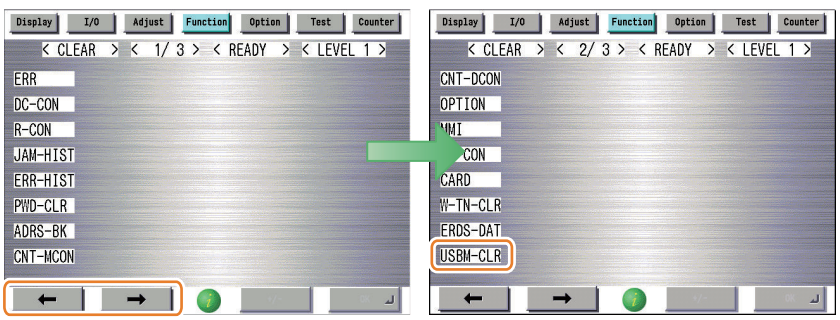
● Initialization of MEAP driver priority registration

When any trouble occurs regarding USB driver settings and it is necessary to reset the setting information, you can reset the MEAP driver preference registration by using service mode.
Steps to initialize preference use registration

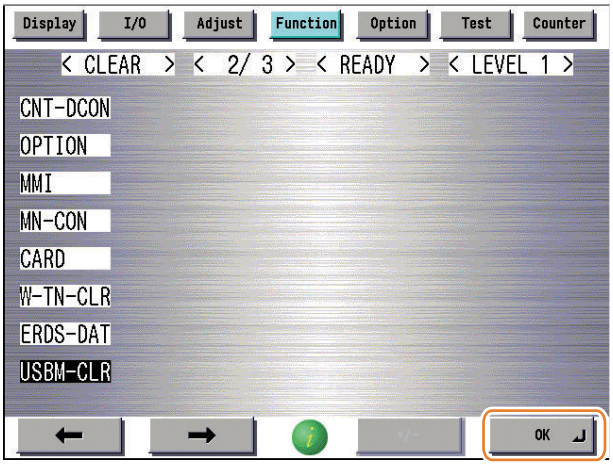
1. **Start [SERVICE MODE] in Level 1.**
2. **Press [COPIER] > [Function] > [CLEAR].**



3. **Press ← or → for several times until [USBM-CLR] is shown on the screen.**
   Press [USBM-CLR].



4. **Press [OK] to restart this device.**

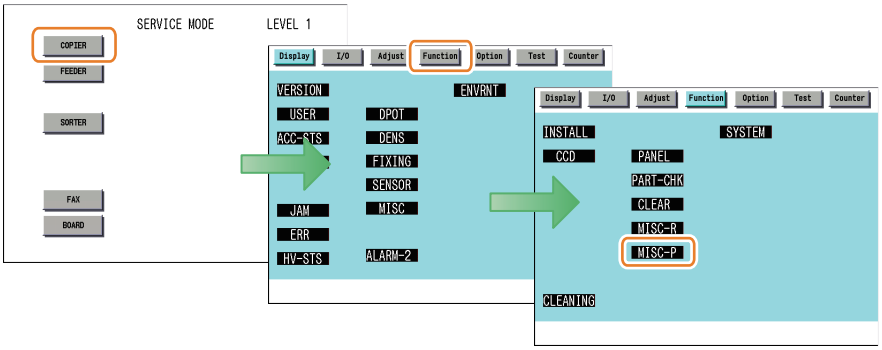


● USB Device report print

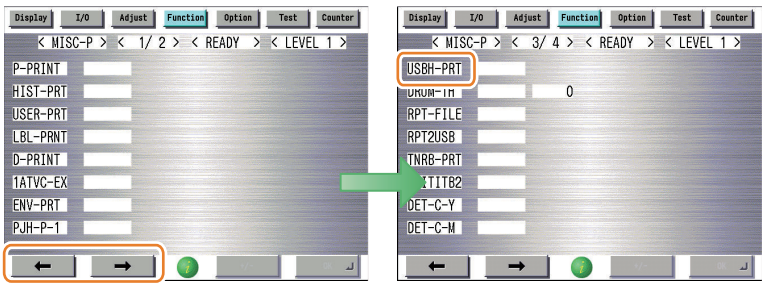
To check the vendor IDs (idVendor) and the product IDs (idProduct) registered in this device by means of declaration in Manifest file of MEAP applications, output the USB Device repot report print.

Steps to output the USB Device report print

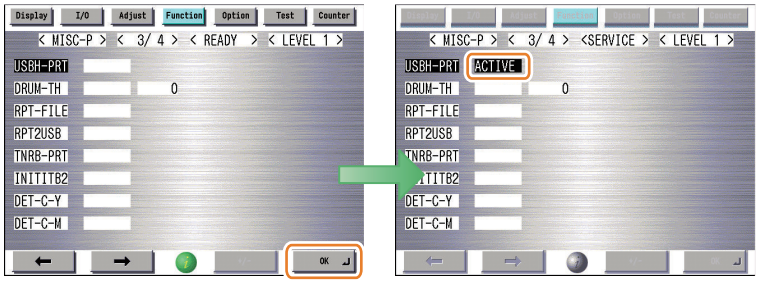
1. **Start [SERVICE MODE] in Level 1.**
2. **Press [COPIER] > [Function] > [MISC-P].**



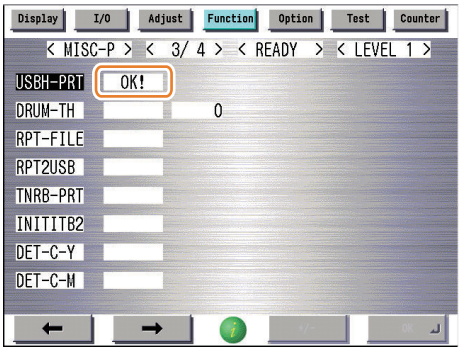
3. **Press ← or → for several times until [USBH-PRT] is shown. Press [USBH-PRT].**



4. **When pressing [OK], [ACTIVE] blinks on the status field.**



5. **When [OK] is shown on the status field, the status print is output. Check the contents of the print.**



Example of output result

```
*********************************
*** USB Device report print ***

Details of USB device information

USB device information recognized by the device is displayed.
If it is not displayed, it is likely that an error has occurred.
Some standard option devices are not displayed in the report.
Details of each item are shown below.

- T: Topology
  The internal hierarchical structure to which the USB device is connected is indicated. The number of the connected bus, hierarchical structure and connection speed is recognizable.
- D: Device
  The USB device information is indicated.
- P: Product
  The USB device product information is indicated. The vendor ID and product ID can be identified here.
- S: String
  The character strings embedded in the USB device are indicated. The manufacturer name and product name can be identified here.
- C: Configure
  The USB device configuration information is indicated. * It is recognizable whether it is active or not by the presence of a stamp.

- I: Interface
  The USB device interface information is indicated. The interface class and available drivers are recognizable.
  The values and details of the drivers are shown below.

Displayed	Description
usbhid	It is displayed when a USB system driver is assigned to the connected input device.
usb-storage	It is displayed when a storage device (such as USB flash drive) is connected.
hub	It is displayed when a hub is connected.
gpusb	It is displayed when a MEAP Application dedicated USB driver is assigned to the connected input device.
gpusbex	It is displayed when a USB device on which a specific ID and product ID are priority registered is connected with a manifest or MEAP API, and a MEAP Application dedicated USB driver is assigned.

- E: Endpoint
  The USB device end-point information is indicated.

Whether to output report

Connection device		Whether to print a report
HID		Yes
Storage		Yes
Fax		No
Device Port	Multimedia Card Reader	Yes
	IC Card Reader	Yes
Image Analysis Board		No
Hub	Internal hub*	No
	External hub*	Yes

* The hub for the Device Port which is installed when the USB Device Port-B1 is introduced

NOTE:
Connection devices such as the Image Analysis Board and Device Port may not be installed depending on the model.

MEAP preferred device information content

Information relating to preferred applications and devices registered by the MEAP Application is displayed.
Viewing this information enables you to check which Application ID MEAP Application is using certain USB devices.

- AppID: Application ID
  Application ID
- VID: Vendor ID
  Vendor ID
- PID: Product ID
  Product ID

NOTE:
The USB device driver setting may change due to operations such as starting and stopping the MEAP Application or uninstalling it. A message prompting you to restart the device will be displayed when necessary due to changed settings.

■ Integrated Authentication Function

● Sharing the Authentication Information

Separately managing the authentication information at login and the authentication information for MEAP applications creates inconveniences such as that the authentication process is executed many times.
In order to solve this problem, the device has an integrated authentication function. This function allows authentication information to be shared between MEAP applications in a MEAP environment.
The supported version of MEAP Specifications is Ver.59, which needs to be supported by both the device and the MEAP application in order to use this function.
There are 2 types of authentication information that can be shared: Volatile Credential whose registered information is discarded at the time of logout or shutdown of the device and Persistent Credential whose registered information is not discarded at the time of logout.

● Volatile Credential

Volatile Credential is used in cases where the authentication information is shared between applications which use the same security domain for authentication.
The credential is registered mainly by the login application, therefore the applications which access the security domain that was used for authentication by the login application can use the credential.

● Persistent Credential

Persistent Credential is used to help entry of authentication information when accessing a different security domain for authentication.
The credential is registered mainly by general MEAP applications, and the authentication information can be reused when the same user logs in for the second time or later.

● Comparison of Functions

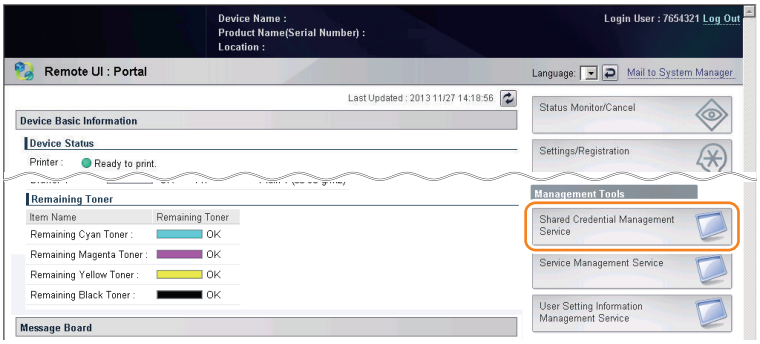
		Volatile Credential	Persistent Credential
Registered information		Character strings or arbitrary Java object	Character strings only User ID/PWD/Domain/arbitrary character strings
Lifetime	Registration	At login (to log into an application) and during registration at any time set by the application	During registration at any time set by the application
	Deleted	Available until logout/shutdown	Available until deletion by the application or management tool
Encryption of Credential data		Not supported	Data stored on the HDD is encrypted.
Storage (save) destination		Memory in the host machine	HDD in the host machine

● Disabling the Integrated Authentication Function

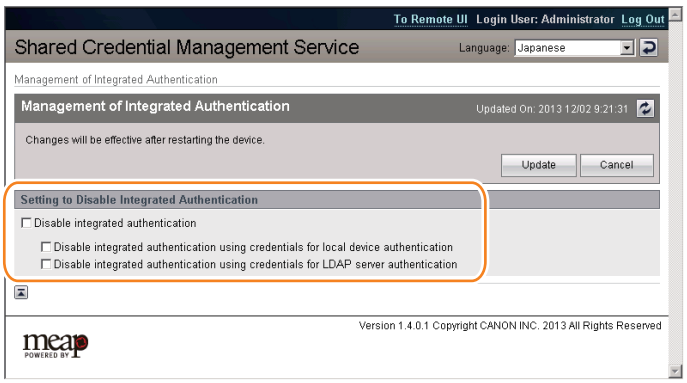
If you do not want Volatile Credential to be used from a security standpoint, the function can be disabled.
The function can be disabled from remote UI or service mode.
Persistent Credential cannot be disabled.
On the setting screen of remote UI, the function can be disabled on a protocol-by-protocol basis.

Remote UI

You can access the setting screen on remote UI for disabling integrated authentication as shown below.



Select the item you want to disable, and click the [Update].



- [Disable integrated authentication]: The integrated authentication function is disabled regardless of the authentication method.
- [Disable integrated authentication using credentials for local device authentication]: The integrated authentication function is disabled only at the time of local device authentication.
- [Disable integrated authentication using credentials for LDAP server authentication]: The integrated authentication function is disabled only at the time of LDAP server authentication.

Service mode

The location of the service mode setting for disabling integrated authentication:
Setting value: 0 = Enabled, 1 = Disabled

■ Points to Note When Enabling the [Quick Startup Settings for Main Power] Setting

If some of the MEAP applications are running on the device, the following problems will occur.

● The [Quick Startup Settings for Main Power] setting cannot be enabled.

If a MEAP application that restricts the device from shifting to deep sleep mode is running, even when the setting of [Quick Startup Settings for Main Power] is enabled (On), the device starts normally instead of quick startup.
In that case, it does not affect the behavior of the MEAP application.

● Changes made in the settings of a MEAP application are not reflected.

If the startup setting [Quick Startup Settings for Main Power] is enabled (On), even when the Main Power Supply Switch of the machine is turned OFF, a shutdown process is not executed internally.
Therefore, in the case of a MEAP application where changes in settings are enabled when the device is restarted, changes in settings are not reflected just by changing the settings.
Follow either of the restart procedures shown below to enable the changes made in the settings.

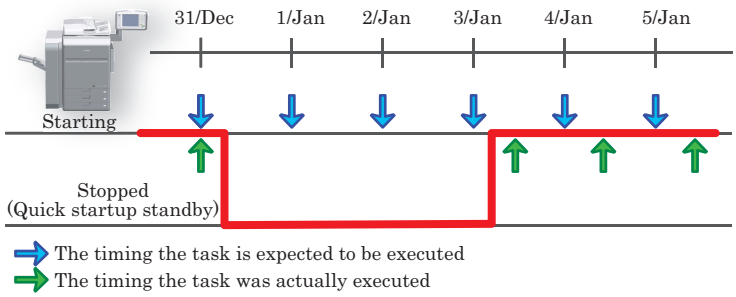
- Execute restart from remote UI.
- Turn OFF the Main Switch, and then turn it ON within 20 seconds.

● After recovery from quick startup, MEAP applications do not work properly.

MEAP applications that are scheduled to execute processes at specified times may not work properly after recovery from quick restart.
Unexpected problems such as that the application executes a task at an unexpected timing may occur.
Problems may occur in the following two cases.

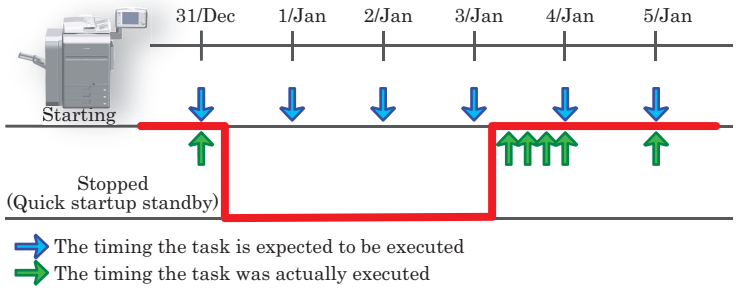
In the case of "Schedule: Execute the task every 24 hours"

A schedule is set to start the specified task at the specified time and repeat "fixed-delay execution".
If execution is delayed for some reason, the delay time is ignored.
Problem: If 24 hours have passed since the last execution of the task, the task is executed only once.
=> The task may be executed at a timing other than the time the user expects it to be executed.



In the case of "Schedule: Execute the task at 00:00 every day"

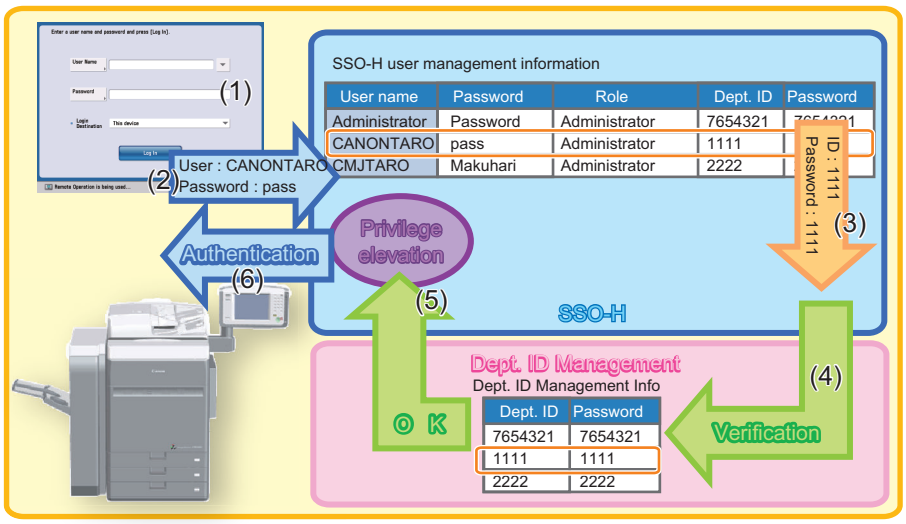
A schedule is set to start the specified task at the specified time and repeat "fixed-rate execution".
If execution was delayed for some reason, two or more tasks are continuously executed to "make up for the delay".
Problem: The tasks of Jan. 1, Jan. 2, and Jan. 3 are executed after quick startup.



■ Remedy to Be Performed When the Device Has Become Unable to Be Logged in

● Overview

Department ID Management and SSO-H (Local Device Authentication) manage user information separately. Therefore, in order to allow coexistence of Department ID Management and SSO-H, it is necessary that the information of SSO-H and the information of Department ID Management are the same.



1. The user enters the ID and password of SSO-H to a device where both SSO-H and Department ID Management are enabled.
2. SSO-H checks the entered ID and password with the SSO-H user information table.
3. SSO-H sends the department ID and password which correspond to the entered ID and password to the department ID management function.
4. The department ID management function checks the department ID and password sent from SSO-H with the user information table.
5. The user is elevated to the corresponding privilege.
6. The user is authenticated.

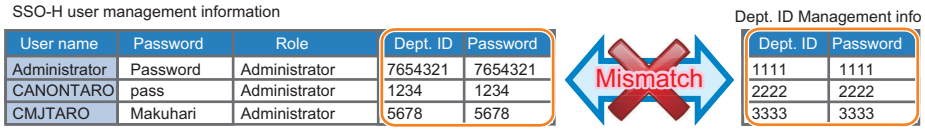
If the department ID and password registered in the user information of SSO-H do not coincide with the department ID and password registered in the Department ID Management, the authentication ends in failure and the user can no longer log in to the device.

NOTE:
Even if the department ID and password registered in the user information of SSO-H do not coincide with the department ID and password registered in the Department ID Management, login is possible when all of the following conditions are satisfied.

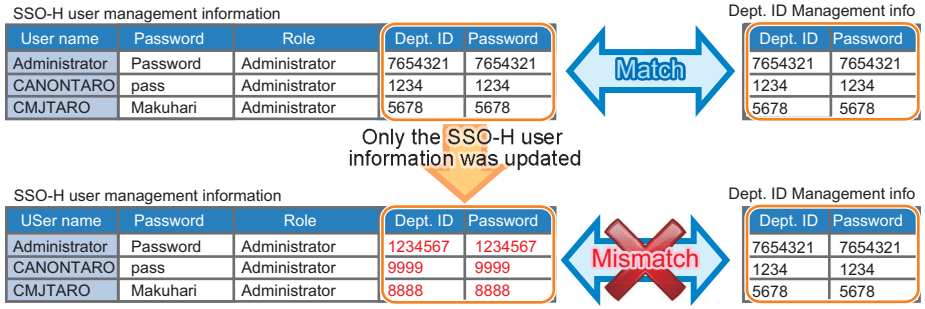
- System manager information of the device ([Settings/Registration] > [Management Settings] > [User Management] > [System Manager Information Settings]) is set.
- Login is performed as a user with the administrator right of SSO-H.

The user information of SSO-H does not coincide with the user information of Department ID Management in the following cases:

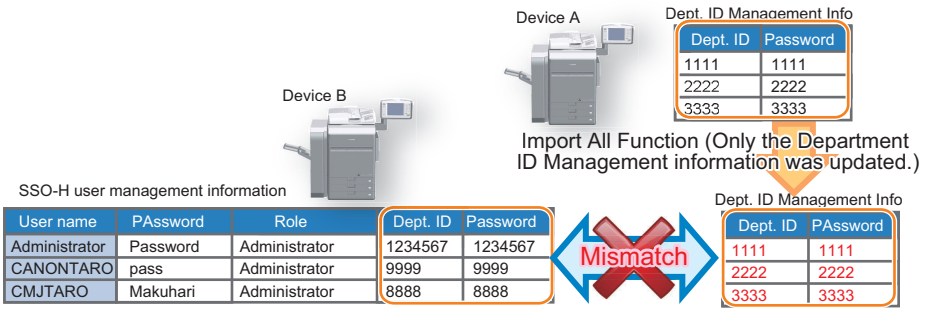
- The user information of SSO-H was different from that of Department ID Management when Department ID Management was enabled.
  Department ID Management was enabled before changing the department ID and password registered in SSO-H to match with the information of Department ID Management.



- Only one of information was updated, resulting in mismatch.
  Only the department ID and password registered in SSO-H or those in Department ID Management were changed.



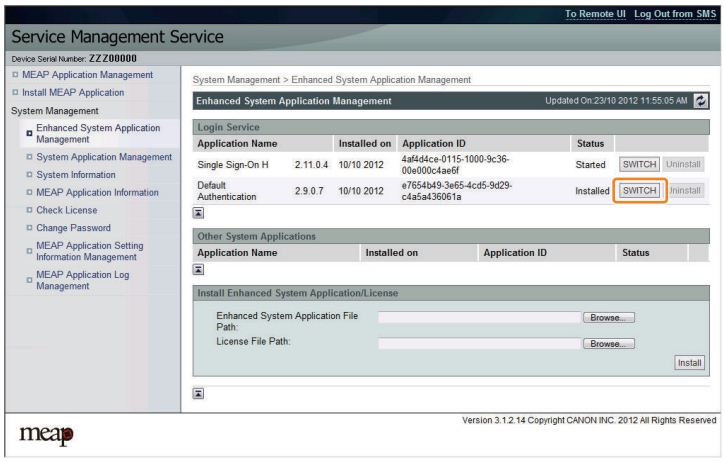
- Only the information of Department ID Management was updated, resulting in mismatch.
  Only the Department ID Management information was changed in "Import All Function", resulting in mismatch. (The SSO-H user information cannot be changed in Import All Function.)



● Remedy

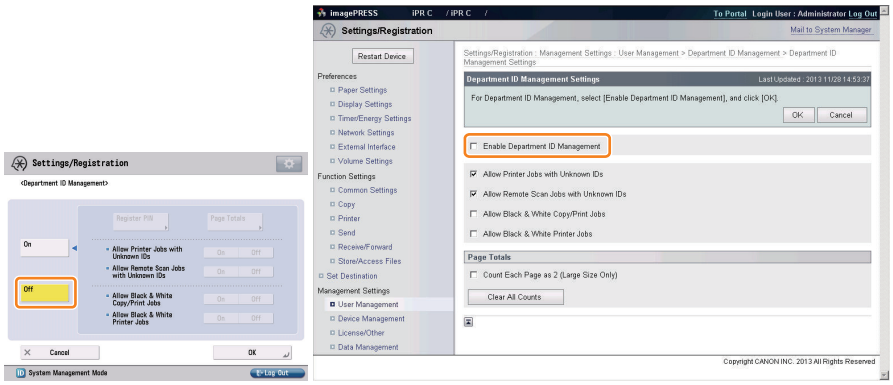
If the device became unable to be logged in due to mismatch of the department ID/password, perform the following remedy.
Procedure

1. **Change the authentication method to DA (Default Authentication).**
   Access SMS, and select [Default Authentication] in [Enhanced System Application Management] > [Login Service]. (How to log in to SMS can be found in "Login to SMS".)

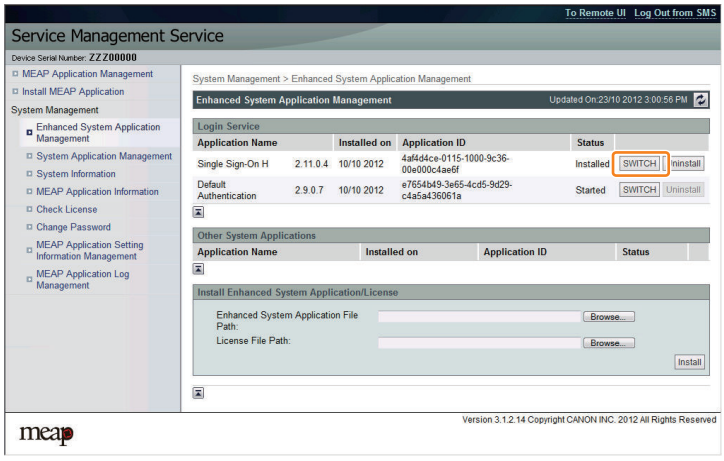


2. **Restart the device.**
   Restart the device in order to reflect the changes in login service.

3. **Disable Depart ID Management.**
   In [Settings/Registration], select [Management Settings] > [User Management] > [Department ID Management] > [OFF]. In the case of remote UI, access [Settings/ Registration] > [Management Settings] > [User Management] > [Department ID Management] > [Department ID Management Settings], and deselect [Enable Department ID Management].



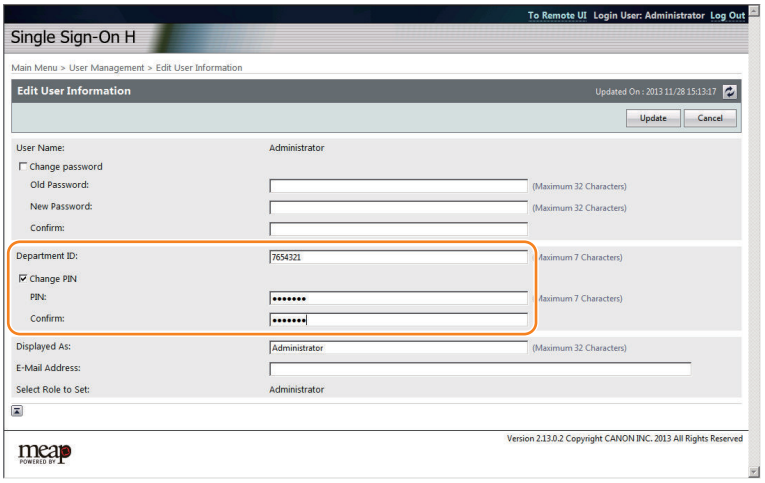
4. **Change the authentication method back to SSO-H authentication.**
   Access SMS, and select [Single Sign-On H] in [Enhanced System Application Management] > [Login Service]. (How to log in to SMS can be found in “Login to SMS” on page 226.)



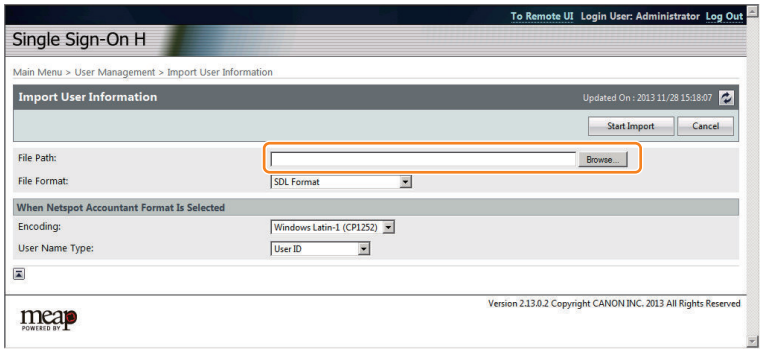
5. **Restart the device.**
   Restart the device in order to reflect the changes in login service.

6. Change the user registration information of SSO-H.

Access the URL shown below, and change the content to the information registered in Department ID Management. Or, import the setting file whose content you want to use.
SSO-H user registration information edition screen:
(SSO management screen [Main Menu] > [User Management] > [Edit User Information] or https://<IP address>:8443/sso/Edit).

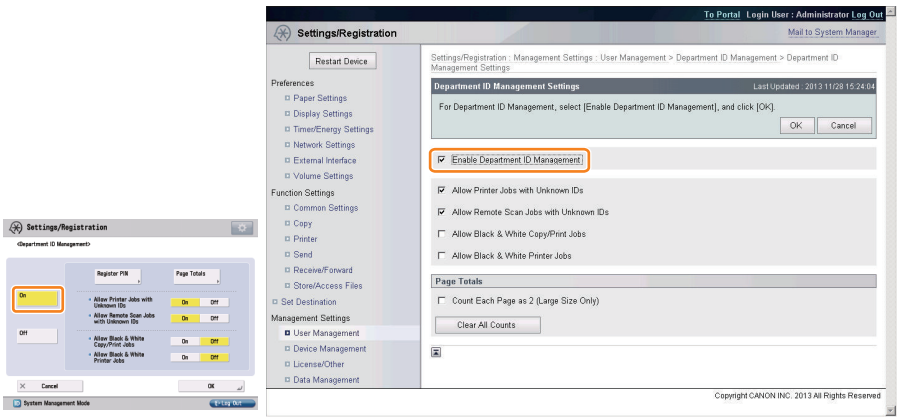


SSO-H user registration information import screen:
(SSO management screen [Main Menu] > [User Management] > [Import User Information] or (https://<IP address>:8443/sso/Import).



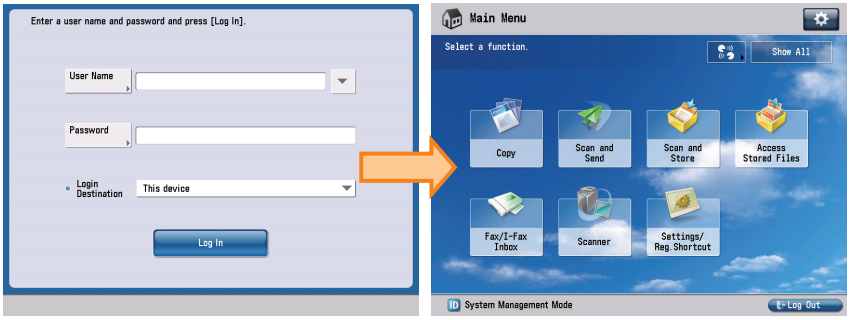
7. Enable Depart ID Management.

In [Settings/Registration], select [Management Settings] > [User Management] > [Department ID Management] > [ON]. In the case of remote UI, access [Settings/ Registration] > [Management Settings] > [User Management] > [Department ID Management] > [Department ID Management Settings], and select [Enable Department ID Management].



8. **Check that the device can be logged in.**

   Log off and then log on to check that the device can be logged in with an environment where Local Device Authentication and Department ID Management are enabled.



Embedded RDS

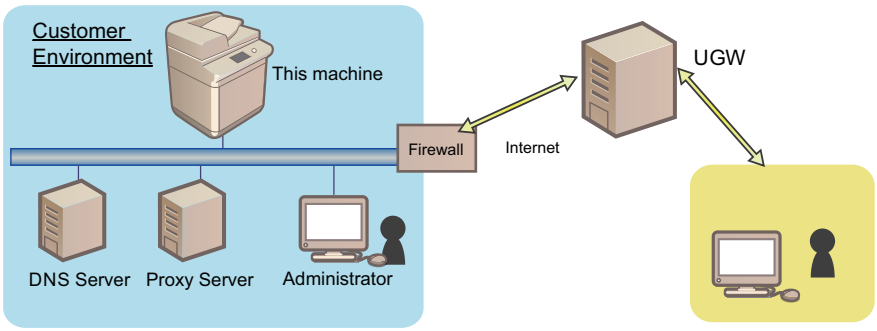
Product Overview

■ Overview of System

NE Controller-E1 (referred to as "E-RDS" hereinafter. E-RDS (refers to Embedded RDS) is a monitoring program that runs on the host machine.) When the monitoring option is enabled by making the setting on this machine, information such as the status change of the machine, counter information, and failure information are collected. The collected device information is sent to a remote maintenance server called UGW (Universal Gateway Server) via Internet,
Information to monitor is as follows:

- Billing counter
- Parts counter
- ROM version
- Service call error log
- Jam log
- Alarm log
- Change of status (such as status of consumables)

Since high confidentiality is required for the information shown above, it performs communication between this machine and the UGW using HTTPS/ SOAP protocol.



■ Features and benefits

E-RDS embedded with a network module in advance can realize a front-end processing of e-Maintenance/ imageWARE Remote system without attaching any extra hardware equipment.

■ Main functions

Functional category	Sub category	Description
Communication Test	COM-TEST	Execute service mode to communicate with the server, retrieve schedule information, and establish communication.
Transmission of counters	Billing/all resources/parts/ mode-by-mode counters	Periodically sends billing/all resources/parts/mode-by-mode counters to the server.
Transmission of event logs	Alert	Each time the status of the device is changed, the status information is sent to the server.
	Service call/alarm/jam log	Each time a service call, alarm, or jam log occurs, the error log is sent to the server.
	Calibration log	Each time a calibration log occurs, the log is sent.
Data transmission	ROM version	Periodically send firmware information of the device.
	Schedule	Periodically send schedule information of the device.
	Debug log	Send debug information of E-RDS which exceeds a specific size to the server.
	Environment log	Periodically send environment information (such as the temperature inside the machine).
	SMART information	Periodically send HDD SMART information.
	Service Mode Menu	When a certain alarm/service control log error and a service mode menu setting change are detected, the service mode menu data is sent.
	Sublog transmission	Send data such as device Sublogs and DCON logs to the server.

Functional category	Sub category	Description
Data transmission	Browser	Send the status of the Web Browser function (SERVICE BROWSER or WEB Browser).
	Get Device Status servlet	Send work event notification by SERVICE BROWSER.
	Replacement / Cleaning of Parts *	Send a parts replacement/ cleaning alarm in accordance with Operator instructions by an iPR Series device that supports Operator Maintenance.
	LUT send *	Send LUT information to the server in accordance with service technician instructions. (iPR Series device)
Operation instruction	Operation check	Contact the server to check if there is processing to be executed, and receive the following instructions if any. • Change the schedule • CDS linking • Change the alarm level • Change the alert filter • Sublog instruction *
Server linking	RDSbit function	Send data to the RDS server in accordance with instructions from the RDS Server
	3rd party function	Send data to a 3rd party server besides the UGW server.

* Limited to some models

Limitations

Service Mode Menu SEND function

- In the case of the following, Service Mode Menu data is not sent.
  - When the unsent alarm log/service control log is detected by the E-RDS at power-ON.
  - When the resend failure alarm log/service control log is detected.
  - When sending the Service Mode Menu fails at the time an alarm/service control error was detected.
  - When an alarm/service control error is detected and a new alarm/service control error occurs while acquiring Service Mode Menu data, the data being acquired will not be sent.
- When alarm/service control errors occur successively and this device's time is corrected/changed while sending that log, the Service Mode Menu data may not be sent correctly. This is because although Link No. * is normally added to newer logs, it may be added to older logs.
  * Link No. :
  Common number used to attach Service Mode Menu data to alarm log/service control log send data.
  After sending the log, Service Mode Menu data is acquired and sent with this number.
- Sending Service Mode Menu setting change data is not instant. Rather, it is sent 60 minutes after a specified period from the time the change was detected or when executing a communication test (there is a time lag).
- When the [COPIER ADJUST] setting is changed in the Service Mode Menu, the data is transmitted even if the data to be transmitted remains unchanged.
  Service Mode data is not sent when a Service Mode setting value (item besides LEVEL 1 and 2) that is not to be sent was changed or when a value was confirmed without changing the setting value.

Sleep

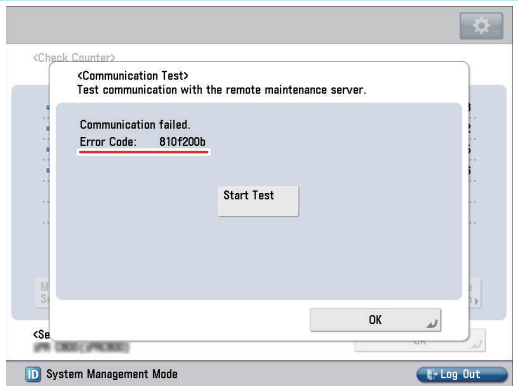
When this function is enabled, the machine will not move into deep sleep from starting to ending communication.

Servicing Notes

- After clearing the RAM of the Main Controller PCB SRAM board, it is necessary to initialize E-RDS (ERDS-DAT) settings and conduct a communication test (COM-TEST). If this action is not taken, sending the counter to the UGW may result in an error.
  It will also be necessary to reset all settings after exchanging the Main Controller PCB.

- The value of the below Service Mode must not be changed unless there are any special instructions.
  Changing it will result in a UGW communication error.
  - Port number of UGW
    [SERVICE MODE] > [COPIER] > [Function] > [INSTALL] > [RGW-PORT]
    Default: 443
  - Connection URL of UGW
    [SERVICE MODE] > [COPIER] > [Function] > [INSTALL] > [RGW-ADR]
    Default: https://a01.ugwdevice.net/ugw/agentif010
- In the case of devices where the contract with NetEye was invalidated, the E-RDS setting must be specified as OFF (E-RDS: 0).
- This machine can perform a communication test from [Counter Check]*. When conducting a communication test from [Counter Check], pay attention to the following points.
  - During a communication test, do not take any actions such as pressing a key.
    Actions are not accepted until the communication test is completed (actions are ignored).
  - When a communication test is being conducted from service mode or from [Counter Check], do not conduct a communication test from the other. This operation falls outside the warranty.

NOTE:
*The user can perform a communication test or browse the results of the communication test.
If the communication results in failure, an error code (hexadecimal number, 8 digit) is displayed on the touch panel display.



E-RDS Setup

■ Preparation

Since this function communicates with the UGW server, it is necessary to connect to the external network.
Check the following items, and make the settings if not yet set.

- IP Address Settings
- DNS Server Settings
- Proxy Server Settings (If authentication is necessary, set the authentication information.)
- CA certificate installation (When using a certificate other than those pre-installed in the device)

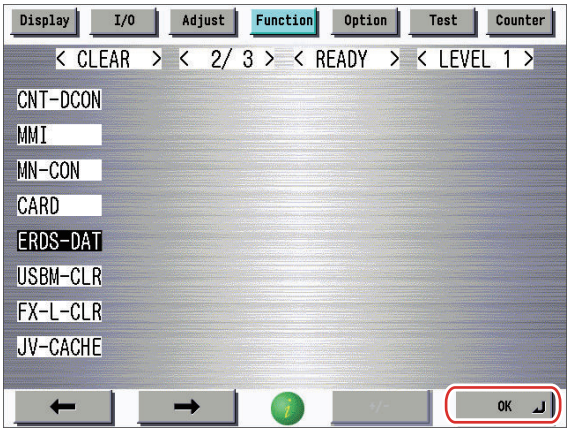
CAUTION:
- Obtain the information on the network environment from the system administrator of the user.
- When changing the network settings, turn OFF and then ON the main power of the machine.

■ Steps to E-RDS settings

1. **Start [Service Mode] at Level 1.**

2. **Select [COPIER] > [Function] > [CLEAR] > [ERDS-DAT] and touch the [OK] button.**

NOTE:
This operation initializes the E-RDS settings to factory setting values.
For the setting values to be initialized, see the section of "Initializing E-RDS settings" on page 313.

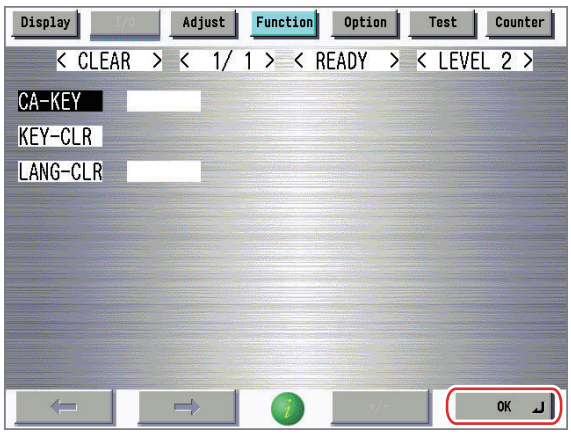


3. **Perform installation or deletion of the CA certificate if necessary, and turn OFF and then ON the main power of this machine.**
   - Installation of the CA certificate: Perform installation from SST or Remote UI.
   - Deletion of the CA certificate: When the following operation is performed, the CA certificate in the factory setting is automatically installed.

CAUTION:
After following procedure, the registered key and CA certificate are deleted, and only the CA certificate installed at the time of shipment is registered.
It is therefore necessary to check with the user in advance.

1. Start [Service Mode] at Level 2.

2. Select [COPIER] > [Function] > [CLEAR] > [CA-KEY] and touch the [OK] button.

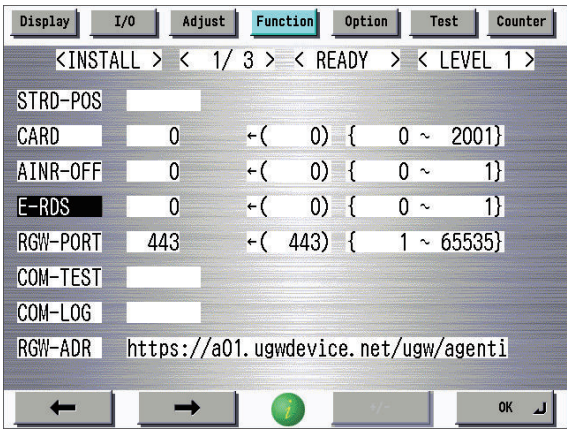


"OK!" is displayed if the CA certificate is initialized. When "NG!" is displayed, see the section of “Troubleshooting” on page 314 to execute the remedy, and then perform initialization of the CA certificate again and check to see if the CA certificate is initialized.

3. Turn OFF and then ON the main power of this machine.

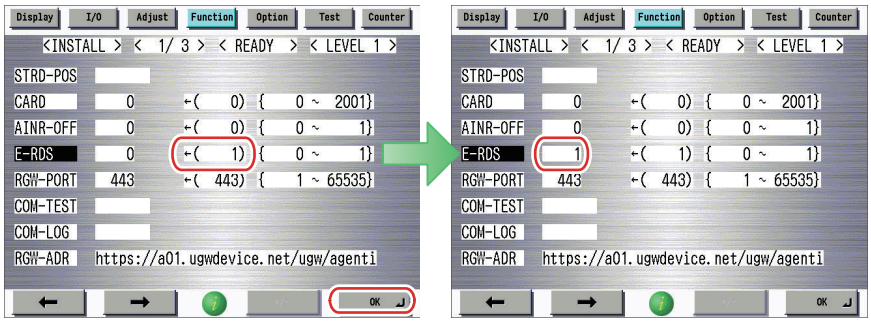
CAUTION:
If a key and a CA certificate have been registered in order to use a function other than E-RDS, it is necessary to register again from SST or Remote UI.

4. **Start [Service Mode] at Level 1.**
5. **Select [COPIER] > [Function] > [INSTALL] > [E-RDS].**

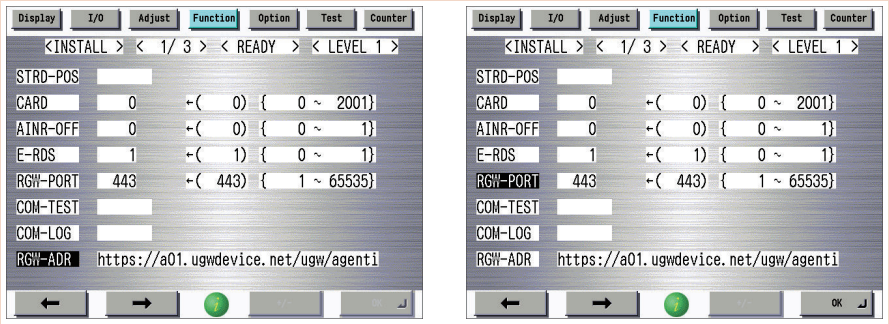


6. **Press the numeric key [1] on the control panel (the setting value is changed to 1) and touch the [OK] button. (The data is reflected to the setting value field.)**

NOTE:
This operation enables the communication function with UGW.

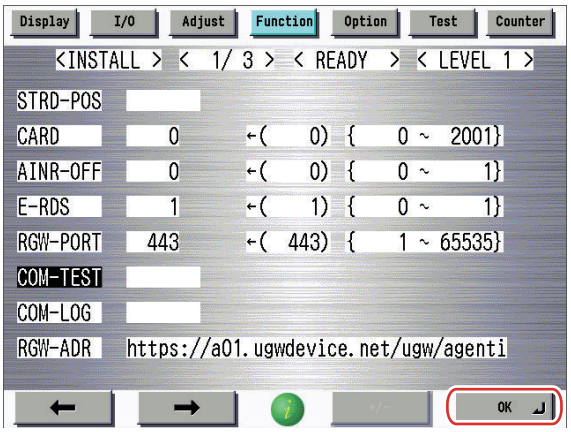


CAUTION:
The following settings i.e. RGW-PORT and RGW-ADR in Service mode must not be change unless there are specific instructions to do so.
Changing these values will cause error in communication with UGW.

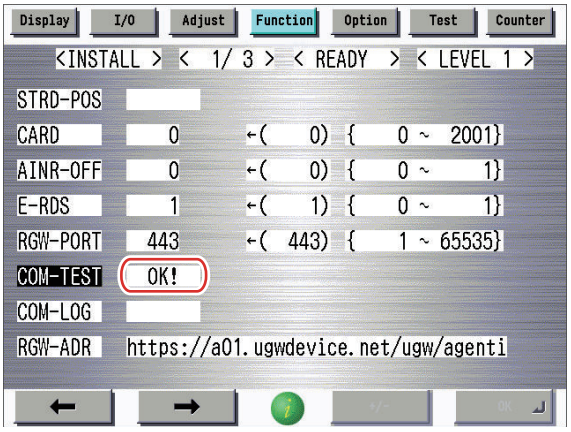


7. **Select [COM-TEST] and then touch [OK].**

NOTE:
This initiates the communication test between the device and the UGW.



If the communication is successful, "OK!" is displayed. If "NG!" (failed) appears, refer to the “Troubleshooting” on page 314 and repeat until "OK!" is displayed.



NOTE:
The communication results with UGW can be distinguished by referring to the COM-LOG. By performing the communication test with UGW, E-RDS acquires schedule information and starts monitoring and meter reads operation.

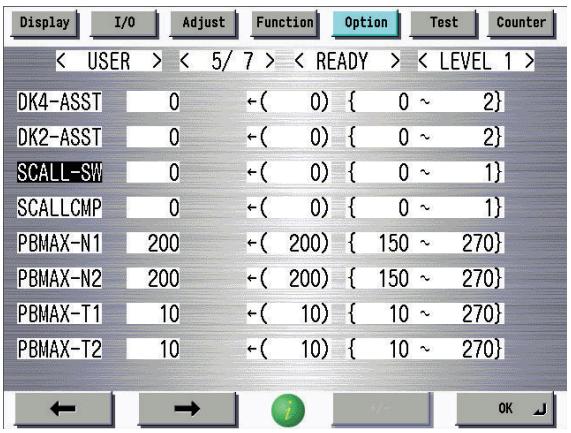
■ Steps to Service Call button settings

● Steps for settings to display the service call button

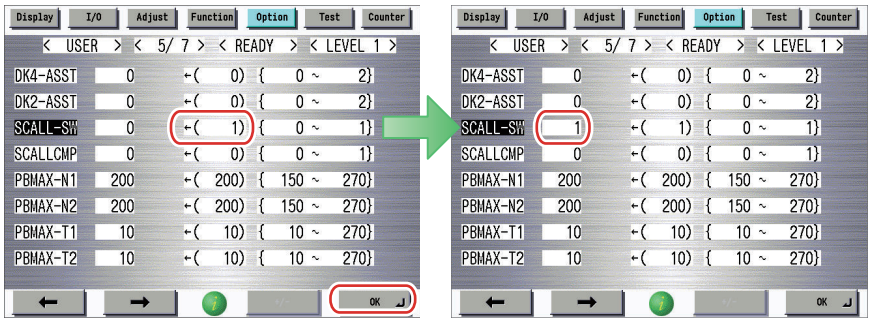
In order to use the "Service Call" button, follow the procedure shown below to display the "Service Call" button.

1. **Start [Service Mode] at Level 1.**

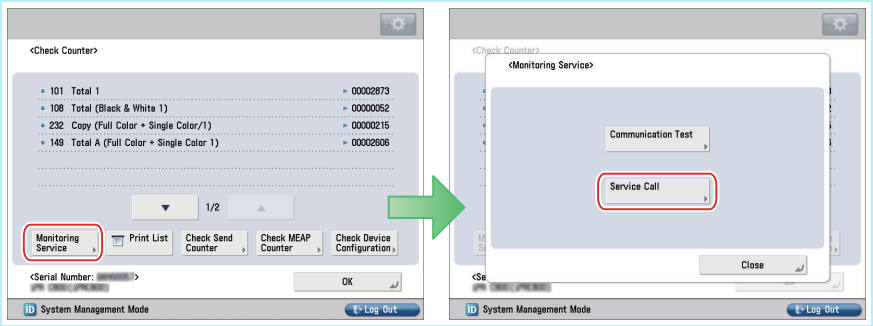
2. **Select [COPIER] > [Option] > [USER] > [SCALL-SW].**



3. **Press the numeric key [1] on the control panel (the setting value is changed to 1) and touch the [OK] button. (The data is reflected to the setting value field.)**



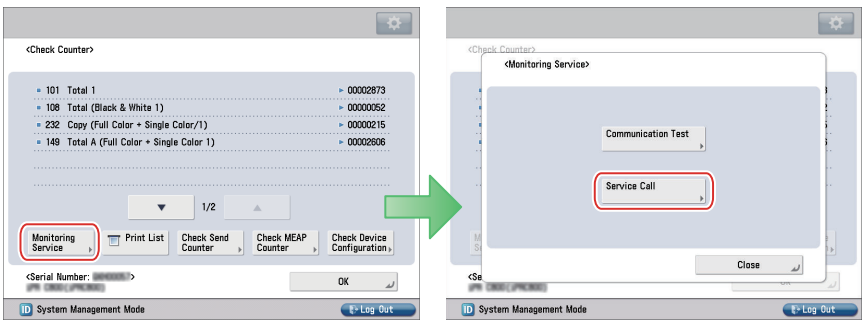
NOTE:
When the function is enabled, the [Service Call] button is displayed on the Monitoring Service screen by touching the [Monitoring Service] button on the Check Counter screen.



● Steps for service call request

Users should follow the instructions as described below to request a service call.

1. **Press the [Counter Check] on the control panel to display the Check Counter screen.**
2. **Touch the [Monitoring Service] button, and touch the [Service Call] button on the Monitoring Service screen.**

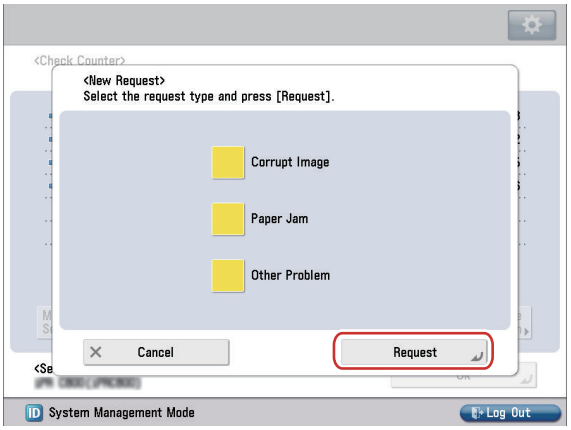


3. **Touch the [New Request] button on the Service Call screen.**

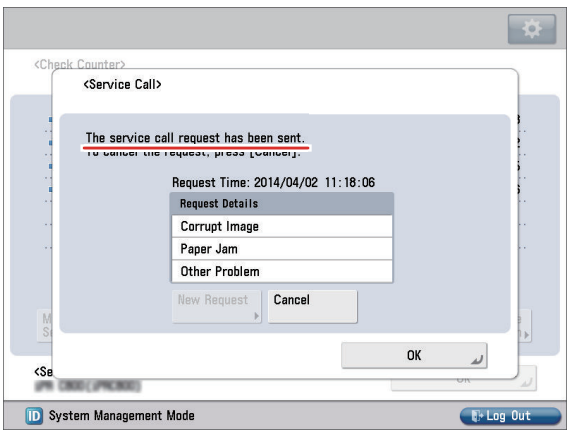
CAUTION:
When a service call has been already requested, another service call cannot be sent. The previous service call needs to be canceled, or a service technician needs to perform processing for service call completion.

4. **Select the request details and touch the [Request] button.**

NOTE:
E-RDS generates an alarm of service call request at this timing, and sends the alarm to UGW.



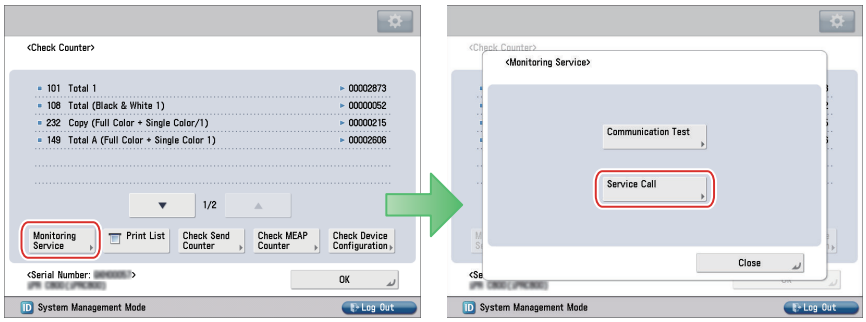
5. **If the service call request is successful, "The service call request has been sent." is displayed. If "Could not send the service call request." appears, refer to the "Troubleshooting" on page 314 and repeat until "The service call request has been sent." is displayed.**



● Steps for service call cancellation

To cancel the service call, follow the instructions as described below.

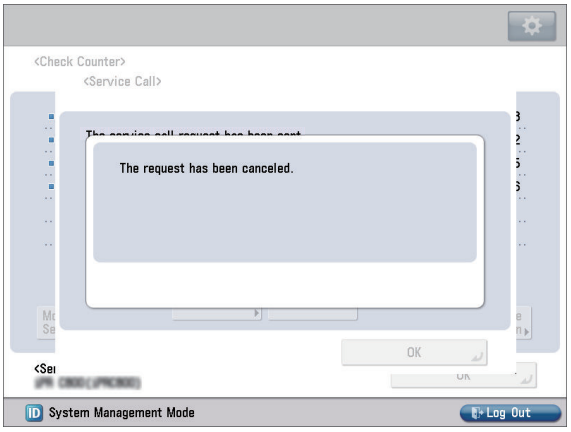
1. **Press the [Counter Check] on the control panel to display the Check Counter screen.**
2. **Touch the [Monitoring Service] button, and touch the [Service Call] button on the Monitoring Service screen.**



3. **Touch the [Cancel] button, and touch the [Yes] button in the check screen.**

NOTE:
E-RDS generates an alarm of service call cancellation at this timing, and sends the alarm to UGW.

4. **"The request has been canceled." is displayed.**

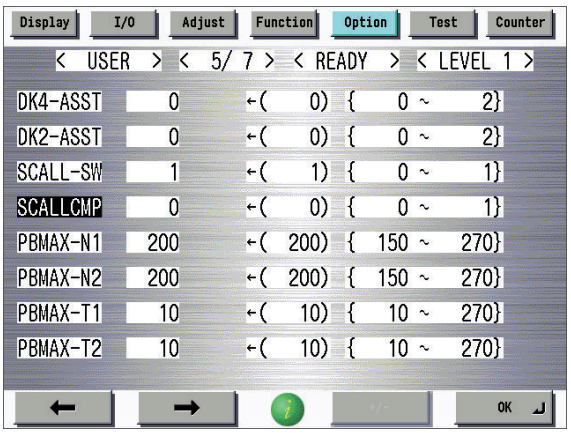


● Steps for settings of service call completion

When the service technician completes the work for the service call, follow the instruction as described below to execute the service call completion work.

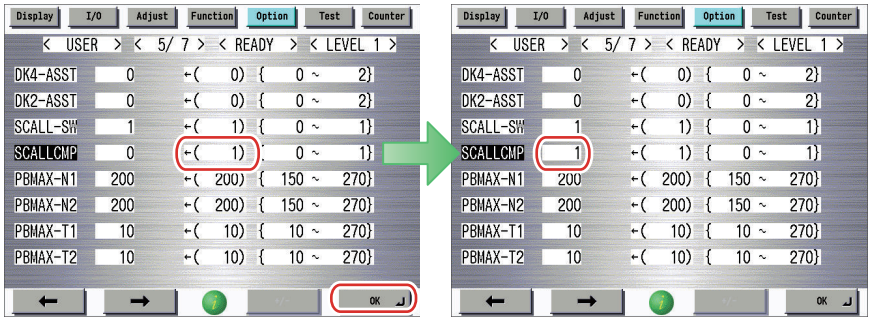
1. **Start [Service Mode] at Level 1.**

2. **Select [COPIER] > [Option] > [USER] > [SCALLCMP].**



3. **Press the numeric key [1] or [0] on the control panel (the setting value is changed to 1 or 0) and touch the [OK] button. (The data is reflected to the setting value field.)**

NOTE:
E-RDS generates an alarm of service call completion at this timing, and sends the alarm to UGW.



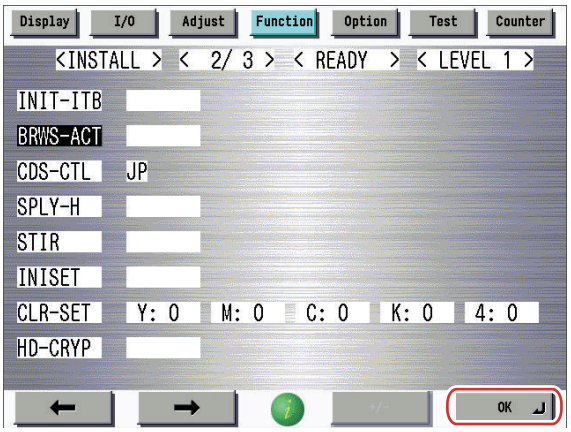
NOTE:
In the current condition, touching the [OK] button completes the service call regardless of whether 0 or 1 is set.

■ Steps to Service Browser settings

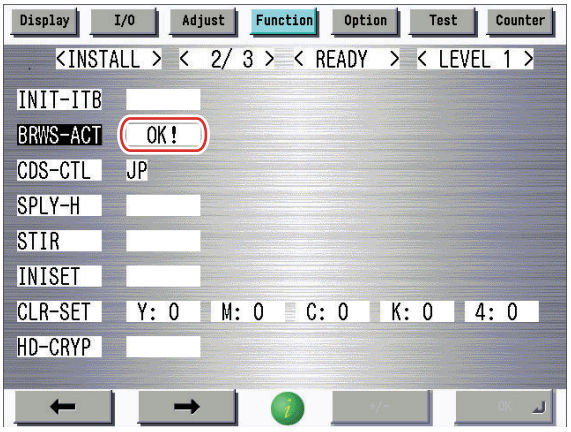
1. **Start [Service Mode] at Level 1.**

2. **Select [COPIER] > [Function] > [INSTALL] > [BRWS-ACT] and then touch [OK].**

NOTE:
When the status of the service browser is changed to enabled, E-RDS sends the browser information to the UGW at this timing.

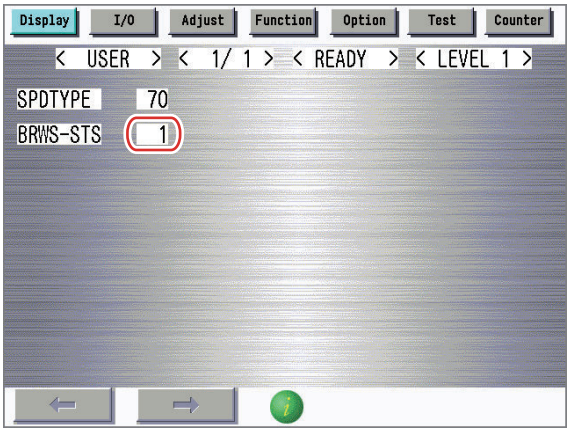


If the connection is established with UGW successfully, "OK!" is displayed. When "NG!" is displayed, perform the steps referring to “Troubleshooting” on page 314 until connection is established with UGW.

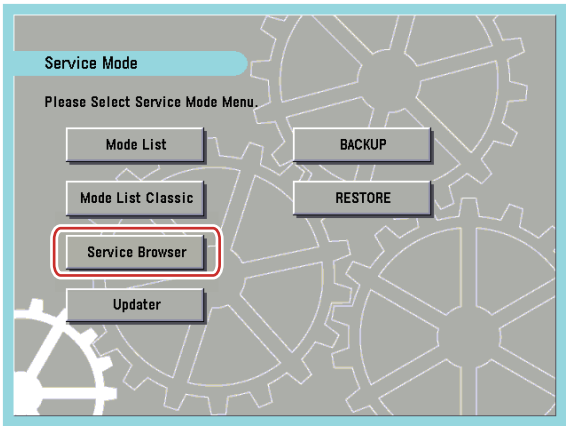


3. **Turn OFF and then ON the main power of this machine.**

4. **Make sure that "1 (: ACTIVE)" is set under [COPIER] > [Display] > [USER] > [BRWS-STS].**



5. **When the above-shown setting values are enabled, [Service Browser] is displayed in the Service Mode screen.**



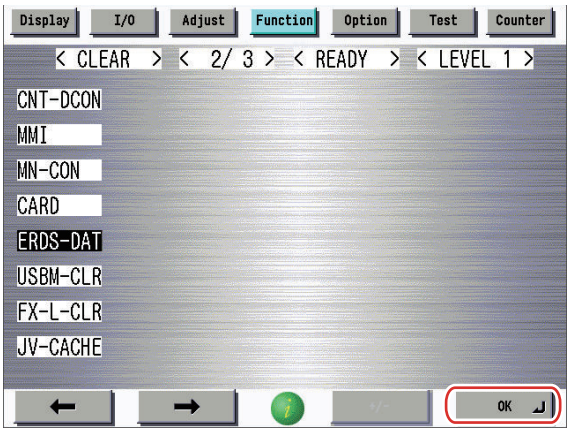
NOTE:
Generally, once service browsing is enabled, to stop the service browsing, execute BRWS-ACT again, turn OFF and then ON the main power of this machine.

■ Initializing E-RDS settings

It is possible to clear the SRAM data of E-RDS and change the E-RDS setting back to the default value.

● Initialization procedure

1. **Start [Service Mode] at Level 1.**
2. **Select [COPIER] > [Function] > [CLEAR] > [ERDS-DAT] and then touch [OK].**



● Setting values and data to be initialized

The following E-RDS settings, internal data, and Alarm filtering information are initialized.

- COPIER > Function > INSTALL > E-RDS
- COPIER > Function > INSTALL > RGW-ADR
- COPIER > Function > INSTALL > RGW-PORT
- COPIER > Function > INSTALL > COM-LOG

CAUTION:
In case of replacing the CA certificate file, even if initialization of E-RDS is executed, the status is not returned to the factory default.
When installing the certificate file other than the factory default CA certificate file, it is required to delete the certificate file after E-RDS initialization and install the factory default CA certificate file.
For detailed procedures, see ""Steps to E-RDS settings" on page 303 - step 3.".

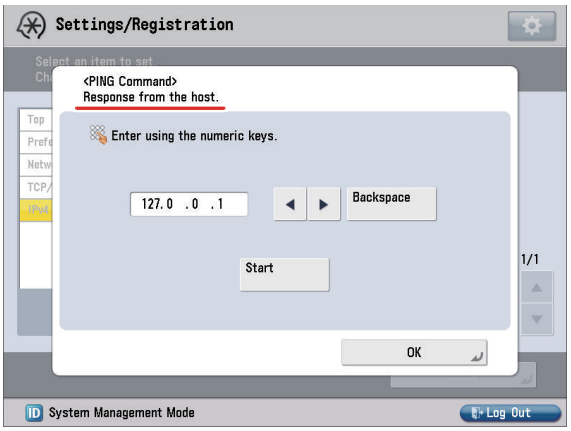
Troubleshooting

No.1

Symptom: A communication test (COM-TEST) results NG!
Cause: Initial settings or network conditions is incomplete.
Remedy 1: Check and take actions mentioned below.

1. Check network connections
   Is the status indicator LED for the HUB port to which this machine is connected ON?
   YES: Proceed to Step 2).
   NO: Check that the network cable is properly connected.
2. Confirm loop back address (* In case of IPv4)
   Select [Settings/Registration] > [Preferences] > [Network] > [TCP/IP Settings] > [IPv4 Settings] > [PING Command], enter "127.0.0.1", and touch the [Start] button.

   Does the screen display "Response from the host."? (See the next figure.)
   YES: Proceed to Step 3).
   NO: There is a possibility that this machine's network settings are wrong. Check the details of the IPv4 settings once more.



3. Confirmation from another PC connected to same network.
   Request the user to ping this machine from a PC connected to same network.
   Does this machine respond?
   YES: Proceed to Step 4).
   NO: Confirm the details of this machine's IP address and subnet mask settings.

4. Confirm DNS connection
    1. Select [Settings/Registration] > [Preferences] > [Network] > [TCP/IP Settings] > [DNS Settings] > [DNS Server Address Settings], write down the primary and secondary addresses of the DNS server, and touch the [Cancel] button.

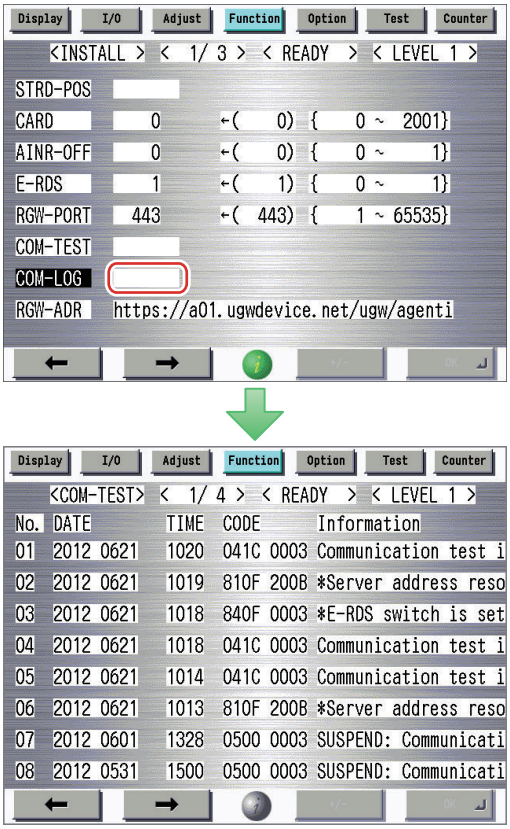
    2. Touch the [Up] button.

    3. Select [IPv4 Settings] > [PING Command], enter the primary DNS server noted down in step a) as the IP address, and touch the [Start] button.
    Does the screen display "Response from the host."?
    YES: Proceed to Remedy 2.
    NO: Enter the secondary DNS server noted down in step a) as the IP address, and then touch the [Start] button.
    Does the screen display "Response from the host."?
    YES: Proceed to Remedy 2.
    NO: There is a possibility that the DNS server address is wrong. Reconfirm the address with the user's system administrator.

Remedy 2: Troubleshooting using communication error log (COM-LOG)

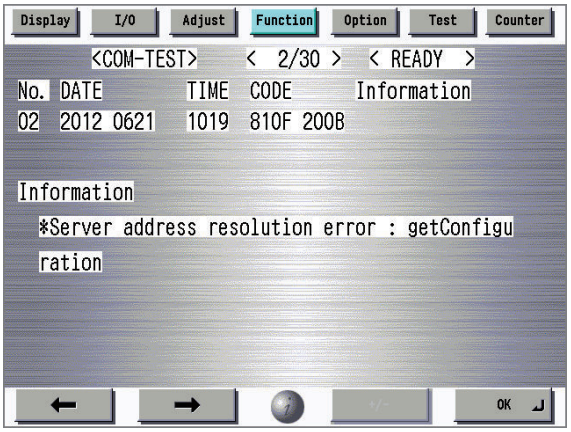
1. Start [Service Mode] at Level 1.

2. Select [COPIER] > [Function] > [INSTALL] > [COM-LOG] and touch the blank field on the right side. The communication error log list screen is displayed.



NOTE:
- Only the initial part of error information is displayed in the communication error log list screen.
- "*" is added to the top of the error text in the case of an error in communication test (method name: getConfiguration or communicationTest) only.

3. When each line is selected, the communication error log detailed screen is displayed as shown in the figure below. (Example: No. 02)



NOTE:
- A detailed description of the error appears below 'Information'. (Max 128 characters)
- Touch the [OK] button to return to the communication error log list screen.

4. When a message is displayed, take an appropriate action referring to “Error Message List” on page 318.

No.2

Symptom: A communication test results NG! even if network setting is set properly.
Cause: The network environment is inappropriate, or RGW-ADR or RGW-PORT settings for E-RDS have been changed.

Remedy: The following points should be checked.

1. Check network conditions such as proxy server settings and so on.
2. Check the E-RDS setting values.
   - Check the communication error log from COM-LOG.
   - Check whether RGW-ADR or RGW-PORT settings has changed. If RGW-ADR or RGW-PORT settings has changed, restore initial values. For initial values, see “Servicing Notes” on page 302.

No.3

Symptom: Registration information of the E-RDS machine was deleted from the device information on Web Portal, and then registered again. After that, if a communication test is left unperformed, the device setting in the UGW becomes invalid.
Cause: When the registration information of the E-RDS machine is deleted, information related to E-RDS is also deleted. Therefore, when 7 days have passed without performing a communication test after registering the E-RDS machine again, the device setting becomes invalid.
Remedy: Perform a communication test before the device setting becomes invalid.

No.4

Symptom: There was a log, indicating "Device is not ready, try later" in error details of COM-LOG list.
Cause: A certain problem occurred in networking.
Remedy: Check and take actions mentioned below.

1. Check networking conditions and connections.
2. Turn on the power supply of this machine and perform a communication test about 60 seconds later.

No.5

Symptom: "Unknown error" is displayed though a communication test (COM-TEST) has done successfully.
Cause: It could be a problem at the UGW side or the network load is temporarily faulty.
Remedy: Try again after a period of time. If the same error persists, check the UGW status with a network and UGW administrator.

No.6

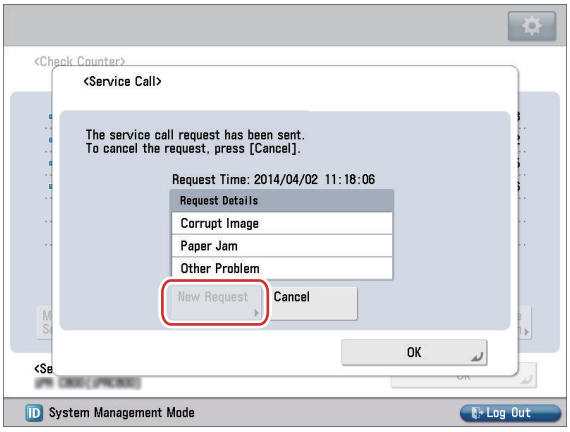
Symptom: Enabling Service Browser (BRWS-ACT) results NG!
Cause: A communication test with UGW has not been performed, or a communication test result is NG!
Remedy: Perform a communication test, and check that the test with UGW finishes successfully.

No.7

Symptom: The display indicates that the service browser is enabled (BRWS-STS: 1), but the service browser fails to be activated.
Cause: The main power switch of this machine has not been turned OFF and then ON. ON/OFF of the service browser is enabled after reboot.
Remedy: Turn OFF and then ON the main power of this machine.

No.8

Symptom: A service call request cannot be made because the [New Request] button is grayed out.



Cause: There has been already a service call request.
Remedy: Perform either of the following remedy works:

- Touch the [Cancel] button to cancel the service call request that has been made.
- A service technician performs a complete processing for the service call request that has been made.

No.9

Symptom: Initializing the CA certificate (CA-KEY) results in NG!

Cause: Initialization process of the CA certificate has completed abnormally.
Remedy: Initialize the HDD.

No.10

Symptom: A service call request is failed, and a message "Could not send the service call request" is displayed.
Cause: A communication test with UGW has not been performed, or a communication test result is NG!
Remedy: Perform a communication test, and check that the test with UGW finishes successfully.

No.11

Symptom: When a communication test (COM-TEST) is repeatedly executed, an error occurs.
Cause: During communication conducted after execution of a COM-TEST, another COM-TEST was executed again.
Remedy: When repeatedly executing COM-TEST, execute COM-TEST at intervals of 5 minutes or more.

Error Message List

Error information displayed on the communication error log detail screen is shown below.
(The "server" described here means UGW.)

- Error information is displayed in the format shown below.
  [*] [character strings]: [function classification (the method name, etc.)] [detailed error information on the server side]

NOTE:
"*" is added to the beginning of the error character strings only in the case of an error in a communication test (method name: "getConfiguration" or "communicationTest").

No.	Code	Character strings	Cause	Remedy
1	0000 0000	SUSPEND: mode changed.	Operation mode mismatch	Execute initialization of the E-RDS settings (ERDS-DAT).
2	0500 0003	SUSPEND: Communication test is not performed.	E-RDS was enabled, but the main power of the device was turned OFF and then ON without performing a communication test.	Perform a communication test (COM-TEST).
3	0xxx 0003	Server schedule is not exist	The schedule does not exist.	Perform and complete a communication test (COM-TEST).
4	0xxx 0003	Communication test is not performed	Communication test has not been completed.	Perform and complete a communication test (COM-TEST).
5	84xx 0003	E-RDS switch is setted OFF	E-RDS has not been enabled	Set the value of the E-RDS setting (E-RDS) to 1, and perform a communication test (COM-TEST).
6	8600 0002, 8600 0003, 8600 0101, 8600 0201, 8600 0305, 8600 0306, 8600 0401, 8600 0403, 8600 0414, 8600 0415	Event Registration is Failed	Processing in the device (event processing) failed.	Turn OFF and then ON the power of the device. If the error occurs again after turning the power OFF and then ON, replace the system software of the device (version upgrade).
7	8700 0306	SRAM version unmatch!	An invalid value has been entered at the beginning of the NVMEM area of E-RDS (nonvolatile memory area).	Turn OFF and then ON the power of the device.
8	8700 0306	SRAM AeRDS version unmatch!	An invalid value has been entered at the beginning of the NVMEM area of Ae-RDS (nonvolatile memory area).	Turn OFF and then ON the power of the device.
9	8xxx 0004	Operation is not supported	The user tried to execute a method which is not supported by E-RDS.	Consult the Service Desk.

No.	Code	Character strings	Cause	Remedy
10	8xxx 0101	Server response error (NULL)	UGW reply error: UGW error code processing failure	Perform and complete a communication test (COM-TEST).
11	8xxx 0201, 8xxx 0202, 8xxx 0203, 8xxx 0204, 8xxx 0206	Server schedule is invalid	The schedule specified by UGW is invalid.	Report the detailed information at the time of occurrence of the error to the Support Dept. Perform a remedy on the UGW side, and then perform a communication test again.
12	8xxx 0207, 8xxx 0208	Internal Schedule is broken	The internal schedule of E-RDS is invalid.	Perform a communication test (COM-TEST).
13	8xxx 0221	Server specified list is too big	The number of elements UGW server instructed to send for the alert code filter function exceeds the upper limit (12).	Alert filtering is not supported by UGW.
14	8xxx 0222	Server specified list is wrong	The information the UGW server instructed to send for the alert code/alarm code filter function is invalid.	Alert filtering is not supported by UGW.
15	8xxx 0304	Device is busy, try later	A semaphore consumption error occurred during a communication test.	Wait for a while and then perform a communication test again.
16	8xxx 0709	Tracking ID is not match	When the firmware is updated, the tracking ID in the reply of Updater differs from that specified by UGW.	Collect Sublog and contact the Support Dept. of the sales company.
17	8xxx 2000	Unknown error	Other communication errors	Perform and complete a communication test (COM-TEST).
18	8xxx 2001	URL Scheme error (not https)	URL schema specification error: The registered URL header of UGW is not included in the https tag.	Confirm that the URL of the UGW (RGW-ADR) is "https://a01.ugwdevice.net/ugw/agentif010".
19	8xxx 2002	URL server specified is illegal	UGW specified URL error: A URL different from that specified by UGW is specified.	Confirm that the URL of the UGW (RGW-ADR) is "https://a01.ugwdevice.net/ugw/agentif010".
20	8xxx 2003	Network is not ready, try later	After the main power of the device is turned OFF and then ON, a communication test was performed with the network not ready.	Check the connection status of the network. Perform a communication test (COM-TEST) about 60 seconds after turning ON the power of the device.
21	8xxx 2004	Server response error ([hexadecimal]) [detailed error information on the server side][*1]	UGW reply error: Communication to UGW has succeeded, but an error occurred and UGW returned an error.	Wait for a while and then try again. Check the error code (in hex notation) and the details of the error (detailed error information on the server side) from UGW displayed after the message.
22	8xxx 200A	Server connection error	UGW connection error: • TCP/IP communication failed. • The IP address of the device has not been set.	• Check the connection status of the network. • If proxy is used, configure the proxy settings and check the status of the proxy server.
23	8xxx 200B	Server address resolution error	UGW address resolution error	• Confirm that the URL of the UGW (RGW-ADR) is "https://a01.ugwdevice.net/ugw/agentif010". • Check that Internet connection is available in the environment.
24	8xxx 2014	Proxy connection error	The address is invalid and connection to the proxy server fails.	Check the address/port of the proxy server, and configure the settings again.
25	8xxx 2015	Proxy address resolution error	Proxy address name resolution error	• Check the host name and the DNS settings of the proxy server. • Set the proxy server using the IP address.
26	8xxx 201E	Proxy authentication error	Proxy authentication error	Check the user name and password for logging in to the proxy, and configure the settings again.

No.	Code	Character strings	Cause	Remedy
27	8xxx 2028	Server certificate error	• The root certificate for the server has not been registered on the device. • The user has used another certificate and the correct certificate file has not been registered. • The date and time of the device is correct.	• Install the latest device system software (upgrade the version). • Set the correct date and time on the device. • Execute CLEAR > CA-KEY, and turn the power of the device OFF and then ON (automatic installation of the CA certificate at the time of shipment).
28	8xxx 2029	Server certificate verify error	Server certificate URL check error	Confirm that the URL of the UGW (RGW-ADR) is "https://a01.ugwdevice.net/ugw/agentif010".
29	8xxx 2046	Server certificate expired	• The root certificate registered on the device has expired. • The root certificate registered by the user at first is used and the correct certificate has not been registered. • The date of the device is outside the validity period.	Set the correct date and time on the device. If the date and time set on the device is correct, upgrade the version to the latest system.
30	8xxx 2047	Server response time out	UGW reply time-out	If this occurs during a communication test or when the service browser is enabled, wait for a while and then try again.
31	8xxx 2048	Service not found	The service is not found (invalid path).	Confirm that the URL of the UGW (RGW-ADR) is "https://a01.ugwdevice.net/ugw/agentif010".
32	8xxx 2052	URL error	URL setting error	Confirm that the URL of the UGW (RGW-ADR) is "https://a01.ugwdevice.net/ugw/agentif010".
33	8xxx 2058	Unknown error	SOAP Client failed to obtain SOAP Response. It may be caused by a problem on the server side or a temporary problem in network load, etc.	Perform and complete a communication test (COM-TEST).
34	8xxx 2063	SOAP Fault	SOAP error (SOAP Fault)	Check that the value of the port number of UGW (RGW- PORT) is 443.
35	xxxx xxxx	Device internal error	Device internal error	Turn OFF and then ON the power of the device. Alternatively, replace the system software of the device (version upgrade).
36	xxxx xxxx	SUSPEND: Initialize Failure!	Internal error at startup of E-RDS	Turn OFF and then ON the power of the device.

*1: In [hexadecimal], the error code returned from the server is displayed in hex notation.
In [detailed error information on the server side], the error detail character strings returned from the server are displayed.

Updater

Functional Overview

■ Overview

Updater provides functions that enable network communication with Content Delivery System (hereinafter CDS) or Local CDS to install firmware, MEAP applications and system options.

- Firmware Installation
  Updater function enables users to distribute firmware through networks. Particularly on e-Maintenance/UGW (called NETEYE in Japan)-enabled devices, firmware can be updated remotely, which effectively slashes costs incurred in field services.
- MEAP Application/System Option Installation
  By linking devices to CDS and License Management System (providing the function to manage licenses; hereinafter LMS), applications can be installed in devices via Updater, regardless of those not embedded (MEAP application) or embedded (system options) in devices.

● Firmware Installation

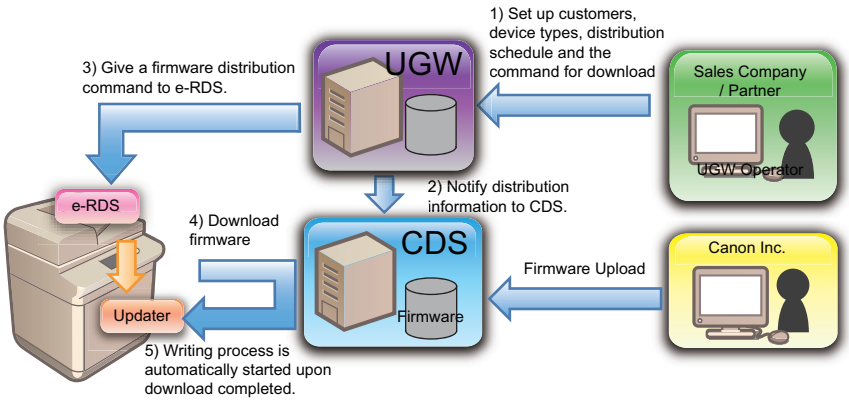
The service technician is involved in the following 5 firmware installation methods by introducing CDS (Contents Delivery System):

Delivery method	Download instructions given by	Update timing	Versions which can be delivered		
			Older than the current	Same as the current	Newer than the current
a. CDS Remote Update (Download and update in conjunction with UGW)	UGW	Automatic	No	Yes*1	Yes*2
b. CDS Remote Download (download in conjunction with UGW)	UGW	Manual	Yes	Yes*1	Yes
c. CDS On-site Download (manual download and update)	Local UI	Automatic	No	Yes*1	Yes*2
		Manual	Yes	Yes*1	Yes
d. CDS Scheduled Update Method (UGW-linked Periodical Download and Periodical Update)	UGW	Scheduled	No	No	Yes*2
e. Update using SST (Service Support Tool)	SST	-	Yes	Yes	Yes

*1: Do not execute Updated Module.
*2: Versions for which remote update is enabled can only be selected.

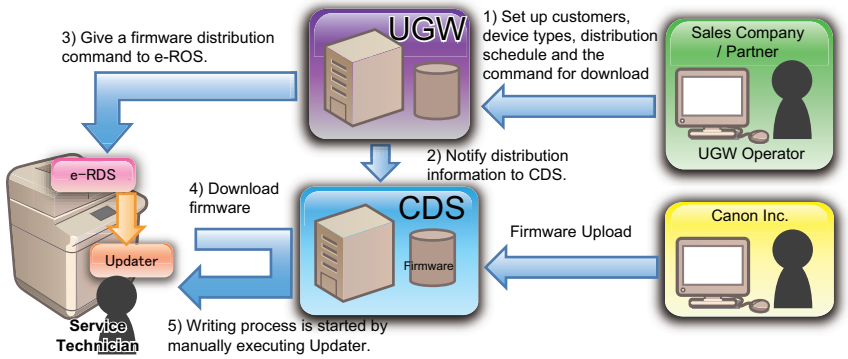
a. CDS Remote Update (download and update in conjunction with UGW)

By registering delivery schedule and update settings on a device which is an imagePRESS Series device and uses UGW in advance, full remote firmware updates will be achieved. The device downloads firmware updates from CDS and then updates the firmware with the acquired firmware updates.
The management department will announce when the implementation of this method starts.



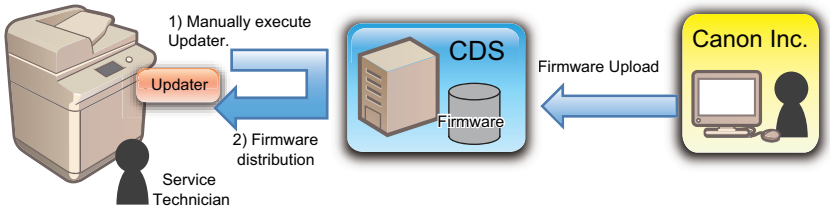
b. CDS Remote Download (download in conjunction with UGW)

By registering delivery schedule and update settings on a device which is an imagePRESS Series device and uses UGW in advance, firmware updates can be delivered before the service technician visits the customer. This makes it possible for the service technician to check the status of the device and then manually update firmware when he/she visits the customer.



c. CDS On-site Download (manual download and update)

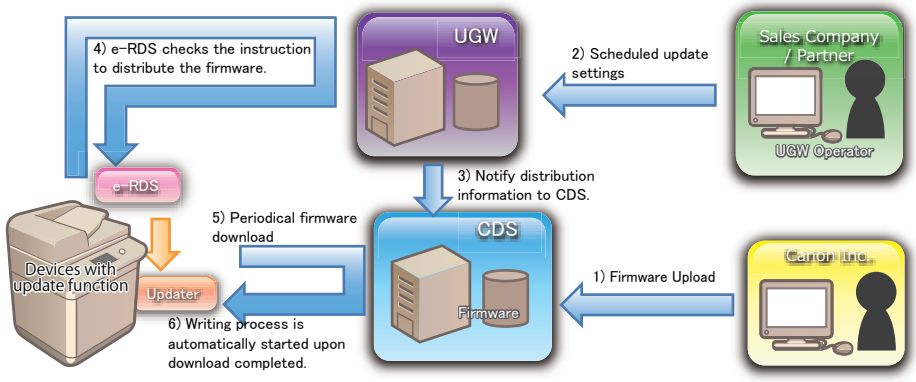
For a device which is an imagePRESS Series device and is connected to an external network, the service technician can download firmware updates and update firmware using service mode. This makes it possible for the service technician to update firmware without using a PC when it is necessary to update firmware when he/she visits the customer.



NOTE:
An external network refers to a network which connects this machine and CDS via the Internet.

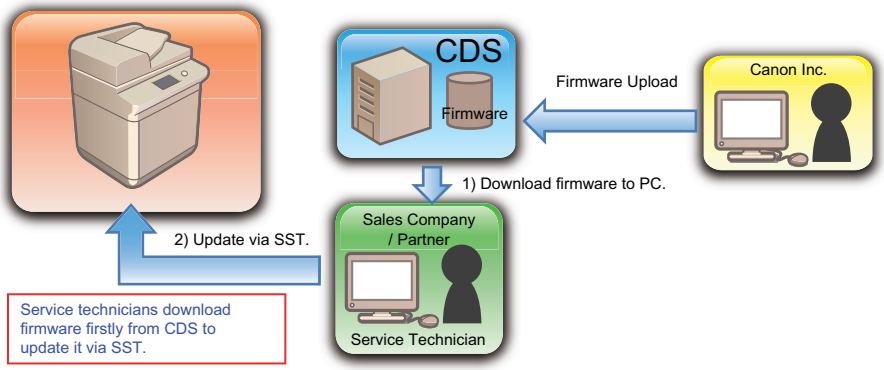
d. CDS Scheduled Update Method (UGW-linked Periodical Download and Periodical Update)

For devices with an update function using UGW, scheduled update settings can be made from UGW. If scheduled update settings are registered on UGW in advance, Updater of the device will periodically and automatically update firmware.



e. Update using SST (Service Support Tool)

For a device which is an imagePRESS Series device and is not connected to an external network, firmware updates cannot be delivered using any of the three methods explained above. Firmware updates to be released from now on is scheduled to be delivered via CDS, instead of distributing master CD as before. In the field, it is possible to download firmware updates from CDS with the Web browser on a PC and so on.



NOTE:
By introducing CDS, firmware updates can be delivered using the following 4 methods.
For details, refer to the e-Manual.

Delivery method	Download instructed from	Update timing	Versions which can be delivered		
			Older than the current	Same as the current	Newer than the current
CDS on-site download	Local UI/Remote UI	Automatic	No	No	Yes*1
		Manual	No	No	Yes*1
Periodical download (Periodical download and update set up on site)	Local UI/Remote UI	Scheduled	No	No	Yes*1
Special download and update using remote UI	Remote UI	-	Limited versions only (separately acquired)		
Local CDS on-site download	DFU*2	Automatic	×	×	Yes*1

*1: Latest versions for which remote update is enabled can only be selected.

*2: iW EMC/iW MC Device Firmware Update Plug-in

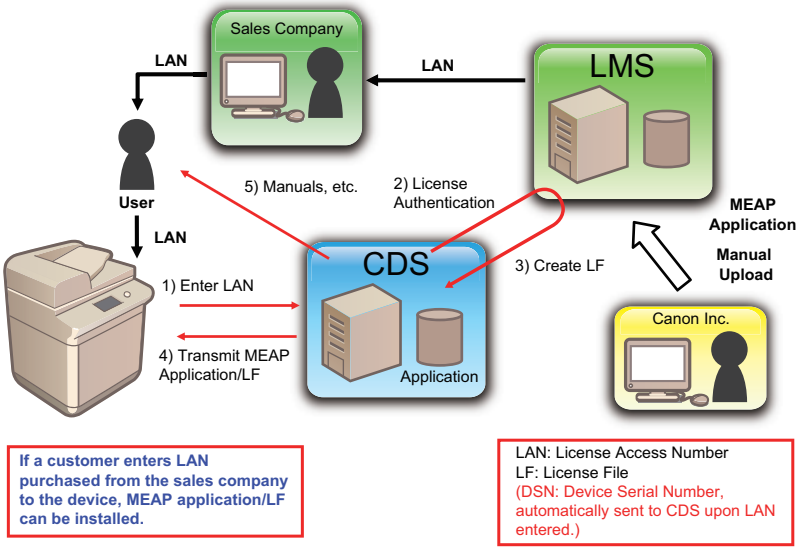
● Installing MEAP Application/System Option

The following is the installation method of MEAP application/system option which is enabled by applying CDS.

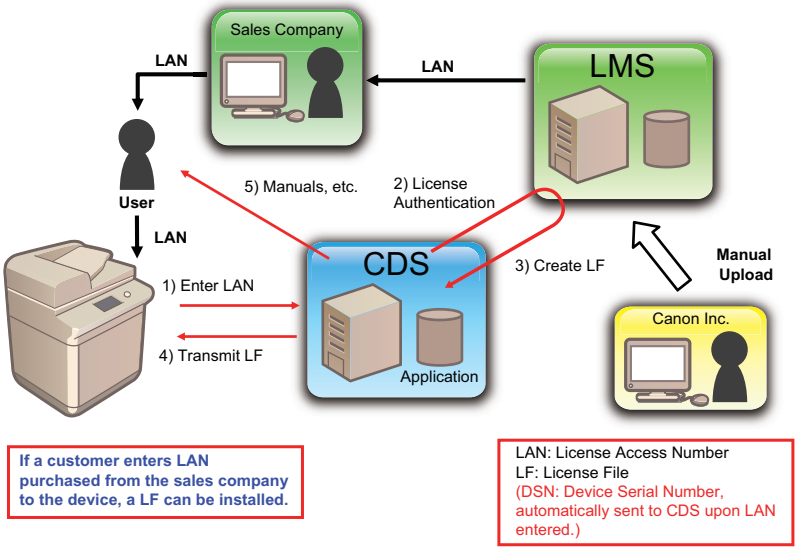
a. LMS-linked MEAP Application/System Option Installation

If an imagePRESS-series device is connected to the external network, user or service technician can gain access to CDS from [Settings/Registration] to install a MEAP application or a system option.

Installing MEAP Application

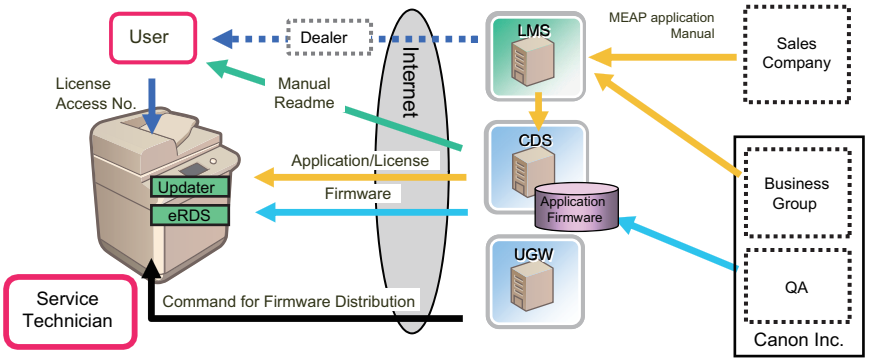


Installing System Option



■ System Configuration

The system configuration when using CDS is shown below.



■ List of Functions

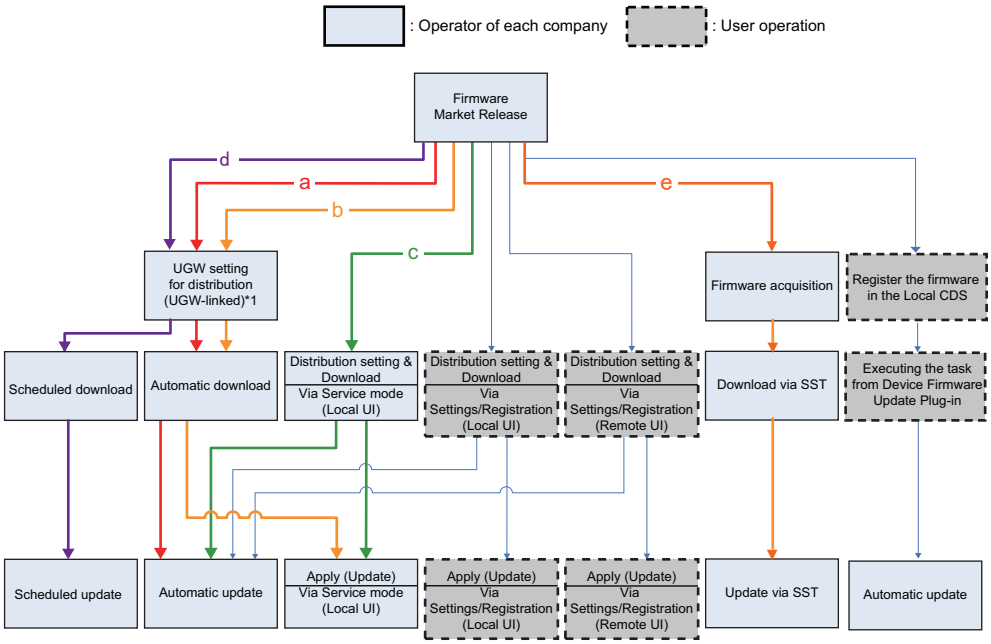
The matrix below shows the list of functions provided by Updater.

Category	Function	Service Mode	[Settings/Registration]	Remote UI	UGW-linked
Firmware	Checking firmware compatibility	Yes	-	-	-
	Checking special firmware	Yes	-	-	-
	Checking latest firmware version	-	Yes	Yes	-
	Registering/deleting firmware distribution schedule	Yes	Yes	Yes	-
	Confirming and downloading firmware	Yes	Yes	Yes	Yes
	Updating downloaded firmware	Yes	Yes	Yes	-
	Cancelling downloaded firmware	Yes	Yes	Yes	-
	Acquiring firmware distribution information registered from UGW	-	-	-	Yes
	Notifying firmware version information	-	-	-	Yes
MEAP application/ system option	Inquiring license for MEAP application/ system option	-	Yes	Yes	-
	Installing MEAP application / system option	-	Yes	Yes	-
System Management	Settings	Yes	-	-	-
	Testing communications	Yes	Yes	Yes	-
	Displaying update logs	Yes	Yes	Yes	-
	Displaying system logs	Yes	Yes	Yes	-
Internal system error notification	Notifying internal system error occurrence to distribution server	Yes	Yes	Yes	Yes

■ Distribution Flow

● Firmware Installation Flow

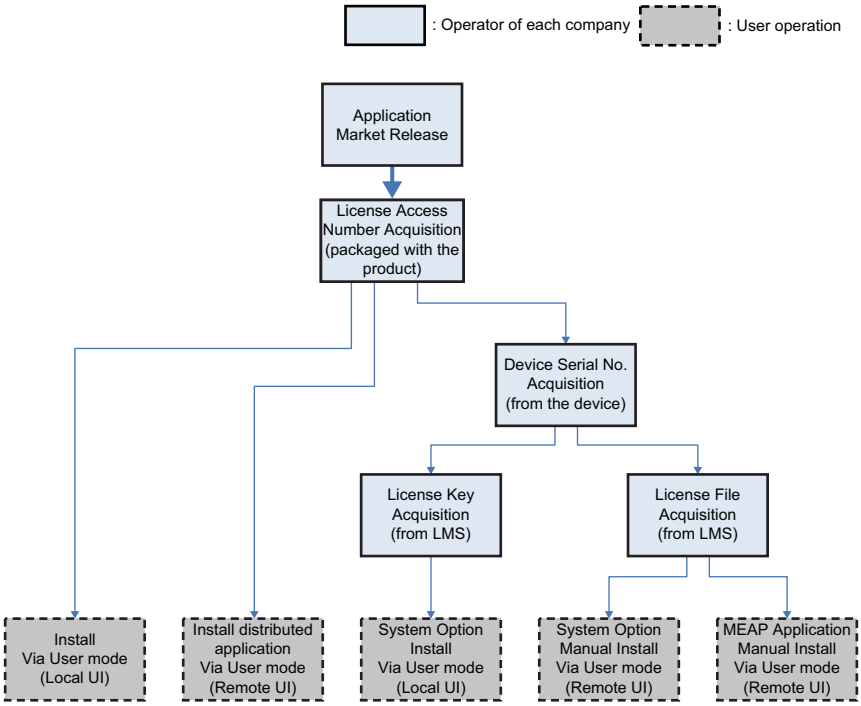
Service technicians provide firmware install services in the following 5 methods.
a: UGW-linked download and update
b: UGW-linked download
c: Manual download and update
d: UGW-linked periodical download and periodical update
e: Update using SST



*1: Schedules for UGW-linked distribution are maintained on CDS.

● MEAP Application/System Option Installation Flow

MEAP application/system option installation method using service mode is not provided.
Be sure to use the [Settings/Registration] to install.



Limitations and Cautions

■ Limitations

Changing Date/Time on Device
When a user changes the date/time setting on the device (including change of the setting according to daylight saving time), the firmware distribution may not be performed as scheduled.
But there is not the problem if it is time adjustment of several minutes with NTP servers.
Change of Setting from Service mode
Any settings from Service mode will be enabled after restarting the device.

■ Cautions

Concurrent use of Updater functions

Multiple users cannot use Updater functions on a device concurrently by using it together with Remote UI.

Coexistence of Remote UI and other tools

Users logged in SMS (Service Management Service) are unable to use Update functions from Remote UI.

Using Updater function from Remote UI

Upon the following operations done, Updater functions are suspended from Remote UI for certain duration.

- When a user exits Web browser without clicking [Portal] or [Log Out] button in the setting of Remote Login Service via SMS
- When a user exits Web browser without clicking [Portal] button in the setting of not to use Remote Login Service via SMS.
- When a user exits Web browser without clicking [Log out from SMS] or [To Remote UI] button.

Wait for EOJ (end of job) Function

Firmware update will be triggered only after the following jobs are completed.
This is the Updater-specific specification.

Job/Function type	Receiving	Printing	Queued print jobs	Sending	Queued send jobs
COPY	-	Wait for EOJ	Wait for EOJ	-	-
PRINT	Wait for EOJ (end of job)	Wait for EOJ Wait for EOJ	-	-	
FAX	Wait for EOJ	Wait for EOJ	Wait for EOJ	Wait for EOJ	Wait for EOJ
I-FAX Receipt	Cancel processing to trigger update *	Wait for EOJ	Wait for EOJ	Wait for EOJ	Wait for EOJ
Report Print	-	Wait for EOJ	Wait for EOJ	-	-
SEND	-	-	-	Cancel processing to trigger update *	Cancel processing to trigger update *

*The data are guaranteed even if cut off in the middle of a job.It becomes the recovery object after the device reboot and carry out send / reception again.
Even during transfer, Pull SCAN job processing is cancelled soon after scanning is completed.
Firmware update is cancelled if the jobs are not completed within 10 minutes. If this occurs, the error code, 8x001106, will be returned (different numbers will be shown for x depending on the execution modes).
Firmware update is executed if the jobs stated above are not in the queue.
Follow the shutdown sequence to reboot the device after the firmware is updated.

Preparation

■ Preparation

The following preparations are required to upgrade the firmware using the Updater.

Distribution name	Settings of Vice-Company of Sales	Network settings	Enabling linkage with UGW	Enabling the [Update Firmware] button in the [Settings/Registration] menu	Enabling the [Manual Update] button on the remote UI	Enabling scheduled update (*1)	enabling the Local CDS button
CDS remote update method	✓	✓	✓	-	-	-	-
CDS remote download method	✓	✓	✓	-	-	-	-
CDS on-site download method	✓	✓	-	-	-	-	-
CDS scheduled update method	✓	✓	-	✓	-	✓	-
CDS on-site download method by local UI	✓	✓	-	✓	-	-	-

Distribution name	Settings of Vice-Company of Sales	Network settings	Enabling linkage with UGW	Enabling the [Update Firmware] button in the [Settings/Registration] menu	Enabling the [Manual Update] button on the remote UI	Enabling scheduled update (*1)	enabling the Local CDS button
CDS on-site download method by remote UI	✓	✓	-	✓	-	-	-
Special download and update using remote UI	✓	-	-	-	✓	-	-
Local CDS update method	-	-	-	✓	-	-	✓

*1: It is required when configuring the schedule update setting from the Control Panel.

■ Setting the Sales Company

With devices sold in the following countries, it is necessary to change the device's sales company setting from the default setting in order to use the CDS firmware distribution. Be sure to do this because if the necessary changes are not made, it may not be possible to select the target firmware.

Country of sale	Default setting of the sales company	Change the setting of the sales company to:
Canada	US	CA
Latin America	US/SG	LA
Hong Kong	SG	HK

Sales company setting changes are made in the following Service Mode.

- COPIER > FUNCTION > INSTALL > CDS-CTL

NOTE:
CDC-CTL sales companies in various countries are shown below. Change to the following settings if the settings differ.
<CDS-CTL setting values and list of relevant sales companies>

Japan = JP	China = CN
USA = US	Hong Kong = HK
Singapore = SG	Australia = AU
Europe = NL	Canada = CA
Korea = KR	Latin America = LA

■ Network Settings

● Connecting to External Network

The method of connecting to external network is similar to a normal network connection method. Refer to user manual of the device for details.

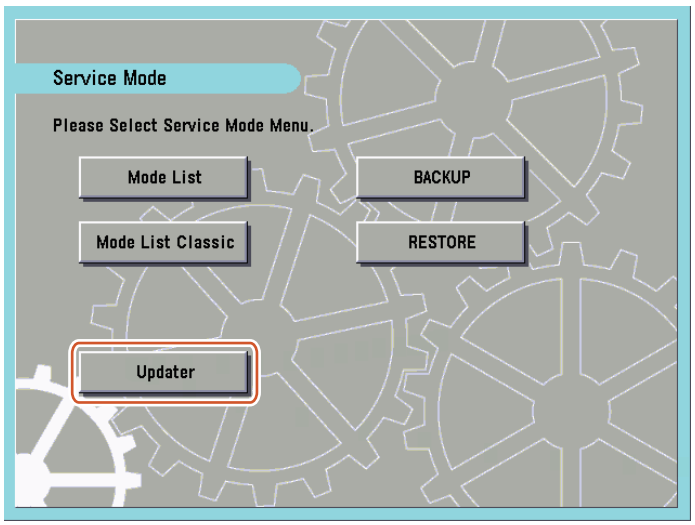
NOTE:
"External Network" here means the network connecting the device to CDS via Internet.

● Confirming URL Setting of Distribution Server

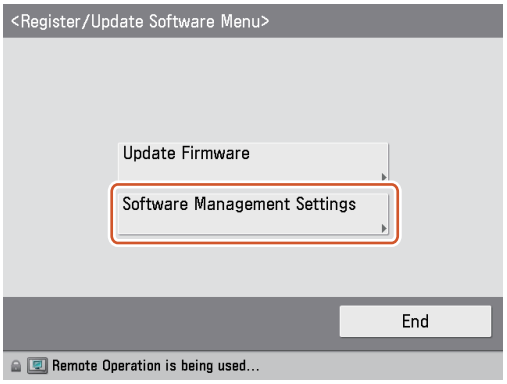
This section describes how to confirm the URL setting of the distribution server.

1. **Start [Service Mode] at Level 1.**

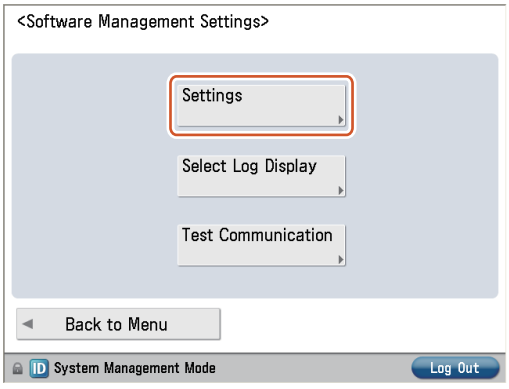
2. **Press [Updater] button.**



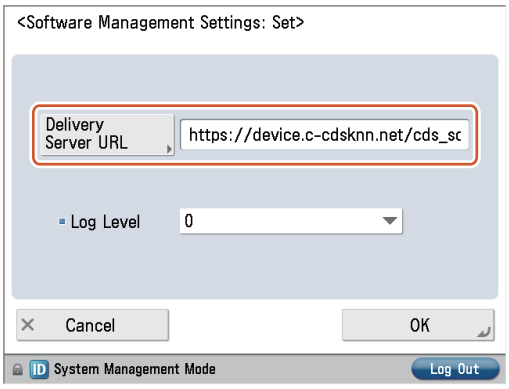
3. **Press [Software Management Settings] button.**



4. **Press [Settings] button.**



5. **Ensure to enter "https://device.c-cdsknn.net/cds_soap/updaterif" in the field beside the [Delivery Server URL] button.**
   If the URL is not entered or a wrong URL is entered in the field, click [Delivery Server URL] button to show the virtual keypad. Check the URL and enter the correct one.



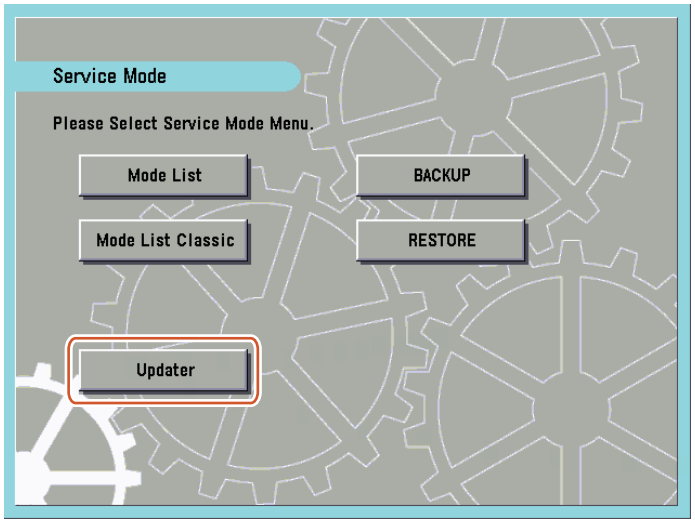
6. **Press [OK] to set the entered items. Now the URL of the distribution server is successfully set.**

• Communication Test

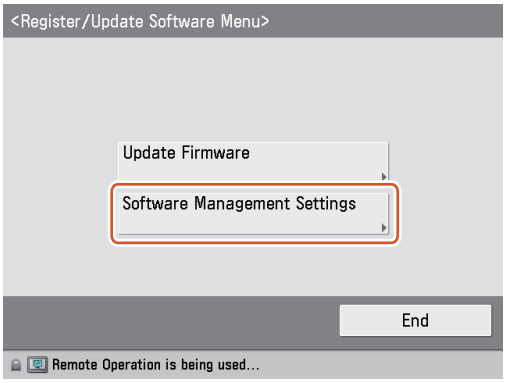
This section describes how to check if the communication is normally done to the distribution server and/or the file server.

NOTE:
Carry out the communication test with both Embedded RDS and CDS.

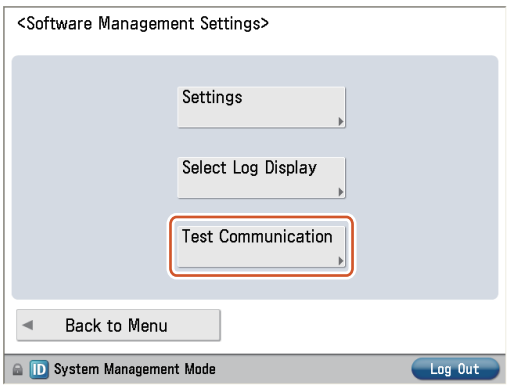
1. **Start [Service Mode] at Level 1.**
2. **Press [Updater] button.**



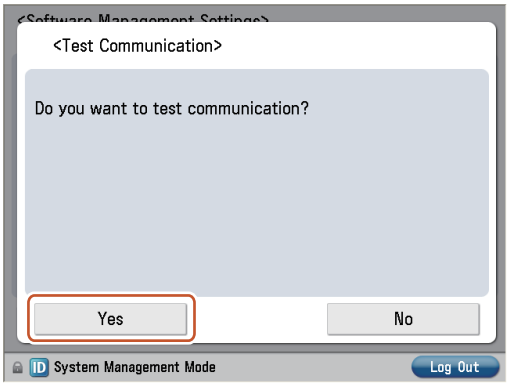
3. **Press [Software Management Settings] button.**



4. **Press [Test Communication] button.**

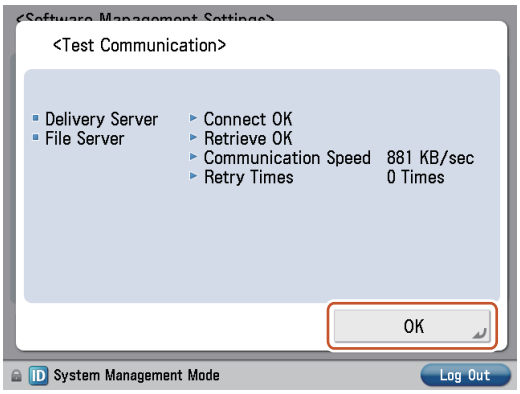


5. **Press [Yes] button.**



Obtain the download file information for communication test from the distribution server (to execute the communication test to the distribution server).
Using the download file information for communication test, the contents for test are downloaded from the file server (for the communication test to the file server).

6. **Upon the communication test completed, the communication test result screen is shown.**
   Press [OK] button to exit this operation.



■ Enabling Linkage with UGW

When "CDS Remote Update Method" and "CDS Remote Download System" are performed by installing firmware, the below settings must be made in advance together with UGW.

1. Set "On" for the following service mode:
   - SERVICE MODE > FUNCTION GR. >MEAP > CDS-UGW
2. Access the [Customer Information Management] screen of the UGW WebPortal, and specify [Yes] for the following setting.
   - Firmware distribution

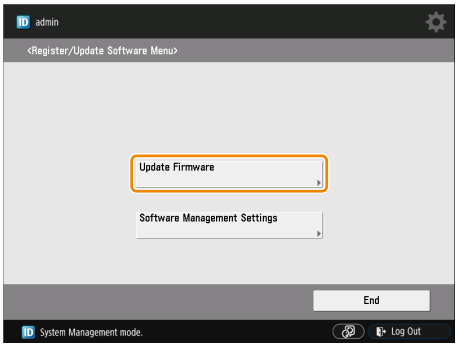
NOTE:
- Refer to the NetEye business management manual with respect to the UGW WebPortal operation method.
- When the person responsible for setting "Input Customer Information" or "Specify Firmware Distribution" selects the relevant device in the [Firmware Distribution Information] screen, it will be necessary to specify "Yes" for firmware distribution in the [Customer Information Management] screen to make it a search target.
- When [Firmware Distribution] is not displayed in the [Customer Information Management] screen of the UGW WebPortal, it is possible that display authority for firmware distribution information has not been set to an account. Check this with the sales company.

■ Enabling the [Update Firmware] Button in the [Settings/Registration] Menu

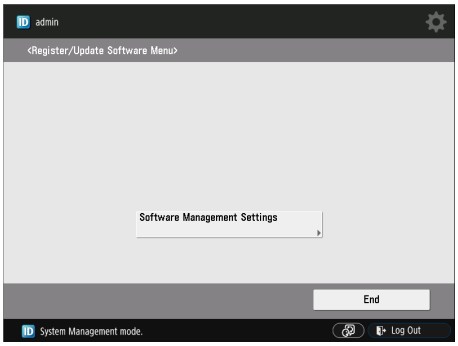
Setting this service mode enables/disables the [Update Firmware] button in the [Settings/Registration] menu so that whether or not to permit firmware installation by users using Updater can be set.
Set "1" when enabling the [Update Firmware] button and set "0" when disabling it.

COPIER > OPTION > FNC-SW > CDS-FIRM

- Example of the Updater screen when the [Update Firmware] button is enabled (setting value: "1")



- Example of the Updater screen when the [Update Firmware] button is disabled (setting value: "0")

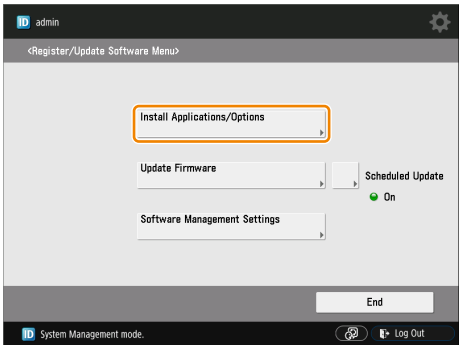


■ Enabling the [Application/Option Installation] Button

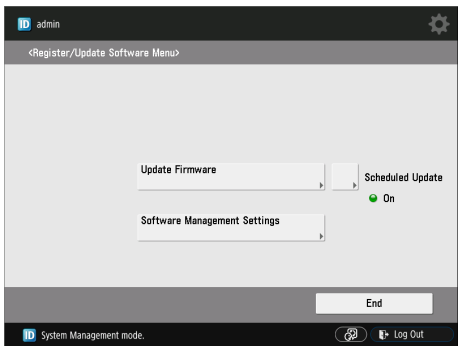
By changing the following service mode, whether or not to display the button for installing applications for users (MEAP application, system option, etc.) in the [Settings/Registration] menu can be set. When the setting value is "0", the button is hidden whereas when the value is "1", it is displayed.

COPIER >OPTION >FNC-SW >CDS-MEAP

- Example of the Updater screen when the setting is "1" (enabled)



- Example of the Updater screen when the setting is "0" (disabled)

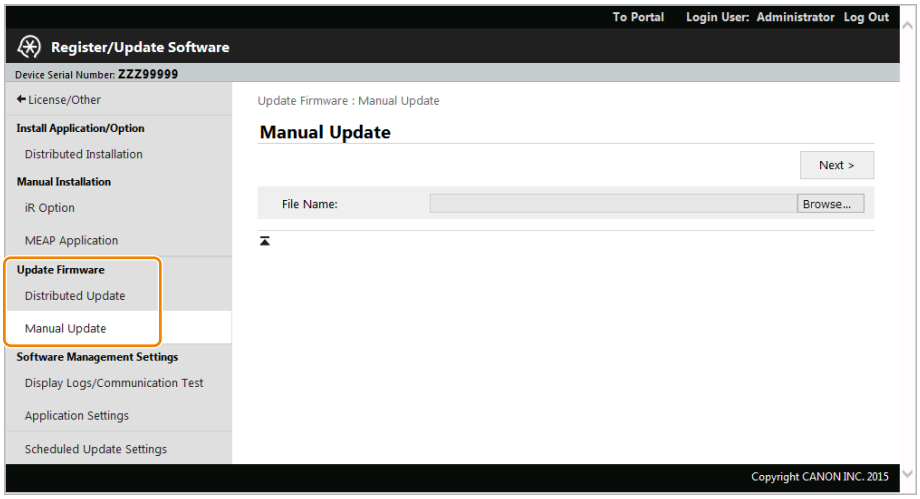


■ Enabling the [Manual Update] Menu on Remote UI

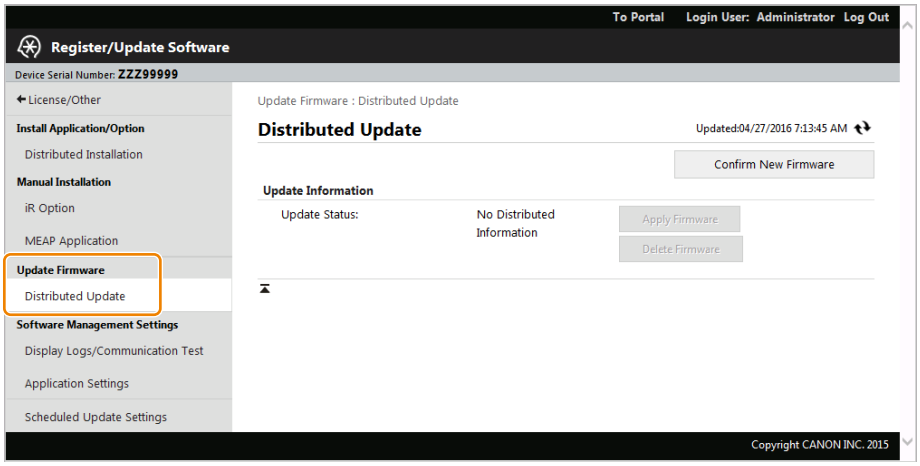
By changing the following service mode, whether or not to permit firmware installation by users can be set.
Set "1" for permitting the firmware installation by users by enabling [Manual Update] menu on the remote UI, and set "0" for not permitting it.
When it is enabled, [Manual Update] menu is displayed in [Settings/Registration] menu of the remote UI.

COPIER > OPTION > FNC-SW > LOCLFIRM

- Example of the Remote UI of Updater when [Manual Update] menu is displayed by enabling it



- Example of the Remote UI of Updater when [Manual Update] menu is hidden by disabling it



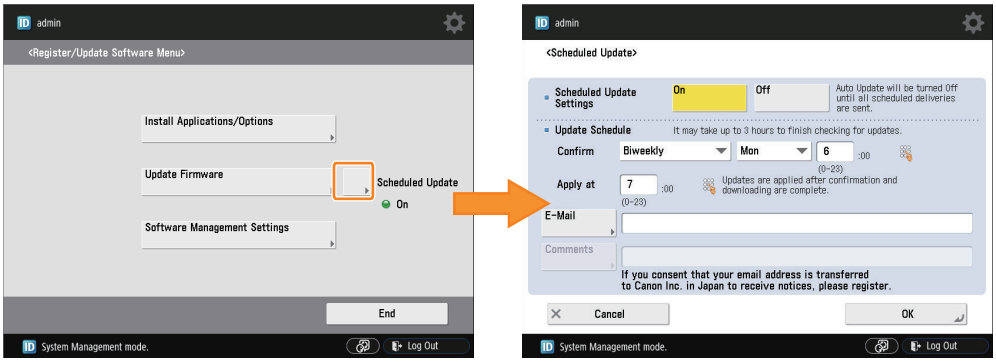
NOTE:
In order to use manual update of the remote UI, firmware for manual update is required.
For regions where firmware update by users is not supported, manual firmware update function cannot be used even if [Manual Update] menu on the remote UI is enabled.

■ Enabling the [Scheduled Update] button in the [Settings/Registration] menu

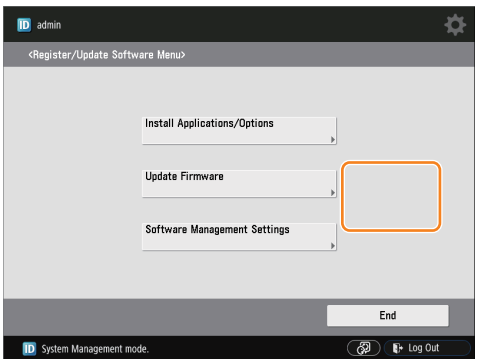
Setting this service mode enables to change whether to display or hide the scheduled update setting button for users.
Set "2" to display the button on the Updater in service mode. Set "1" to display it on the Updater in [Settings/Registration] menu. Set "0" not to display it on neither of them.
When this setting is enabled, the button for setting scheduled update is displayed and ON/OFF of scheduled update and update schedule can be set.

COPIER >OPTION >FNC-SW >CDS-LVUP

- Updater screen when the setting value is "1" or "2"



- Updater screen when the setting value is "0"

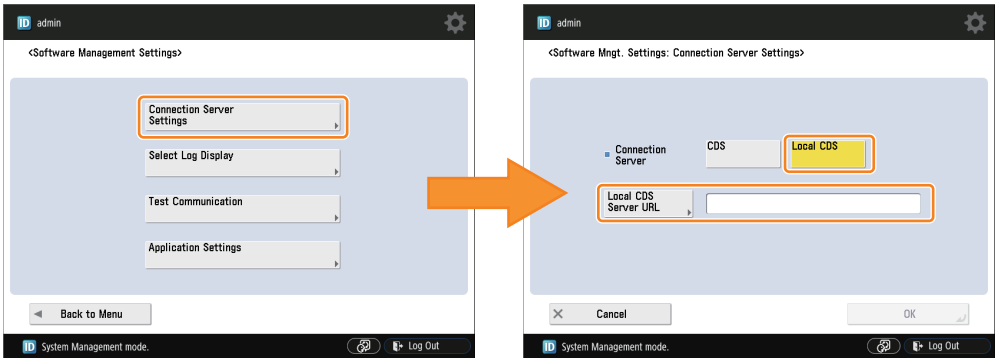


■ Enabling the Firmware Update Using Local CDS

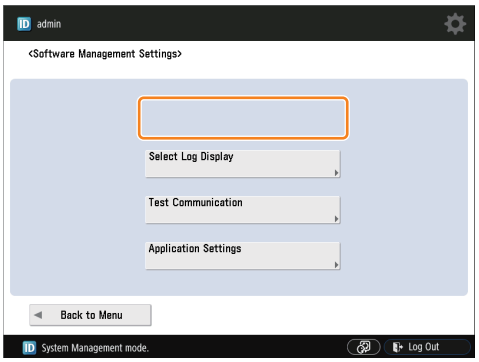
By changing the following service mode setting, firmware update function using the local CDS can be enabled.
Set "1 when enabling the firmware update function using the local CDS, and set "0" when disabling the function.
When the function is enabled, the local CDS setting button [Connected Server Setting] is displayed so ON/OFF of the local CDS connection or setting of connection destination server can be configured.

COPIER >OPTION >FNC-SW >LCDSFLG

- Example of the Updater screen when the firmware update function using the local CDS is enabled (setting value: "1")



- Example of the Updater screen when the firmware update function using the local CDS is disabled (setting value: "0")



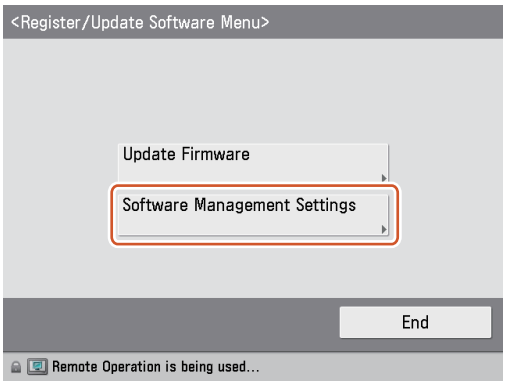
System Management Operations

■ Various Setting

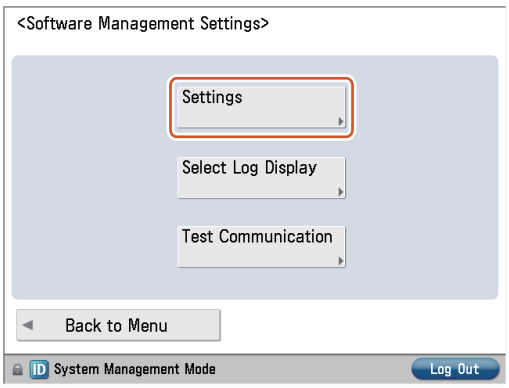
● URL Setting of the Distribution Server

This section describes how to set the URL of the distribution server.

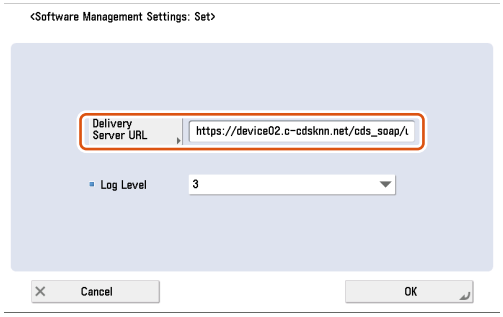
1. **Startup [Service Mode] in Level 1.**
2. **Press the [Updater] button.**
3. **Press the [Software Management Settings] button.**



4. **Press the [Settings] button.**



5. **When the [Distribution Server URL] button is pressed, the virtual keyboard is displayed, so enter the URL.**



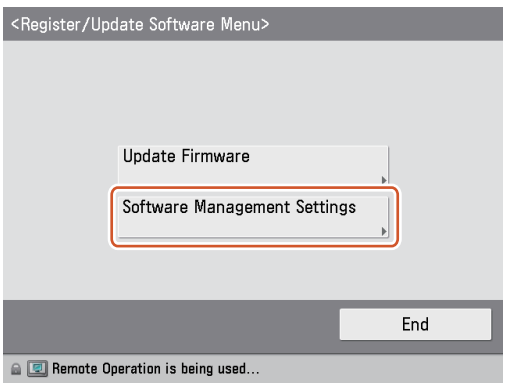
- [Distribution Server URL]:
  Enter "https://device02.c-cdsknn.net/cds_soap/updaterif".

6. **Press the [OK] button to confirm the entered item. This completes the procedure for confirming the URL setting of the distribution server.**

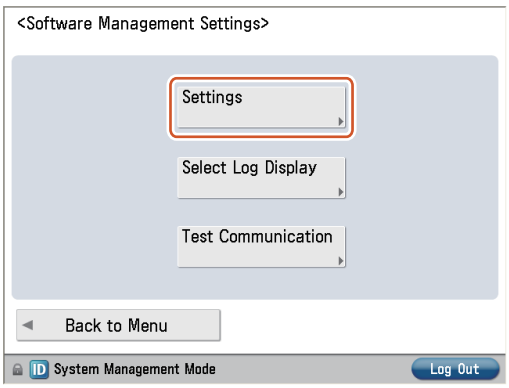
● Setting Log Level

This section describes how to set system log levels.

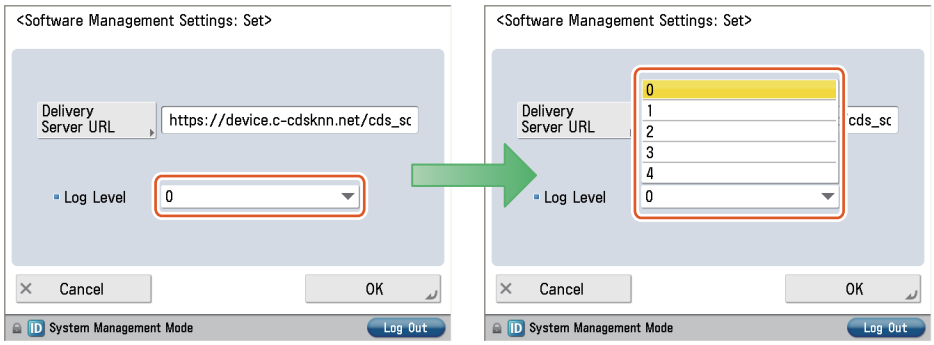
1. **Start [Service Mode] at Level 1.**
2. **Press [Updater] button.**
3. **Press [Software Management Settings] button.**



4. Press [Settings] button.



5. Select a log level from [Log Level] dropdown list.



- [Log Level]:
  Select one of 5 levels ranging from [0] to [4].
  See the table below for logs output in each level.

Log Level	Log Output				
	Trace	Information	Important Message	Ordinary Error	System Error
0	-	-	-	-	Yes
1	-	-	-	Yes	Yes
2	-	-	Yes	Yes	Yes
3	-	Yes	Yes	Yes	Yes
4	Yes	Yes	Yes	Yes	Yes

NOTE:
This list shows the contents of the Log Output.

Log Output	Description
Trace	Detailed logs for debug
Information	Logs related to operations done on the system
Important Message	Update logs output by firmware type Installation logs by MEAP application Logs related to enabled functions by system option
Ordinary Error	Logs for ordinary errors
System Error	Logs for internal system errors

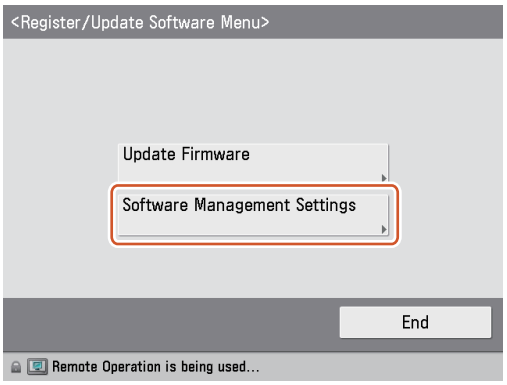
6. Press [OK] button to set the selected log level. Now the log level is successfully set.

■ Displaying Logs

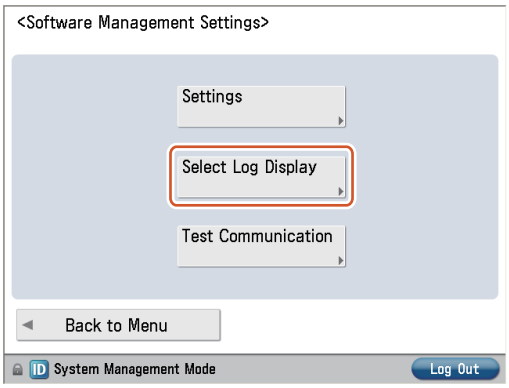
● Update Logs

This section describes how to confirm System Option/MEAP Application Installation Logs and Firmware Update Logs.

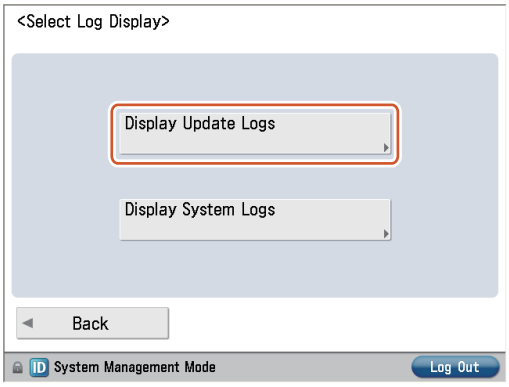
1. **Start [Service Mode] at Level 1.**
2. **Press [Updater] button.**
3. **Press [Software Management Settings] button.**



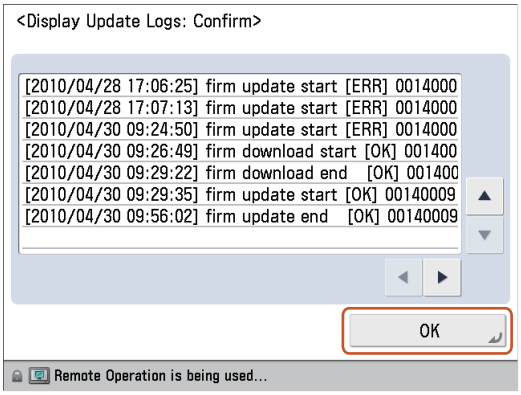
4. **Press [Select Log Display] button.**



5. **Press [Display Update Logs] button.**



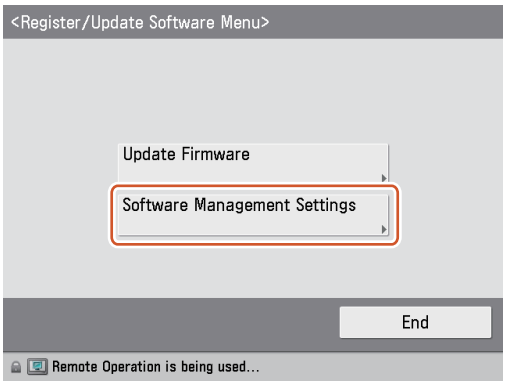
6. **System Option/MEAP Application Installation Logs and Firmware Update Logs are shown.**
   Press [OK] button to exit this operation.



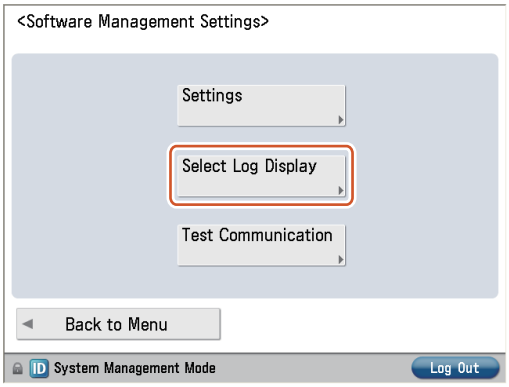
• System Logs

This section describes how to confirm System Logs.

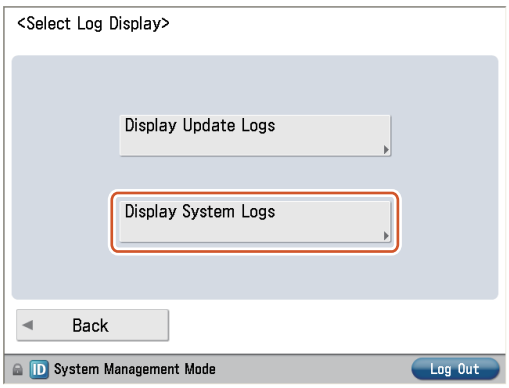
1. **Start [Service Mode] at Level 1.**
2. **Press [Updater] button.**
3. **Press [Software Management Settings] button.**



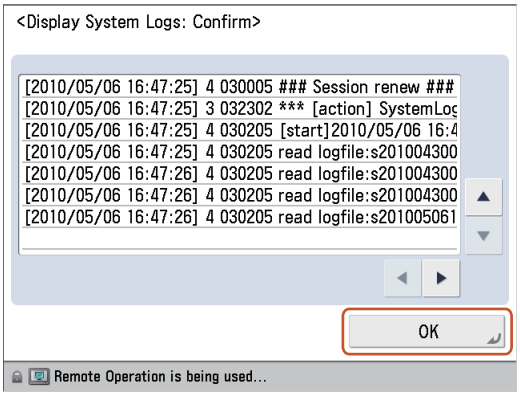
4. **Press [Select Log Display] button.**



5. **Press [Display System Logs] button.**



6. **Updater internal logs are displayed.**
   Press [OK] button to exit this operation

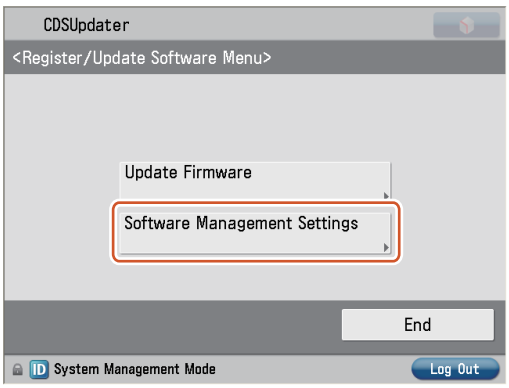


NOTE:
See the section of "Debug Logs" under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” for more detailed information.

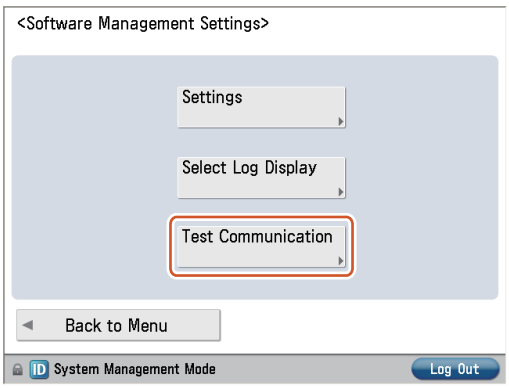
■ Communication Test

This section describes how to check if the communication is normally done to the distribution server and/or the file server.

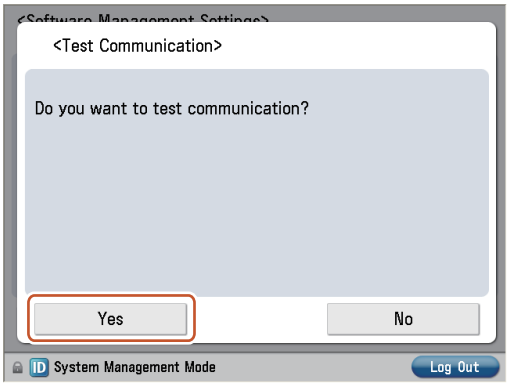
1. **Start [Service Mode] at Level 1.**
2. **Press [Updater] button.**
3. **Press [Software Management Settings] button.**



4. **Press [Test Communication] button.**

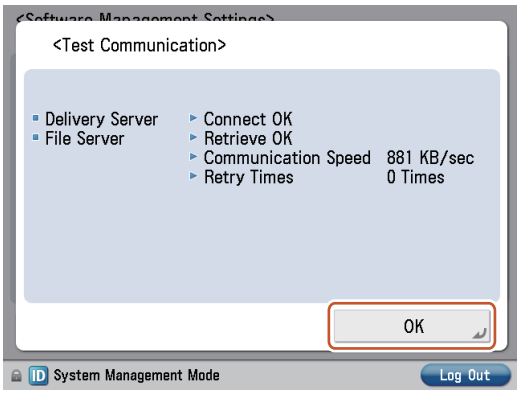


5. **Press [Yes] button.**



Obtain the download file information for communication test from the distribution server (to execute the communication test to the distribution server).
Using the download file information for communication test, the contents for test are downloaded from the file server (for the communication test to the file server).

6. **Upon the communication test completed, the communication test result screen is shown.**
Press [OK] button to exit this operation.



NOTE:
Carry out the communication test with both Embedded RDS and CDS.

Maintenance

■ Upgrading Updater

The firmware installed in the device should be also upgraded when upgrading Updater. See the section of “Version Upgrade” , Chapter 6 “Troubleshooting” for more detailed information.

■ Formatting Hard Disk

Since Updater is a MEAP application, its contents can be temporarily saved in the MEAP application storage area on PC via SST during formatting or replacing HDD. See "MEAP" of Chapter 2 for further information.
The settings initialized in format or replacement should be restored. See the section of “Preparation” on page 327 for more detailed information.

NOTE:
When formatting or replacing HDD, distribution schedule, downloaded firmware (not updated yet) and logs (update/system logs) will be deleted.

■ How to Replace Controller Boards

- Main Controller Board PCB
  The network and service mode setting should be set again after initialization. See the section of “Preparation” on page 327 for more detailed information.

■ How to Replace Devices

All settings should be set again because no data are inherited. See the section of “Preparation” on page 327 for more detailed information.

DCM

DCM

Overview

DCM (Device Configuration Management) is a function to migrate the device settings infomation (e.g.: Settings/Registration Basic Information and Service Mode Settings). In terms of the description in the User's Guide, it is synonymous with "Import/Export All". Service mode setting values can be exported from the screen of service mode.
While the existing method supported only the case of backing up setting values for the same machine, DCM now supports the following 3 cases:

- The same machine (backup for the purpose of providing against emergency)
- A different machine of the same model (setting values are migrated collectively to multiple machines when replacing a host machine)
- A different model (e.g.: the setting values are copied from an old model to a new model)

■ Items to be Exported

The following shows the items to be exported.
Only setting values are exported. Image data such as scanned image cannot be exported.

	Export by remote UI	Export by service mode
Settings/Registration Basic Information	Yes	-
Paper Type Management Settings	Yes	-
Forwarding Settings	Yes	-
Box Settings	Yes	-
Department ID Management Settings	Yes	-
Main Menu Settings	Yes	-
Web Access Settings	Yes	-
Favorite Settings	Yes	-
Address Book	Yes	-
Quick Menu Settings	Yes	-
MEAP Application Setting Information	Yes	-
User Setting Information	Yes	-
Workflow Composer Settings	Yes	-
Service Mode Settings	Yes *	Yes

* Not exported by default in the case of export by remote UI
For items to be imported, refer to ""List of items which can be imported" on page 358".

■ Method of Import/Export

The following shows the methods to import/export DCM files.

- Import/Export by remote UI
- Import/Export by service mode
- Import/Export using iW Management Console DCM Plug-in

Store the backup data in the following location.

- Export by remote UI > PC
- Export by service mode > USB flash drive/internal HDD

Even if data has been exported by one method, it can be exported by another one.
(E.g.: Data which was exported by remote UI can be imported by service mode)
For details of iW Management Console DCM Plug-in, refer to the e-Manual of iW Management Console DCM Plug-in.

■ Limitations on DCM General

- With DCM, stored data in Box, MEAP application, and system option license cannot be migrated.
- A DCM file exported to the internal HDD is not deleted even when the machine is restarted. Only 2 files at a maximum are stored in HDD. When there are more than 2 files, the oldest file are deleted.
- After importing a file, the machine must be restarted. If executing import without restart, NG is displayed and a file is not imported. This operation is not guaranteed.

- When importing DCM file including "Service Mode Settings" and "Settings/Registration Basic Information" separately, perform it in the following procedures.
  1. Perform the import of the DCM file including "Service Mode Settings" earlier
  2. Restart the host machine
  3. Import the DCM file including "Settings/Registration Basic Information"
- As include "Service Mode Settings", if the process is not completed within 5 minutes in the case of export and 15 minutes in the case of import, the item performed at that time is continued until it ends, but the final result becomes ERROR.
- DCM files to which no password is set when exporting by service mode cannot be loaded from collective import by remote UI. When assuming to perform collective import by remote UI, password must be set to data to be exported.
- Following limitations are applied to password for DCM file.
  - Character string of software keyboard: 0 to 32 characters
  - No password is set when 0 character is entered (The setting in which no password is set is allowed only export by service mode)
  - No space is allowed in the middle of a password
  - Password is case sensitive
- At the time of following setting, host matchine does not recognize USB flash drive. The DCM function is not usable, too. [Settings/Registration] > [Preferences] > [External Interface] > [USB Settings] > [Use MEAP Driver for External USB Device] = "On"

■ Limitations about Import/Export by Remote UI

- An import/export process ends with error while the following specific job is executed.
  - Executing/waiting any jobs (sending, forwarding, receiving i-fax, printing reports, functions specified by the Delayed Send mode)
  - During an Import/Export Individually operation
  - Viewing the address book using the Remote UI from another imagePRESS series
  - Delivering the device information
  - While error is occurring
  - Backing up inbox data
- If this function is executed with a print job simultaneously, it affects the operation such as; UI is locked, or a print job is cleared by restart after import. So it requires careful operation.
- A device rejects an import/ export request during shutdown.
- If this function is executed with device information distribution or remote UI import/ export (Individually) simultaneously, the first coming job takes priority and they are controlled exclusively.
- If this function is executed with a firmware update by a CDS (Updater) simultaneously, a firmware update process takes priority, and this function is stopped temporarily by restart.
- When error code is issued, this function ends with error.
- If the display language before import differs from that after import,, a setting value of a text corrupts in some cases. The character corruption can be solved by changing the display language to the appropriate one.

■ Bulk Import using the Remote UI

By changing the values of the related items in service mode, the items of "service mode settings" can be included in the DCM files to be exported from the remote UI.
DCM files exported with the remote UI can be imported into service mode without using the remote UI.
For the detailed procedure for importing/exporting using the remote UI, refer to the e-Manual included with this machine.

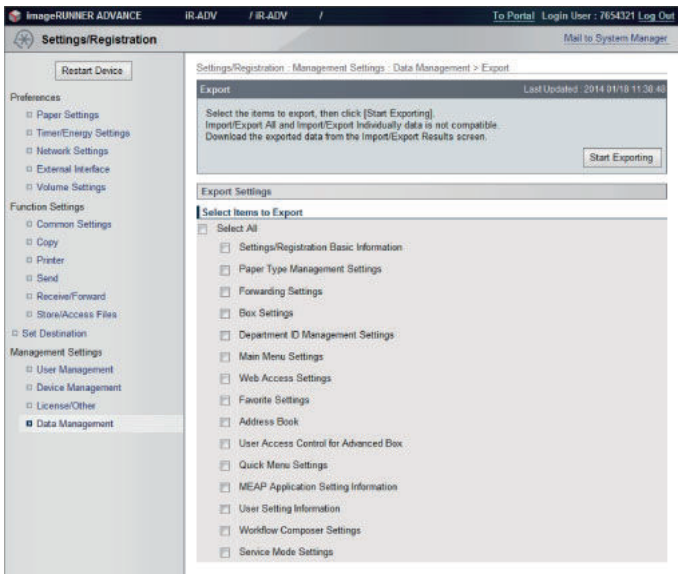
What to Prepare

PC and Web browser
USB flash drive to store data

Overall Flow

1. Complete the device settings as a reference device.
2. Change the following service mode setting value to [1], and display the "Service Mode Settings" on the remote UI.
   Service mode > COPIER > OPTION > USER > SMD-EXPT
   [0]: Hide "Service Mode Settings". (Def.)
   [1]: Display "Service Mode Settings"

3. Export the settings including "Service Mode Settings".



4. Copy the settings to the root folder of the USB flash drive on a PC.
5. Connect the USB flash drive to the copying destination device.
6. Specify the target file from RESTORE in service mode, and then execute import (refer to ""Import Procedure" on page 348" in the section of Import/export (external) using service mode).
7. Change the following service mode setting value to [0], and hide the "Service Mode Settings" on the remote UI.
   Service mode > COPIER > OPTION > USER > SMD-EXPT

■ Import/Export by Service Mode (External)

Import/export by service mode allows the selection between USB flash drive and internal HDD for the save destination of DCM files.
The procedure of import/export when USB flash drive is selected is shown below.
The DCM files to be exported contain only the items of "Service Mode Settings"
The DCM files to be imported can have been exported either by service mode or by remote UI.

● Export Procedure

Preparation

USB flash drive
* Required when exporting to USB flash drive.
It needs to have been formatted to be recognized by the device. No firmware registration is necessary.

Overall flow

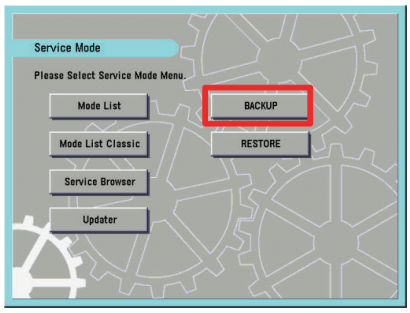
Here, a method to export to a USB flash drive is mentioned below.

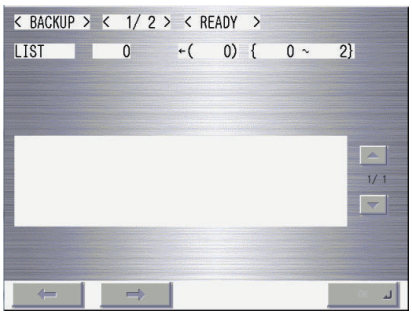
1. Select USB flash drive as save destination (LIST=1)
2. Set the password
3. Export to USB flash drive
4. Remove USB flash drive

Procedure

1. **Connect the USB flash drive and check that it has been mounted.**

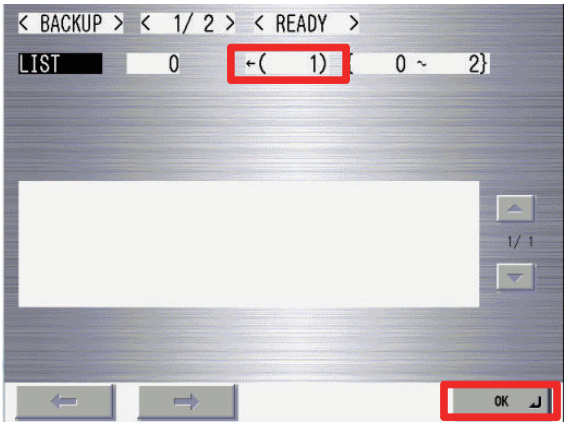
2. **Log in to service mode and press [BACKUP].**



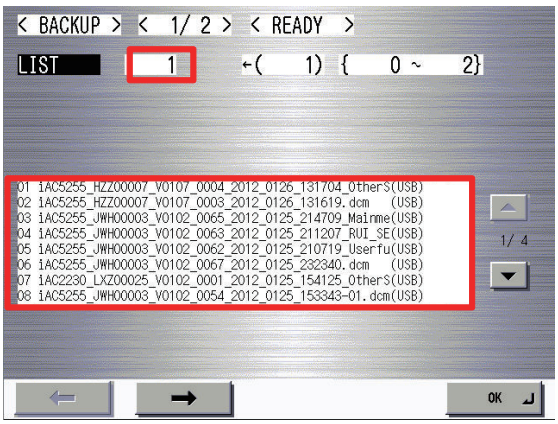


3. **Select [LIST] after the screen moves to <BACKUP>.**

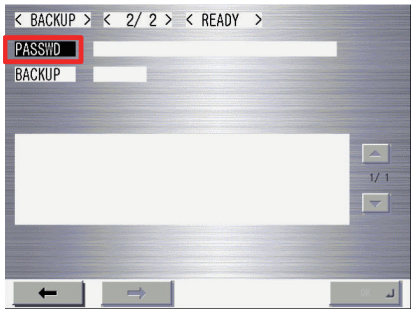
4. **When saving to USB flash drive, enter "1" and press [OK].**

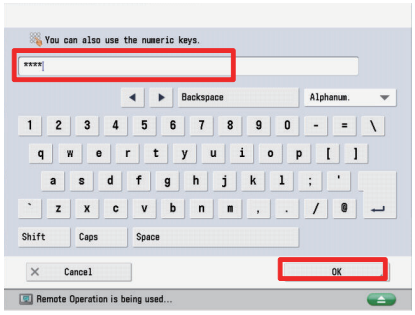


5. **The names of DCM files saved in USB flash drive are displayed. Press [->].**



6. **Select [PASSWD], enter a password from the software keyboard, and then press [OK].**

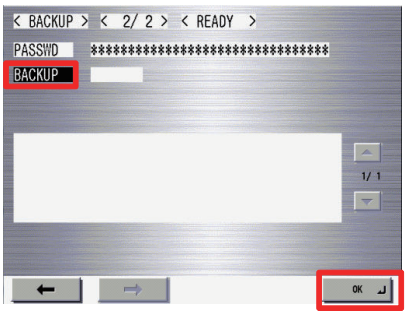




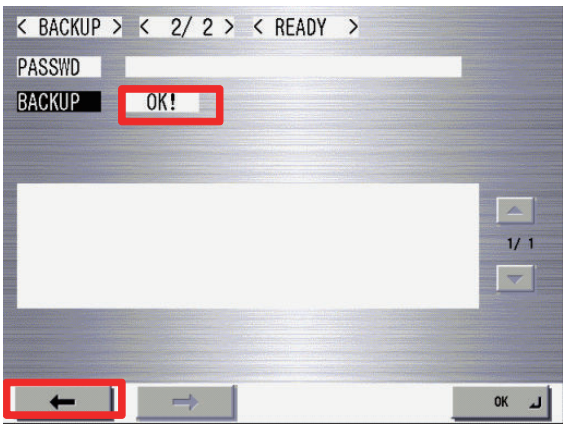
NOTE:
Limitations regarding the password
- Character string of software keyboard: 0 to 32 characters
- No password is set when 0 character is entered
- No space is allowed in the middle of a password
- Password is case sensitive

Limitations regarding the DCM file no password
DCM files exported without password can only be imported by service mode. They cannot be imported by remote UI.

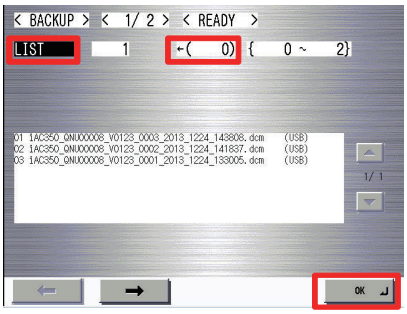
7. **After entering the password, select [BACKUP]. Press [OK] to execute export.**



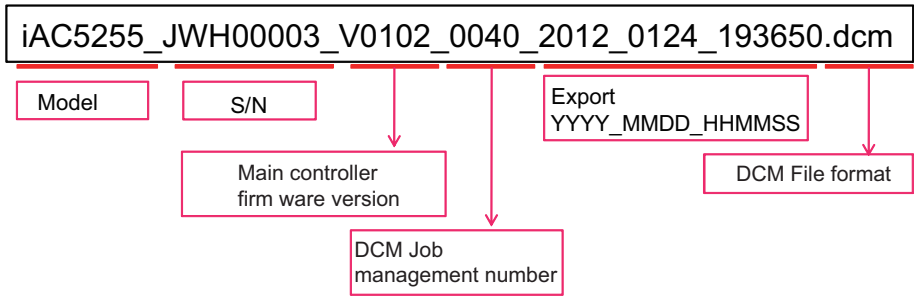
8. **"OK!" is displayed in the status column when the processing is successfully completed. Press [<-].**



9. **Select [LIST], enter "0" and press [OK]. Unmount the USB flash drive.**
   It can also be removed by pressing the Remove button on the main menu.



Reference:



● Import Procedure

Preparation

USB flash drive

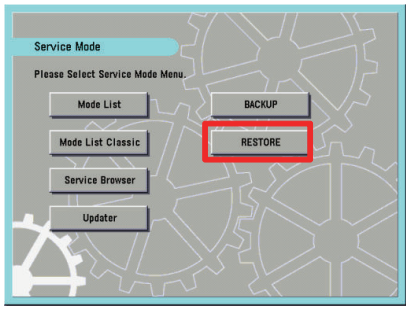
NOTE:
- It needs to have been formatted to be recognized by the device. No firmware registration is necessary
- When necessary, copy the files which you want to import using a PC in advance. Be sure to store them in the root folder of the USB flash drive
- Do not change the extension from ".dcm" (only ".dcm" files can be recognized)
- It is desirable to connect the USB flash drive before entering service mode

Overall flow

Procedure for importing from USB flash drive.
- Select USB flash drive as save destination (LIST=1)
- Select the saved DCM file
- Enter the password
- Import from USB flash drive
- Remove USB flash drive

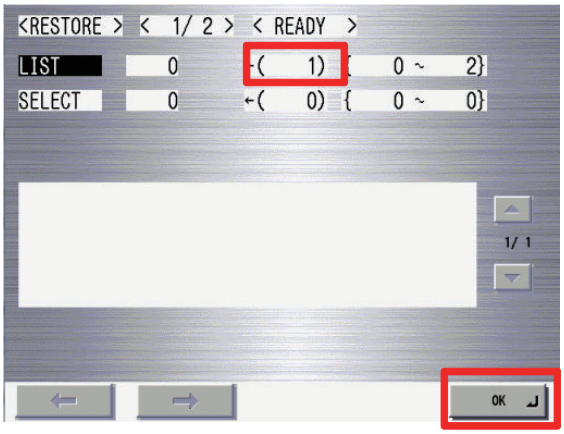
Procedure

1. **Connect the USB flash drive.**
2. **Log in to service mode and press [RESTORE].**

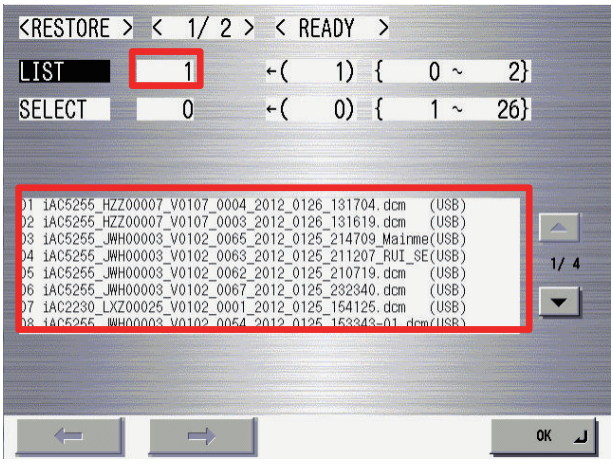


3. **Select [LIST] after the screen moves to <RESTORE>.**

4. **When referring to USB flash drive, enter "1" and press [OK].**

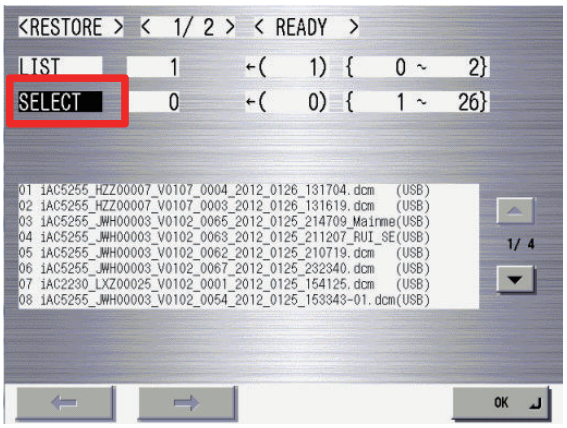


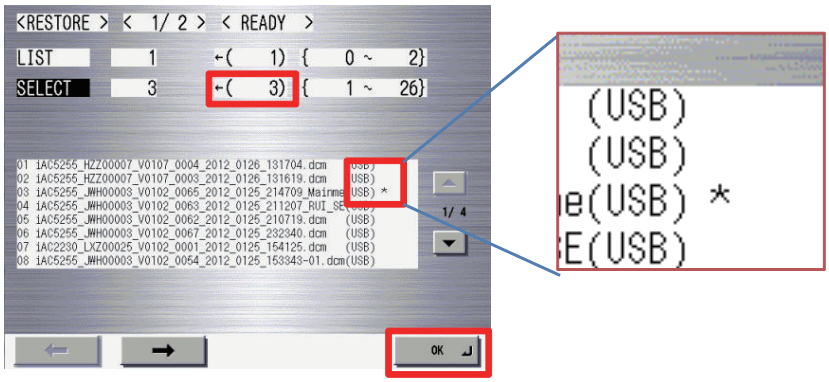
5. **The names of DCM files saved in USB flash drive are displayed.**



6. **Select [SELECT].**

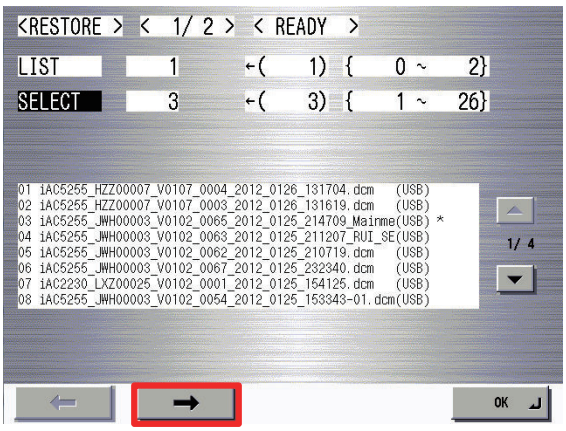
   Enter the selection number displayed on the left side of the file to be selected and press [OK].
   "*" is displayed on the right side of the file to indicate that the file has been selected.



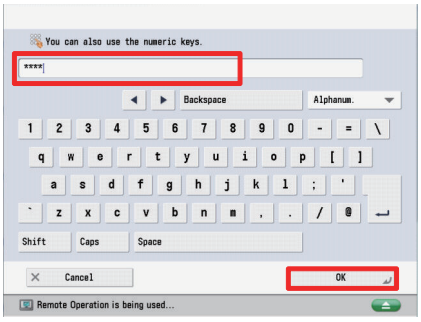


NOTE:
Up to 8 DCM files are displayed in one screen. It is necessary to switch screens when there are more than 8 files.

7. **When the correct file is displayed, press [->].**



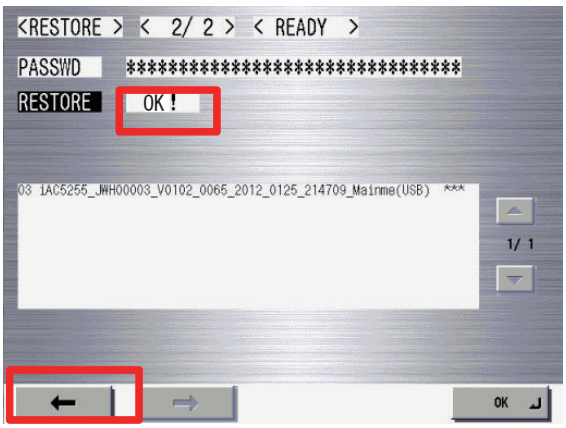
8. **Select [PASSWD], enter a password from the software keyboard, and then press [OK].**



NOTE:
"<-" is displayed on the right side of the file to indicate that the selection of the file has been confirmed.
"***" is displayed after the password is entered.

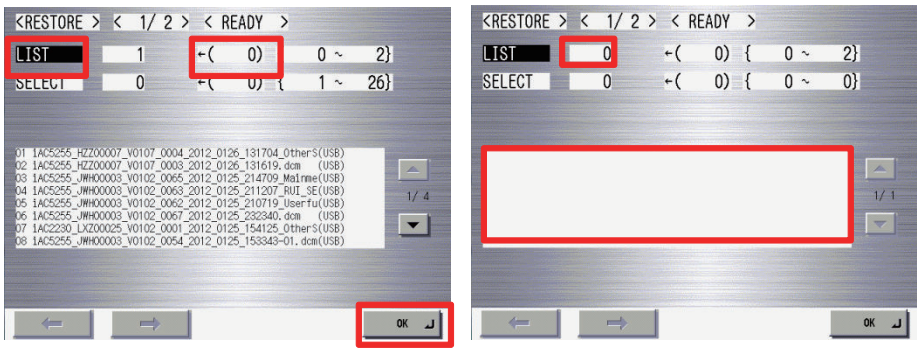
9. **After entering the password, select [RESTORE]. Press [OK] to execute import.**

10. "OK!" is displayed in the status column when the processing is successfully completed. Press [<-].



11. Select [LIST], enter "0" and press [OK]. Unmount the USB flash drive.

It can also be removed by pressing the Remove button on the main menu.



■ Import/Export by Service Mode (Internal)

Import/export by service mode allows the selection between USB flash drive and internal HDD for the save destination of DCM files.
The procedure of import/export when internal HDD is selected is shown below.
It can be used when recovering the initial status after having tried multiple setting changes temporarily for troubleshooting, etc.

NOTE:
- DCM must not be used when replacing PCBs. Be sure to perform backup of DCON/RCON in service mode
- Maximum of 2 files can be saved in the host machine's HDD

● Export Procedure

Preparation

There is no need to newly prepare for saving to internal HDD.

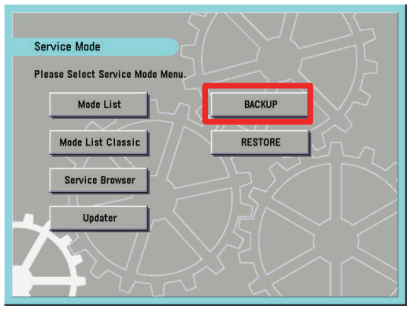
Overall flow

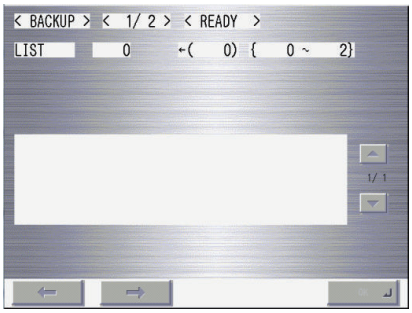
Here is a procedure for exporting to internal HDD.

1. Select internal HDD as save destination (LIST=2)
2. Set the password
3. Export to internal HDD

Procedure

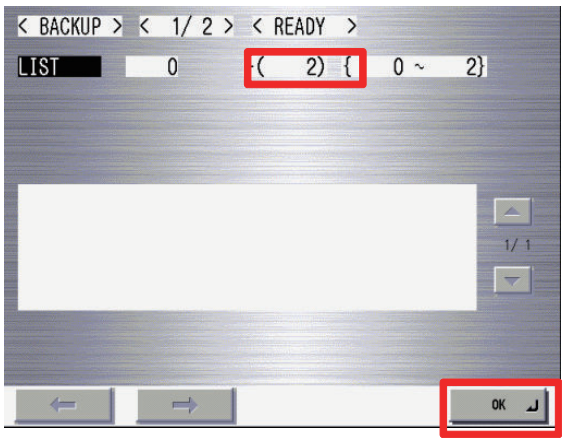
1. **Log in to service mode and press [BACKUP].**



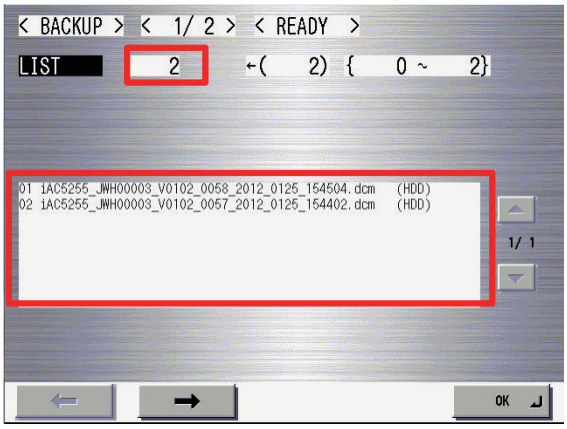


2. **Select [LIST] after the screen moves to <BACKUP>.**

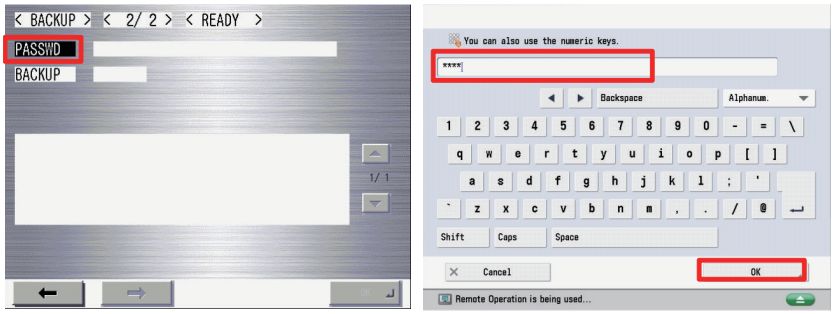
3. **When saving to the internal HDD, enter "2" and press [OK].**



4. **The names of DCM files saved in internal HDD are displayed. Press [->].**

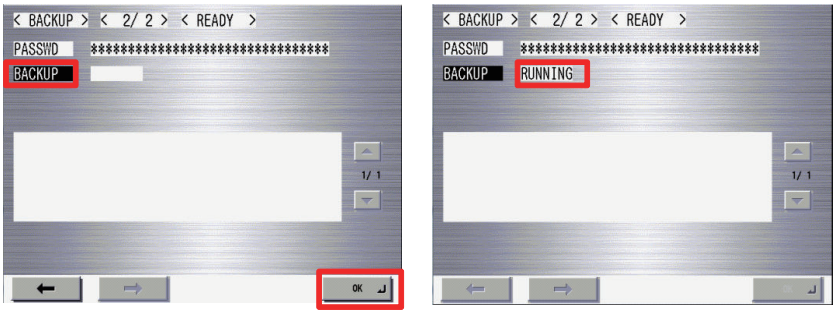


5. Select [PASSWD], enter a password from the software keyboard, and then press [OK].

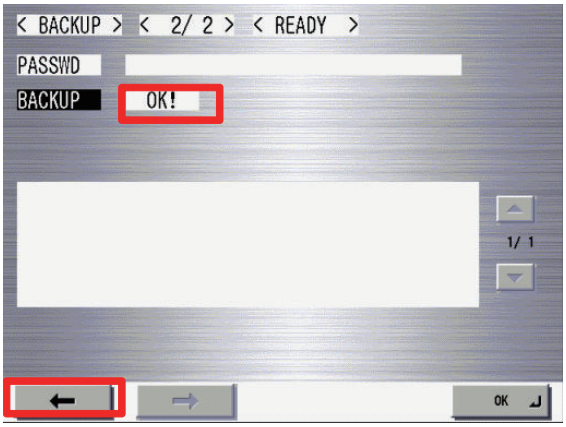


NOTE:
Limitations regarding the password
- Character string of software keyboard: 0 to 32 characters
- No password is set when 0 character is entered
- No space is allowed in the middle of a password
- Password is case sensitive

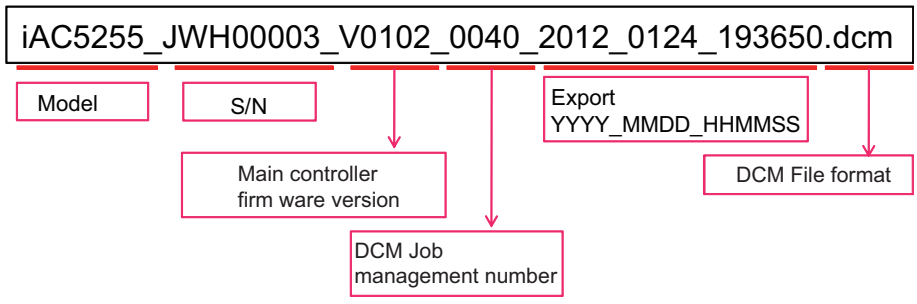
6. After entering the password, select [BACKUP]. Press [OK] to execute export.



7. "OK!" is displayed in the status column when the processing is successfully completed. Press [<-].



Reference:



● Import Procedure

Preparation

There is no need to newly prepare for saving to internal HDD.

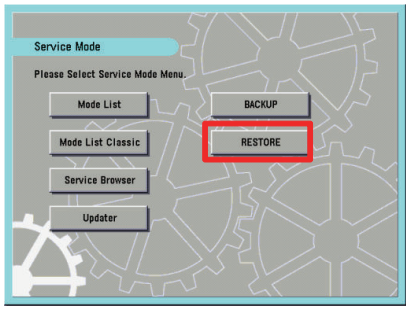
Overall flow

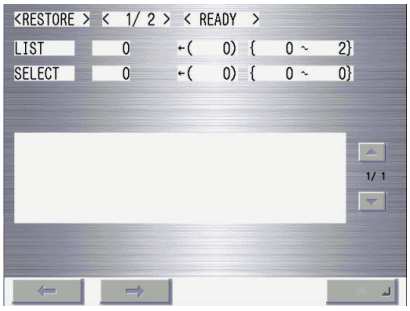
Here is a procedure for Importing from internal HDD.

1. Select internal HDD as save destination (LIST=2)
2. Select the saved DCM file
3. Register password
4. Import from the internal HDD

Procedure

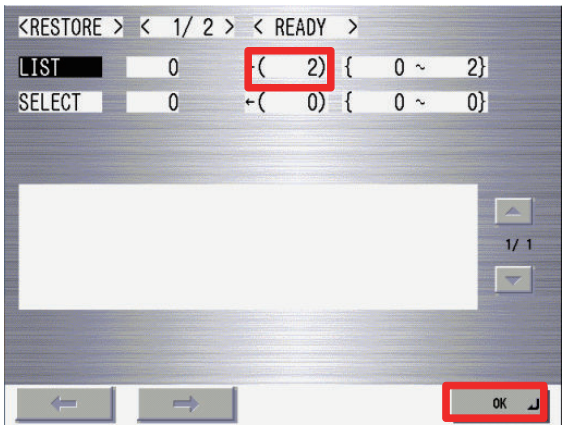
1. Log in to service mode and press [RESTORE].



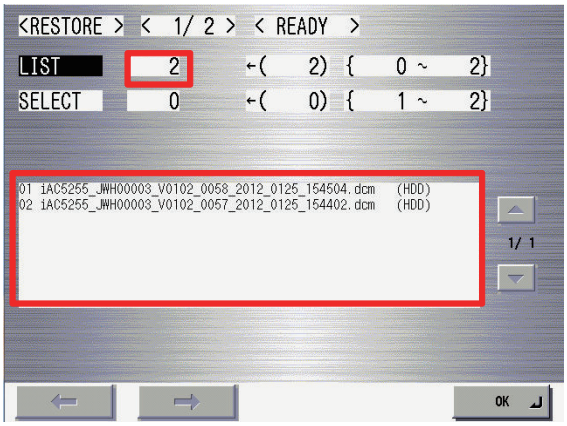


2. Select [LIST] after the screen moves to <RESTORE>.

3. When referring to internal HDD, enter "2" and press [OK].

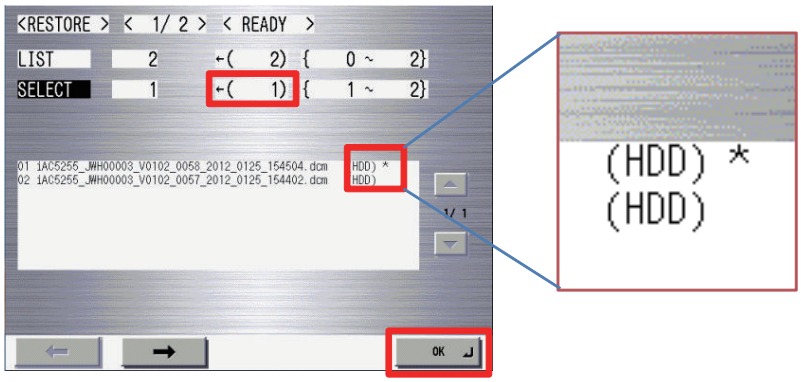


4. **The names of DCM files referred to in internal HDD are displayed.**

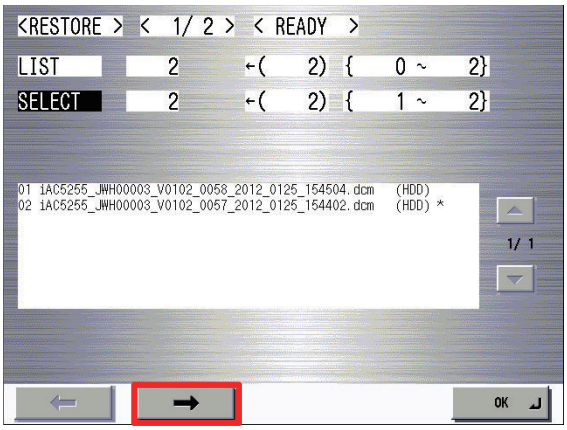


5. **Select [SELECT].**

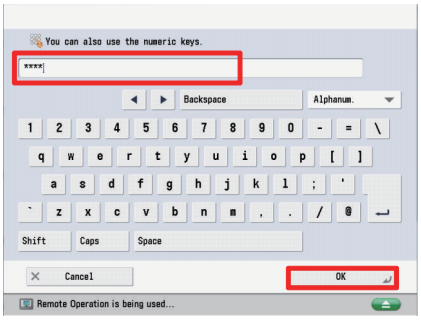
   Enter the selection number displayed on the left side of the file to be selected and press [OK].
   " *" is displayed on the right side of the file to indicate that the file has been selected.

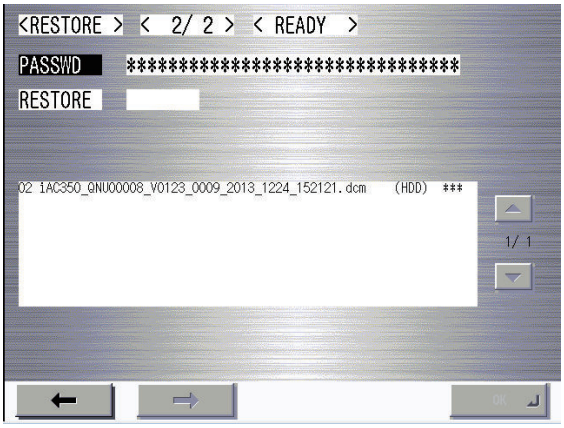


6. **When the correct file is displayed, press [->].**



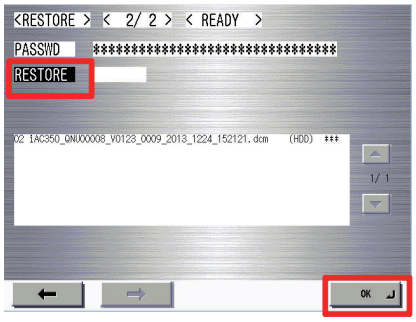
7. **Select [PASSWD], enter a password from the software keyboard, and then press [OK].**



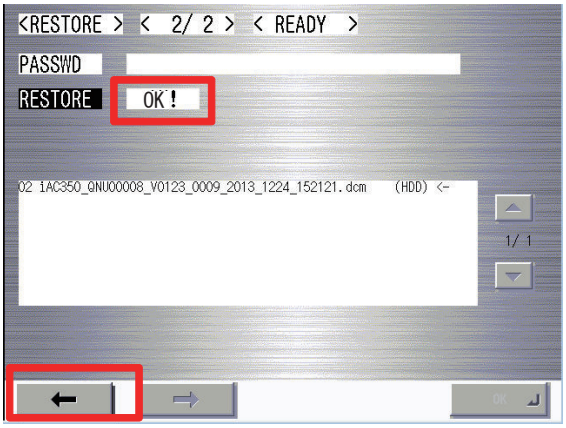


NOTE:
- "<-" is displayed on the right side of the file to indicate that the selection of the file has been confirmed.
- "***" is displayed after the password is entered.

8. **After entering the password, select [RESTORE]. Press [OK] to execute import.**



9. **"OK!" is displayed in the status column when the processing is successfully completed. Press [<-].**



■ List of items which can be imported

The following shows the items to be imported for this model.
Note that the setting values are not imported in cases such as below:

- Items which are originally not included in a DCM file (E.g.:"Settings/Registration Basic Information" of a DCM file exported by service mode)
- Items not defined in the target import range (below cases A through C)
- The options and functions related to the setting values do not exist

The following cases may be possible for the Import function.

	Target import range	Description
Case A	The same machine	Import to the same machine (on the assumption of backup and restoration)
Case B	The same model	Import to a different machine of the same model (the same series)
Case C	Different model	Import to a different machine of a different model (a different series)

● [Settings/Registration] Menu

For items that can be imported from setting information of [Settings/Registration] menu, refer to [Top] > [Remote UI] > [Import/Export Function] > [Available Settings Information Table with the Import All Function] in the e-Manual.

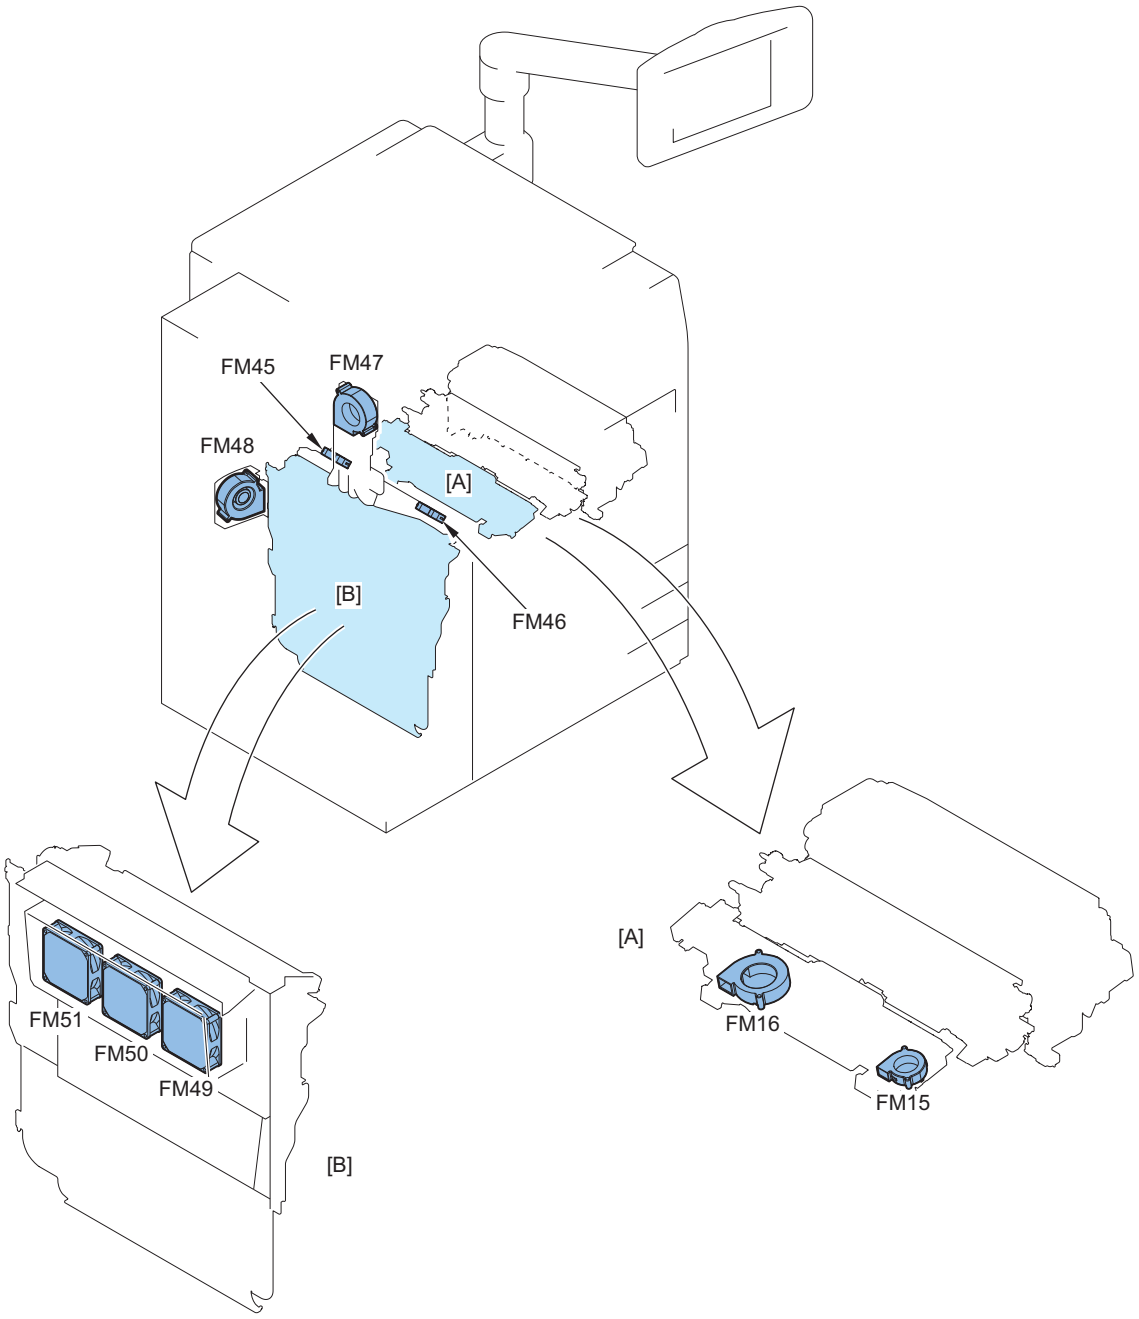
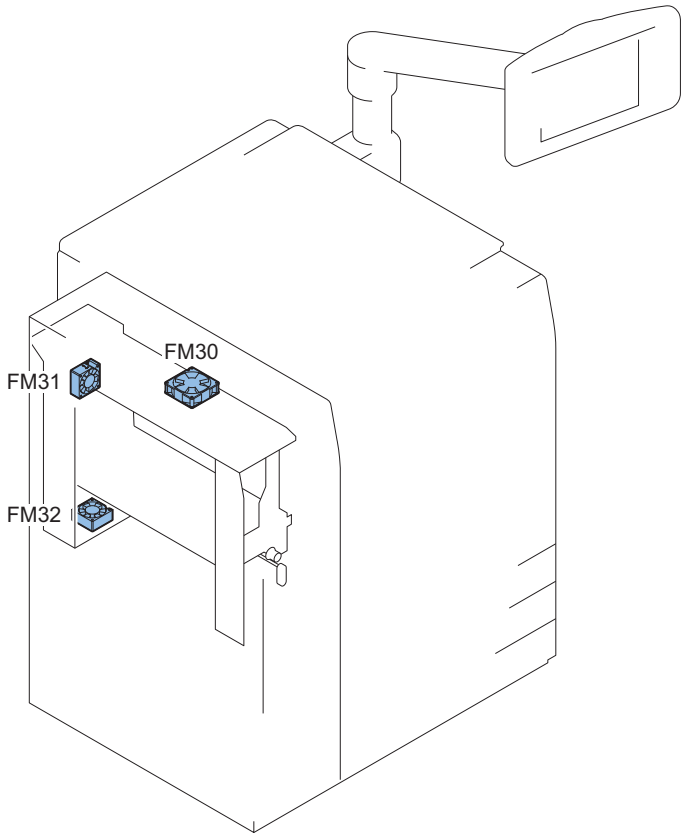
FM43	Developing Cooling Suction Fan (C)	
FM7	IH Power Supply Fan	
FM8	Power Supply Fan 1	
FM9	Power Supply Fan 2	
FM14	Power Supply Cooling Fan (38V)	
FM19	Controller Cooling Fan 1	
FM20	Controller Cooling Fan 2	
FM21	HDD Cooling Fan	
FM52	24V Power Supply Fan	Option

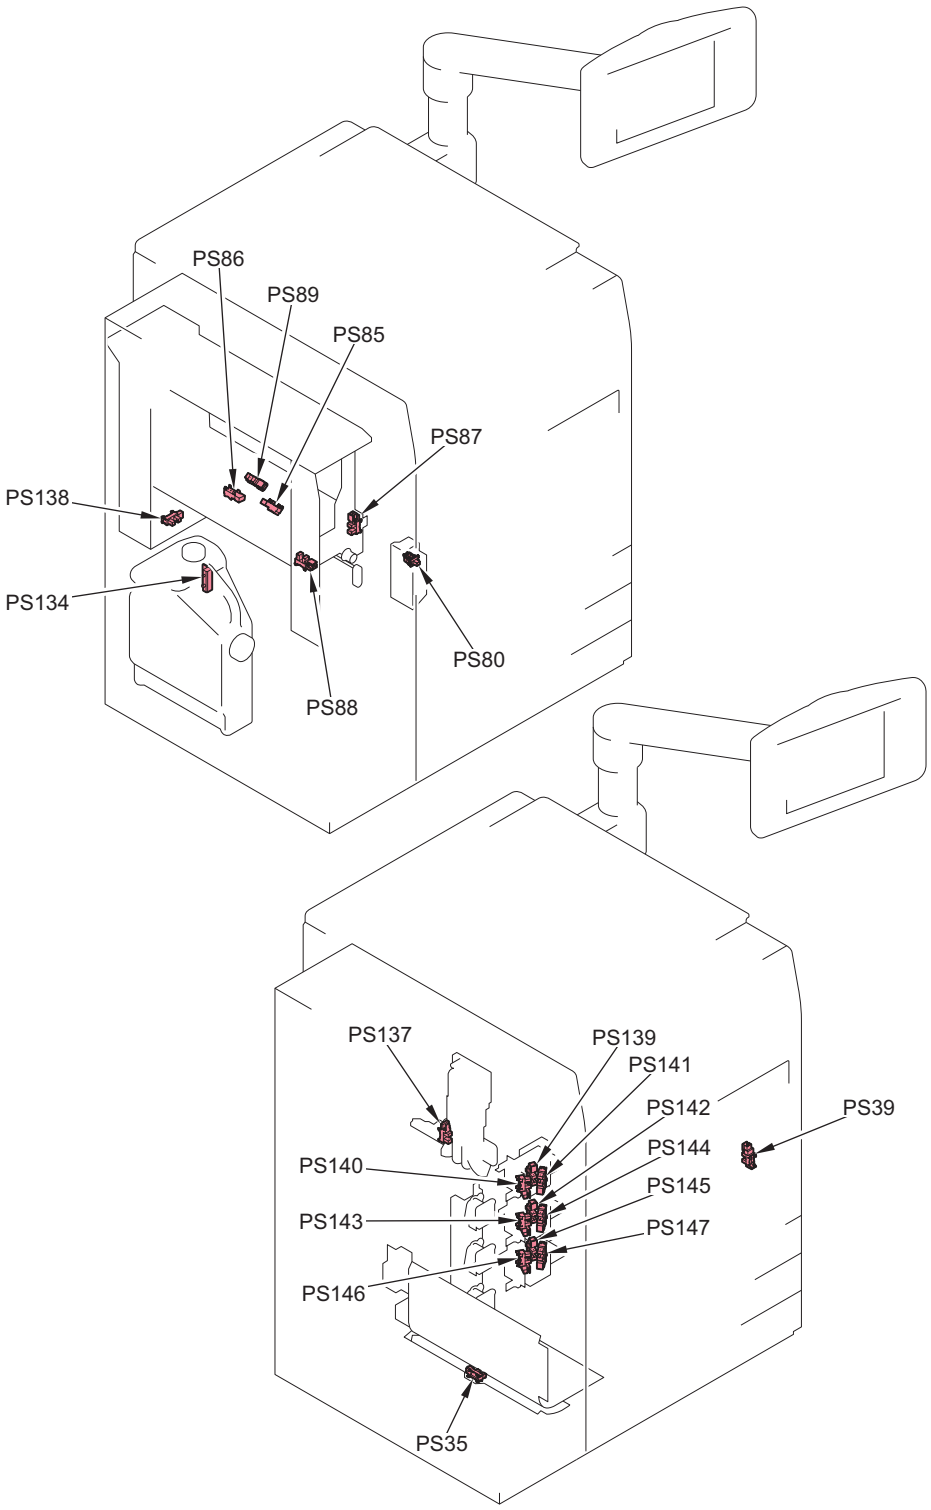


No.	Parts Name
FM15	Pressure Belt Cooling Fan (Front)
FM16	Pressure Belt Cooling Fan (Rear)
FM45	Fixing Belt Edge Cooling Fan 1
FM46	Fixing Belt Edge Cooling Fan 2
FM47	Delivery Upper Cooling Fan
FM48	Delivery Lower Cooling Fan
FM49	Reverse Exhaust Fan 1
FM50	Reverse Exhaust Fan 2
FM51	Reverse Exhaust Fan 3



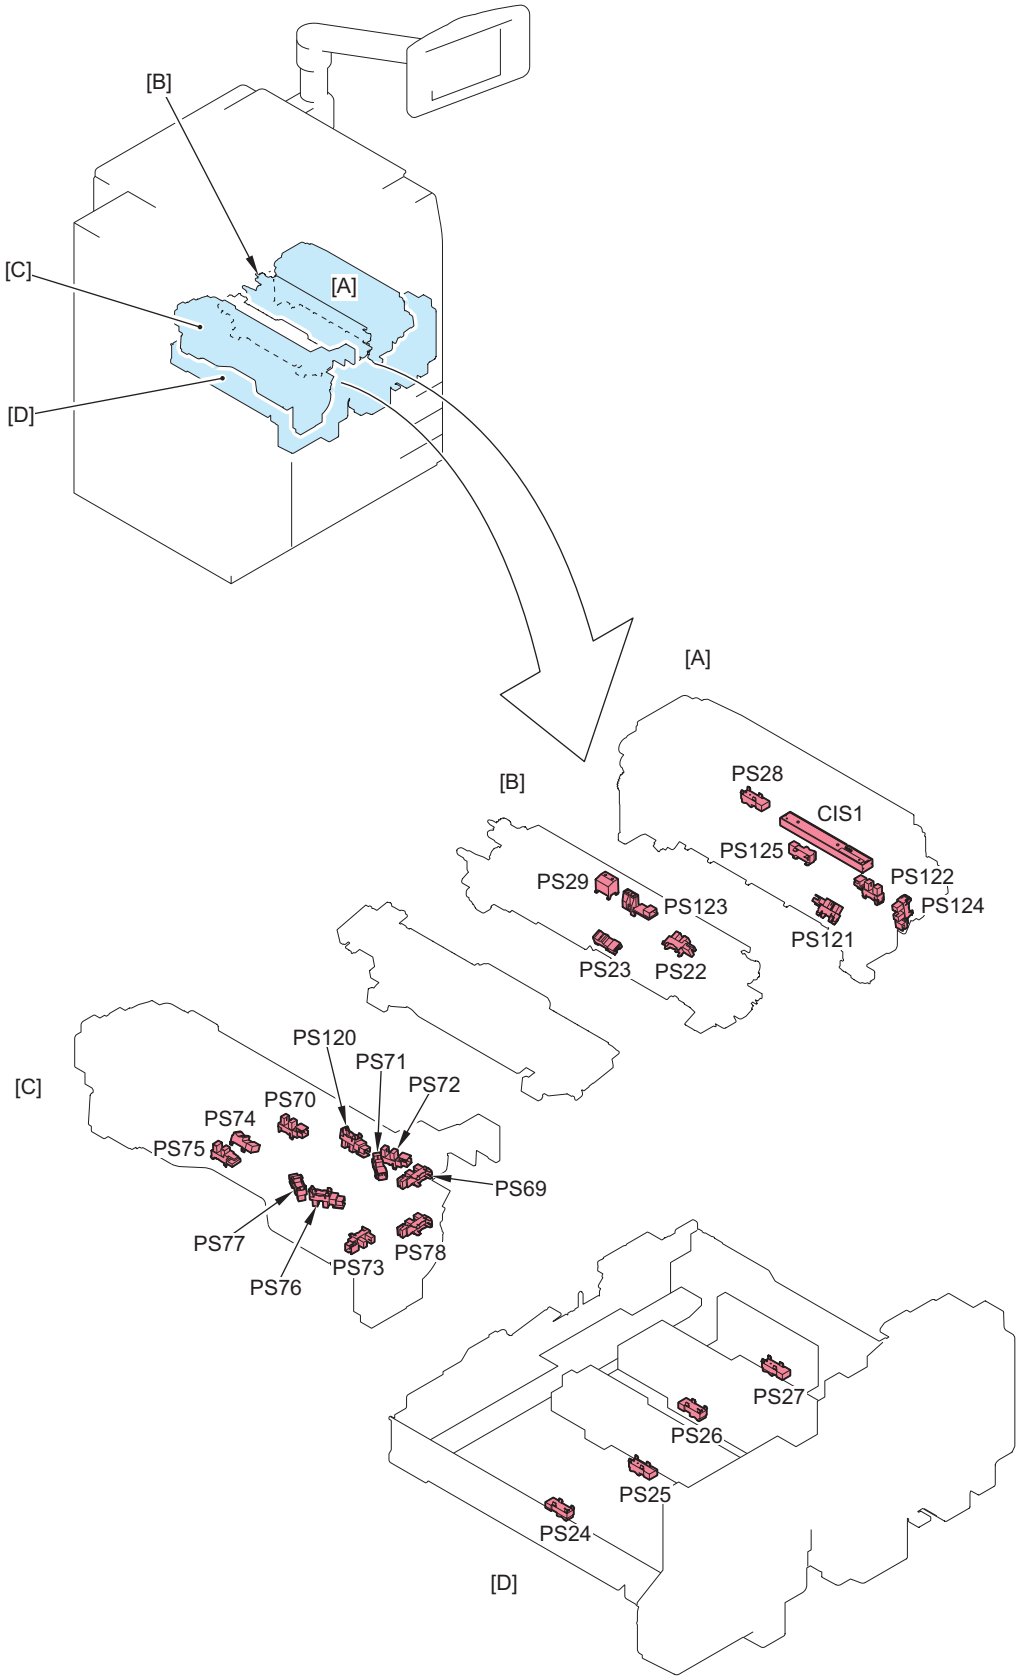
No.	Parts Name
FM30	Decurler Suction Fan
FM31	Decurler Side Exhaust Fan
FM32	Decurler Lower Exhaust Fan

List of Sensors



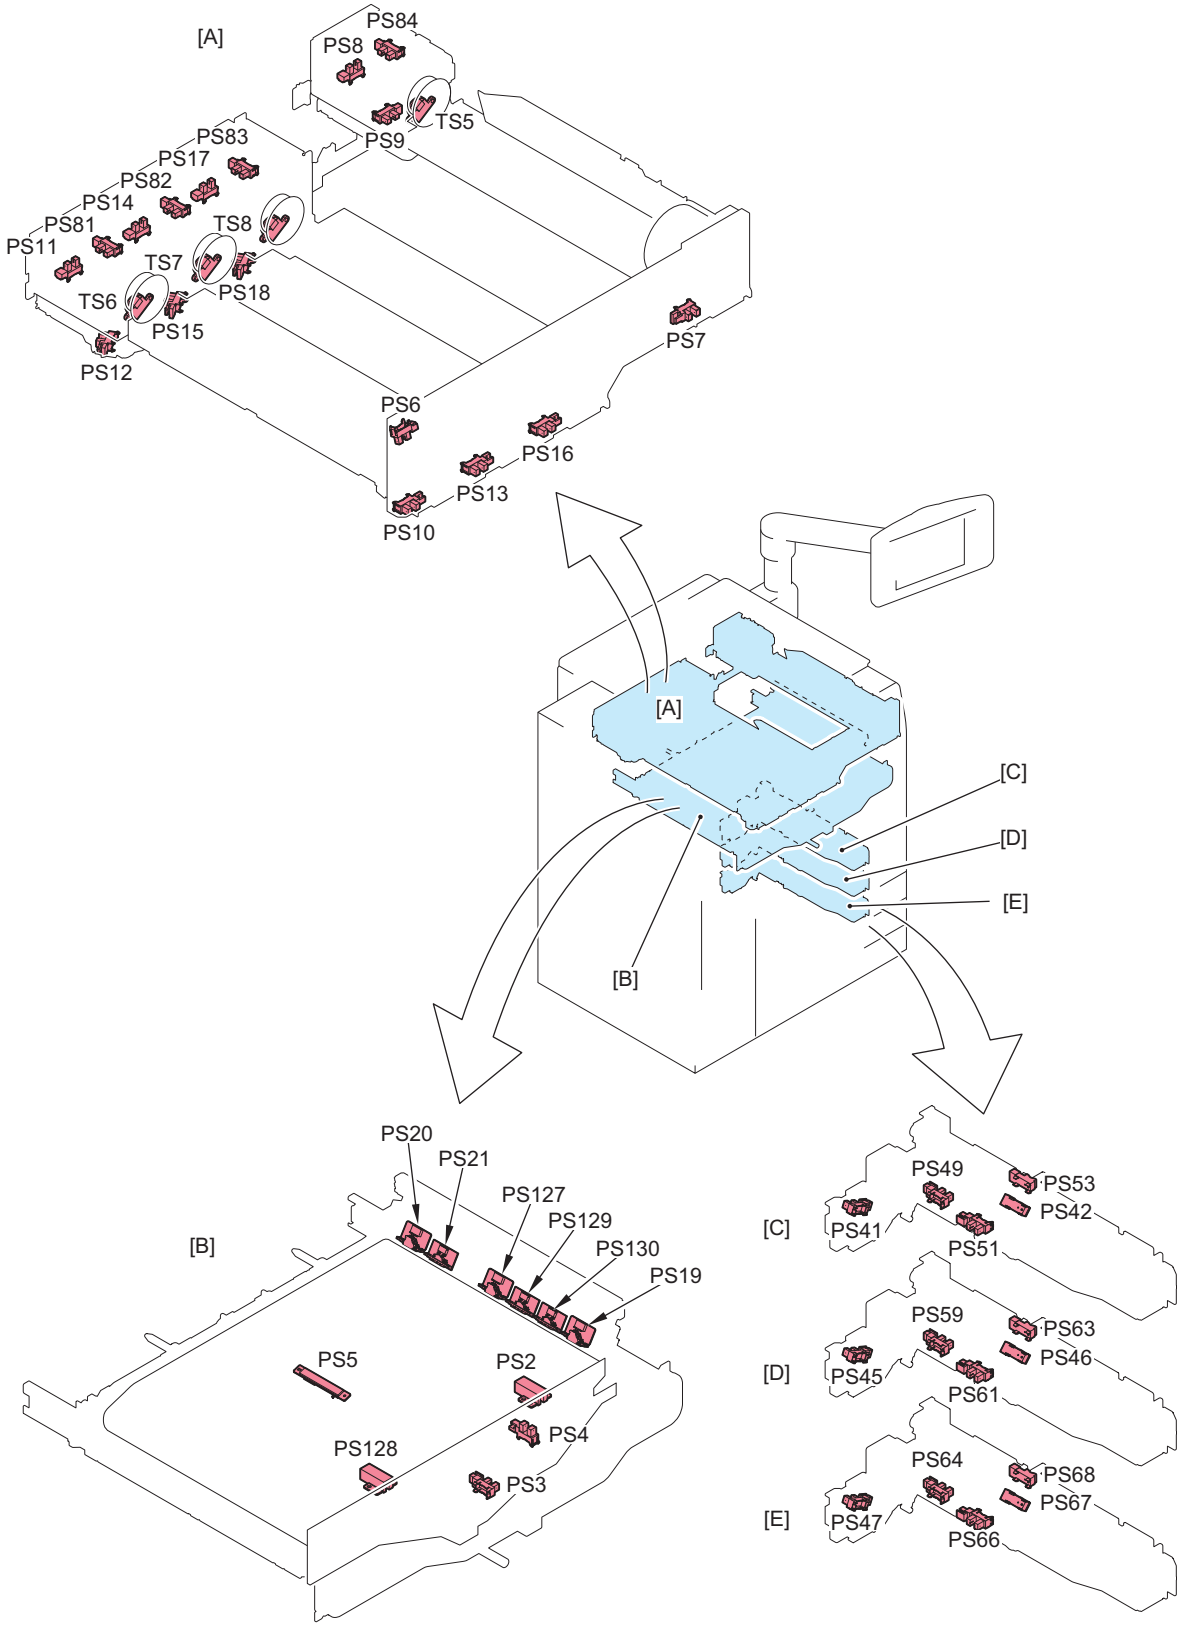
Electric code	Name
PS80	Front Cover Open/Close Sensor
PS85	Decurler Sensor 1
PS86	Decurler Sensor 2
PS87	Front Left Cover Open/Close Sensor
PS88	Decurler HP Sensor 1
PS89	Decurler HP Sensor 2
PS134	Waste Toner Full Sensor
PS138	Waste Toner Shutter Open/Close Sensor
PS35	Reverse Vertical Path Lower Sensor

Electric code	Name
PS39	Right Cover Open/Close Sensor
PS137	Delivery Upper Cooling Switch Flapper HP Sensor
PS139	Cassette 1 Size Sensor 1
PS140	Cassette 1 Size Sensor 2
PS141	Cassette 1 Size Sensor 3
PS142	Cassette 2 Size Sensor 1
PS143	Cassette 2 Size Sensor 2
PS144	Cassette 2 Size Sensor 3
PS145	Cassette 3 Size Sensor 1
PS146	Cassette 3 Size Sensor 2
PS147	Cassette 3 Size Sensor 3



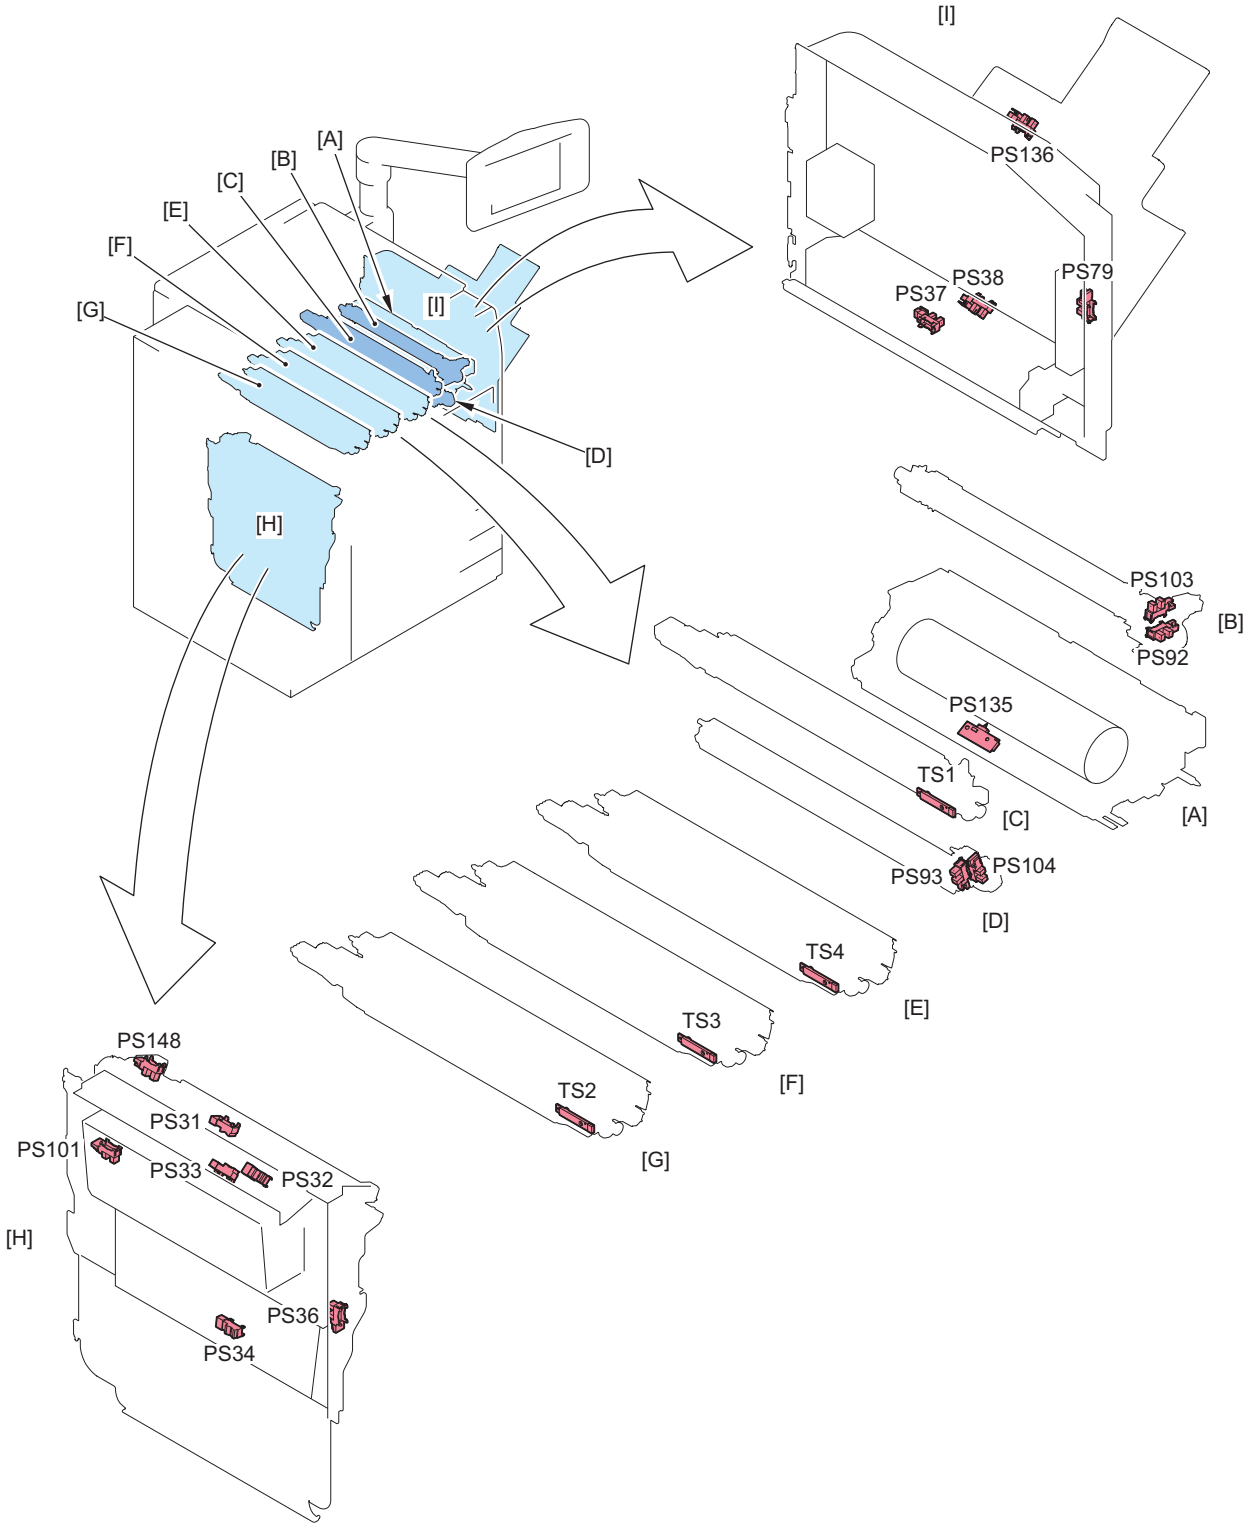
Electric code	Name
PS24	Duplex Sensor 1
PS25	Duplex Sensor 2
PS26	Duplex Sensor 3
PS27	Duplex Sensor 4
PS28	Registration Sensor
PS121	Registration Disengagement HP Sensor

Electric code	Name
PS122	Pre-registration Disengagement HP Sensor
PS124	Registration Shift HP Sensor
PS125	Duplex Merging Sensor
CIS1	Contact Image Sensor Unit
PS22	Secondary Transfer Roller Detachment HP Sensor
PS23	Post-secondary Transfer Sensor
PS29	Transparency Sensor
PS123	Post-registration Sensor
PS69	Fixing Belt HP Sensor
PS70	Fixing Inlet Sensor
PS71	Fixing Belt Position Sensor 1
PS72	Fixing Belt Position Sensor 2
PS73	Fixing Pressure Release Sensor
PS74	Fixing Wrap Sensor
PS75	Fixing Inner Delivery Sensor
PS76	Pressure Belt Position Sensor 1
PS77	Pressure Belt Position Sensor 2
PS78	Pressure Belt HP Sensor
PS120	Refresh Engagement/Disengagement HP Sensor



Electric code	Name
PS6	Toner Container Replacement Cover Sensor
PS7	Toner Container Replacement Door Sensor (BK)
PS8	Toner Container Reciprocation HP Sensor (Bk)
PS9	Toner Feed Screw Rotation Sensor (Bk)
PS10	Toner Container Replacement Door Sensor (Y)
PS11	Toner Container Reciprocation HP Sensor (Y)
PS12	Toner Feed Screw Rotation Sensor (Y)
PS13	Toner Container Replacement Door Sensor (M)

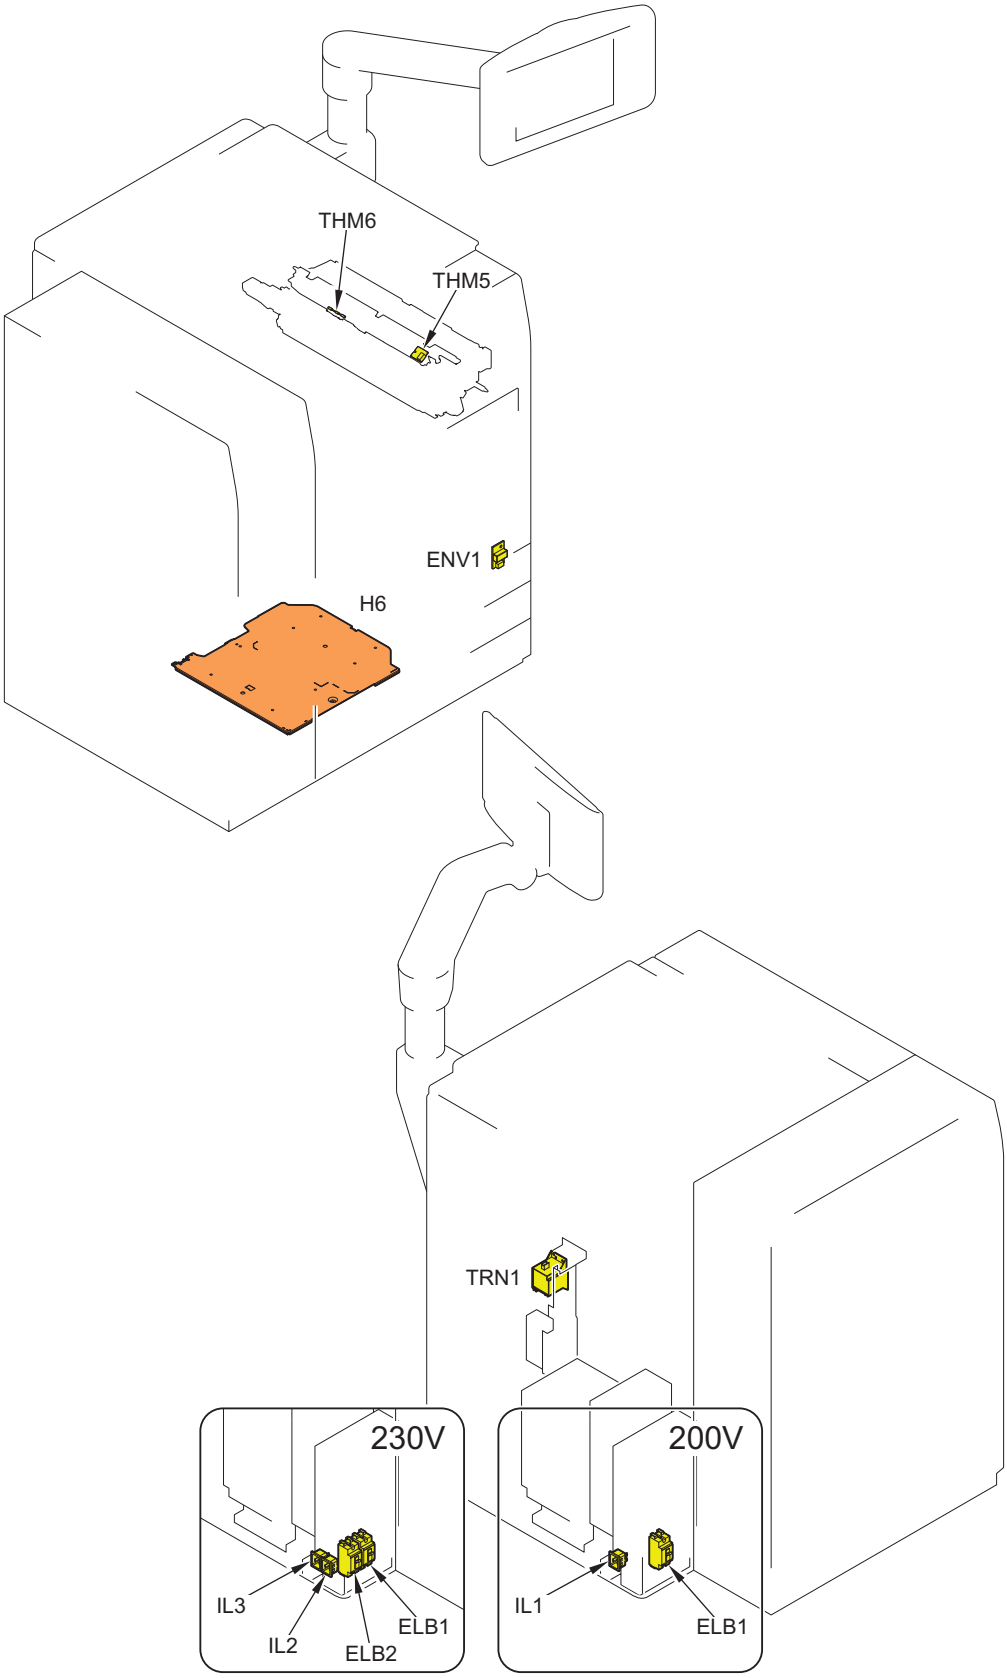
Electric code	Name
PS14	Toner Container Reciprocation HP Sensor (M)
PS15	Toner Feed Screw Rotation Sensor (M)
PS16	Toner Container Replacement Door Sensor (C)
PS17	Toner Container Reciprocation HP Sensor (C)
PS18	Toner Feed Screw Rotation Sensor (C)
PS81	Toner Container Phase Sensor (Y)
PS82	Toner Container Phase Sensor (M)
PS83	Toner Container Phase Sensor (C)
PS84	Toner Container Phase Sensor (Bk)
TS5	Hopper Toner Level Sensor (Bk)
TS6	Hopper Toner Level Sensor (Y)
TS7	Hopper Toner Level Sensor (M)
TS8	Hopper Toner Level Sensor (C)
PS2	ITB Displacement Sensor (Right)
PS3	Steering Drive HP Sensor
PS4	Primary Transfer Roller Detachment HP Sensor
PS5	ITB HP Sensor
PS19	Registration Patch Sensor (Front)
PS20	Registration Patch Sensor (Rear)
PS21	Patch Sensor (Y)
PS127	Registration Patch Sensor (Center)
PS128	ITB Displacement Sensor (Left)
PS129	Patch Sensor (M)
PS130	Patch Sensor (C)
PS41	Cassette 1 Paper Level Sensor
PS42	Cassette 1 Paper Height Sensor
PS49	Cassette 1 Pickup Sensor
PS51	Cassette 1 Paper Sensor
PS53	Vertical Path Sensor 1
PS45	Cassette 2 Paper Level Sensor
PS46	Cassette 2 Paper Height Sensor
PS59	Cassette 2 Pickup Sensor
PS61	Cassette 2 Paper Sensor
PS63	Vertical Path Sensor 2
PS47	Cassette 3 Paper Level Sensor
PS64	Cassette 3 Pickup Sensor
PS66	Cassette 3 Paper Sensor
PS67	Cassette 3 Paper Height Sensor
PS68	Vertical Path Sensor 3



Electric code	Name	Remarks
PS31	Outer Delivery Sensor	
PS32	Pre-reverse Sensor	
PS33	Post-reverse Sensor	
PS34	Reverse Vertical Path Upper Sensor	
PS36	Reverse Door Open/Close Sensor	
PS101	Reverse Roller Detachment HP Sensor	
PS148	Delivery Flapper Switch HP Sensor	
PS92	Primary Wire HP Sensor	
PS103	Primary Charging Wire Rotation Position Sensor	
PS93	Pre-transfer Charging Wire HP Sensor	
PS104	Pre-transfer Charging Wire Rotary Position Sensor	

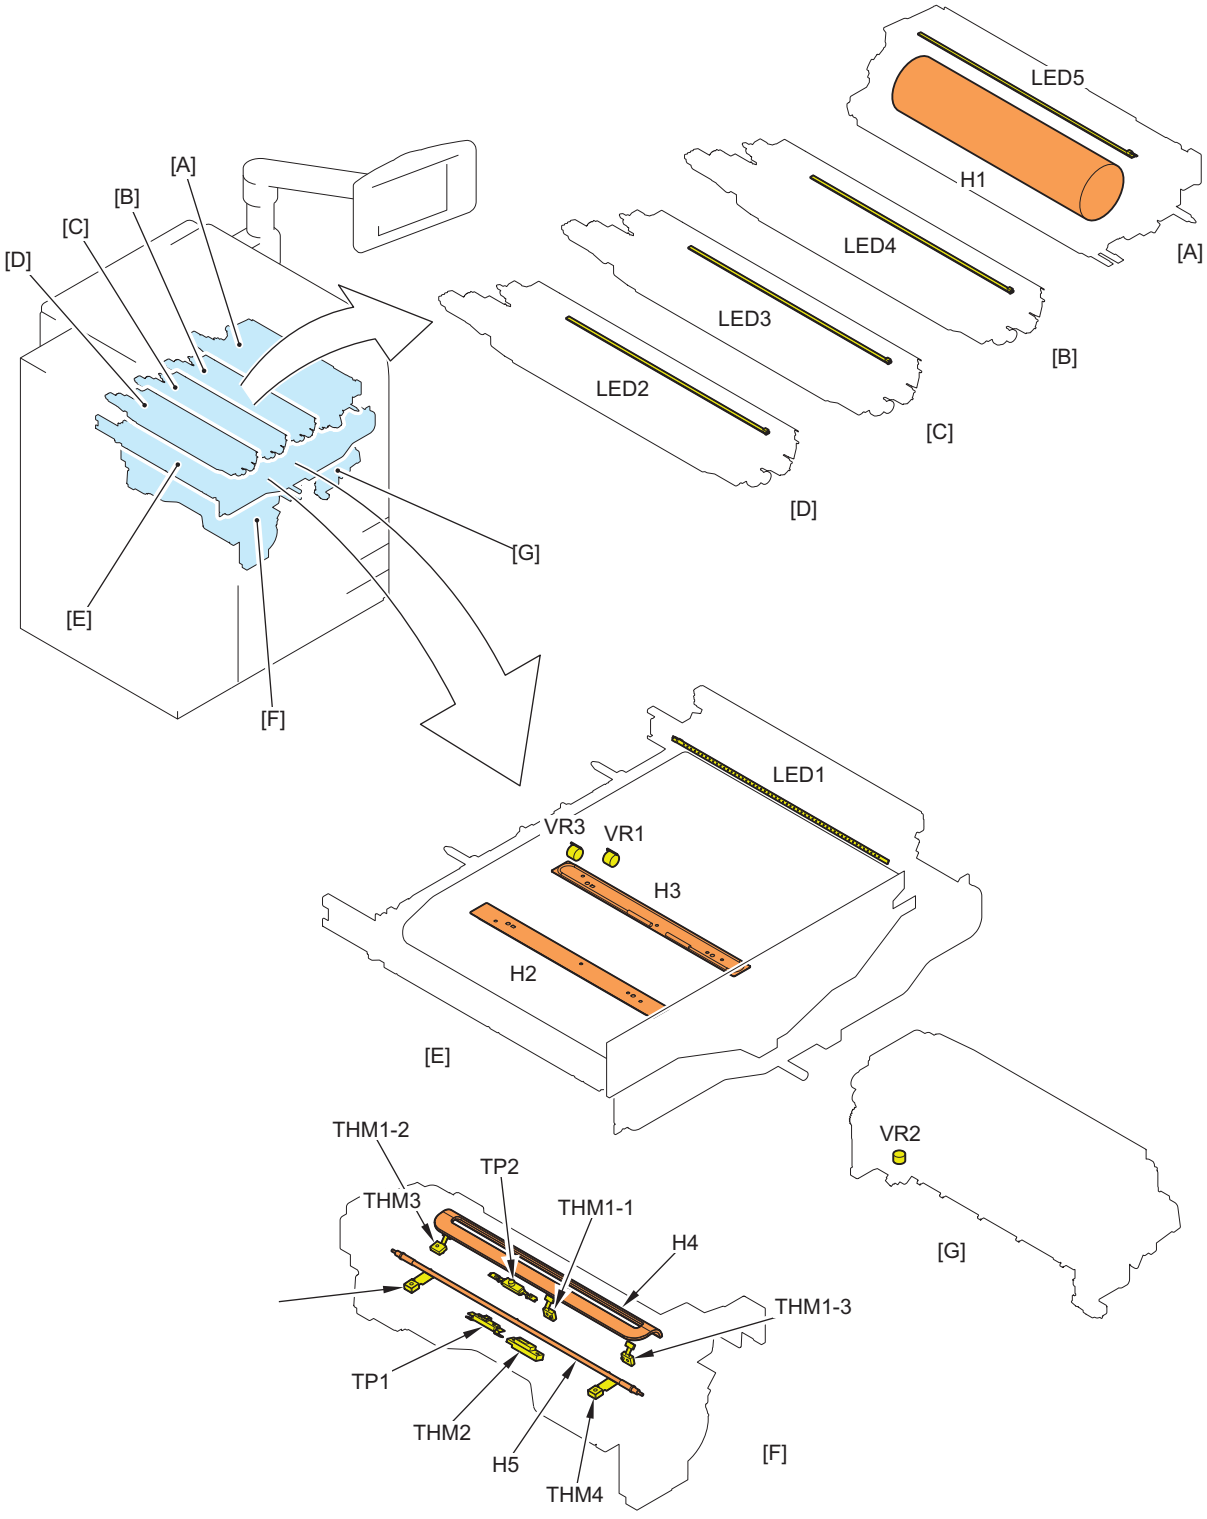
Electric code	Name	Remarks
PS135	Drum Patch Sensor (Bk)	
TS1	Toner Density Sensor (Bk)	
TS2	Toner Density Sensor (Y)	
TS3	Toner Density Sensor (M)	
TS4	Toner Density Sensor (C)	
PS37	Multi-purpose Tray Paper Sensor	Option
PS38	Multi-purpose Tray Last Paper Sensor	Option
PS79	Multi-purpose Tray Cover Sensor	Option
PS136	Multi-purpose Tray Size Sensor	Option

List of Lamp, Heater, Etc.



Electric code	Name	Remarks
H6	Cassette Heater	
THM5	Drum Thermopile	
THM6	Drum Thermistor	
ENV1	Environment Sensor	

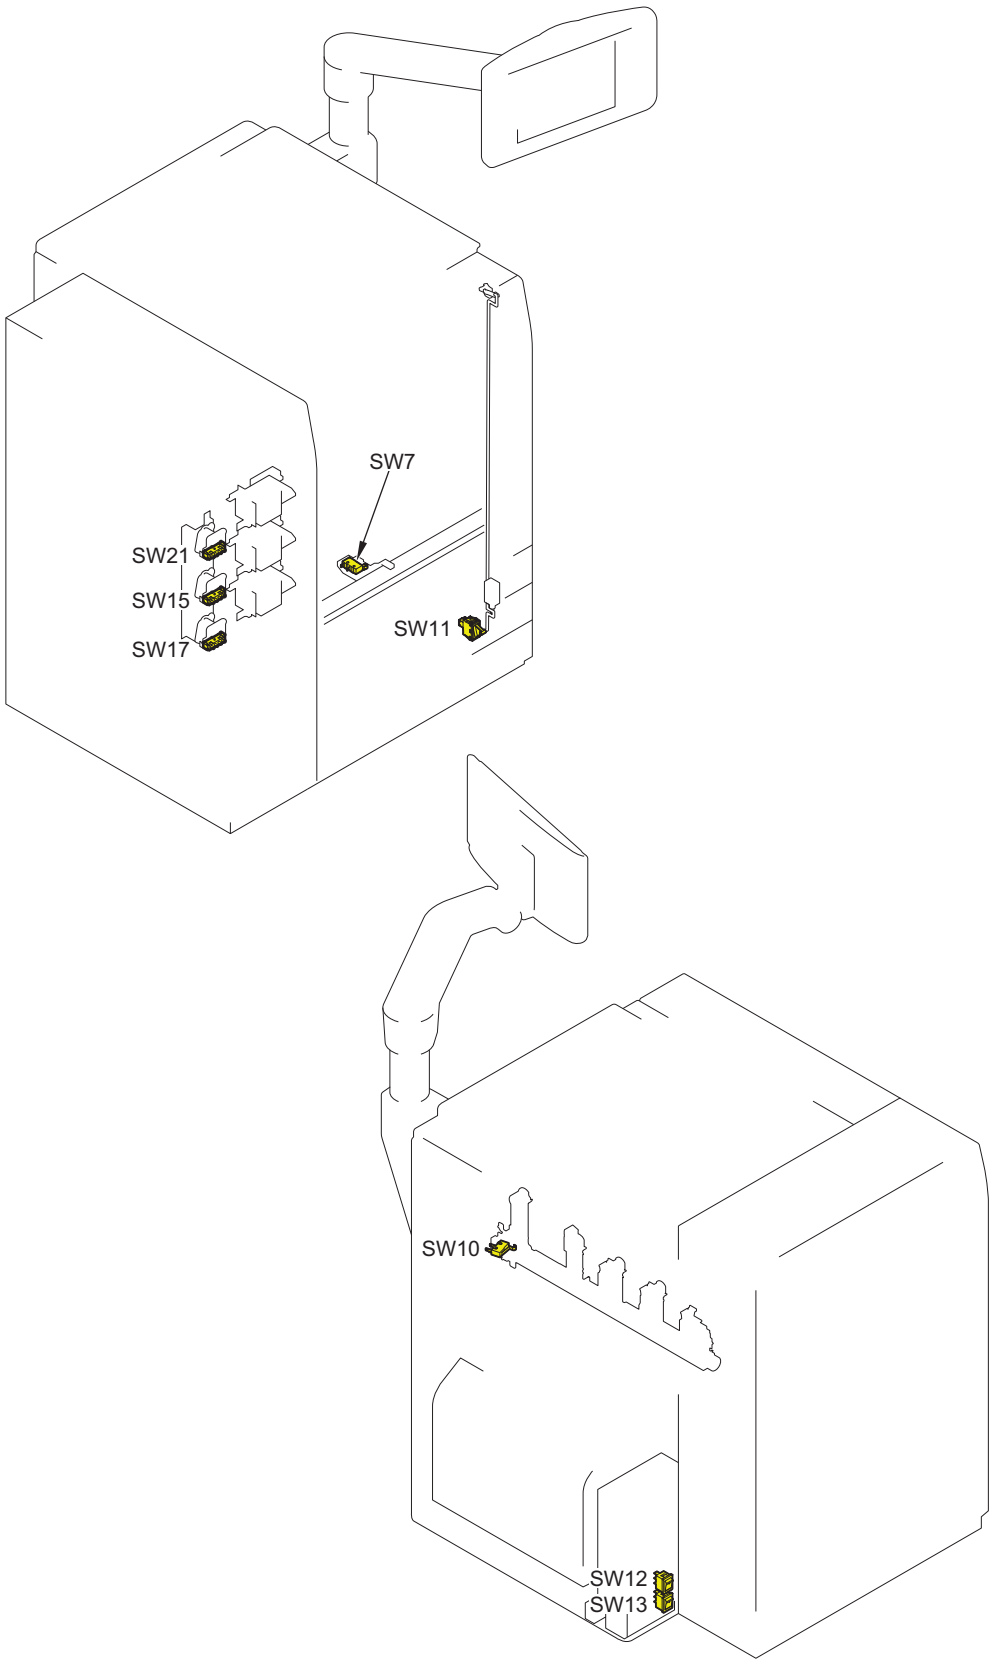
Electric code	Name	Remarks
TRN1	Pre-transfer Charging Transformer	
ELB1	Leakage Breaker 1	
ELB2	Leakage Breaker 2	230V
ELB3	Leakage Breaker 3	100V
IL1	Inlet 1	200V
IL2	Inlet 2	230V
IL3	Inlet 3	230V



Electric code	Name
H1	Drum Heater (Bk)
H2	ITB Heater (Y)/(M)

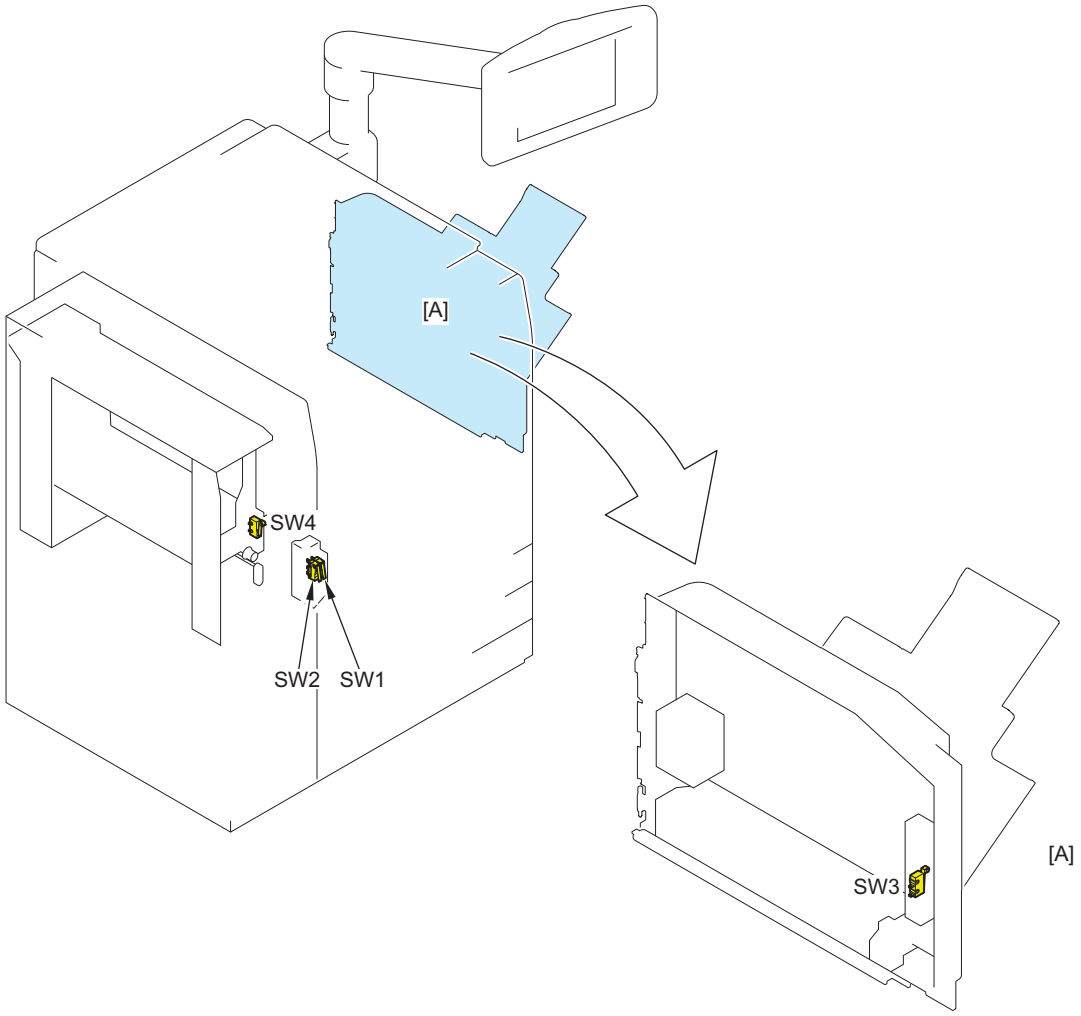
Electric code	Name
H3	ITB Heater (C)/(Bk)
H4	IH Coil
H5	Pressure Heater
LED1	Cleaning Pre-exposure LED (Bk)
LED2	Cleaning Pre-exposure LED (Y)
LED3	Cleaning Pre-exposure LED (M)
LED4	Cleaning Pre-exposure LED (C)
LED5	Cleaning Post-exposure LED (BK)
THM1-1	Fixing Main Thermistor
THM1-2	Fixing Sub Thermistor 1
THM1-3	Fixing Sub Thermistor 2
THM2	Pressure Main Thermistor
THM3	Pressure Sub Thermistor (Rear)
THM4	Pressure Sub Thermistor (Front)
TP1	Pressure Thermal Switch
TP2	Fixing Thermal Switch
VR1	ITB Unit Varistor 1
VR2	Registration Unit Varistor
VR3	ITB Unit Varistor 2

List of Switch



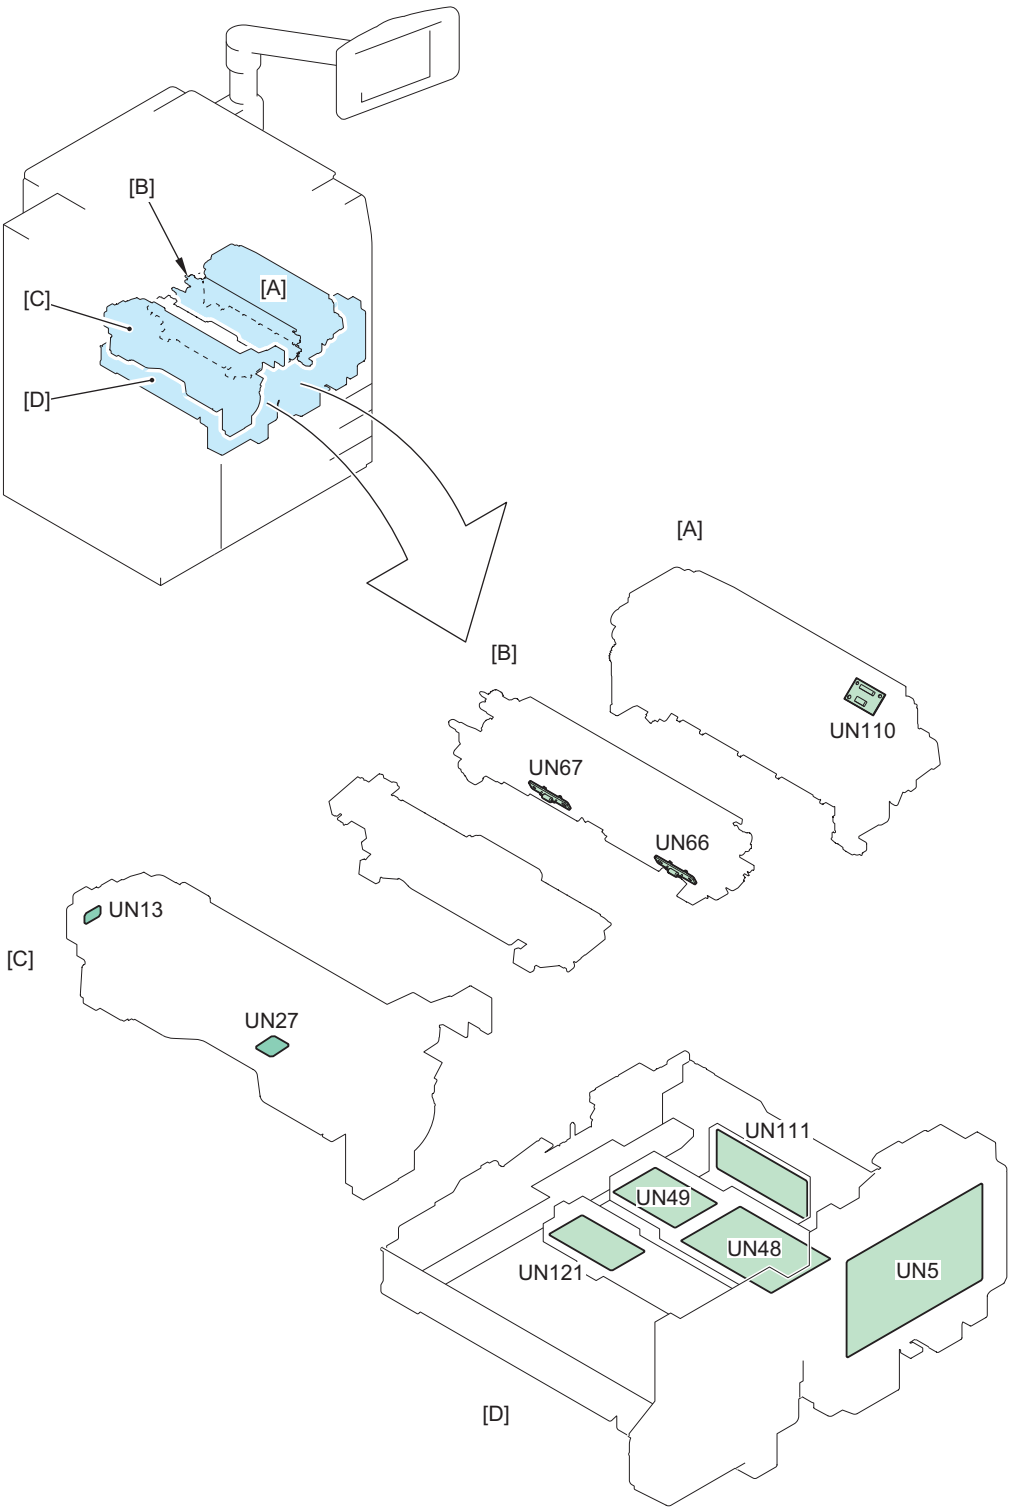
No.	Parts Name
SW7	Fixing Feed Unit Switch
SW11	Main Switch
SW15	Cassette 2 Size Switch
SW17	Cassette 3 Size Switch

No.	Parts Name
SW21	Cassette 1 Size Switch
SW10	Waste Toner Screw Lock Detection Switch
SW12	Environment Switch
SW13	Cassette Heater Switch



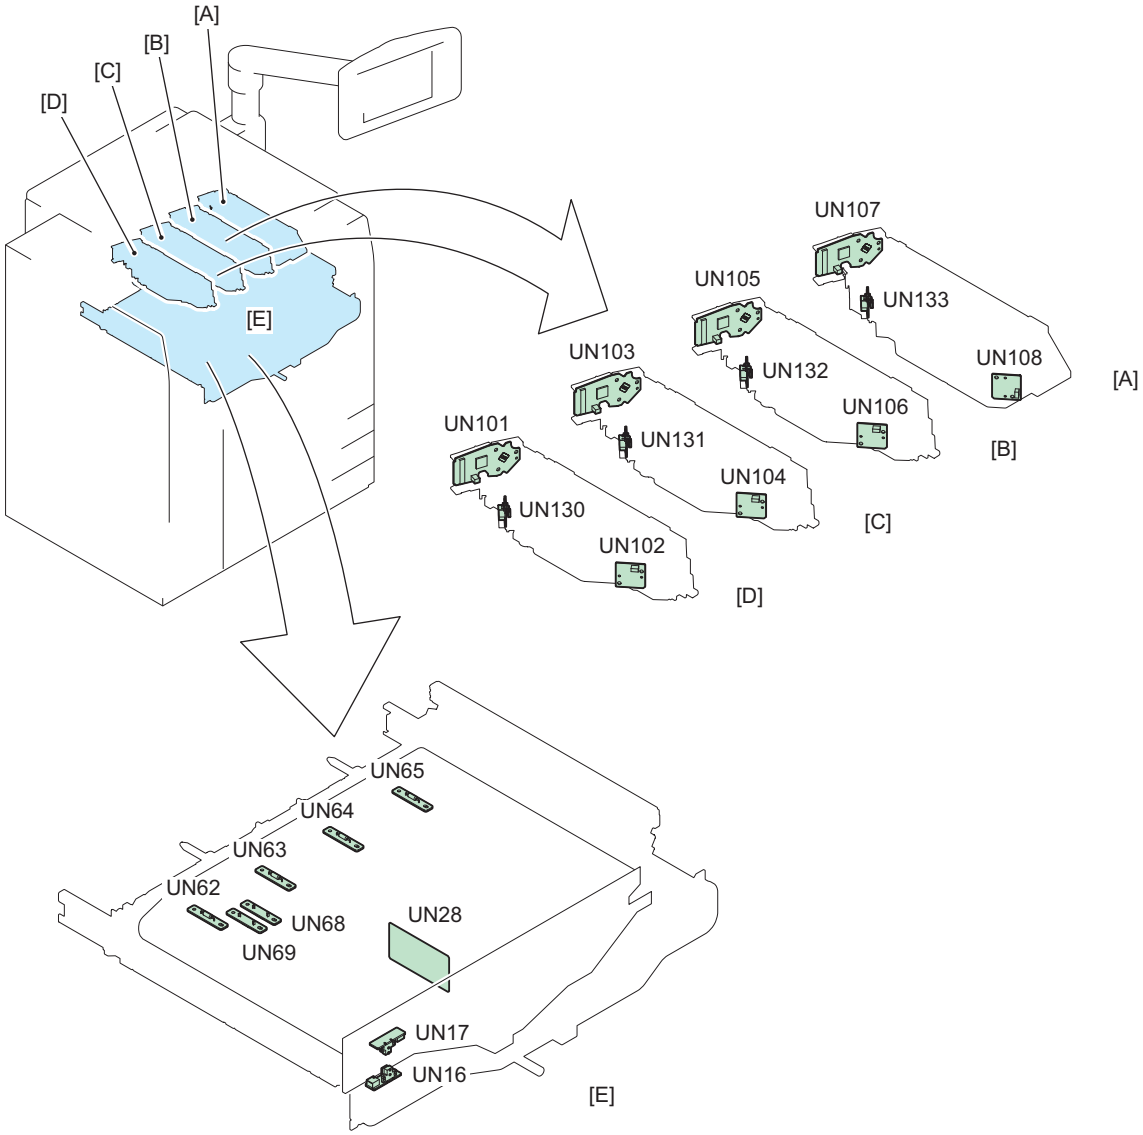
No.	Parts Name	Remarks
SW1	Front Cover Switch 1	
SW2	Front Cover Switch 2	
SW4	Front Left Cover Switch	
SW3	Multi-purpose Tray Unit Switch	Option

List of PCBs



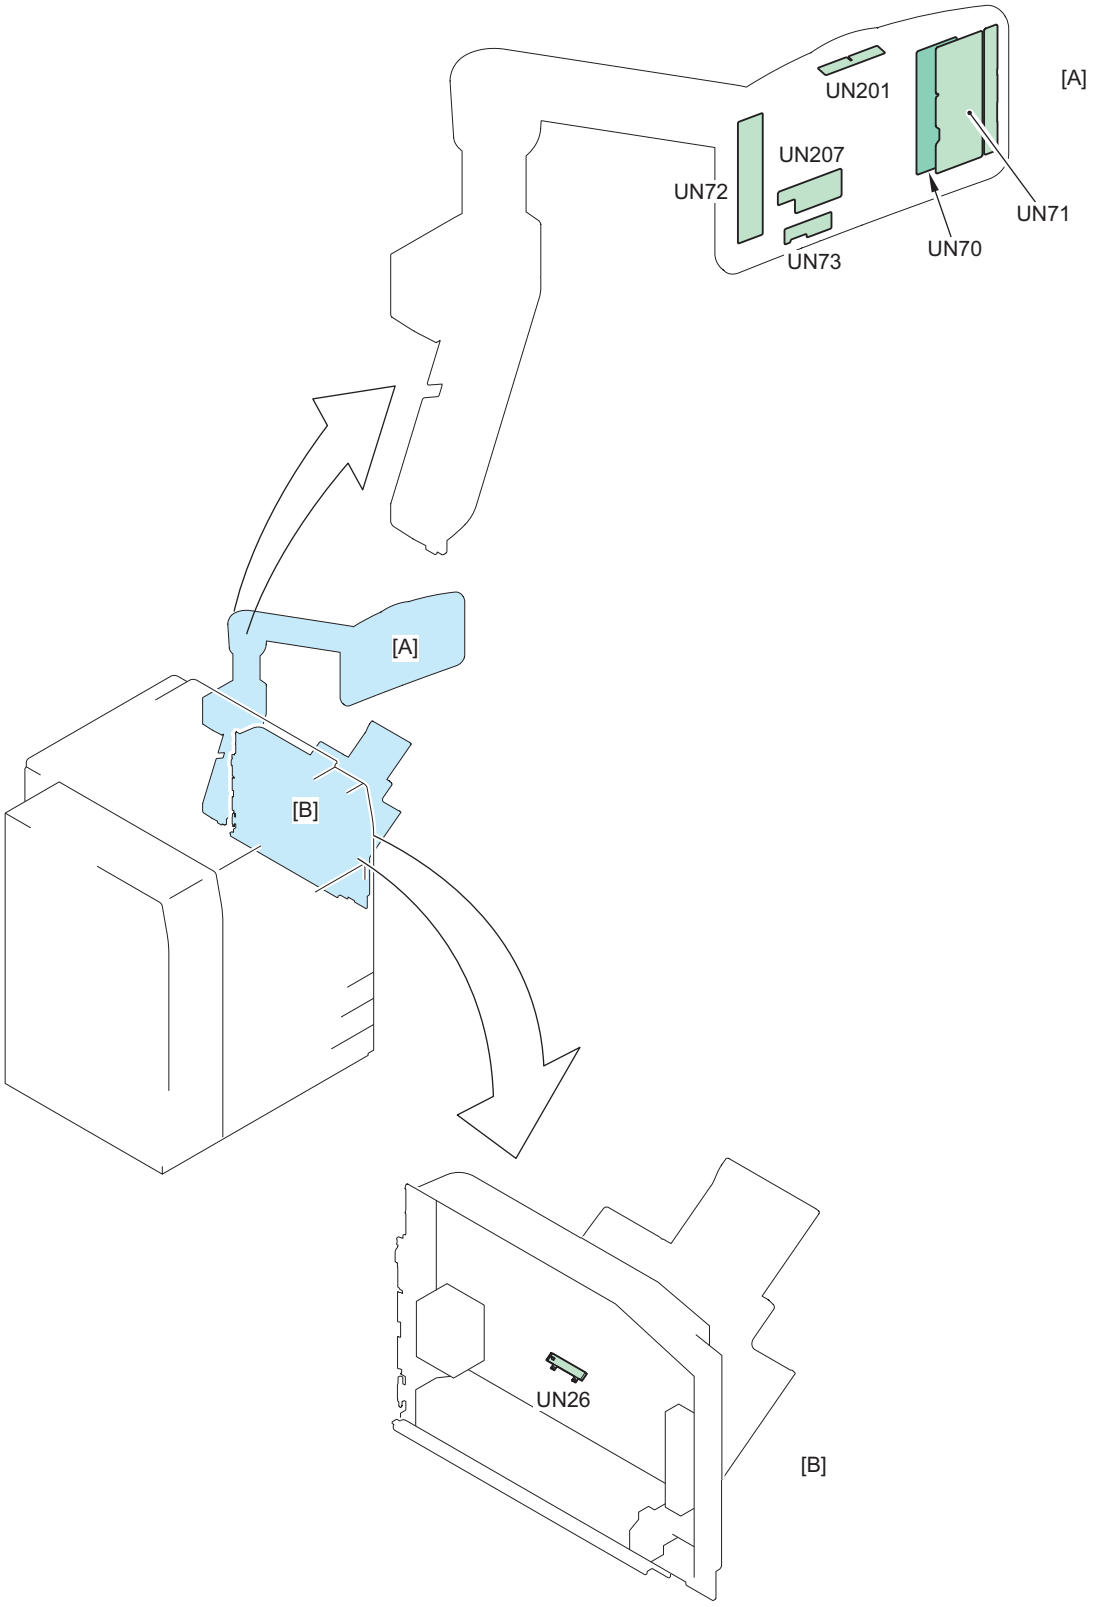
Electric code	Name	Remarks
UN13	Fixing Fuse PCB	
UN27	Fixing Thermistor Relay PCB	
UN66	Secondary Transfer High Voltage Contact Resistance	
UN67	Secondary Transfer Static Elimination High Voltage Contact Resistance	
UN110	CIS Relay PCB	
UN5	Fixing Feed Driver PCB	
UN48	Secondary Transfer High Voltage PCB	
UN49	Post-secondary Transfer Static Elimination High Voltage PCB	

Electric code	Name	Remarks
UN111	CIS Driver PCB	
UN121	Color Sensor Driver PCB	Option



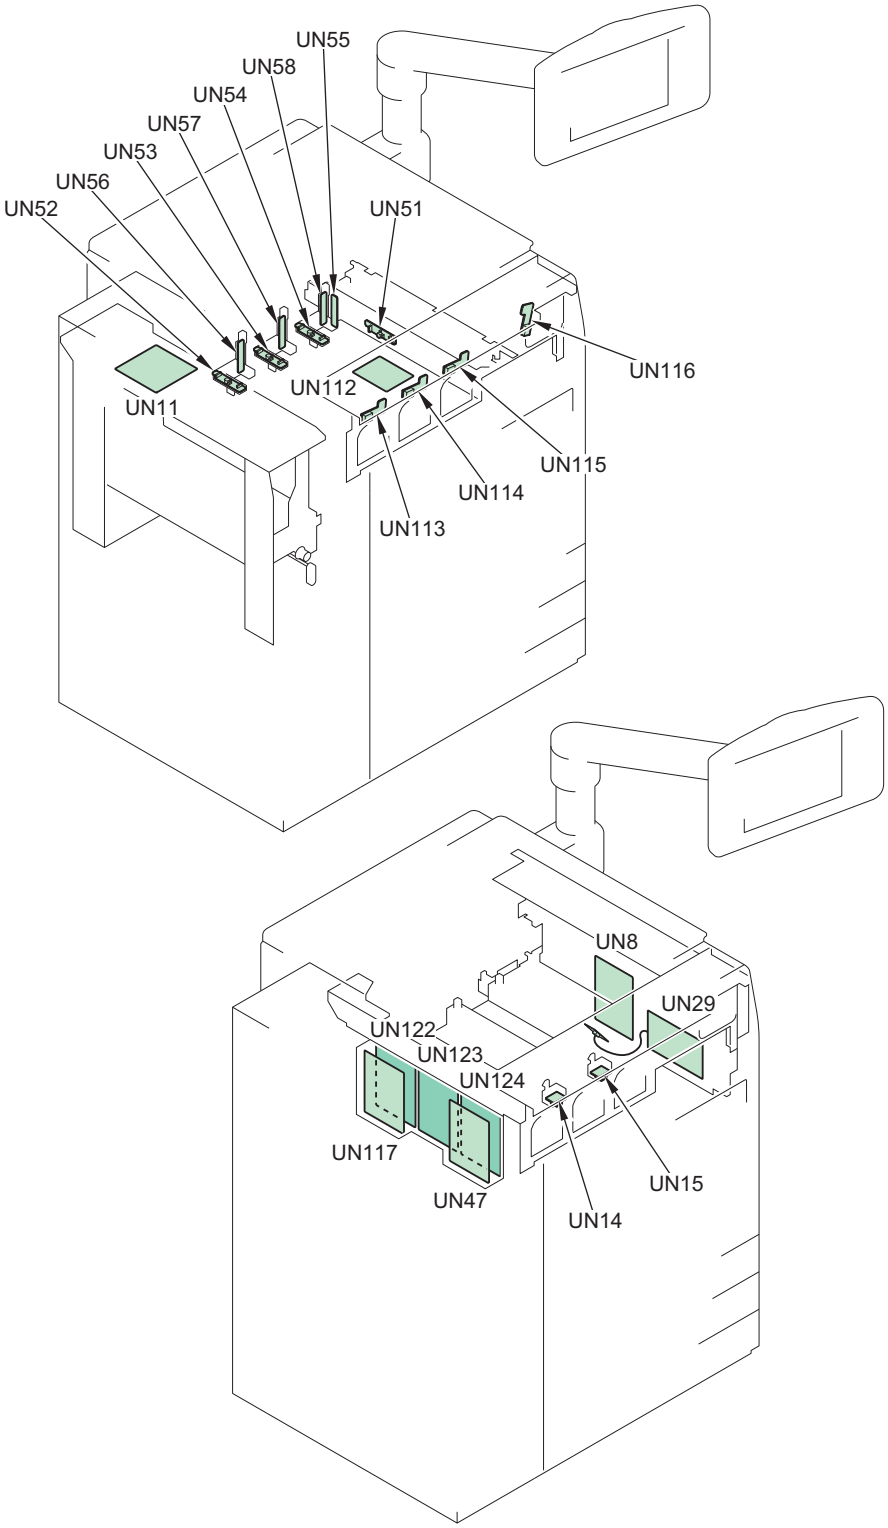
Electric code	Name
UN16	ITB Drive Roller Speed Detection PCB 1
UN17	ITB Drive Roller Speed Detection PCB 2
UN28	ITB Relay PCB
UN62	Primary Transfer High Voltage Contact Resistance (Y)
UN63	Primary Transfer High Voltage Contact Resistance (M)
UN64	Primary Transfer High Voltage Contact Resistance (C)
UN65	Primary Transfer High Voltage Contact Resistance (Bk)
UN68	ITB Transfer High Voltage Contact Resistance 1
UN69	ITB Transfer High Voltage Contact Resistance 2
UN101	Laser Driver PCB (Y)
UN102	BD PCB (Y)
UN130	APC PCB (Y)
UN103	Laser Driver PCB (M)
UN104	BD PCB (M)
UN131	APC PCB (M)
UN105	Laser Driver PCB (C)
UN106	BD PCB (C)

Electric code	Name
UN132	APC PCB (C)
UN107	Laser Driver PCB (Bk)
UN108	BD PCB (Bk)
UN133	APC PCB (Bk)



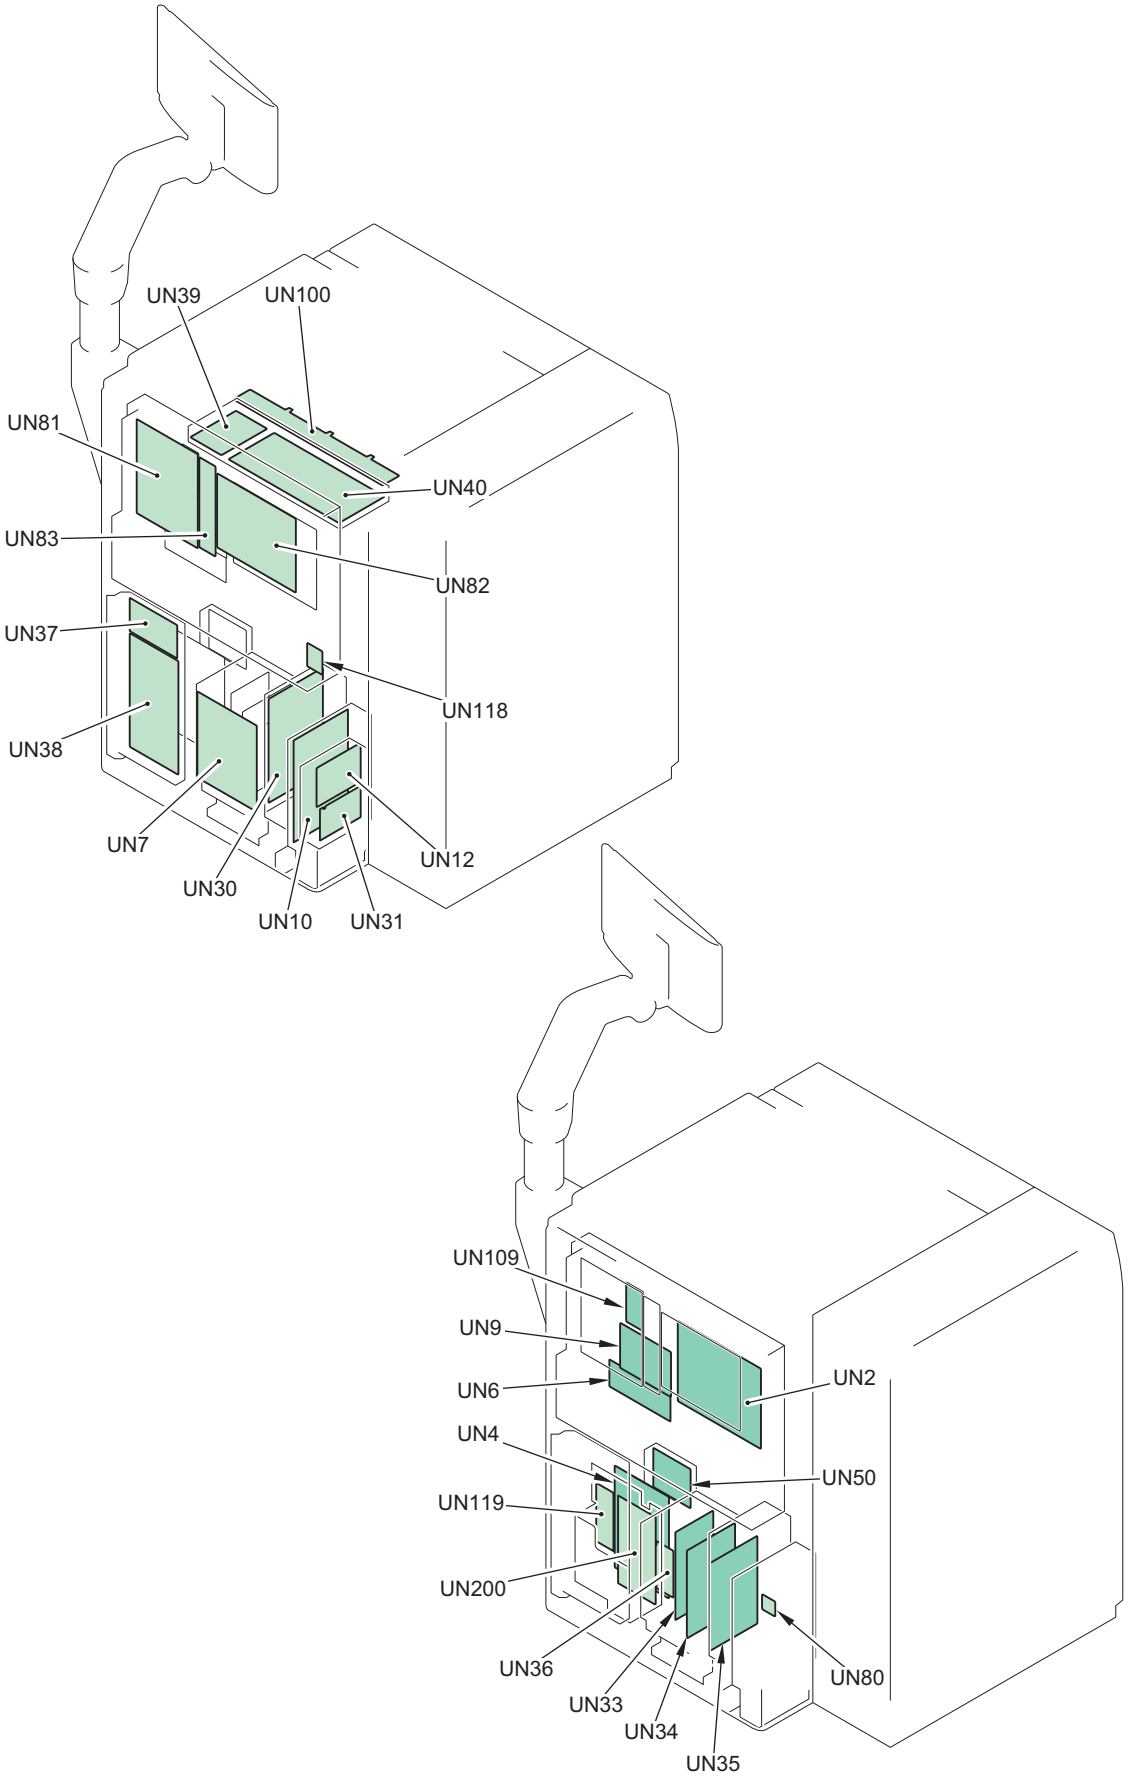
Electric code	Name	Remarks
UN70	CPU PCB	
UN71	Ten Key PCB	

Electric code	Name	Remarks
UN72	Sub Key PCB	
UN73	Volume PCB	
UN201	TALLY PCB	
UN207	LED Driver PCB	
UN26	Multi-purpose Tray Paper Width Detection PCB	Option



Electric code	Name
UN8	Registration Patch Driver PCB
UN14	Host Machine Inner Temperature Detection PCB (Y)/(M)
UN15	Host Machine Inner Temperature Detection PCB (C)/(Bk)
UN29	Potential Sensor PCB Unit

Electric code	Name
UN51	Developing Toner Collection High Voltage PCB (Bk)
UN52	Developing Toner Collection High Voltage PCB (Y)
UN53	Developing Toner Collection High Voltage PCB (M)
UN54	Developing Toner Collection High Voltage PCB (C)
UN55	Developing Toner Collection High Voltage Contact Resistance (Bk)
UN56	Developing Toner Collection High Voltage Contact Resistance (Y)
UN57	Developing Toner Collection High Voltage Contact Resistance (M)
UN58	Developing Toner Collection High Voltage Contact Resistance (C)
UN112	Toner Container ID Driver PCB
UN113	Toner Container ID Read Sensor (Y)
UN114	Toner Container ID Read Sensor (M)
UN115	Toner Container ID Read Sensor (C)
UN116	Toner Container ID Read Sensor (Bk)
UN117	Transfer Cleaning High Voltage PCB
UN47	Primary Transfer High Voltage PCB (Bk)
UN122	Primary Transfer High Voltage PCB (Y)
UN123	Primary Transfer High Voltage PCB (M)
UN124	Primary Transfer High Voltage PCB (C)
UN11	Buffer Driver PCB



Electric code	Name	Remarks
UN2	DC Controller PCB	
UN4	Pickup Feed Driver PCB	
UN6	Drum ITB Driver PCB	
UN7	Relay PCB	

Electric code	Name	Remarks
UN9	DC Controller DIFF PCB	
UN10	AC Driver PCB	
UN12	Drum Heater Driver PCB	
UN30	IH Power Supply PCB	
UN31	All-night Power Supply PCB	
UN33	DC Power Supply PCB (12V)

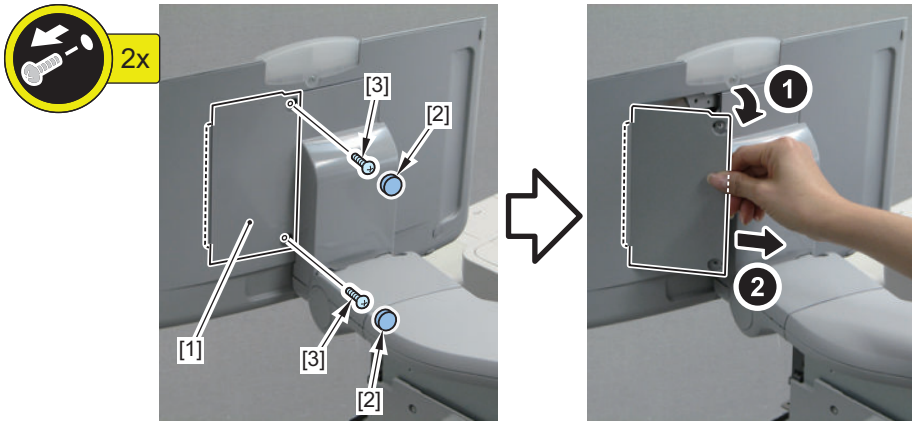
Main Controller System

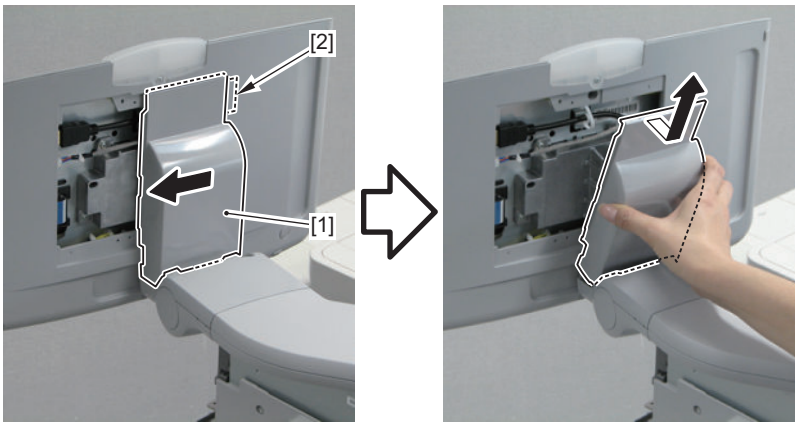
Removing the Upright Control Panel Unit

■ Procedure

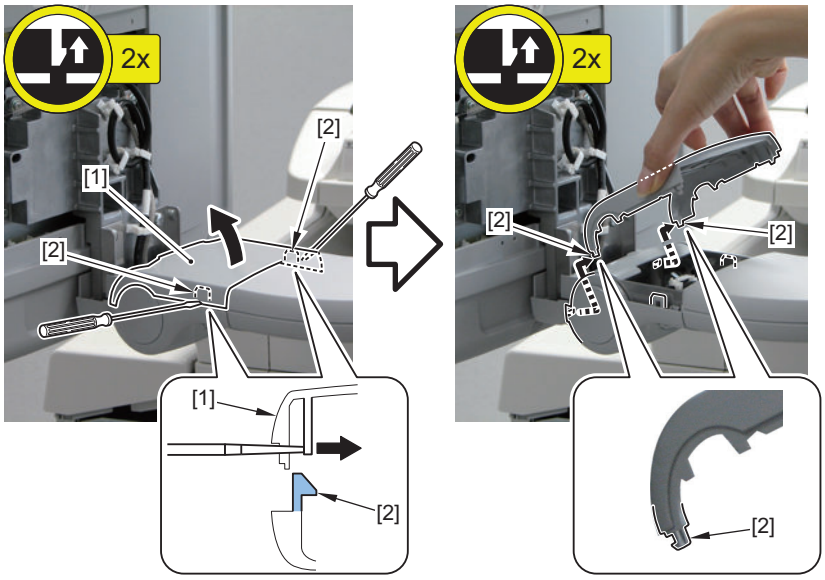
1. **Remove the Control Panel Rear Cover 2 [1].**
   - 2 Rubber Caps [2]
   - 2 Screws [3]



2. **Remove the Control Panel Rear Cover 3 [1].**
   - 1 Hook [2]

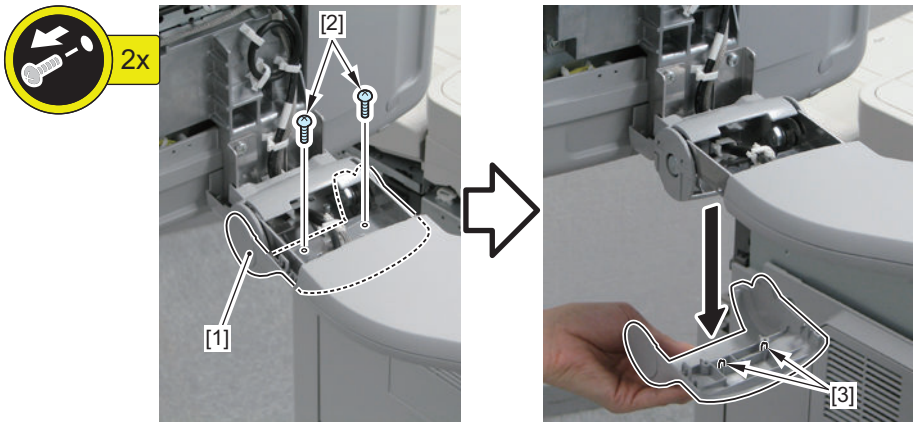


3. **Remove the Hinge Upper Cover [1].**
   - 4 Claws [2]

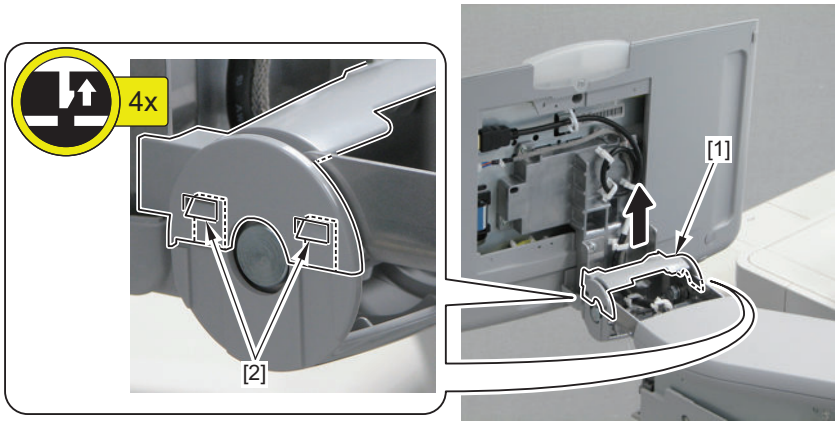


NOTE:
How to install the Hinge Upper Cover
The Hinge Upper Cover [1] cannot be installed if the Upright Control Panel Unit is not in an upright position. Therefore, if angle of the hinge has been changed, be sure to put the unit back in the upright position.

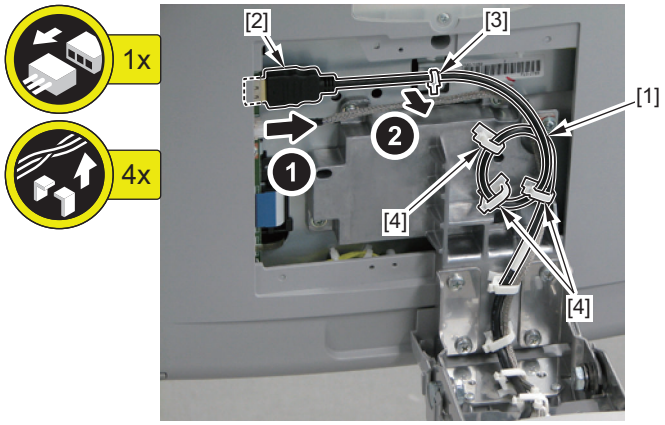
4. **Remove the Hinge Lower Cover [1].**
   - 2 Screws [2]
   - 2 Bosses [3]



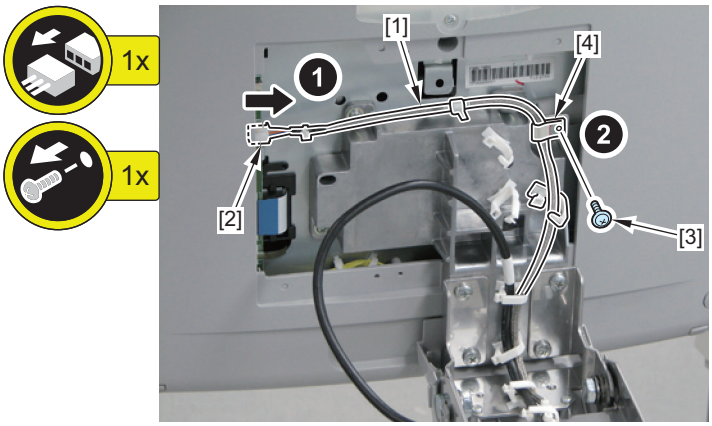
5. **Remove the Hinge Inner Cover [1].**
   - 4 Claws [2]



6. **Disconnect the Control Panel Cable [1].**
   - 1 Connector [2]
   - 1 Reuse Band [3]
   - 3 Wire Saddles [4]

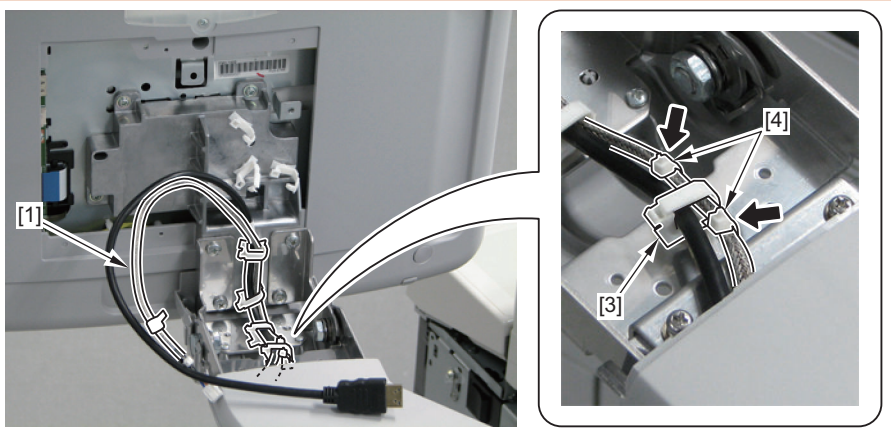


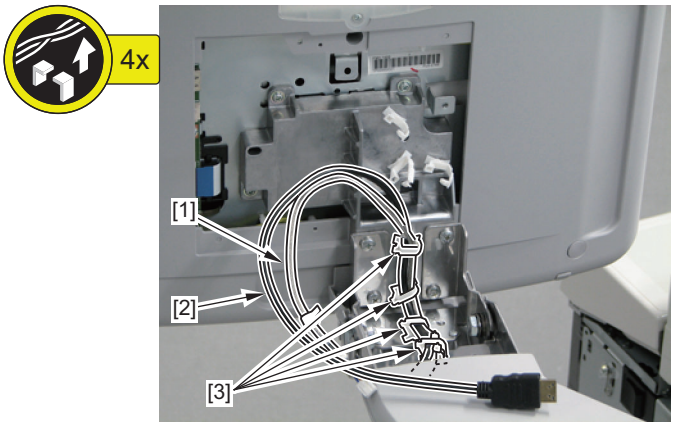
7. **Disconnect the Power Supply Cable [1].**
   - 1 Connector [2]
   - 1 Screw [3]
   - 1 Cable Clamp [4]



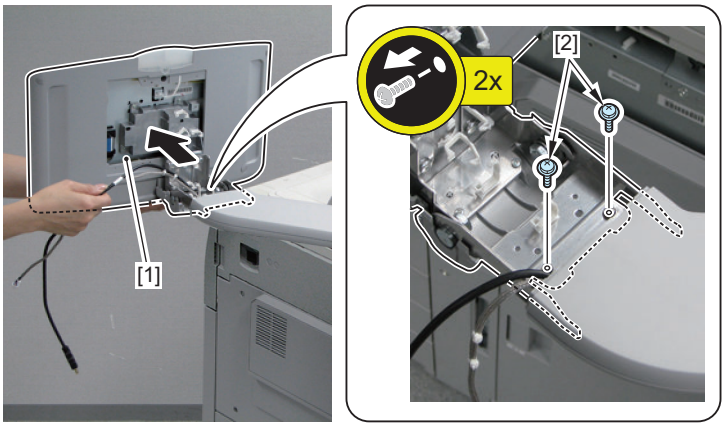
8. **Disconnect the Power Supply Cable [1] and the Control Panel Cable [2].**
   - 4 Wire Saddles [3]

CAUTION:
At installation, be sure to secure the part of the Power Supply Cable [1] between the 2 tie-wraps [4] with the Wire Saddle [3].





9. **Remove the Upright Control Panel Unit [1].**
   - 2 Screws [2]



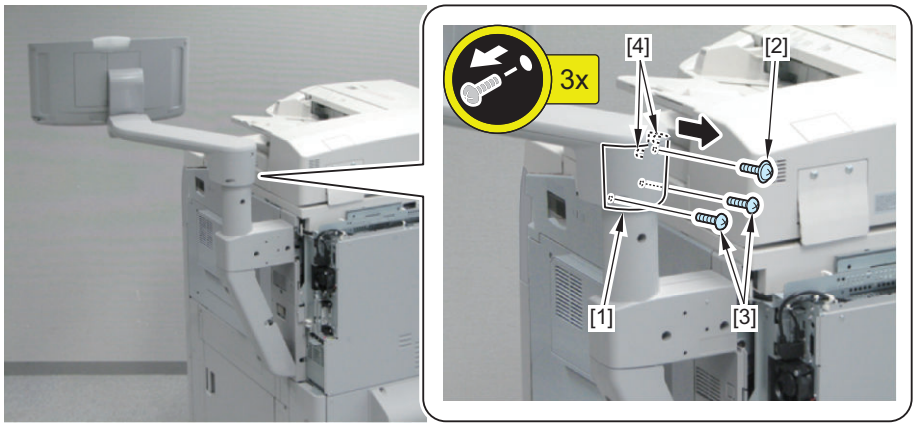
Removing the Upright Control Panel Arm Unit

■ Preparation

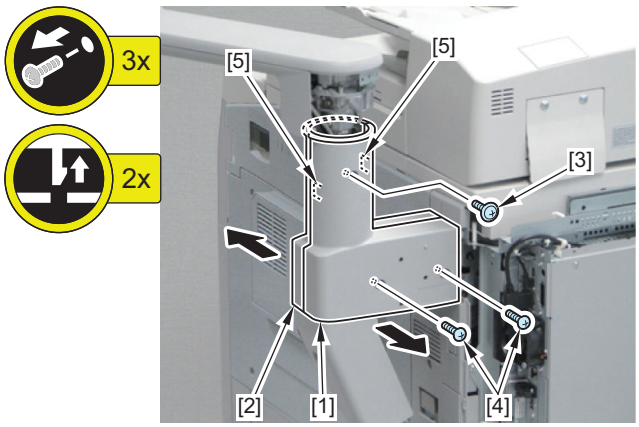
1. **Removing the Box Left Cover**"Removing the Box Left Cover" on page 947
2. **Removing the Box Right Cover**"Removing the Box Right Cover" on page 946
3. **Removing the Box Upper Cover**"Removing the Box Upper Cover" on page 948

■ Procedure

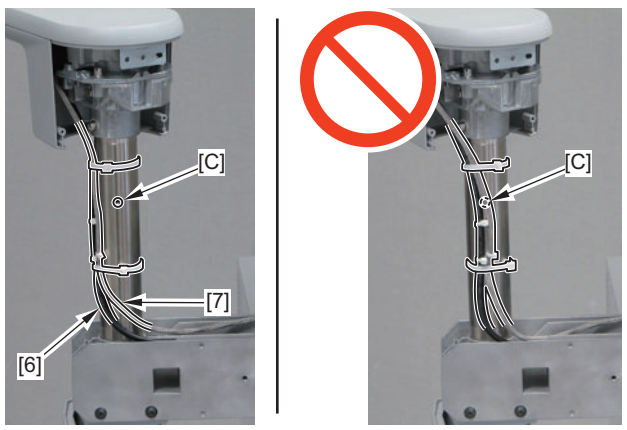
1. **Remove the Arm Rear Cover [1].**
   - 1 Screw (TP) [2]
   - 2 Screws (Tapping) [3]
   - 2 Bosses [4]



2. **Remove the Base Rear Cover [1] and the Base Front Cover [2].**
   - 1 Screw (TP) [3]
   - 2 Screws (Tapping) [4]
   - 2 Claws [5]

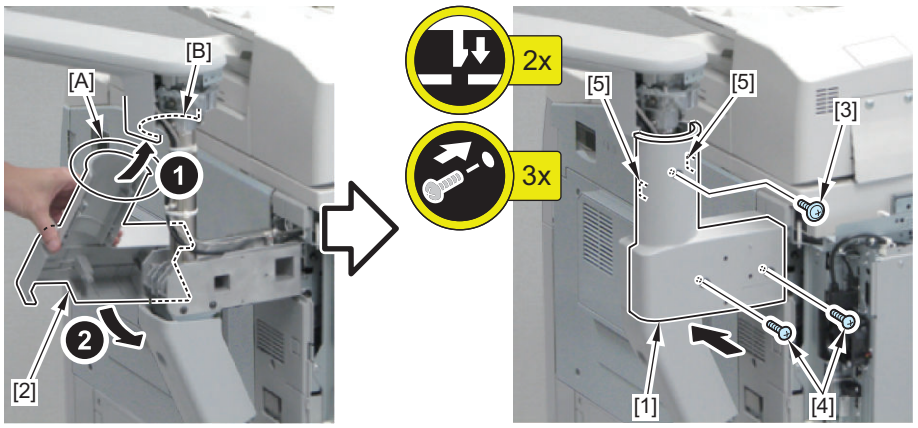


CAUTION:
Be sure that the Control Panel Cable [6] and the Power Supply Cable [7] do not cover the screw hole [C] at installation.



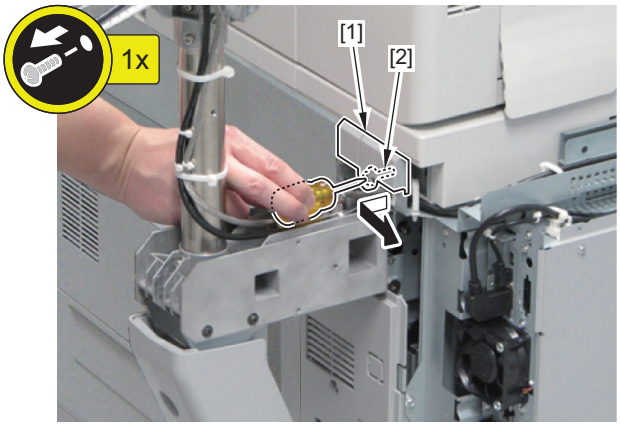
NOTE:
How to install the Base Rear Cover [1] and the Base Front Cover [2]

1. Put the [A] part of the Base Front Cover [2] in the [A] part which is on the inside [B] of the Arm Lower Cover.
2. Install the Base Rear Cover [1].
   - 2 Claws [5]
   - 1 Screw (TP) [3]
   - 2 Screws (Tapping) [4]



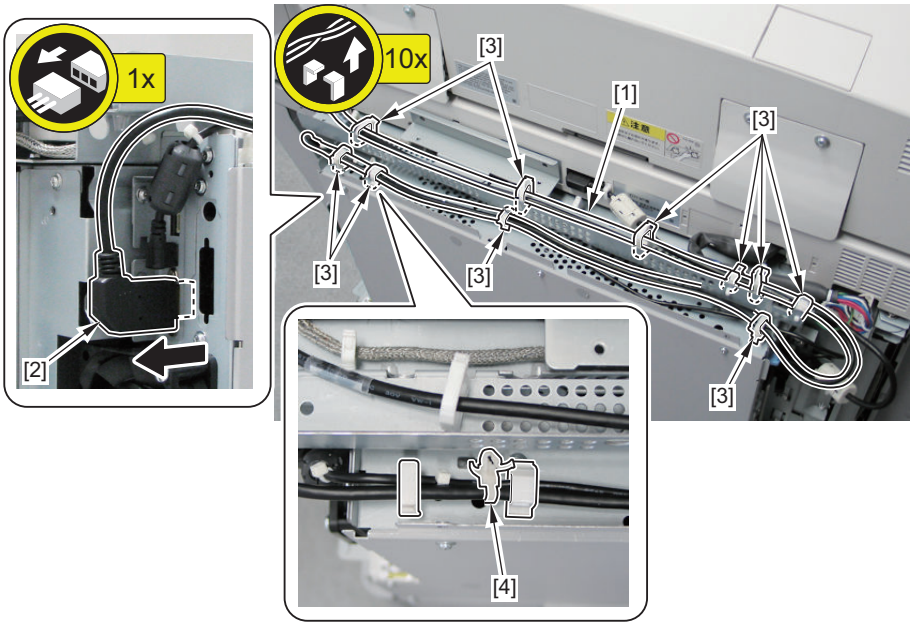
3. Remove the Right Upper Rear Cover [1].

- 1 Screw [2]

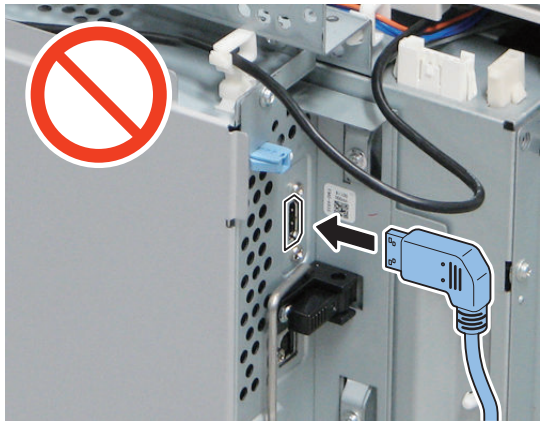


4. **Disconnect the Control Panel Cable [1].**
   - 1 Connector [2]
   - 10 Wire Saddles [3]

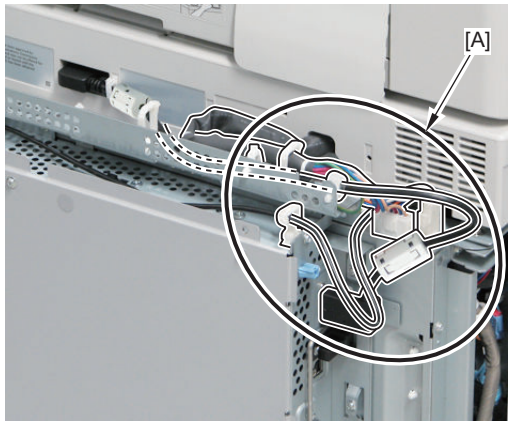
CAUTION:
At installation, do not secure the Reuse Band [4] in place.
At installation, secure the Control Panel Cable [1] so that the Reuse Band [4] is located as shown in the figure.



CAUTION:
Points to Note when Connecting the Control Panel Cable:
Do not connect the Control Panel Cable to the connector for connecting the Image Reader Unit of the Controller Box 2. If it is connected by mistake, PCBs may be damaged.

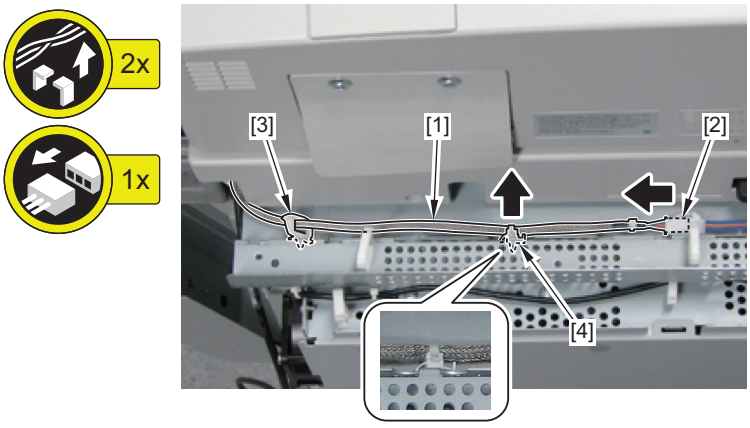


NOTE:
How to route the Control Panel Cable
Be sure to allow extra slack of the cable at the [A] part for opening and closing the Controller Box.



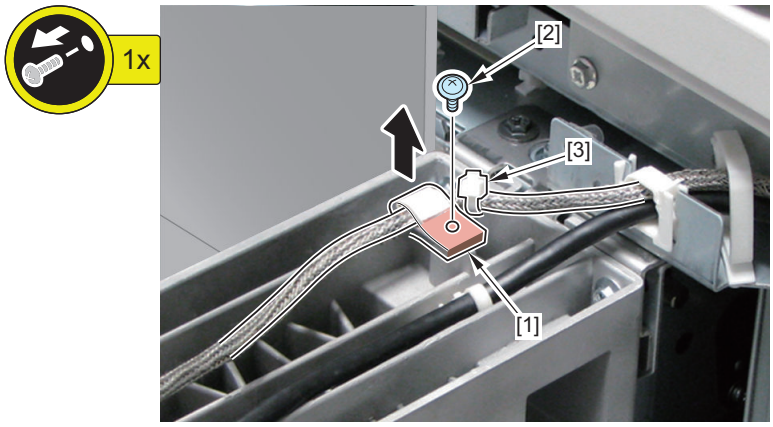
5. Disconnect the Power Supply Cable [1] of the Upright Arm.

- 1 Connector [2]
- 1 Wire Saddle [3]
- 1 Reuse Band [4]

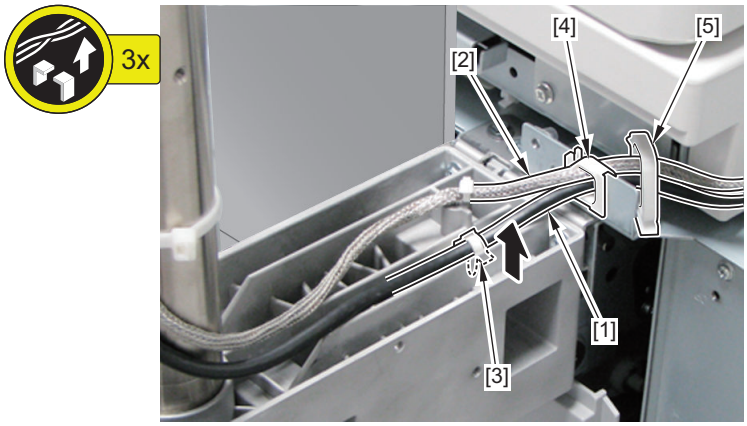


6. **Disconnect the Power Supply Cable [1].**
   - 1 Screw [2]
   - 1 Cable Clamp [3]

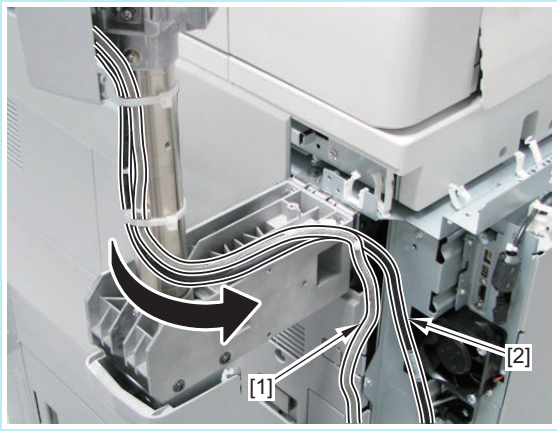
CAUTION:
At installation, be sure to secure the Cable Clamp [3] with the Power Supply Cable [1] on the host machine side.



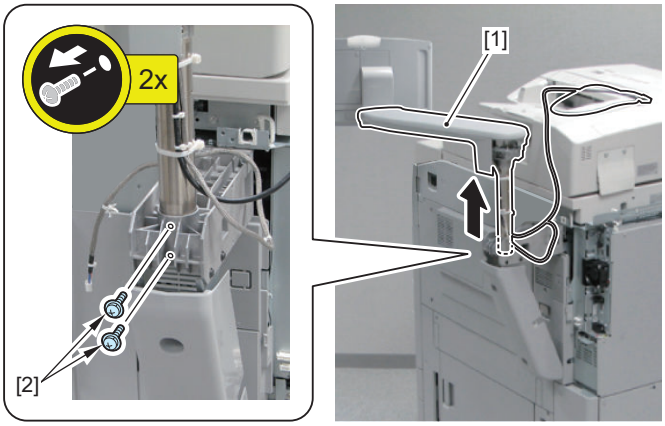
7. **Disconnect the Control Panel Cable [1] and the Power Supply Cable [2].**
   - 1 Reuse Band [3]
   - 1 Edge Saddle [4]
   - 1 Wire Saddle [5]



NOTE:
How to route the Control Panel Cable and the Power Supply Cable
Route the Control Panel Cable [1] and the Power Supply Cable [2] from the rear side of the host machine.



8. **Remove the Upright Control Panel Arm Unit [1].**
   - 2 Screws [2]



Removing the HDD

■ Actions before Replacement (Refer to Chapter 5 HDD)

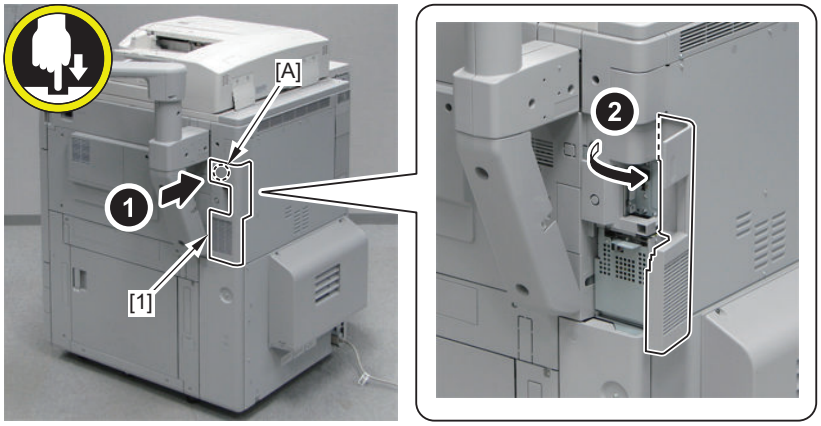
Backup the Settings/Registration data.

1. **Be sure to change the setting value of the following service mode to "1" so that service mode setting values can be exported on remote UI.**
   COPIER > OPTION > USER > SMD-EXPT
2. **Be sure to execute the following backup from remote UI.**
   1. Settings/Registration > Management Settings > Data Management > Import/Export All > Export
   2. Settings/Registration > Management Settings > Data Management > Import/Export Individually
   3. Settings/Registration > Management Settings > Data Management > Back Up

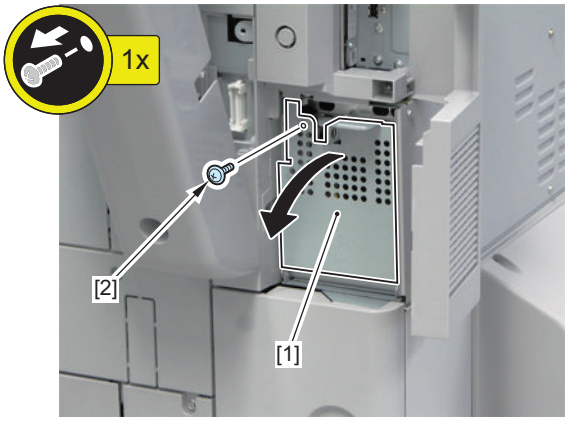
CAUTION:
Batch export cannot be executed in the following cases.
- When a job is being executed or while waiting for a job (transmission, forward, fax reception, I-Fax reception, report print, and timer-controlled functions)
- When an individual import or export is being executed
- When the address book is being browsed remotely from another imageRUNNER ADVANCE machine
- During distribution of device information
- When an error has occurred
- During Box backup

■ Procedure

1. **Push the [A] part to open the HDD Cover [1].**

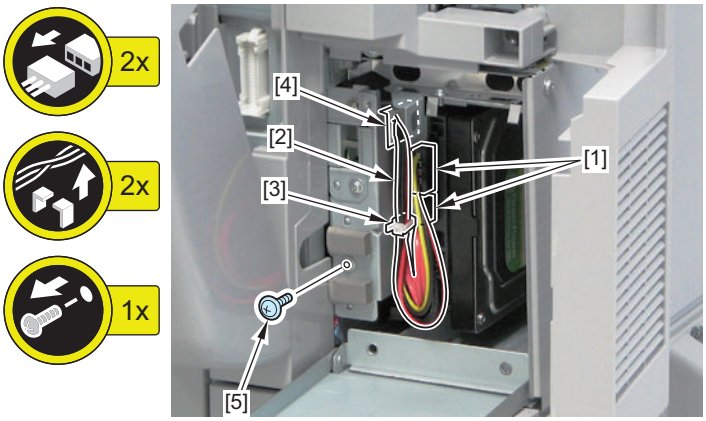


2. **Open the HDD Cap.[1].**
   - 1 Screw [2]

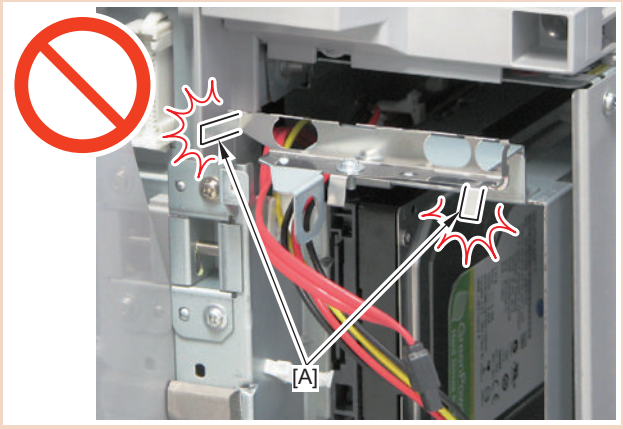


3. **Disconnect the 2 connectors [1] of the HDD, and free the 2 harnesses [2].**
   - 1 Wire Saddle [3]
   - 1 Edge Saddle [4]

4. **Remove the screw [5].**

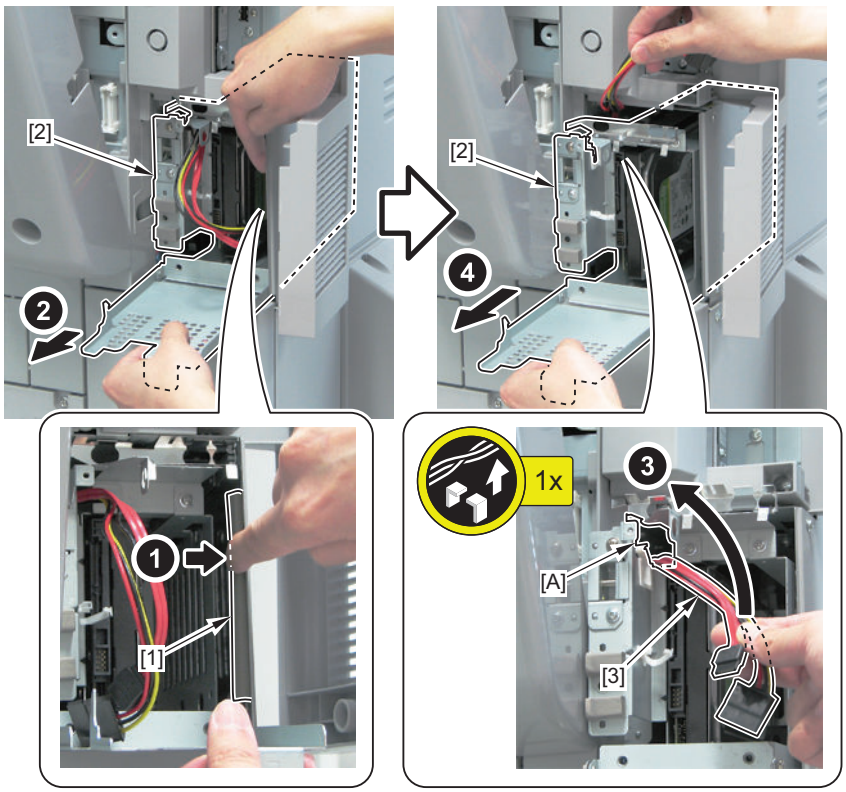


CAUTION:
Be sure not to deform the [A] part of the Grounding Plate.



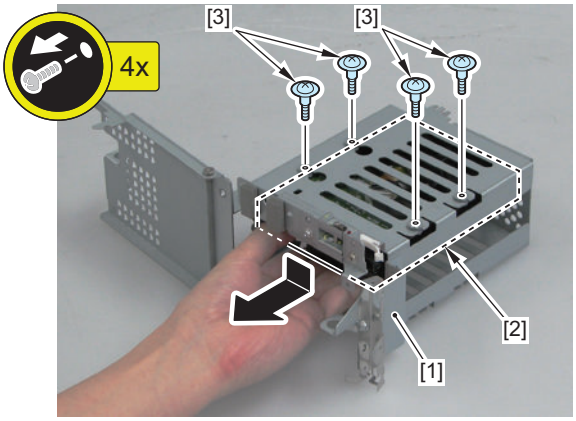
5. **Pull out the HDD Unit [2] while avoiding contact with the gasket [1].**

6. **Free the harness [3] from the [A] part, and remove the HDD Unit [2].**



7. **Remove the HDD [2] from the HDD Unit [1].**
   - 4 Stepped Screws [3]

CAUTION:
Be sure to perform the work while supporting the HDD [2] by hand to prevent it from falling.



■ Actions after Replacement(see Chapter 5, "HDD.")

1. **HDD format**
   1. Start the machine in safe mode (turn ON the main power switch while simultaneously pressing 2+8 keys).
   2. Execute Formatting All Partitions using SST.
2. **Download the system software (refer to Upgrade).**
3. **Initialize the key/certificate/CA certificate.**
   (Lv.2) COPIER > FUNCTION > CLEAR > CA-KEY
4. **Turn OFF and then ON the power.**

5. **Restore the backup data.**
   Use the remote UI. Follow the steps below to specify the DCM file stored earlier.
   1. Settings/Registration > Management Settings > Data Management > Import/Export All > Import
   2. Settings/Registration > Management Settings > Data Management > Restore
   3. Settings/Registration > Management Settings > Data Management > Import/Export Individually
   4. Restore of MEAP: SST(Meapback)
6. **When the user generates and adds the encryption key, certificate and/or CA certificate, request the user to generate them again.**
7. **Executing “Auto Adjust Gradation (Full Adjust)” Settings/Registration mode: Adjustment/Maintenance > Adjust Image Quality > Auto Adjust Gradation**

CAUTION:
Points to note when using an HDD with system software already installed
Use of an HDD in which the system software of another machine (a machine of a different serial number) is installed for a troubleshooting is possible if it is an HDD of a model of iR-ADV C5255 series and later. However, be sure to format it after installing it. Operation is not guaranteed if it is continued to be used as is.At installation, HDD must be formatted. Therefore, it is not recommended to use an HDD which has been used with another machine. If you use an HDD which has been used with another machine, be sure to get agreement from user in advance that user data will be deleted.
In addition, an HDD used in iR-ADV C5255 series and later cannot be accessed from a PC due to enhanced security.

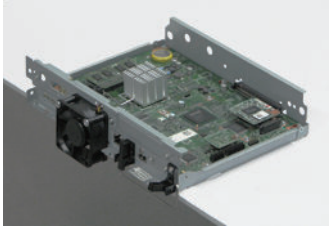
● When Using the Card Reader and imageWARE Accounting Manager

Because the card ID used for imageWARE Accounting Manager is stored in HDD, collection of the card information by NSA is not available immediately after replacement of the HDD.
After performing "After Replacing the HDD", reinstall the card ID from imageWARE Accounting Manager by the following procedures.

1. **Go to COPIER > FUNCTION > INSTALL > CARD and enter the numerical value of the leading card which is used for Department ID. Then, press "OK" button. (e.g.: If No. 1 to No. 1000 cards are used for Department ID, enter "1" of the leading card.)**
2. **After turning OFF and then ON the main power switch, perform the following operations in Settings/Registration mode.**
   - In Management Settings > User Management > Department ID Management > Page Totals, be sure that "ID00000001" to "ID00001000" are created.
   - Set the following: Preferences > Network > TCP/IP Settings > IPv4 Settings > IP Address Settings > IP Address, Gateway Address, Subnet Mask.
   - In Management Settings > User Management > System Manager Information Settings > System Manager ID and System PIN, register any number for them. Then, turn OFF and ON the main power switch.

   If "System Manager ID" and "System PIN" are not registered, "card registration to device" cannot be executed for the imageWARE Accounting Manager setting operation.
3. **Download the card ID from imageWARE Accounting Manager to the Main Body again.**
4. **After downloading is completed, go to Management Settings > User Management > Department ID Management > Page Totals. Be sure that only the downloaded card ID is displayed.**
5. **Print using the user card registered from imageWARE Accounting Manager. Be sure that the card information used for the target devices of imageWARE Accounting Manager is collected.**

Removing the Main Controller PCB 1



■ Actions before Replacement(see Chapter 5, "Main controller PCB 1.")

Backup the Settings/Registration data.

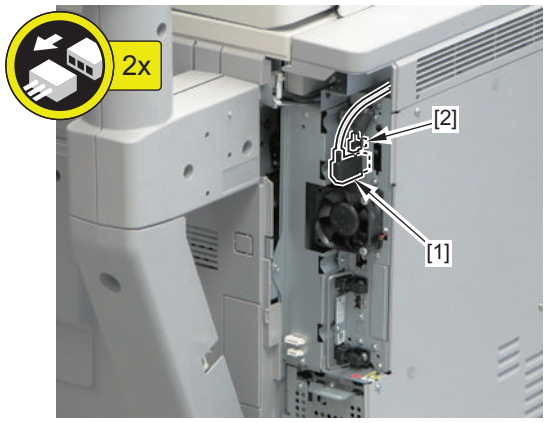
1. **Execute the collective export on remote UI.**
   Settings/Registration > Management Settings > Data Management > Import/Export Individually

■ Preparation

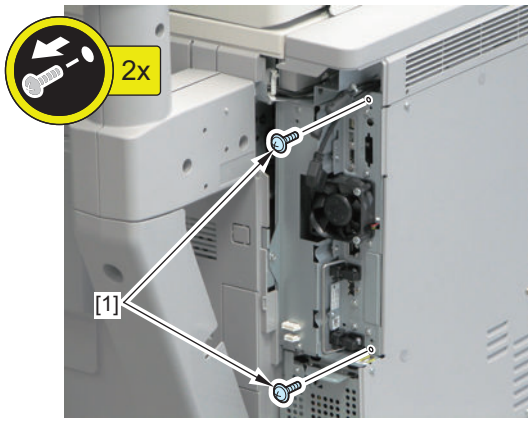
1. **Removing the Box Right Cover****"Removing the Box Right Cover" on page 946**

■ Disassembling Procedure

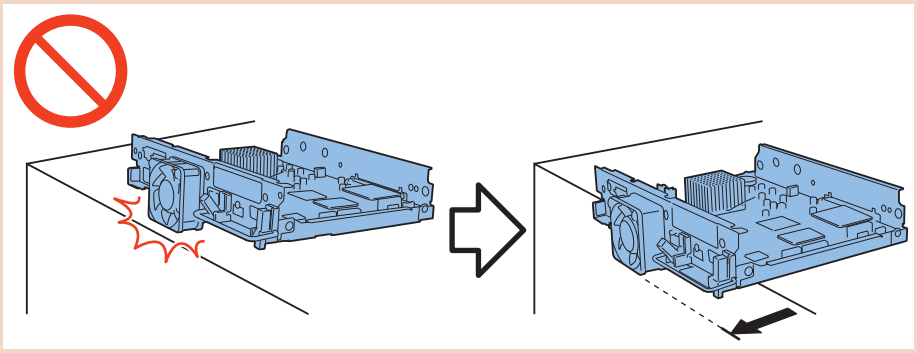
1. **Disconnect the USB Cable [1] and the Control Panel Cable [2].**



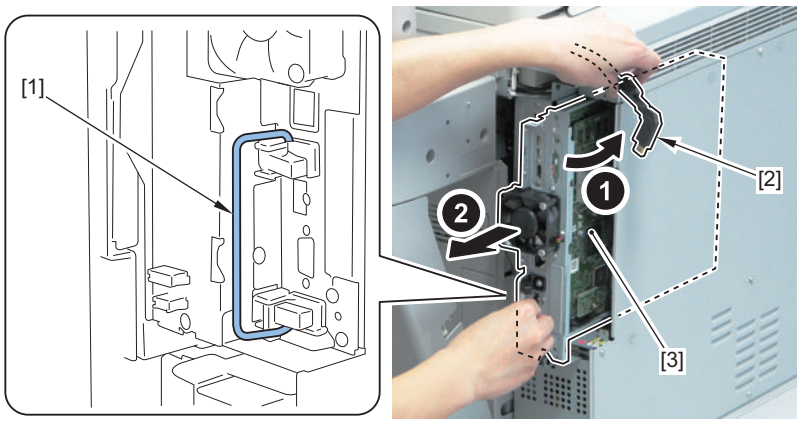
2. **Remove the 2 screws [1].**



CAUTION:
When replacing the boards installed on the Main Controller PCB 1, remove the Main Controller PCB 1 and place it on a flat surface for the work.



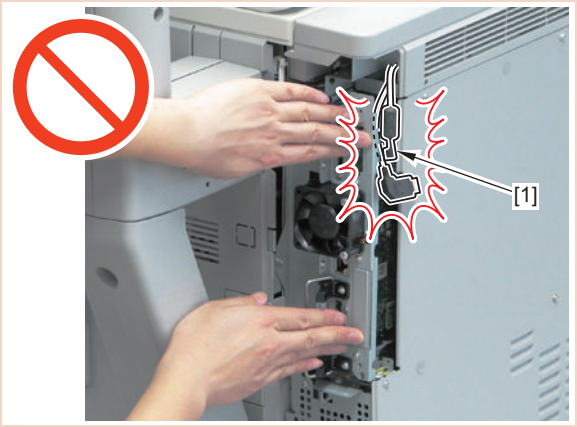
3. **Remove the Main Controller PCB 1 [3] while holding the handle [1] and avoiding contact with the harness [2].**



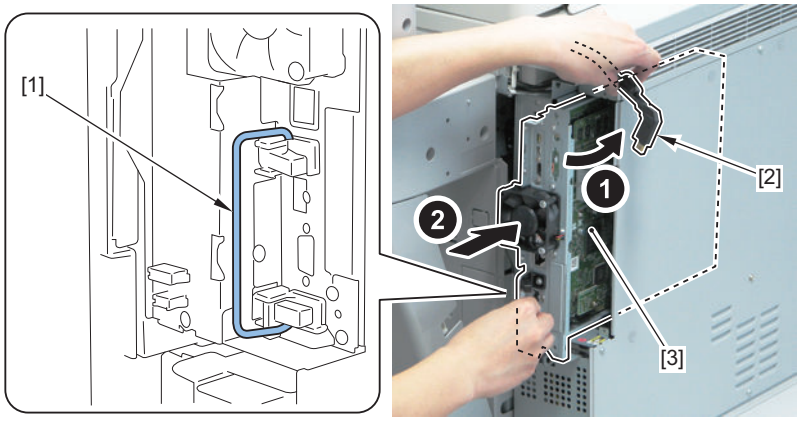
■ Assembling Procedure

CAUTION:

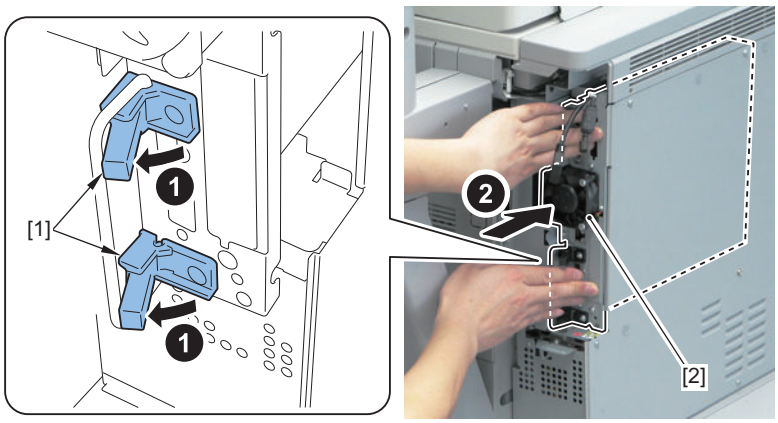
- When replacing the PCB, be sure to transfer any optional PCBs installed on the old Main Controller PCB 1 to the new PCB.
- When assembling, be sure to install the Main Controller PCB 1 while paying attention not to trap the cables [1].



1. **While holding the handle [1] and avoiding contact with the harness [2], insert the Main Controller PCB 1 [3] halfway into the host machine.**

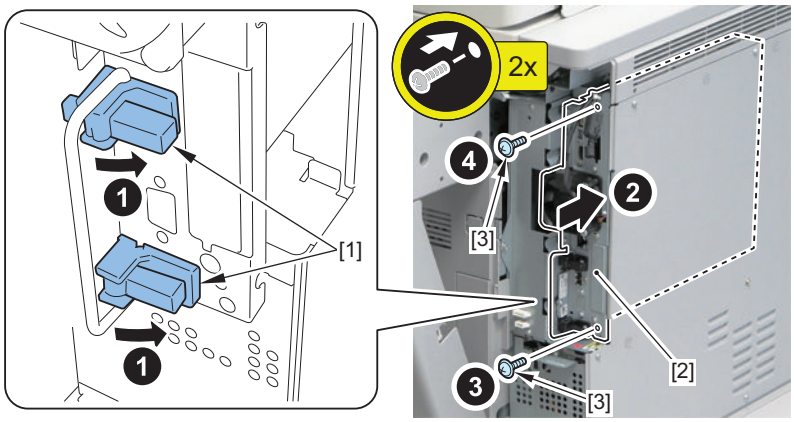


2. **Release the 2 Lock Levers [1], and uniformly push in the Main Controller PCB 1 [2] with both hands until it stops.**



3. **Turn over the 2 Lock Levers [1], and push in and secure the Main Controller PCB 1 [2].**
   - 2 Screws [3] (Removed in step 2. Install the lower one first and then the upper one.)

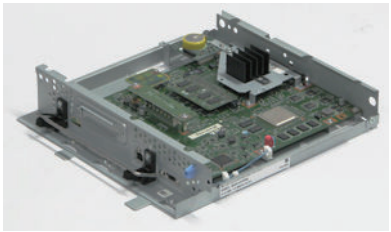
CAUTION:
Be sure to perform the work in the order from (1) to (4) in the figure because the Inner Connector of the Main Controller PCB 1 may not be connected.



■ Actions after Replacement(see Chapter 5, "Main controller PCB 1.")

1. **Restore the backup data.**
   Use the remote UI. Follow the steps below to specify the DCM file stored earlier.
   Settings/Registration > Management Settings > Data Management > Import/Export Individually

Removing the Main Controller PCB 2



■ Actions before Replacement(see Chapter 5, "Main controller PCB 2.")

Backup the Settings/Registration data.

1. **Select the following so that the service mode setting values can be exported on remote UI.**
   Service mode (Lv1) > Option > USER > SMD-EXPT > [1]

2. **Execute the collective export on remote UI.**
    1. Settings/Registration > Management Settings > Data Management > Import/Export All > Export
    2. Settings/Registration > Management Settings > Data Management > Import/Export Individually
3. **Backup of SRAM(with HDD Encryption Board): SST(Sramimg)**

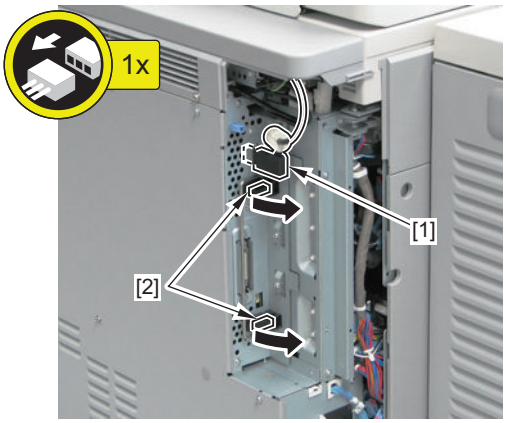
CAUTION:
Collective export cannot be executed in the following cases.
- Job is being executed, or job is being waited for (various functions set by transmission, forwarding, fax reception, I-FAX reception, report print and timer)
- Individual import/export is being executed
- The address book is being remotely referenced by another imageRUNNER ADVANCE
- Device information is being distributed
- An error has occurred
- Box is being backed up

■ Preparation

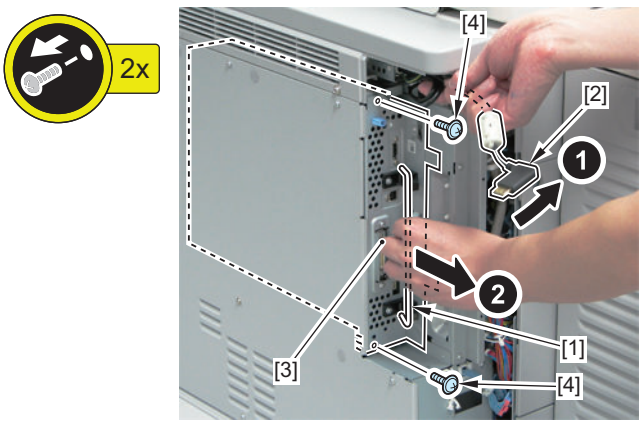
1. **Removing the Box Left Cover****"Removing the Box Left Cover" on page 947**

■ Disassembling Procedure

1. **Disconnect the Reader Communication Cable [1], and release the 2 Lock Levers [2].**



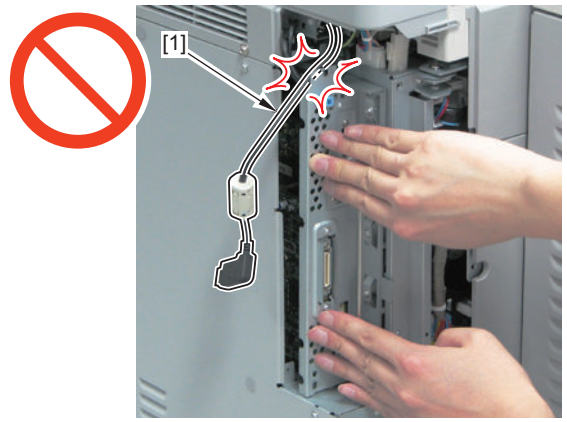
2. **Remove the Main Controller PCB 2 [3] while holding the handle [1] and avoiding contact with the harness [2].**
    - 2 Screws [4]



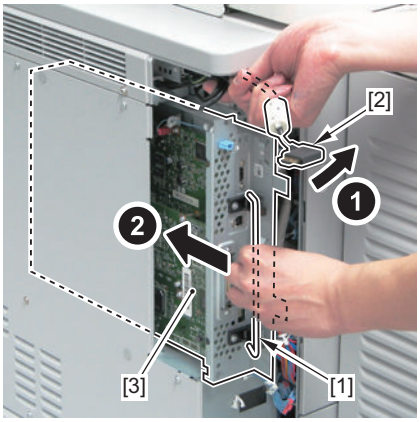
■ Assembling Procedure

CAUTION:

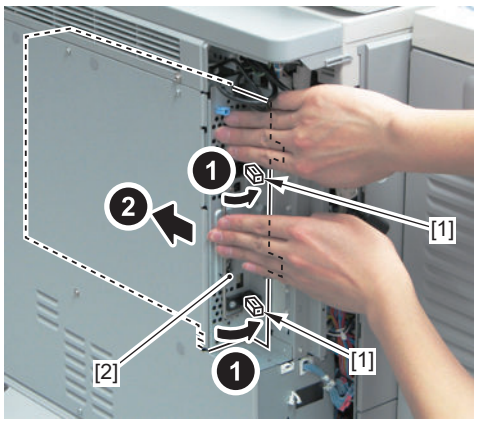
- When replacing the PCB, be sure to transfer any optional PCBs installed on the old Main Controller PCB 2 to the new PCB.
- When assembling, be sure to install the Main Controller PCB 2 while paying attention not to trap the cables [1].



1. **While holding the handle [1] and avoiding contact with the harness [2], insert the Main Controller PCB 2 [3] halfway into the host machine.**

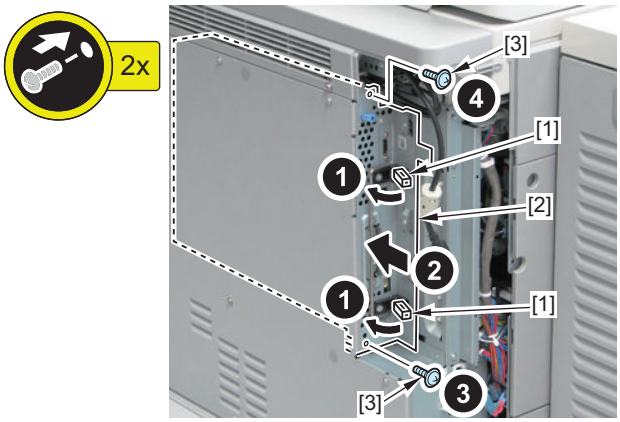


2. **Release the 2 Lock Levers [1] in the direction of the arrows, and uniformly push in the Main Controller PCB 2 [2] with both hands until it stops.**



3. **Turn over the 2 Lock Levers [1], and push in and secure the Main Controller PCB 2 [2].**
   - 2 Screws [3] (Removed in step 2. Install the lower one first and then the upper one.)

CAUTION:
Be sure to perform the work in the order from (1) to (4) in the figure because the connector of the Main Controller PCB 2 may not be connected.



■ Actions after Replacement(see Chapter 5, "Main controller PCB 2.")

1. **Restore the backup data.**
   Use the remote UI. Follow the steps below to specify the DCM file stored earlier.
   1. Settings/Registration > Management Settings > Data Management > Import/Export All > Import
   2. Settings/Registration > Management Settings > Data Management > Import/Export Individually
2. **Restore of SRAM(with HDD Encryption Board): SST(Sramimg)**
3. **When the user generates and adds the encryption key, certificate and/or CA certificate, request the user to generate them again.**
4. **Executing “Auto Adjust Gradation (Full Adjust)”.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation]
5. **Execute "Auto Correct Color Mismatch".**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

CAUTION:
Do not transfer the following parts to another machine (a machine of a different serial number.).
The machine will not start up normally, and may become unrecoverable in some cases.
- Main Controller PCB 2 (with the Memory PCB unremoved)
- Memory PCB

Open the Controller Box

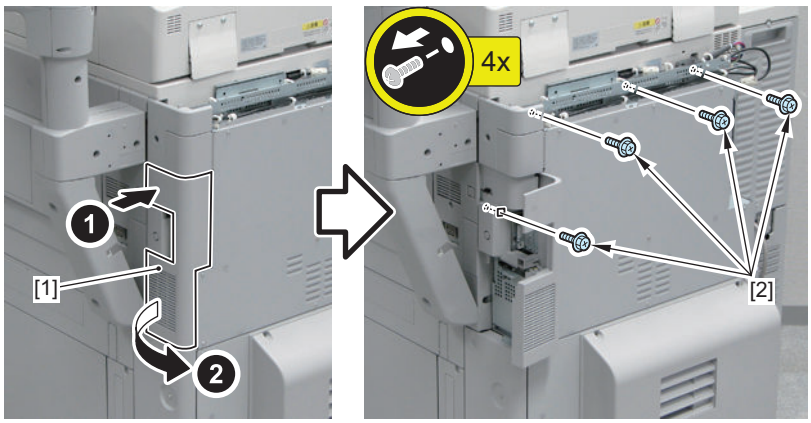
■ Preparation

1. **Removing the Box Left Cover****“Removing the Box Left Cover” on page 947**
2. **Removing the Box Upper Cover****“Removing the Box Upper Cover” on page 948**

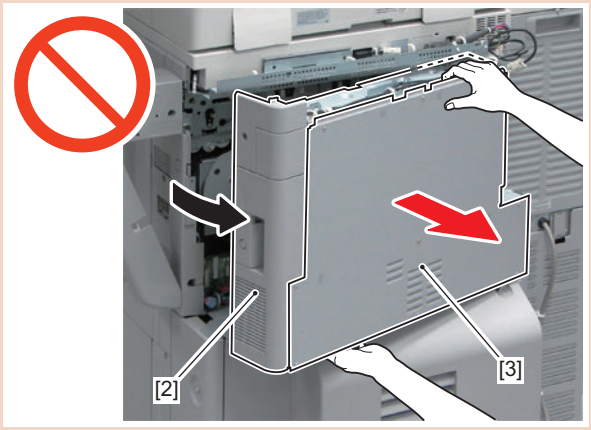
■ Procedure

1. **Push the [A] part to open the HDD Cover [1].**

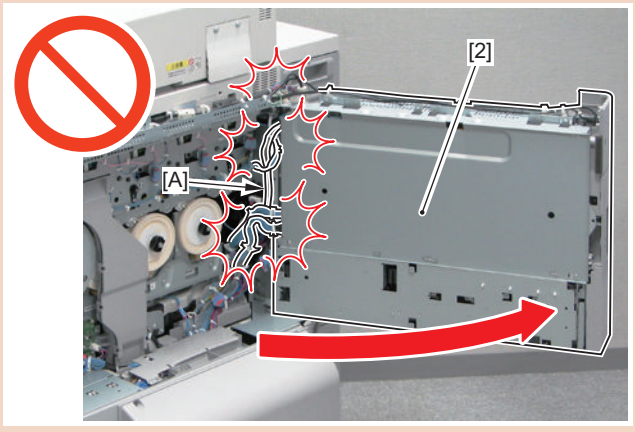
2. Remove the 4 screws [2] from the Controller Box Unit.



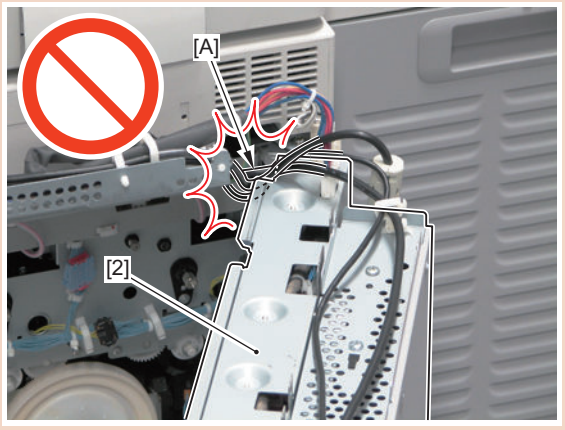
CAUTION:
Do not install/remove the Controller Cover [3] while the Controller Box Unit [2] is open. Otherwise, the Controller Box Unit may be distorted.



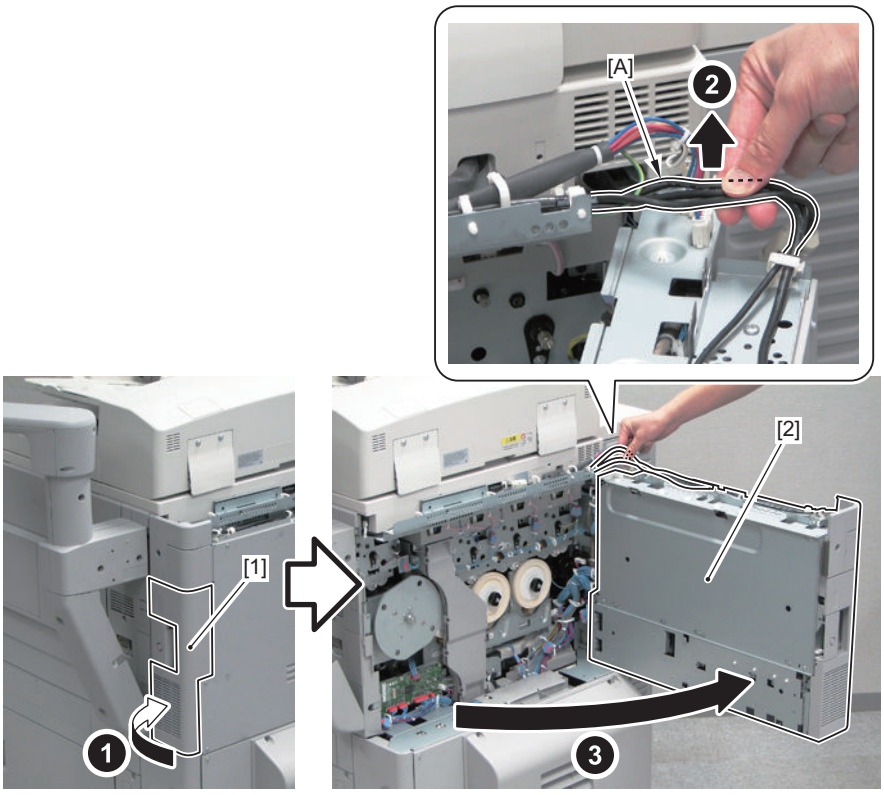
CAUTION:
Do not open the Controller Box Unit [2] 90 degrees or more due to the load being applied to the harness [A].



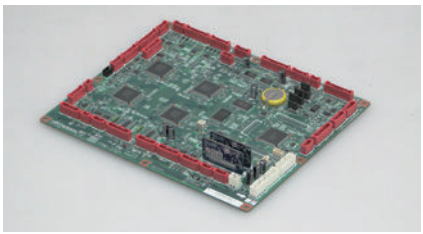
CAUTION:
Do not trap the harness [A] when opening/closing the Controller Box Unit [2].



3. **Close the HDD Cover [1], and open the Controller Box Unit [2] while pulling the harness [A].**



Removing the DC Controller PCB



■ Actions before Replacement(see Chapter 5, "DC controller PCB.")

Backup of DC Controller PCB SRAM
COPIER > FUNCTION > SYSTEM > DSRAMBUP (LEVEL2)

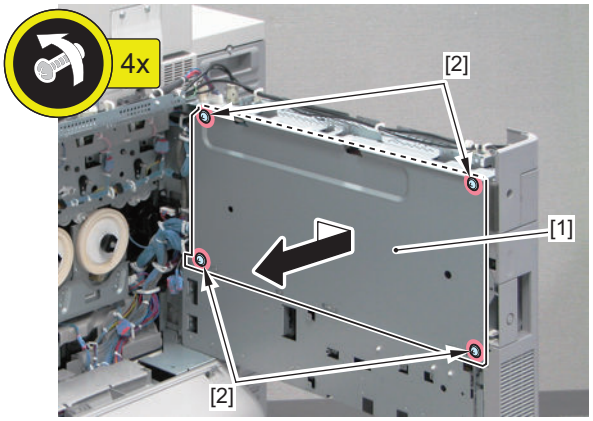
“ACTIVE” is displayed and then “OK!” is displayed about 2 minutes later.
Turn OFF the main power when the above work is complete.

■ Preparation

1. **Removing the Box Left Cover****“Removing the Box Left Cover” on page 947**
2. **Removing the Box Upper Cover****“Removing the Box Upper Cover” on page 948**
3. **Opening the Controller Box****“Open the Controller Box” on page 507**

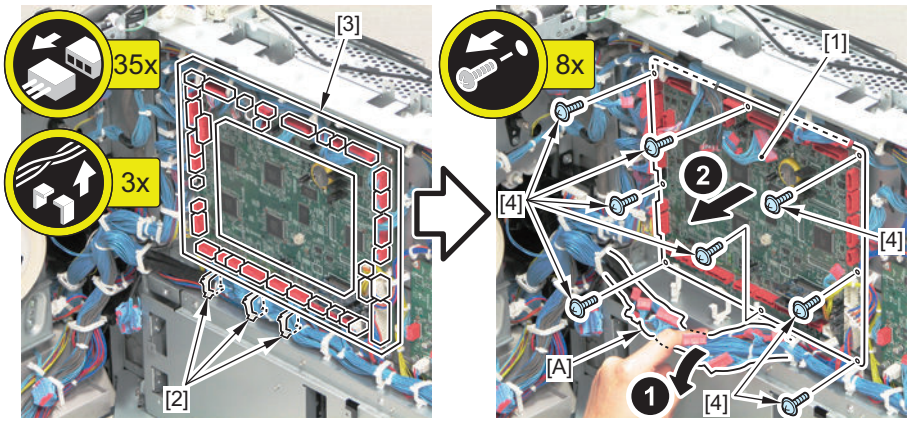
■ Procedure

1. **Remove the DC Controller Cover [1].**
   - 4 Screws [2] (to loosen)

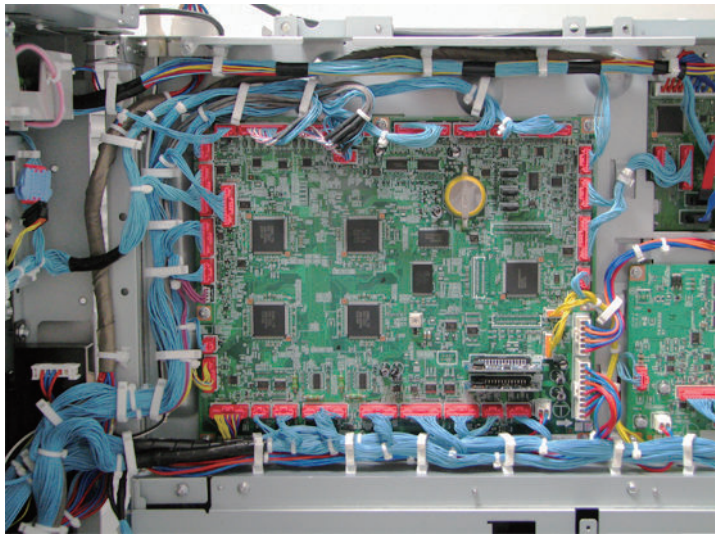


2. **Remove the DC Controller PCB [1] while lowering the harness [A].**
   - 3 Wire Saddles [2]
   - 35 Connectors [3]

   8 Screws [4]



NOTE:
The completed assembly of the DC Controller PCB is shown below.

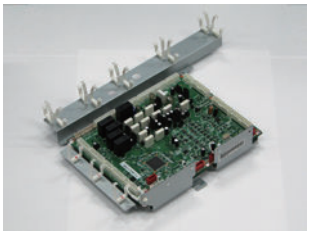


■ Actions after Replacement(see Chapter 5, "DC controller PCB.")

Restoration of DC Controller PCB SRAM
COPIER > FUNCTION > SYSTEM > DSRAMRES (LEVEL2)
“ACTIVE” is displayed at execution and then “OK!” is displayed about 2 minutes later. Restoration is complete.

CAUTION:
When replacing the DC Controller PCB, be sure to use a new one. Do not use the DC Controller PCB which was used with another machine.
After replacing the DC Controller PCB, E101-0001 may occur due to a wrong combination of versions.
After replacing the DC Controller PCB, update it to an appropriate version if necessary in accordance with the versions of other PCBs.

Removing the Relay PCB Unit

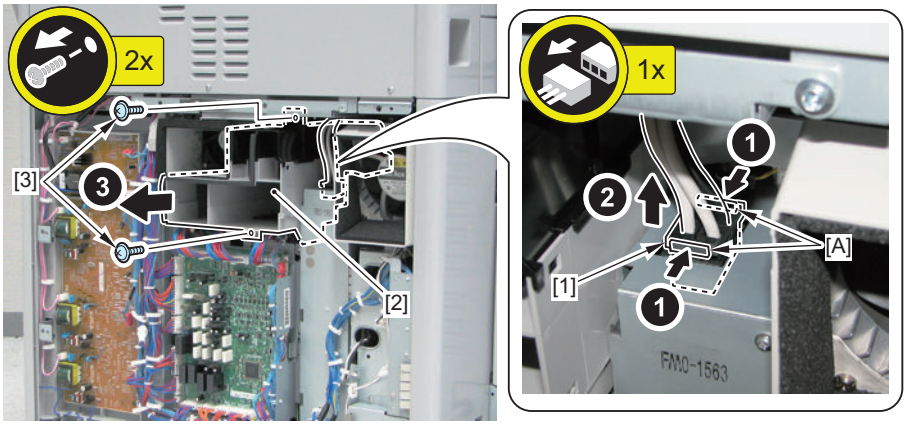


■ Preparation

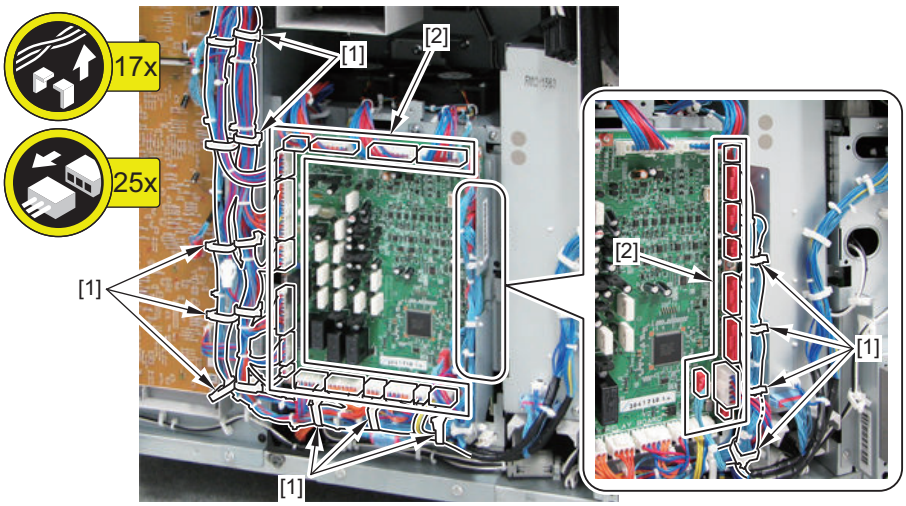
1. **Removing the Rear Lower Cover**"Removing the Rear Lower Cover" on page 953

■ Procedure

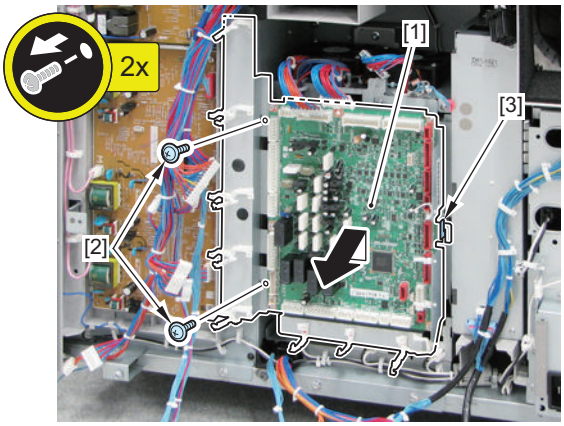
1. **Disconnect the connector [1] while pressing the [A] part, and remove the Fan Duct [2].**
   - 2 Screws [3]



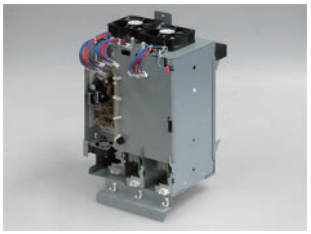
2. **Open the 17 Wire Saddles [1], and disconnect the 25 connectors [2] of the Relay PCB Unit.**



3. **Remove the Relay PCB Unit [1].**
   - 2 Screws [2]
   - 1 Hook [3]



Removing the Main Power Supply Box

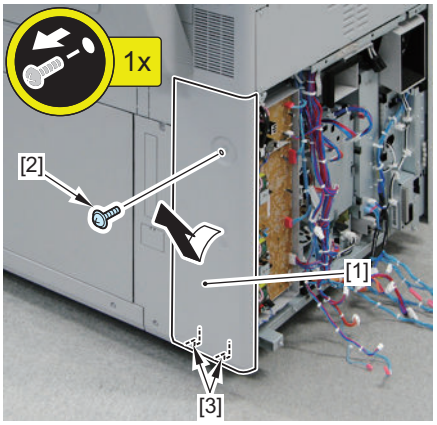


■ Preparation

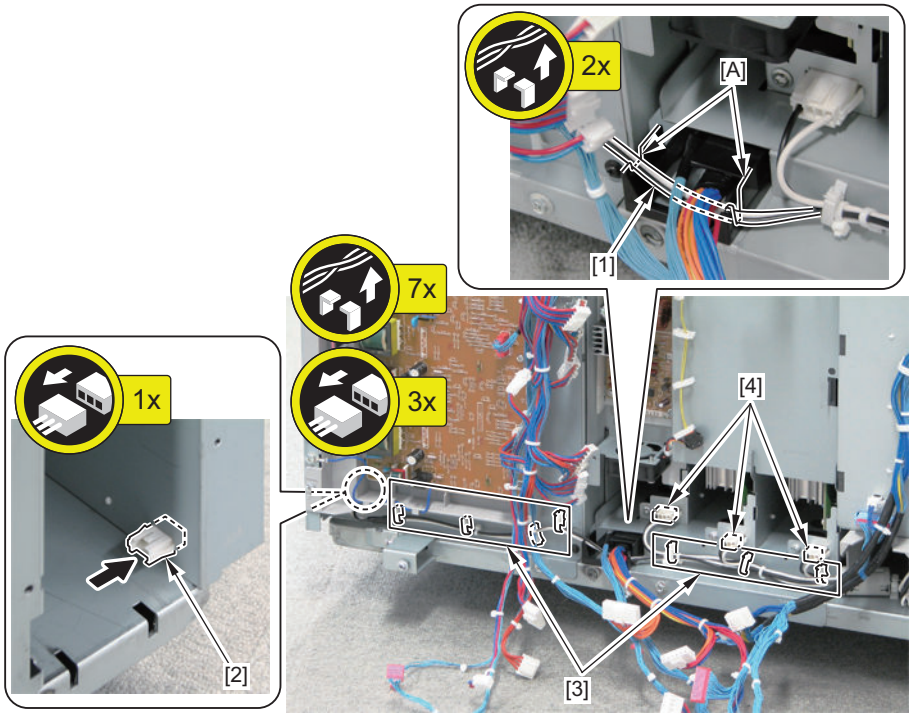
1. **Removing the Rear Lower Cover****"Removing the Rear Lower Cover" on page 953**
2. **Removing the Relay PCB Unit****"Removing the Relay PCB Unit" on page 512**

■ Procedure

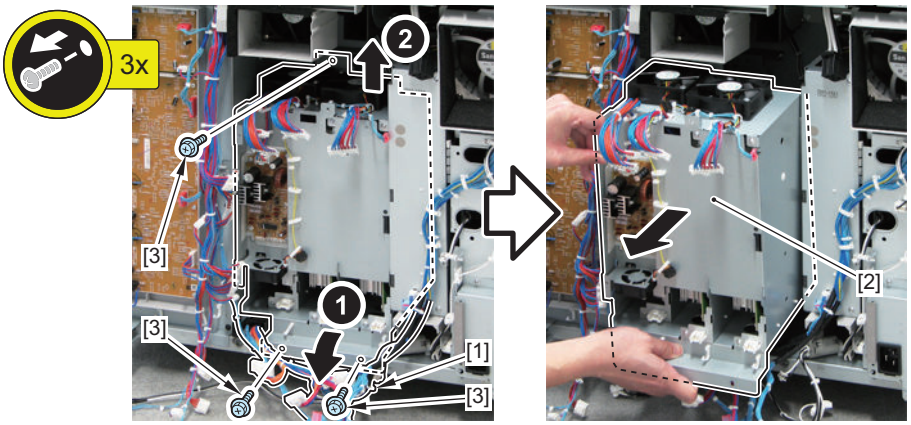
1. **Remove the Right Lower Rear Cover 1 [1].**
   - 1 Screw [2]
   - 2 Hooks [3]



2. **Free the harness [1] from the 2 guides [A], and disconnect the Relay Connector [2].**
   - 7 Wire Saddles [3]
   - 3 Connectors [4]



3. **While avoiding the harness [1], remove the Main Power Supply Box [2].**
   - 3 Screws [3]



Removing the AC Driver Box

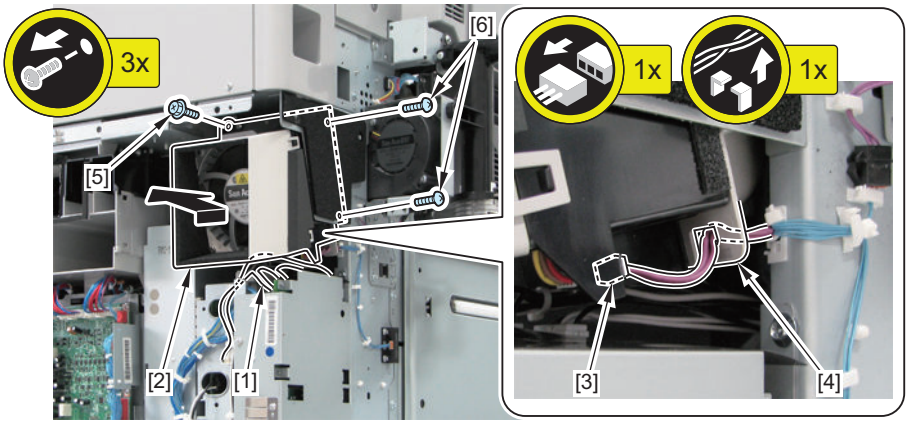
■ Preparation

1. **Removing the Rear Lower Cover****"Removing the Rear Lower Cover" on page 953**
2. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**

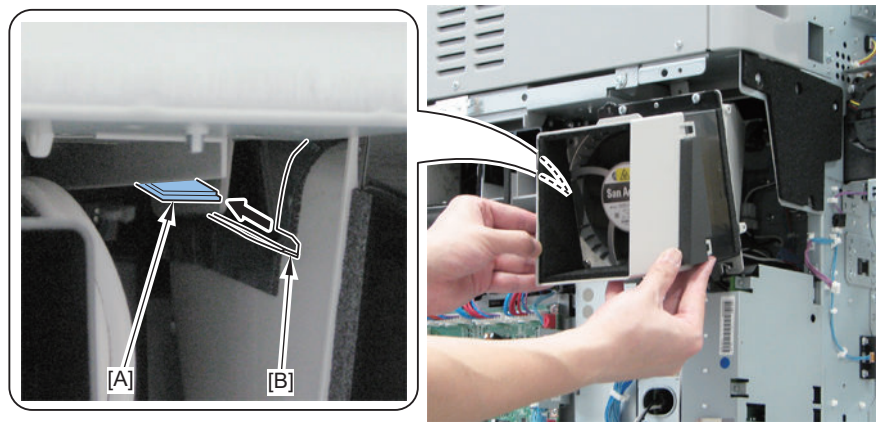
3. **Removing the Decurler Unit****"Removing the Decurler Unit" on page 910**
4. **Removing the Left Lower Rear Cover****"Removing the Left Lower Rear Cover" on page 952**

■ Procedure

1. **While avoiding the harness [1], remove the Fixing Heat Fan Unit [2].**
   - 1 Connector [3]
   - 1 Guide [4]
   - 1 Screw (black) [5]
   - 2 Screws [6]

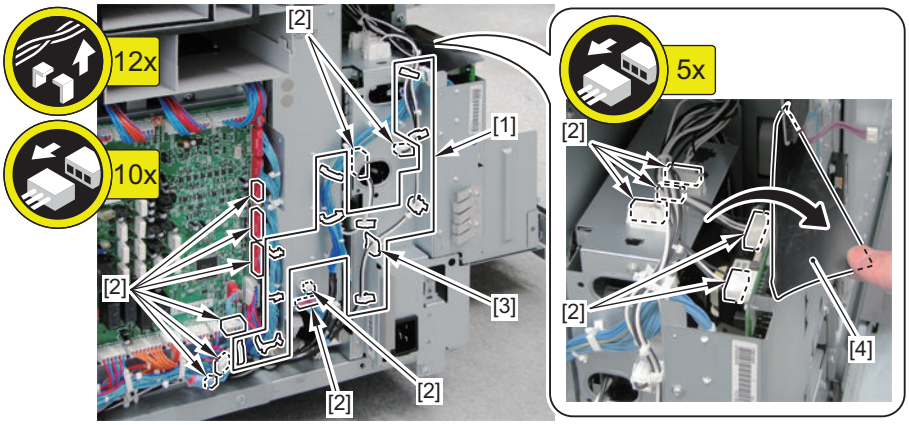


NOTE:
How to install the Fixing Heat Fan Unit
Be sure to align the cut-off [B] of the Fixing Heat Fan Unit with the plate [A] to install the unit.

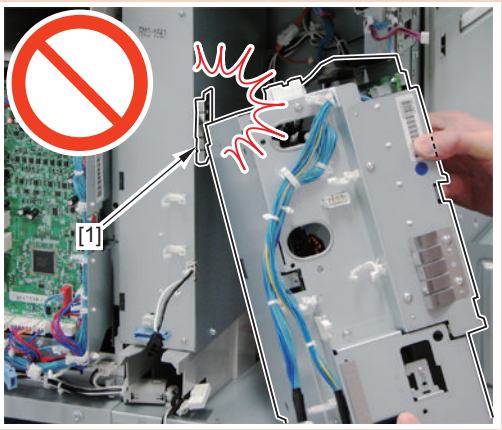


2. Open the 11 Wire Saddles [1] and the Edge Saddle [3], and disconnect the 15 connectors [2].

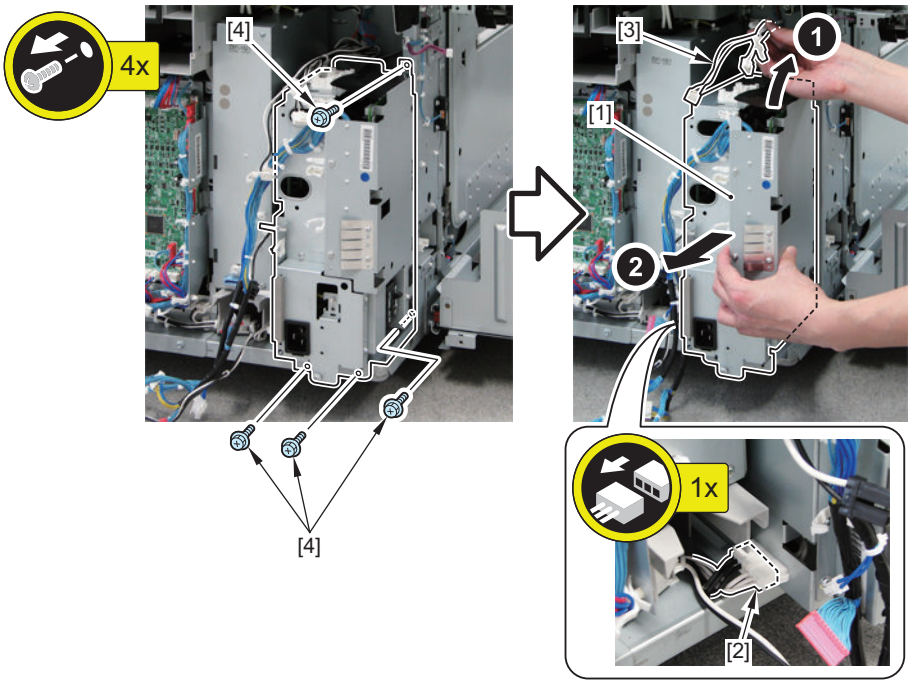
NOTE:
When disconnecting the connectors [2], flip the sheet [4] as needed.



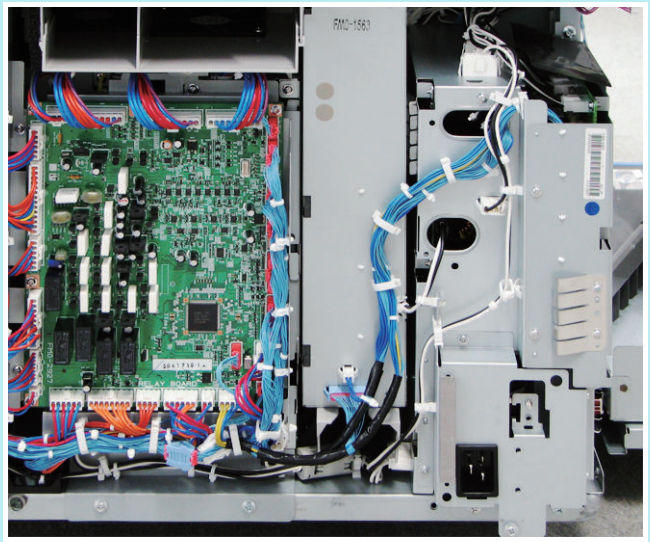
CAUTION:
When removing/installing the AC Driver Box, be sure not to deform the Grounding Plate [1].



3. **Disconnect the connector [2] while pulling out the AC Driver Box [1], and then remove the AC Driver Box [1] while lifting the harness [3].**
   - 4 Screws [4]



NOTE:
The completed assembly of the AC Driver Box is shown below.



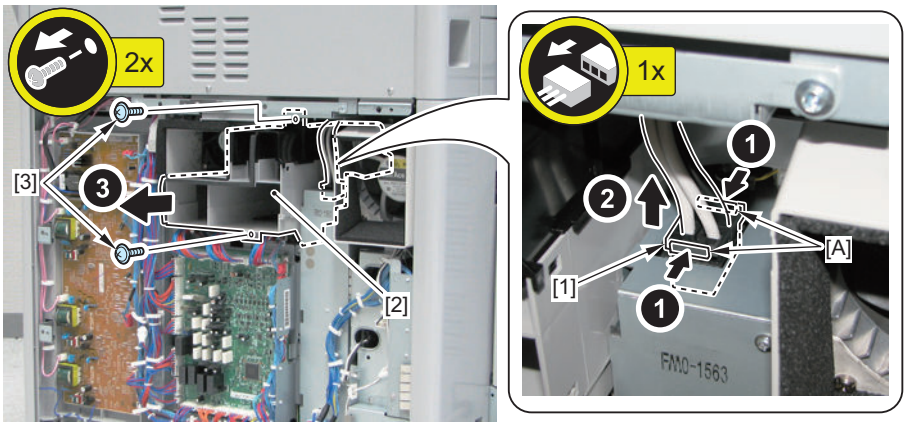
Removing the IH Power Supply PCB Box

■ Preparation

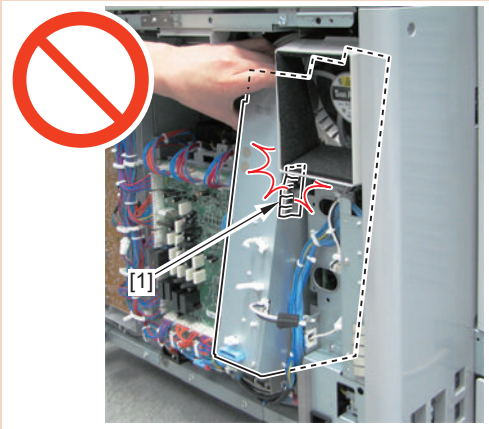
1. **Removing the Rear Lower Cover****"Removing the Rear Lower Cover" on page 953**

■ Procedure

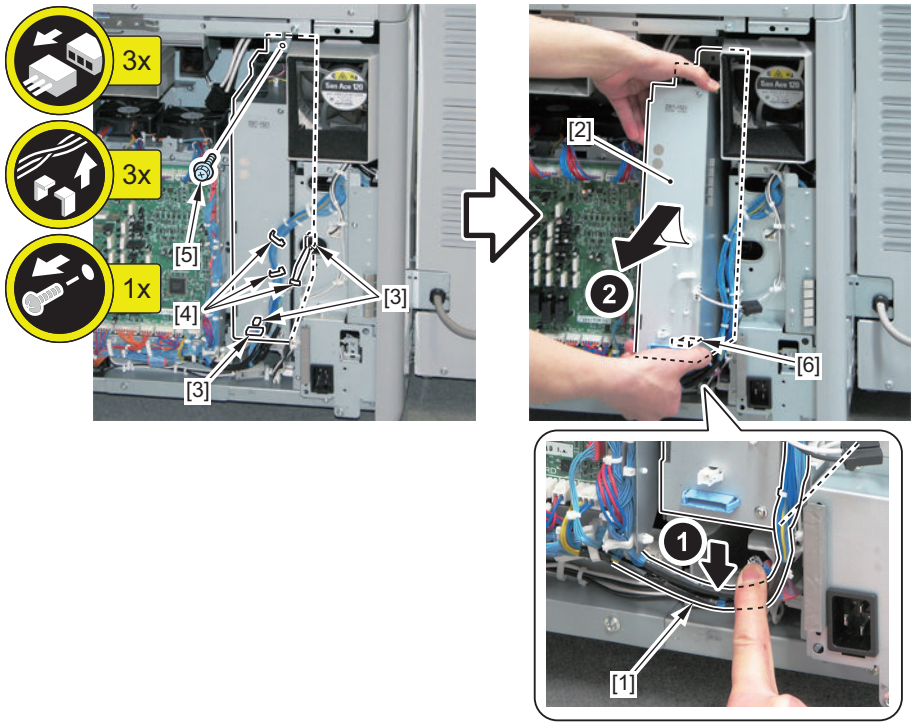
1. **Disconnect the connector [1] while pressing the [A] part, and remove the Fan Duct [2].**
   - 2 Screws [3]



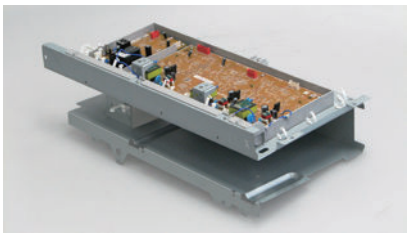
CAUTION:
When removing/installing the IH Power Supply PCB Box, be sure not to deform the Grounding Plate [1].



2. **Remove the IH Power Supply PCB Box [2] while lowering the harness [1].**
   - 3 Connectors [3]
   - 3 Wire Saddles [4]
   - 1 Screw [5]
   - 1 Hook [6]



Removing the Primary Charging High Voltage PCB Box

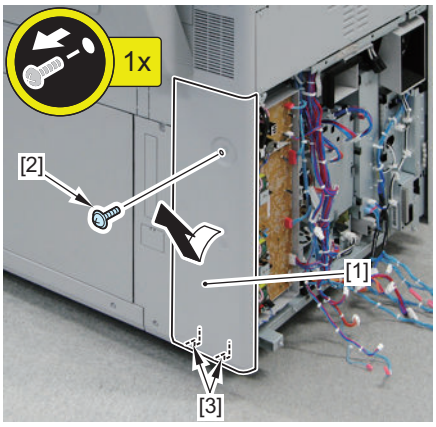


■ Preparation

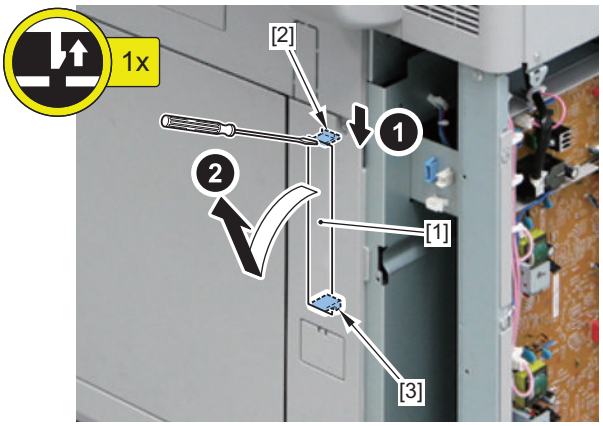
1. **Removing the Rear Lower Cover****"Removing the Rear Lower Cover" on page 953**

■ Procedure

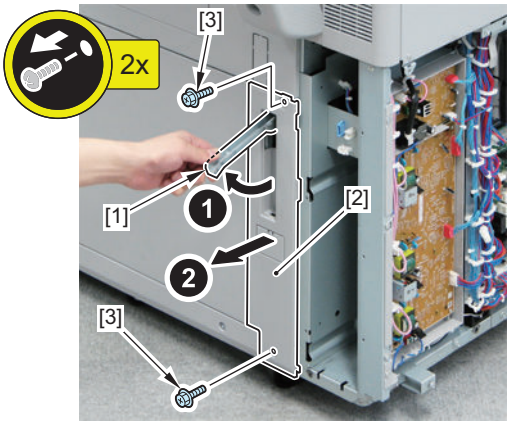
1. **Remove the Right Lower Rear Cover 1 [1].**
   - 1 Screw [2]
   - 2 Hooks [3]



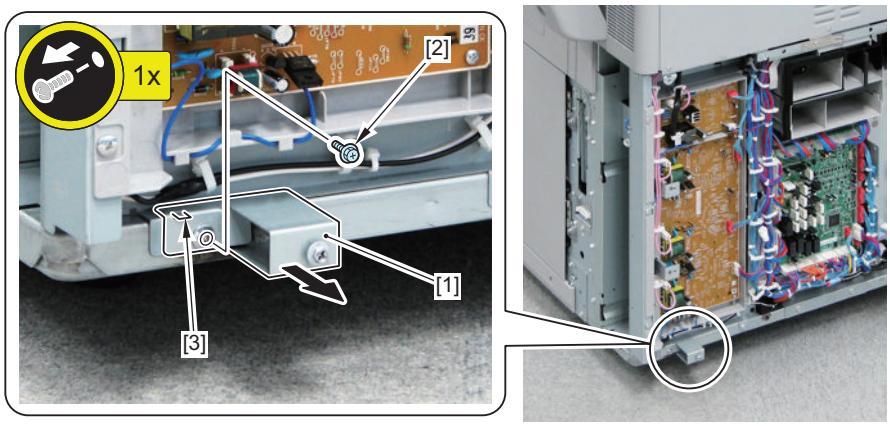
2. **Remove the Handle Cover [1].**
   - 1 Claw [2]
   - 1 Hook [3]



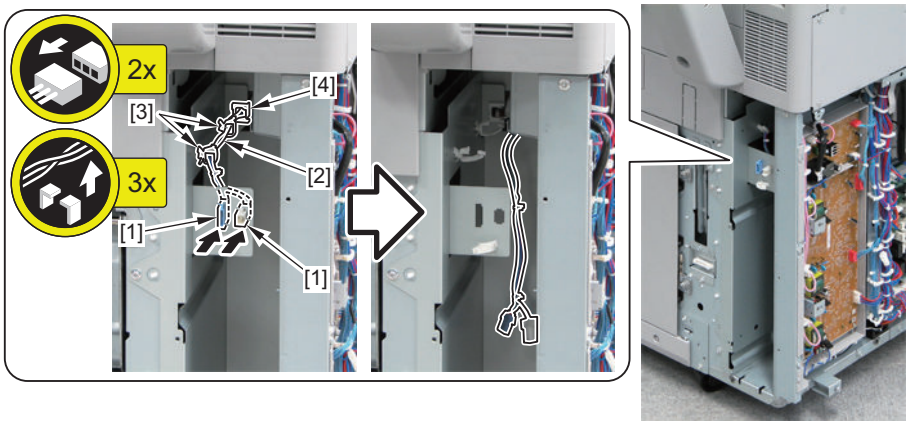
3. **Lift the handle [1], and remove the Right Lower Cover [2].**
   - 2 Screws [3]



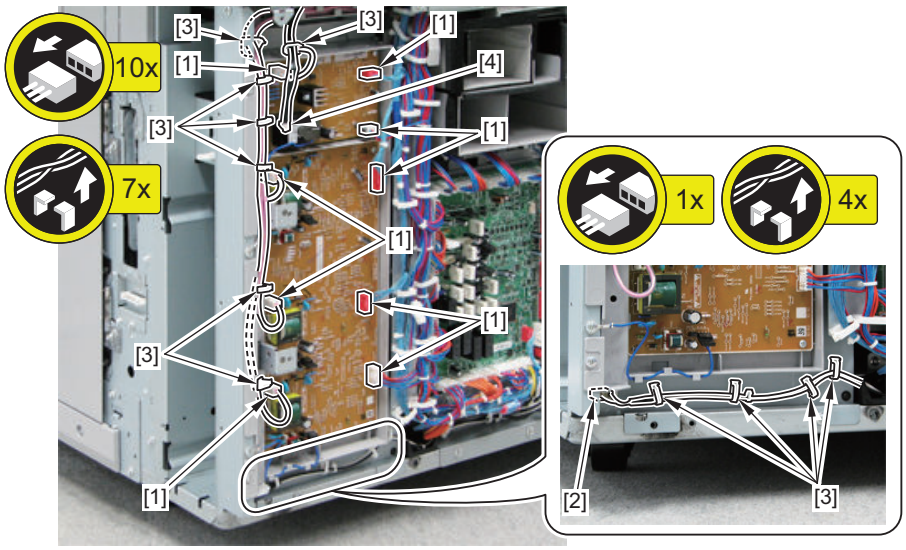
4. **Remove the Fixation Plate [1].**
   - 1 Screw [2]
   - 1 Boss [3]



5. **Disconnect the 2 Relay Connectors [1], and free the harness [2].**
   - 2 Wire Saddles [3]
   - 1 Edge Saddle [4]

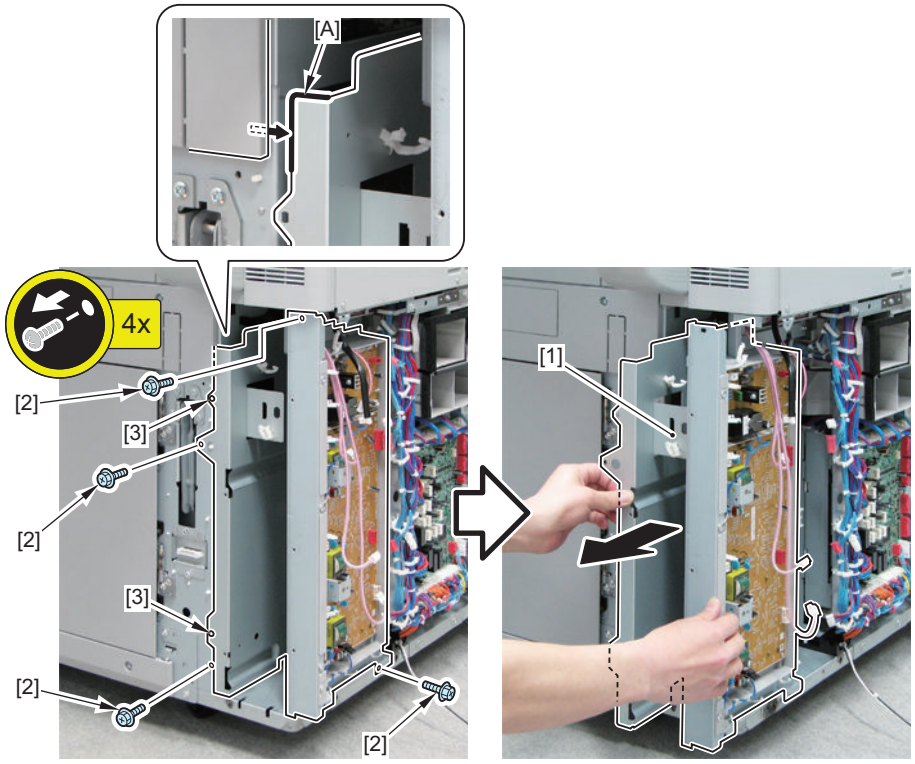


6. **Disconnect the 9 connectors [1] on the Primary Charging High Voltage PCB.**
   - 1 Relay Connector [2]
   - 11 Wire Saddles [3]
   - 1 Fasten Terminal [4]

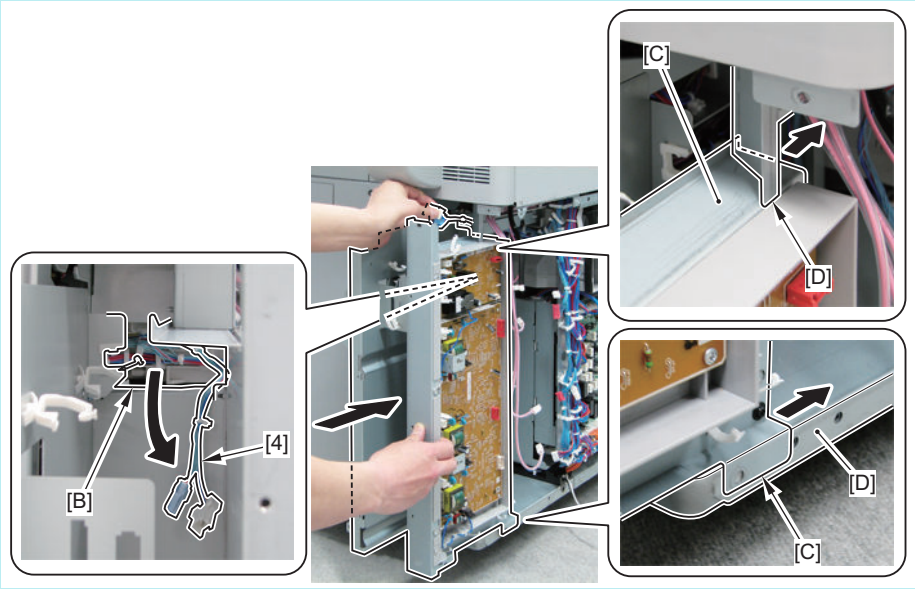


7. Remove the plate [A], and remove the Primary Charging High Voltage PCB Box [1].

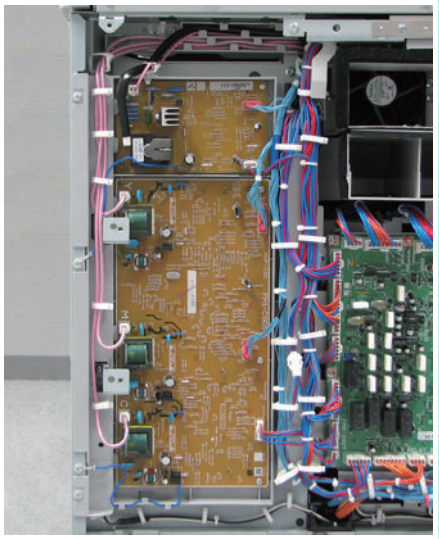
- 4 Screws [2]
- 2 Bosses [3]



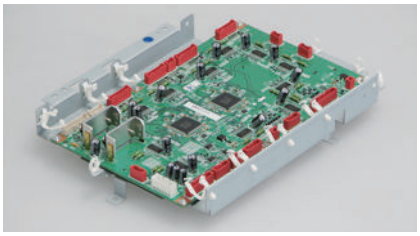
NOTE:
How to install the Primary Charging High Voltage PCB Box
Be sure to pass the harness [4] through the plate [B] and align the 2 [C] parts of the Primary Charging High Voltage PCB Box with the 2 plates [D] to install the box.



NOTE:
The completed assembly of the Primary Charging High Voltage PCB Box is shown below.



Removing the Pickup Feed Driver PCB Unit

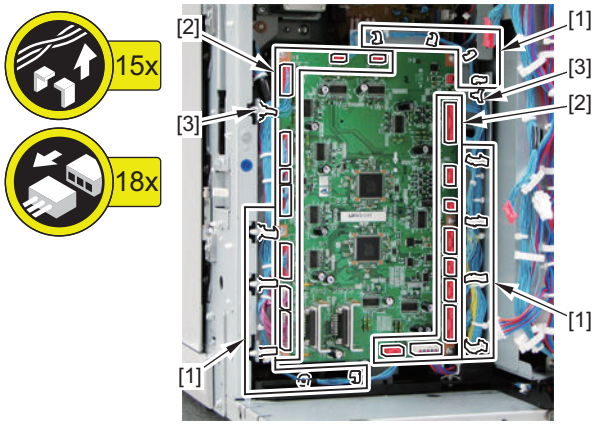


■ Preparation

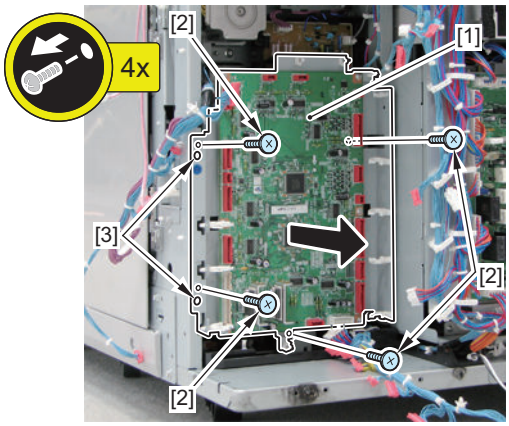
1. **Removing the Rear Lower Cover**"Removing the Rear Lower Cover" on page 953
2. **Removing the Primary Charging High Voltage PCB Box**"Removing the Primary Charging High Voltage PCB Box" on page 519

■ Procedure

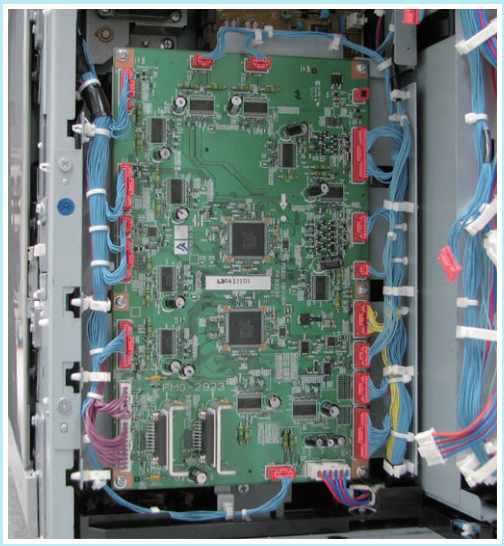
1. **Open the 13 Wire Saddles [1] and disconnect the 18 connectors [2].**
   - 2 Reuse Bands [3]



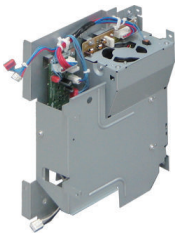
2. **Remove the Pickup Feed Driver PCB Unit [1].**
   - 4 Screws [2]
   - 2 Bosses [3]



NOTE:
The completed assembly of the Pickup Feed Driver PCB Unit is shown below.

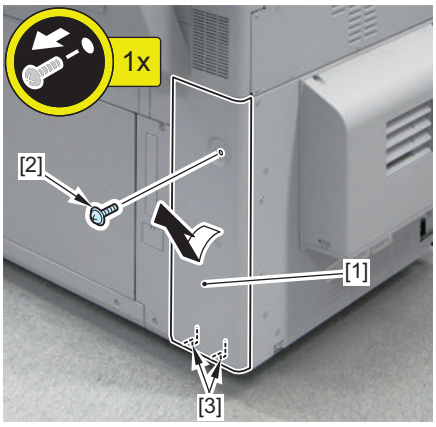


Removing the Finisher Power Supply Unit (Option)

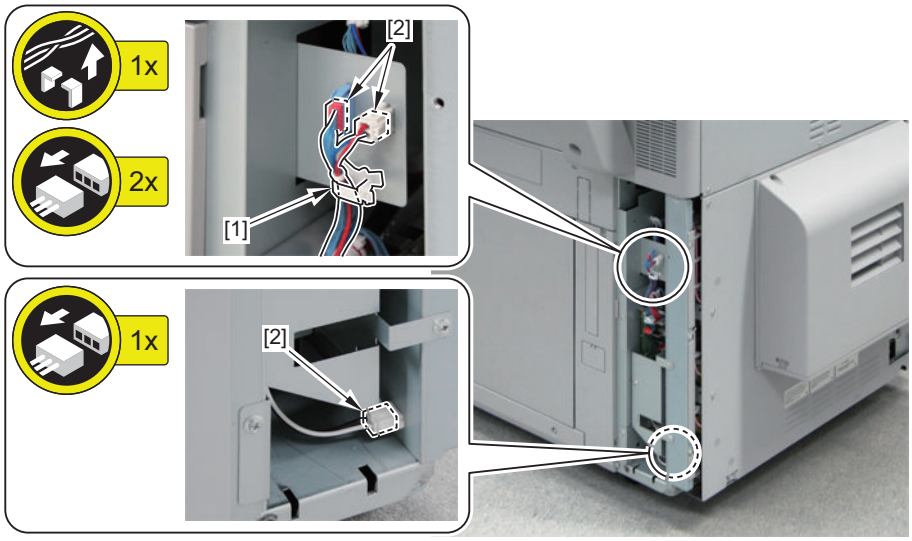


■ Procedure

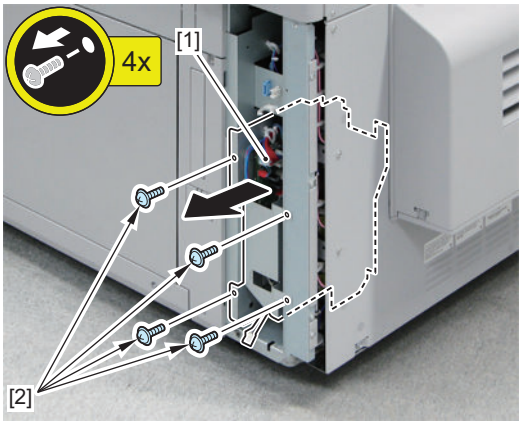
1. **Remove the Right Lower Rear Cover 1 [1].**
   - 1 Screw [2]
   - 2 Hooks [3]



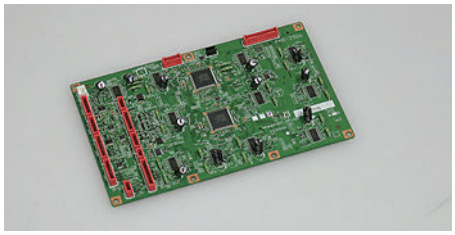
2. **Open the Wire Saddle [1], and disconnect the 3 connectors [2].**



3. **Remove the Finisher Power Supply Unit [1].**
   - 4 Screws [2]



Removing the Fixing Feed Driver PCB

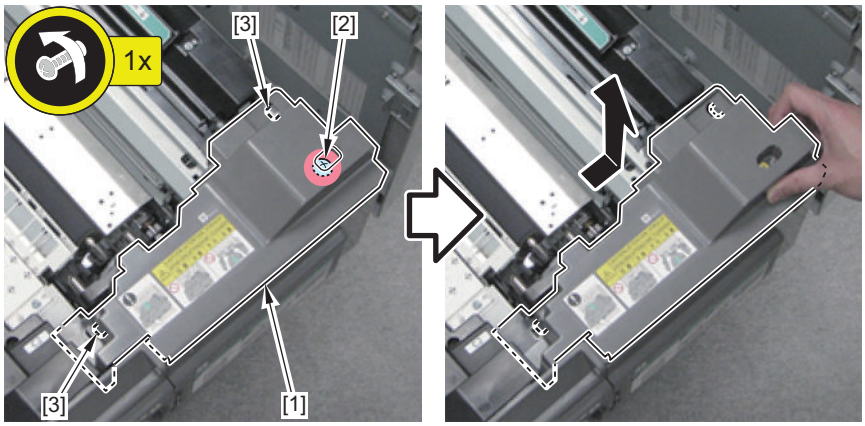


■ Preparation

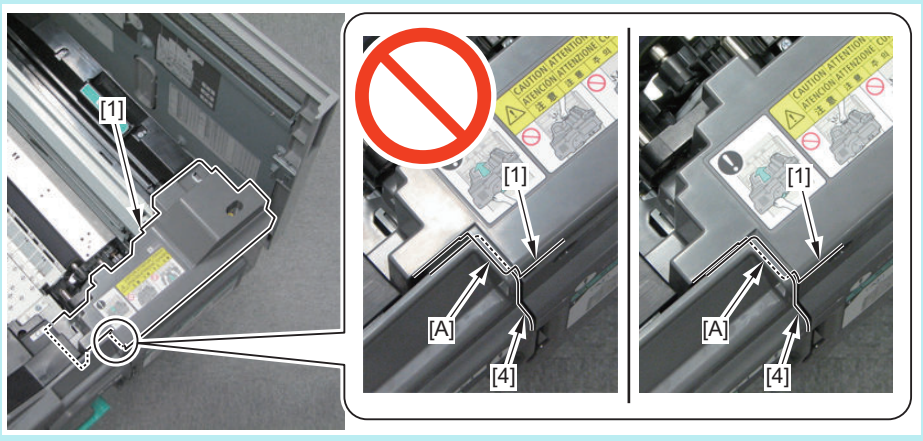
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

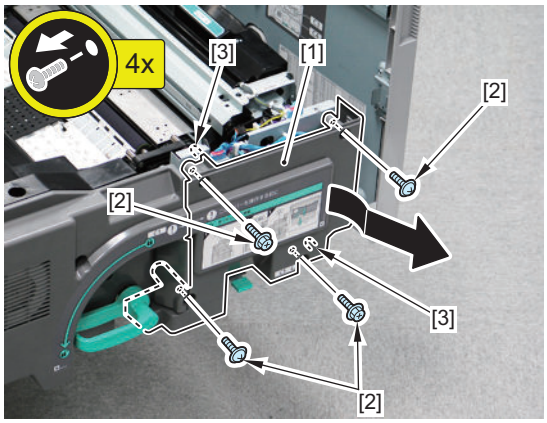
1. **Remove the Fixing Feed Sub Cover [1].**
   - 1 Screw [2] (to loosen)
   - 2 Hooks [3]



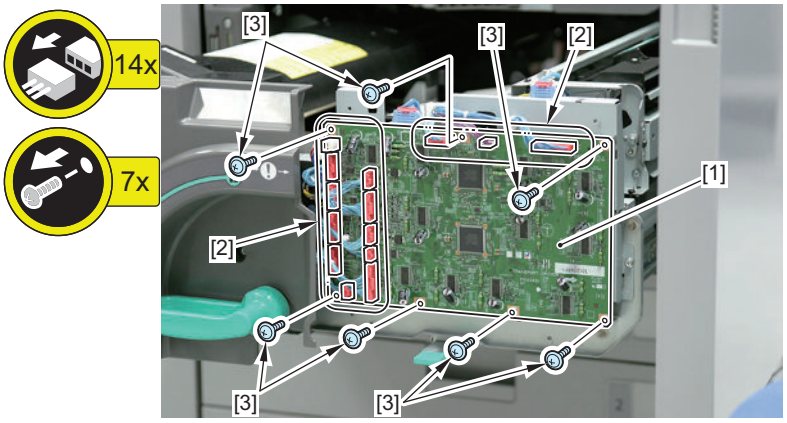
NOTE:
How to install the Fixing Feed Sub Cover
Put the [A] part of the Fixing Feed Front Left Cover [4].



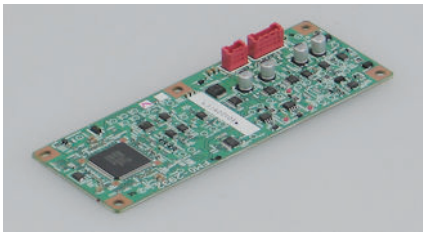
2. **Remove the Fixing Feed Front Right Cover [1].**
   - 4 Screws [2]
   - 2 Bosses [3]



3. **Remove the Fixing Feed Driver PCB [1].**
   - 14 Connectors [2]
   - 7 Screws [3]



Removing the CIS Driver PCB

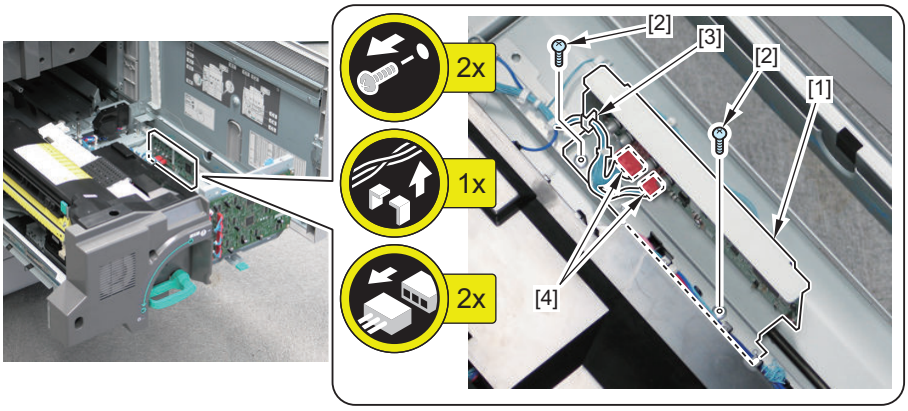


■ Preparation

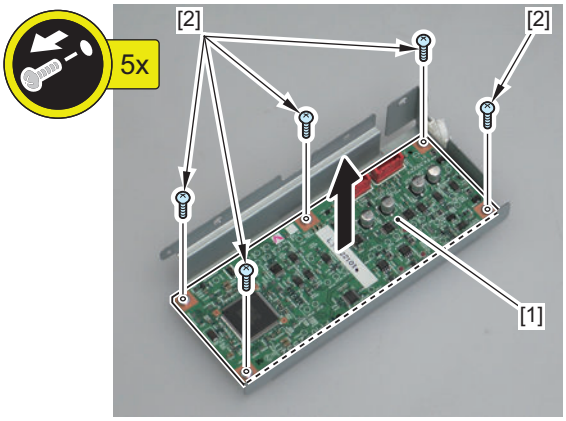
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Secondary Transfer Unit****"Removing the Secondary Transfer Unit" on page 617**
4. **Removing the Registration Unit****"Removing the Registration Unit" on page 892**

■ Procedure

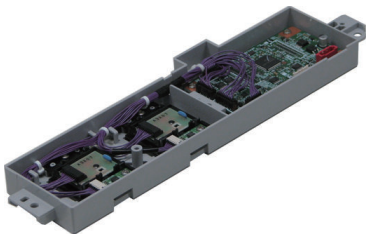
1. **Remove the CIS Driver PCB Unit [1].**
   - 2 Screws [2]
   - 1 Edge Saddle [3]
   - 2 Connectors [4]



2. **Remove the CIS Driver PCB [1].**
   - 5 Screws [2]



Removing the Color Sensor Driver PCB Unit (Option)

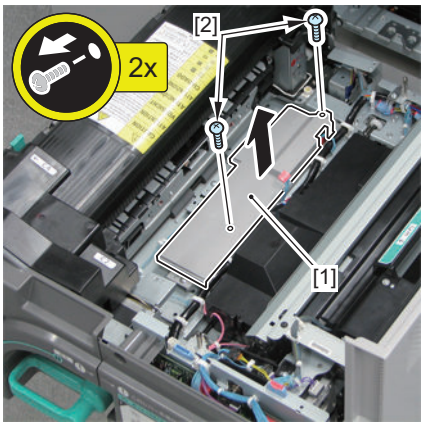


■ Preparation

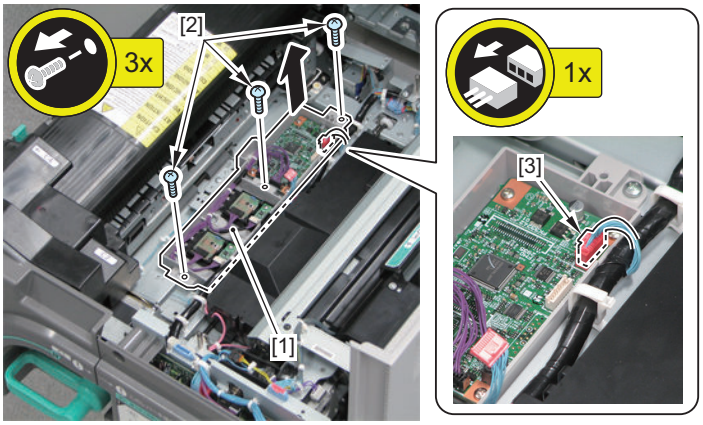
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Secondary Transfer Unit****"Removing the Secondary Transfer Unit" on page 617**
4. **Removing the Pre-fixing Feed Unit****"Removing the Pre-fixing Feed Unit" on page 902**

■ Procedure

1. **Remove the Color Sensor Cover [1].**
   - 6 Screws [2]

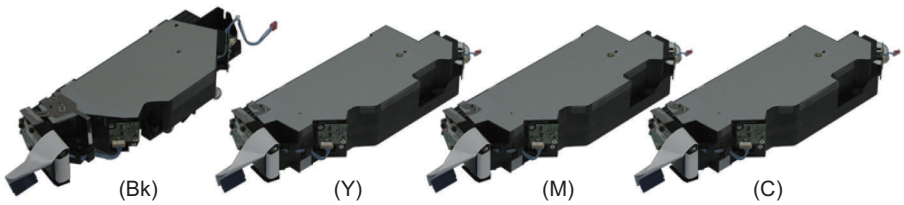


2. **Remove the Color Sensor Driver PCB Unit [1].**
   - 3 Screws [2]
   - 1 Connector [3]



Laser Exposure System

Removing the Laser Scanner Unit



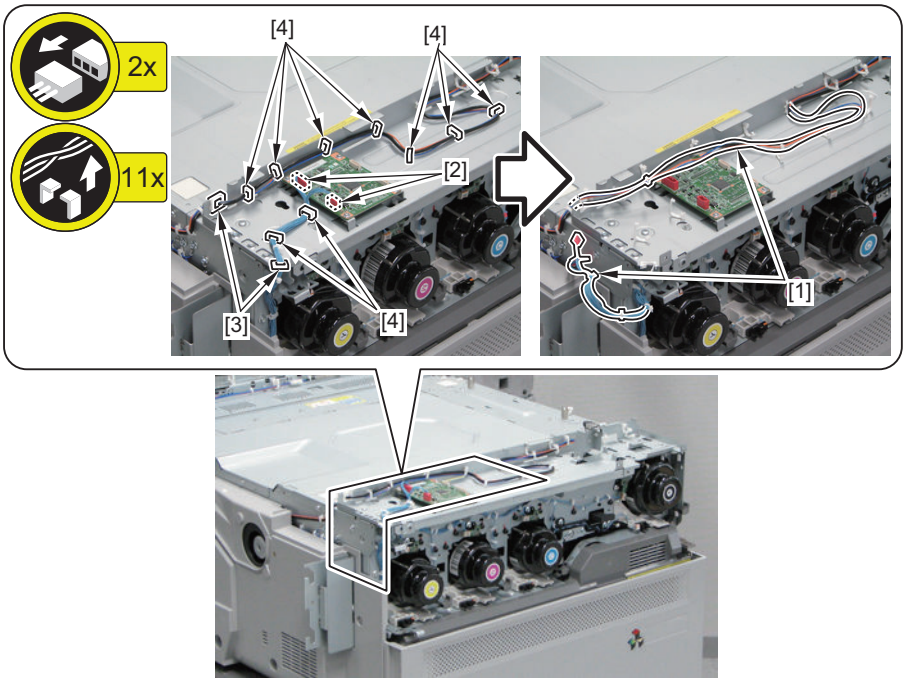
■ Preparation

NOTE:
When pickup system options are installed, be sure to disconnect them from the host machine as needed.

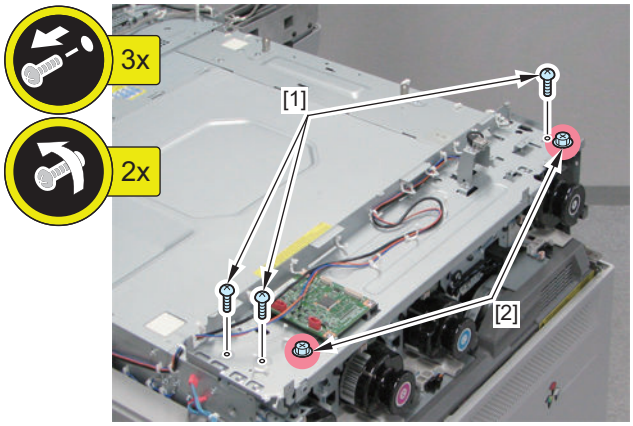
1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**
2. **Removing the Decurler Unit****"Removing the Decurler Unit" on page 910**
3. **Removing the Box Right Cover****"Removing the Box Right Cover" on page 946**
4. **Removing the Box Left Cover****"Removing the Box Left Cover" on page 947**
5. **Removing the Left Upper Cover****"Removing the Left Upper Cover" on page 950**
6. **Removing the Box Upper Cover****"Removing the Box Upper Cover" on page 948**
7. **Be sure to refer to the correct step according to the following instruction since the step differs depending on whether the Multi-purpose Tray Pickup Unit (option) is installed.**
   - If the Multi-purpose Tray Pickup Unit is not installed
     1. Removing the Right Middle Front Cover 1"Removing the Right Middle Front Cover 1" on page 944
   - If the Multi-purpose Tray Pickup Unit is installed
     1. Open the Multi-purpose Tray Pickup Unit.
8. **Removing the Right Upper Front Cover****"Removing the Right Upper Front Cover" on page 945**
9. **Close the Multi-purpose Tray Pickup Unit. (If the Multi-purpose Tray Pickup Unit is installed)**
10. **Be sure to refer to the correct step according to the following instruction since the step differs between the copier model and the printer model.**
    - In the Case of Copier Model
      1. Removing the DADF Unit + Reader Unit"Removing the DADF Unit + Reader Unit" on page 961
    - In the Case of Printer Model
      1. Removing the Printer Upper Cover
11. **Open the Front Cover.**
12. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
13. **Close the Front Cover.**
14. **Removing the Toner Container Replacement Cover****"Removing the Toner Container Replacement Cover" on page 941**
15. **Removing the Upper Front Cover****"Removing the Upper Front Cover" on page 940**

■ Procedure

1. **Free the 2 harnesses [1].**
   - 2 Connectors [2]
   - 2 Edge Saddles [3]
   - 9 Wire Saddles [4]

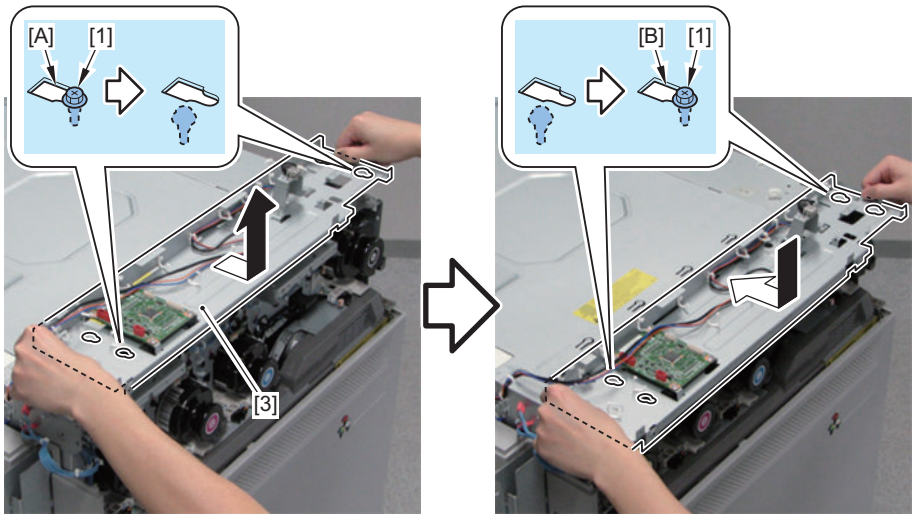


2. **Remove the 3 screws [1], and loosen the 2 Stepped Screws [2].**



3. **Remove the 2 grooves [A] of the Control Panel Plate from the 2 Stepped Screws [1].**

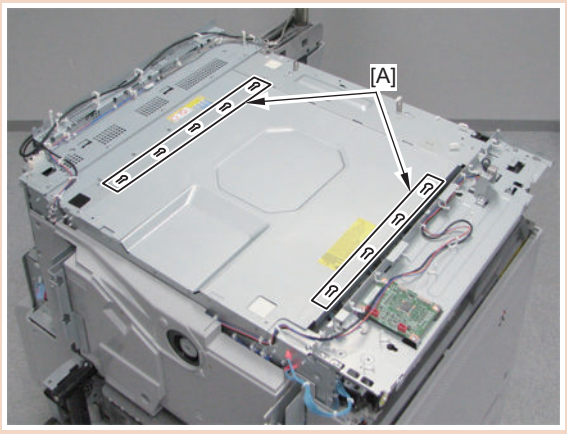
4. **Move the Control Panel Plate [3] toward the front, and hook the 2 grooves [B] of the Control Panel Plate on the 2 Stepped Screws [1].**

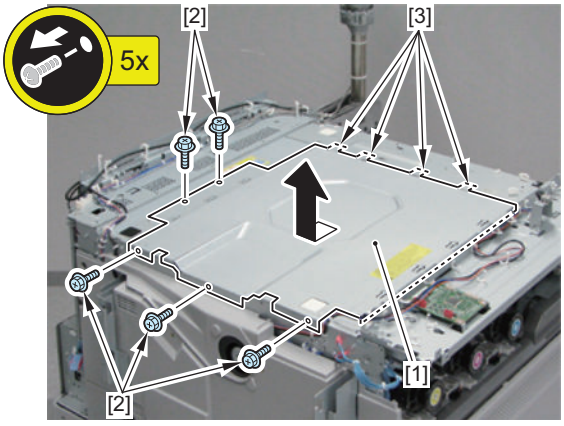


5. Remove the Top Plate Cover [1].

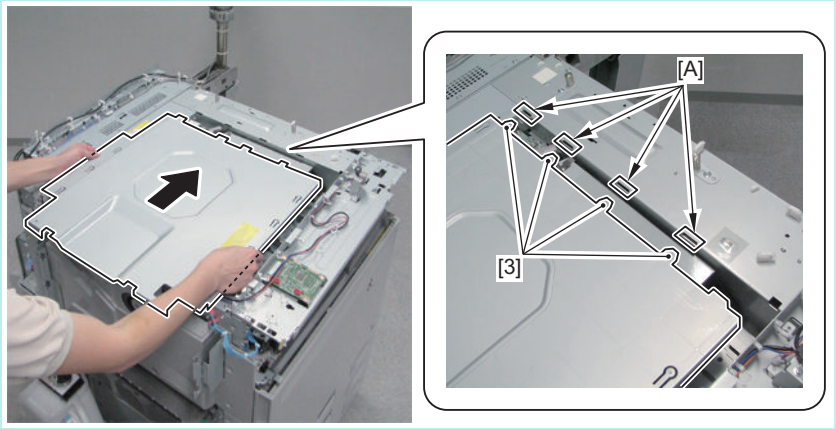
- 5 Screws [2]
- 4 Protrusions [3]

CAUTION:
Do not deform the 9 grounding contacts [A] of the Top Plate Cover when installing/removing.





NOTE:
How to install the Top Plate Cover
Be sure to install the 4 protrusions [3] of the Top Plate Cover in the holes [A] of the plate.

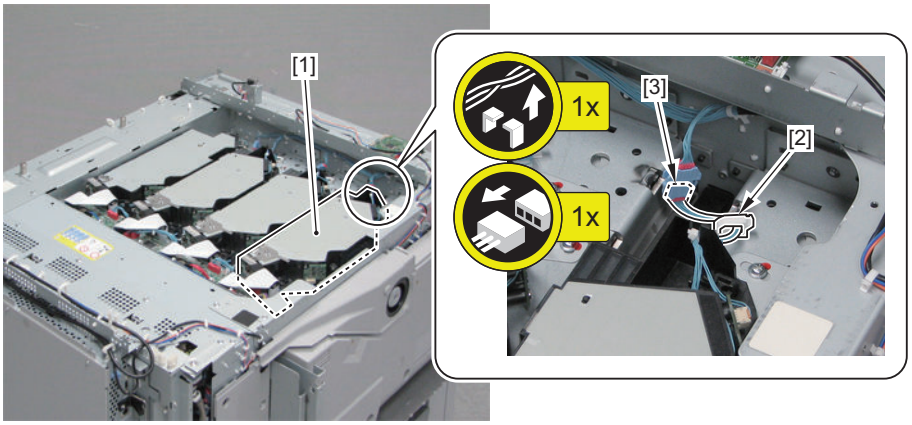


6. Remove the Laser Scanner Unit (Y)/(M)/(C)/(Bk).

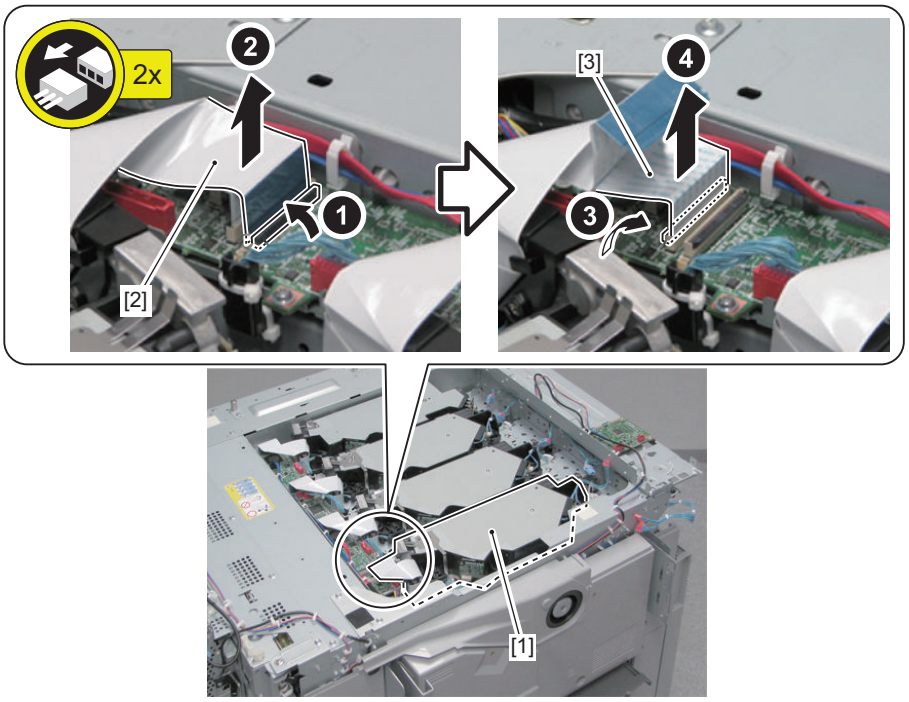
- In the case of Laser Scanner Unit (Y)/(M)/(C)

NOTE:
This procedure shows the steps to be taken in the case of Laser Scanner Unit (Y). Perform the same procedure for removing the Laser Scanner Unit (M)/(C).

1. Free the harness connected to the Laser Scanner Unit (Y) [1].
   - 1 Wire Saddle [2]
   - 1 Connector [3]

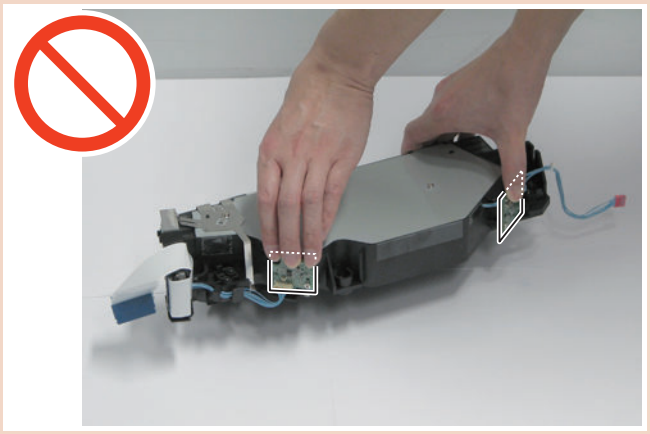


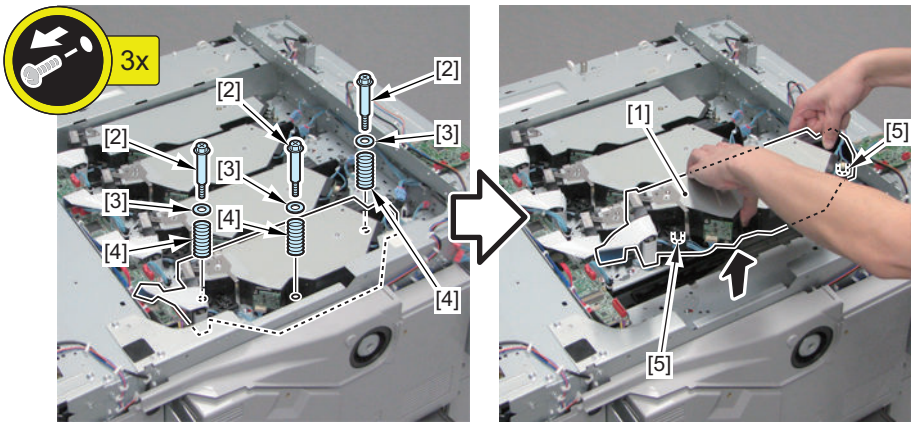
2. Free the Flat Cable [2] on the right side and the Flat Cable [3] on the left side which are connected to the Laser Scanner Unit (Y) [1].



3. Remove the Laser Scanner Unit (Y) [1].
   - 3 Stepped Screws [2]
   - 3 Washers [3]
   - 3 Springs [4]
   - 2 Bosses [5]

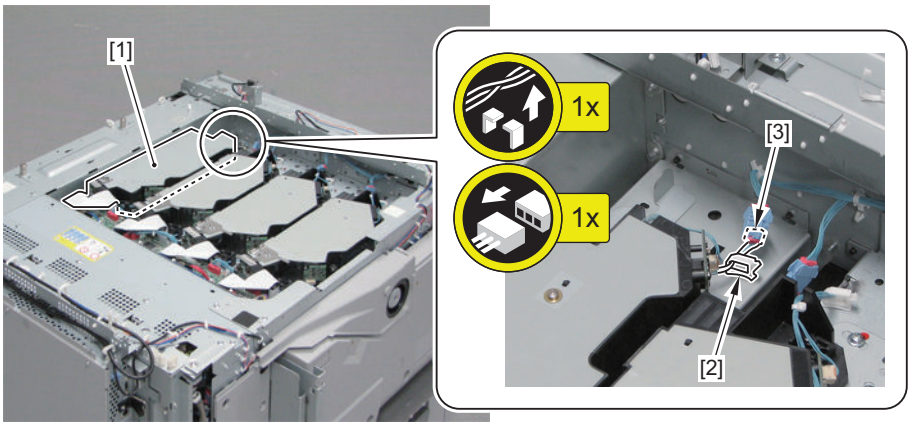
CAUTION:
Do not touch the PCB installed to the Laser Scanner Unit when disassembling/assembling.



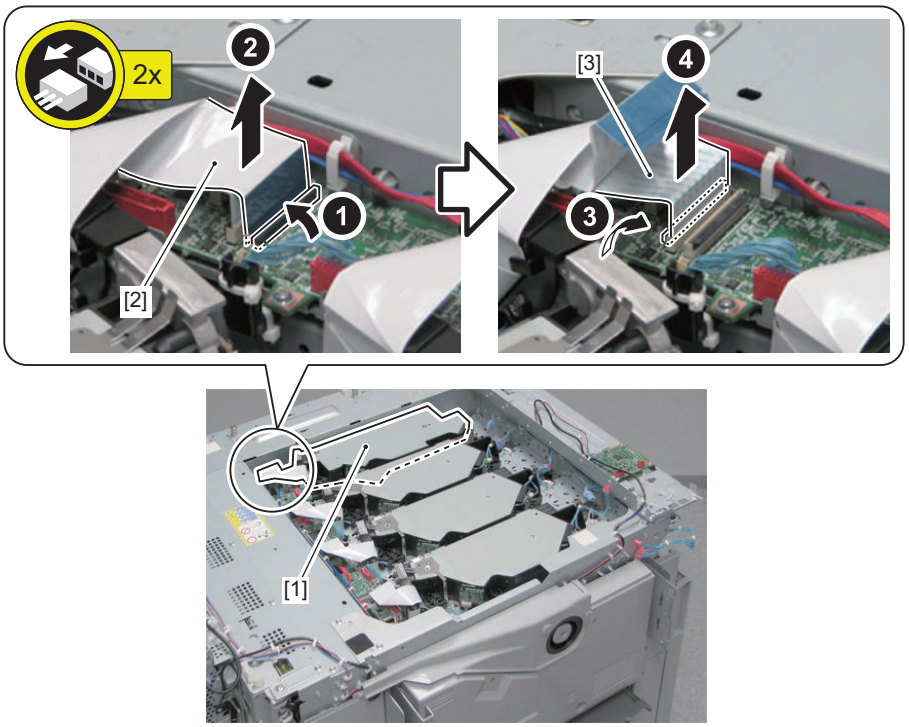


- In the case of Laser Scanner Unit (Bk)

1. Free the harness connected to the Laser Scanner Unit (Bk) [1].
   - 1 Wire Saddle [2]
   - 1 Connector [3]

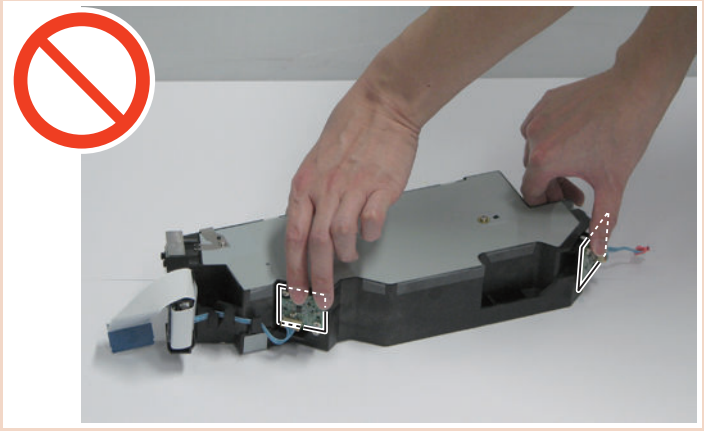


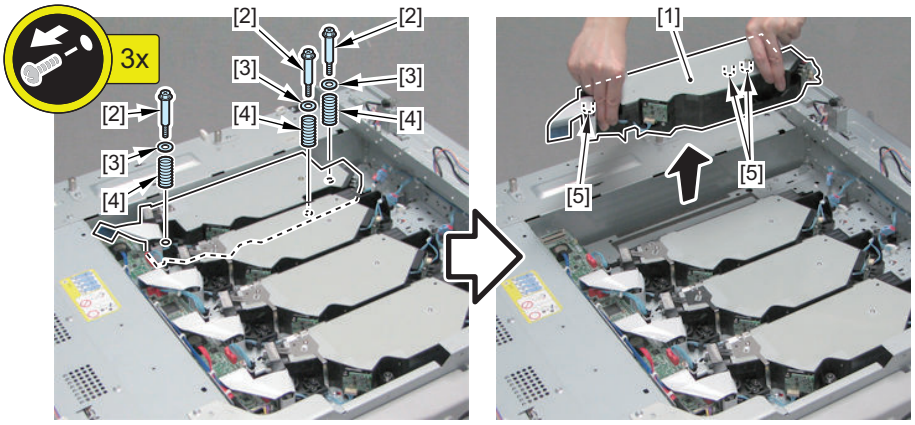
2. Free the Flat Cable [2] on the right side and the Flat Cable [3] on the left side which are connected to the Laser Scanner Unit (Bk) [1].



3. Remove the Laser Scanner Unit (Bk) [1].
   - 3 Stepped Screws [2]
   - 3 Washers [3]
   - 3 Springs [4]
   - 3 Bosses [5]

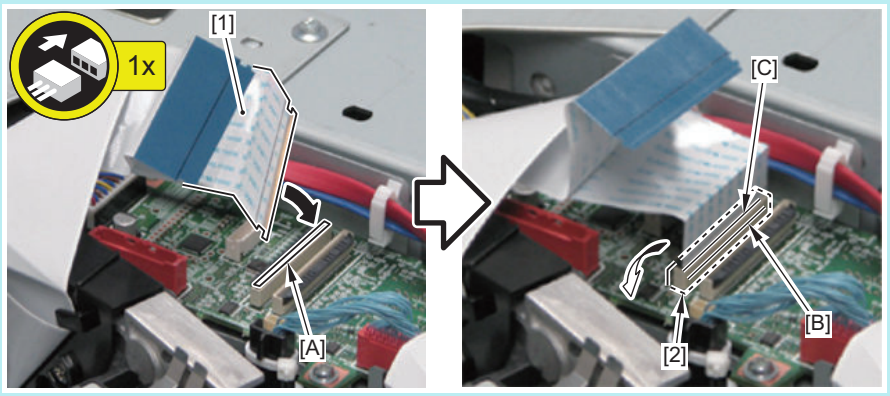
CAUTION:
Do not touch the PCB installed to the Laser Scanner Unit when disassembling/assembling.



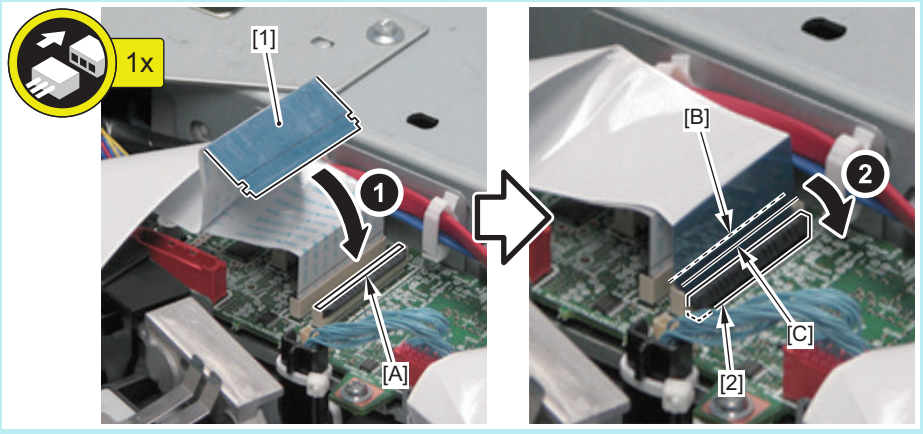


NOTE:
How to install the Flat Cable connected to the Laser Scanner Unit (Y)/(M)/(C)/(Bk)

- How to install the Flat Cable on the left side
  1. Insert the Flat Cable [1] in the space [A] of the Connector Holder until it stops.
  2. After checking that the edge [B] of the Connector Holder and the line [C] of the Flat Cable are parallel, open the Connector Lock [2].



- How to install the Flat Cable on the right side
  1. Insert the Flat Cable [1] in the space [A] of the Connector Holder until it stops.
  2. After checking that the edge [B] of the Connector Lock and the line [C] of the Flat Cable are parallel, open the Connector Lock [2].



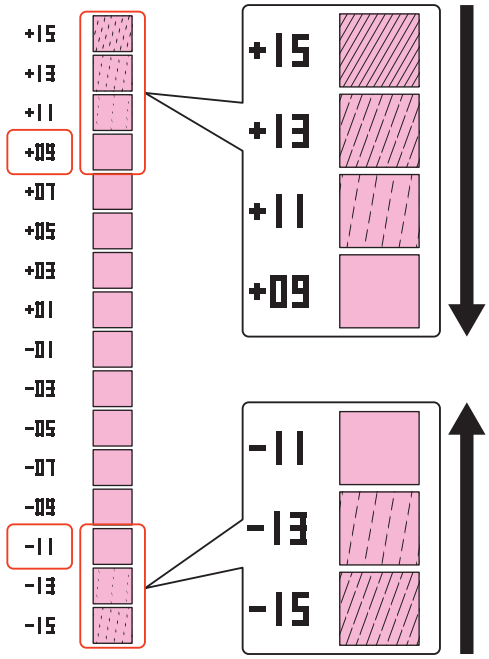
When Replacing the Laser Scanner Unit

■ Procedure

1. **Initialize the adjustment value.**
   Enter 0 for the service mode that corresponds to the color of the replaced Laser Scanner Unit.
   (COPIER > ADJUST > LASER > M-ADJ-Y, M, C, K: 0)
2. **Execute Auto Adjust Gradation.**
   Settings/Registration > Adjustment/Maintenance > Adjust Image Quality > Full Adjust
3. **Execute color displacement correction.**
   Settings/Registration > Adjustment/Maintenance > Adjust Image Quality > Auto Correct Color Mismatch
   The following moiré adjustment is for colors M, C and K. Since moiré is not visible in the color Y, there is no need for adjustment.

4. **Adjust the scanner phase.**
   Output a PG for phase adjustment (PG 23 outputs the total three sheets of test chart of M, C, and K). *Output by color is not available.
   (COPIER > TEST> PG > TYPE: 23)
   (COPIER > TEST> PG > PG-PICK: Select the paper source where A3 or LDR size paper is loaded)
   In the service mode that corresponds to the color, enter the median of the values of the areas where moiré has not occurred in the output chart.
   (COPIER > ADJUST > LASER > LSADJ1-M, C, K)
   * See below for how to check the chart.

5. **Adjust the scanner magnification ratio.**
   Output a PG for magnification ratio adjustment (PG24 outputs the total three sheets of test chart of M, C, and K). *Output by color is not available.
   (COPIER > TEST> PG > TYPE: 24)
   (COPIER > TEST> PG > PG-PICK: Select the paper source where A3 or LDR size paper is loaded)
   In the service mode that corresponds to the color, enter the median of the values of the areas where moiré has not occurred in the output chart.
   (COPIER > ADJUST > LASER > LSADJ2-M, C, K)
   How to see the chart for moiré adjustment
   Check the following for each of the 2 columns of the chart:
   1. Starting from +15, look for the location where moiré has disappeared.
   2. Starting from -15, look for the location where moiré has disappeared.
   3. Take note of the numeric value obtained by adding the two numbers and then dividing it by two.
   4. Check the other side (column) in the same manner, and take note of the numeric value.
   5. The value to be entered in service mode is the one obtained by adding the two numbers and then dividing it by two.



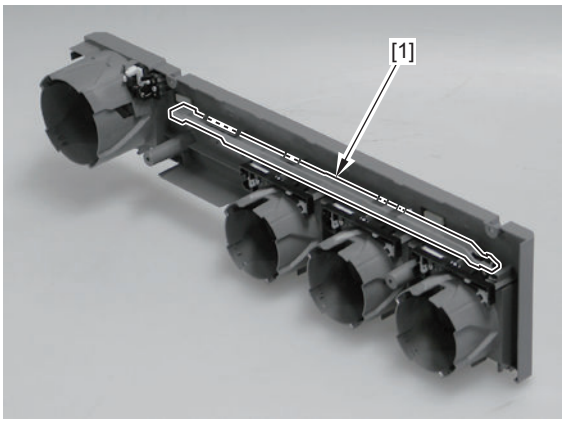
Cleaning the Dustproof Glass

■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Removing the Toner Container Replacement Cover****"Removing the Toner Container Replacement Cover" on page 941**

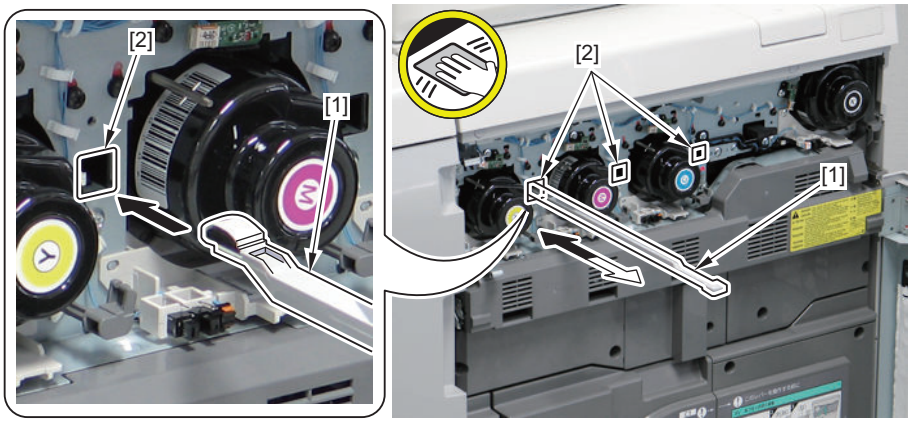
■ Procedure

1. **Remove the Dustproof Glass cleaning tool [1] from the backside of the Toner Container Replacement Unit Inner Cover.**

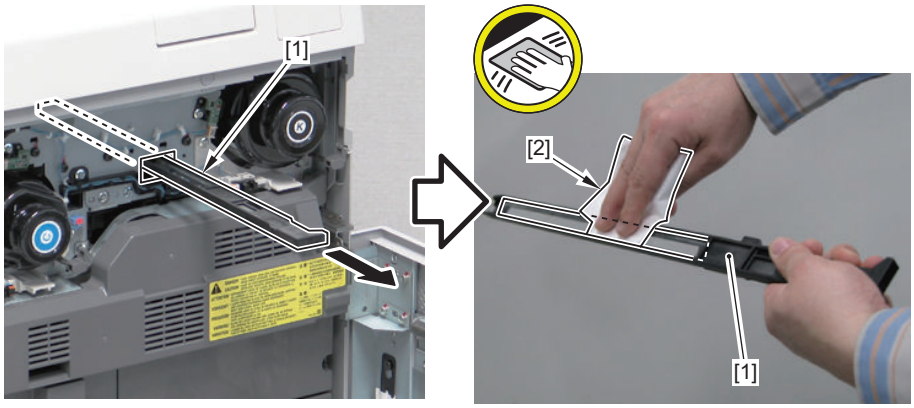


2. **Insert the Dustproof Glass cleaning tool [1] into a cleaning hole [2] and clean the Dustproof Glass on the top side.**

CAUTION:
- Push the Dustproof Glass cleaning tool until it stops, and then pull it out.
- Push and pull the tool at least one time.



3. **Pull out the Dustproof Glass [1], and clean both sides of the Dustproof Glass with lint-free paper [2] moistened with alcohol.**



CAUTION:
When installing the Dustproof Glass, insert it into the mounting hole [1] with the mark "UP" [A] upward.

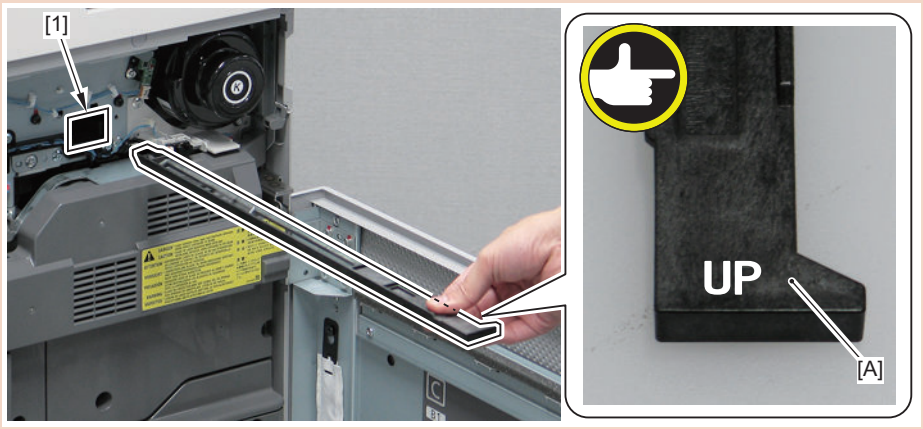


Image Formation System

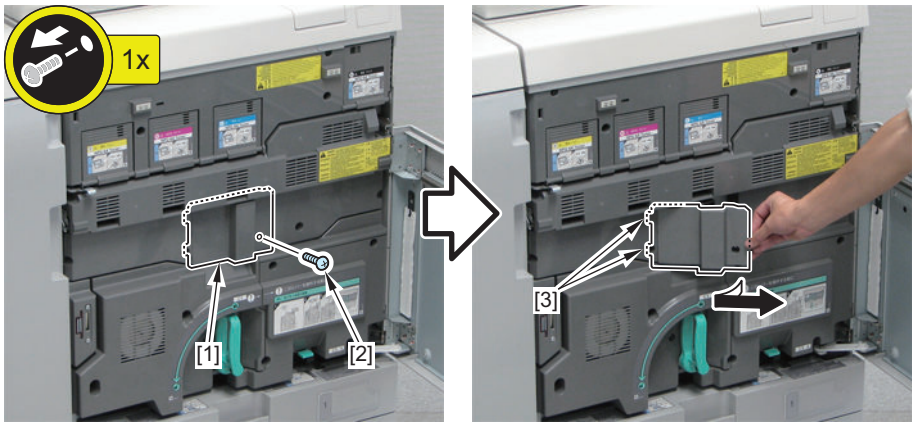
Opening the Process Unit Inner Cover

■ Preparation

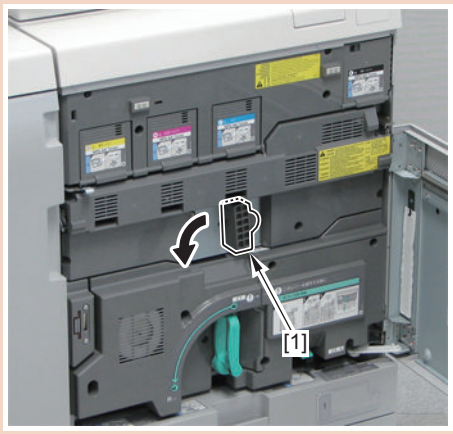
1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****“Removing the Toner Replacement Cover” on page 941**

■ Procedure

1. **Remove the ITB Front Middle Cover [1].**
   - 1 Screw [2]
   - 2 Hooks [3]

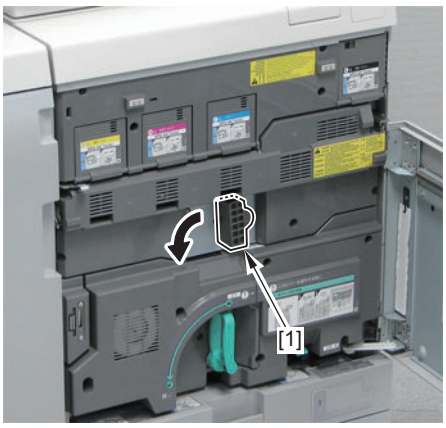


CAUTION:
If the pressure is released from the ITB by turning the ITB Pressure Release Lever [1], be sure to perform “Actions when releasing the pressure from the ITB” on page 548.

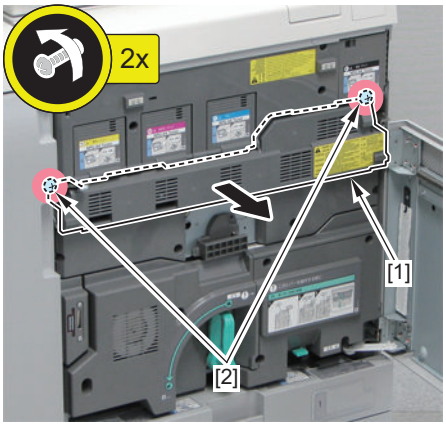


CAUTION:
Be sure to turn OFF the power of the host machine before releasing pressure from the ITB Unit.
When the ITB Pressure Release Lever is turned at power-on, the Secondary Transfer Outer Roller is put in the engaged position, and comes in contact with the ITB whose pressure has been released. Pulling out the Fixing Feed Unit in the above state causes the Secondary Transfer Outer Roller to interfere with the ITB Unit, resulting in the risk of deformed Secondary Transfer Outer Roller and the damaged ITB.
If the ITB Pressure Release Lever was turned with the power ON, be sure to assemble the machine in the reverse order, and turn OFF and then ON the host machine power (turning OFF and then ON the host machine power puts the Secondary Transfer Outer Roller back in the disengaged state).

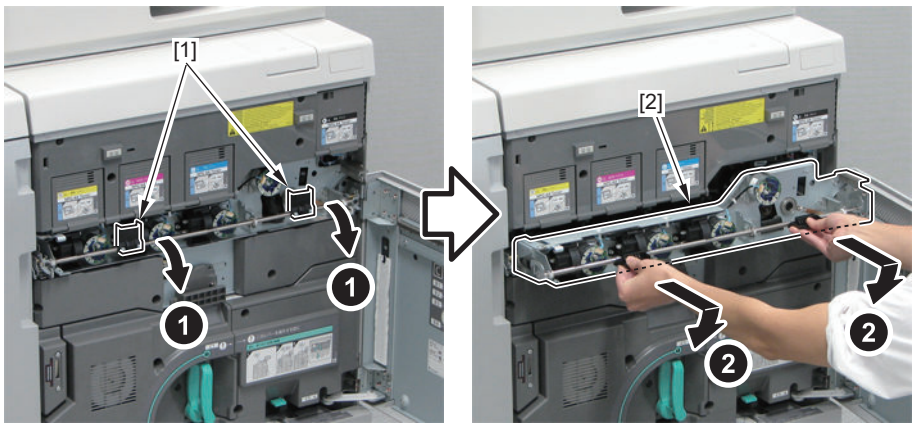
2. **Turn the ITB Pressure Release Lever [1] to release the pressure.**



3. **Remove the Process Unit Front Cover [1].**
   - 2 Screws [2] (to loosen)

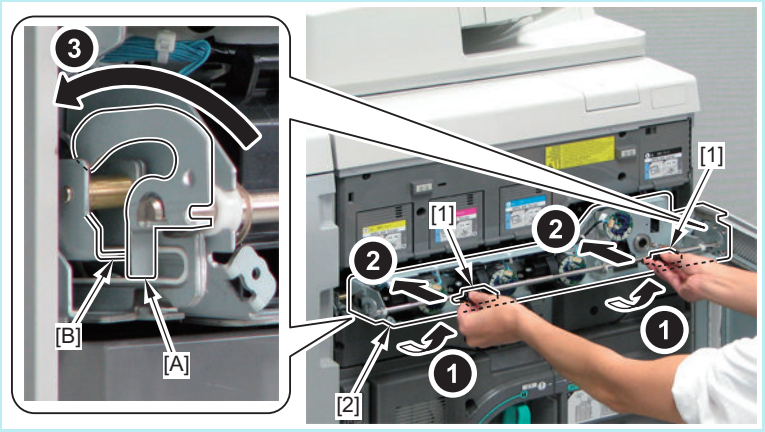


4. **Turn the 2 handles [1], pull out the Process Unit Inner Cover [2] until it stops, and open it.**

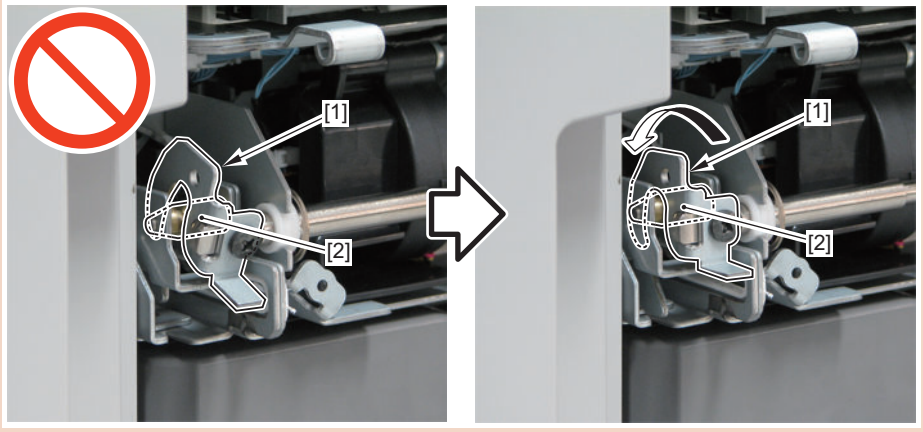


CAUTION:
Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) and the Drum Unit (Bk) inside the machine if the Process Unit Inner Cover is kept open for 5 minutes or more.
Be sure to either install the Lightproof Sheet or close the Process Unit Inner Cover and the Front Cover within 5 minutes.

NOTE:
How to close the Process Unit Inner Cover
Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the handles at a 90-degree angle further and close the Process Unit Inner Cover [2].



CAUTION:
Be sure that the 2 hooks [1] of the Process Unit Inner Cover are hooked to the 2 Hinges Shafts [2] of the machine so that the cover is locked.



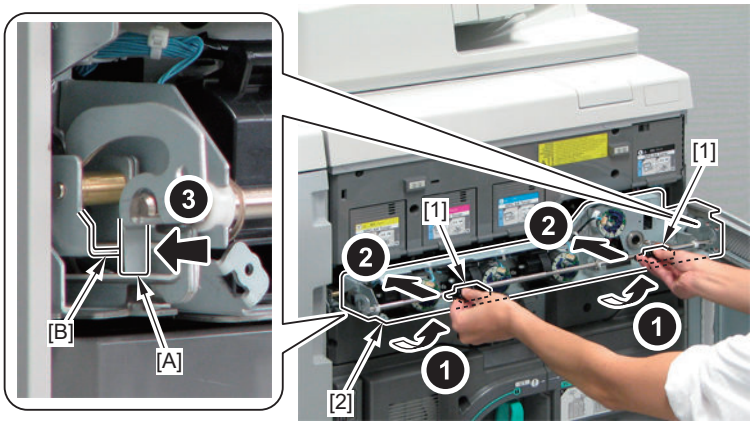
Closing the Process Unit Inner Cover

■ Preparation

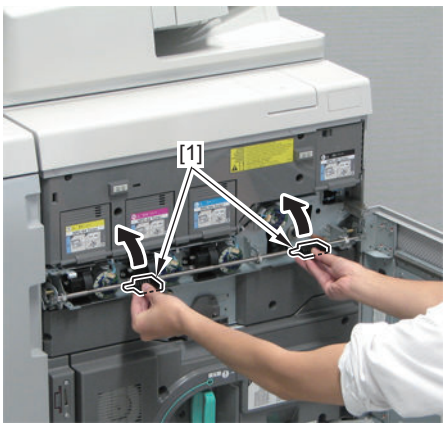
1. Open the Front Cover.
2. Removing the Toner Replacement Cover"Removing the Toner Replacement Cover" on page 941
3. Open the Process Unit Inner Cover."Opening the Process Unit Inner Cover" on page 542

■ Procedure

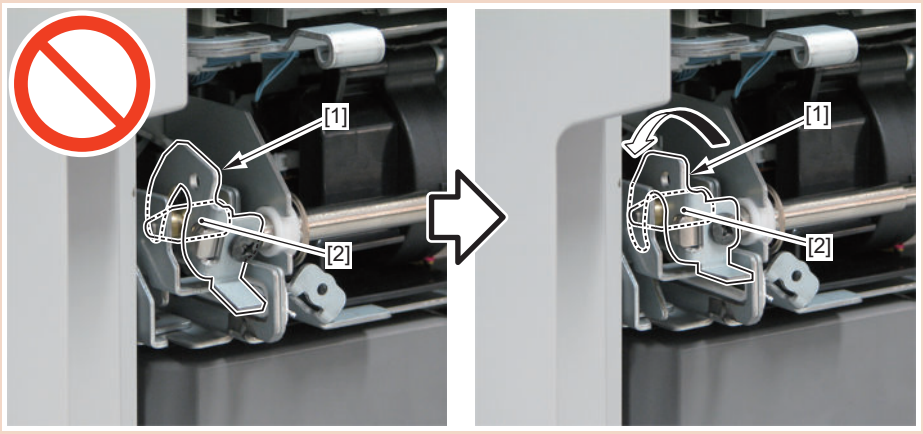
1. Hold the 2 handles [1] and raise the Process Unit Inner Cover [2].
2. Push the Process Unit Inner Cover [2], and push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder.



3. **Raise the 2 handles [1] at a 90-degree angle further and close the Process Unit Inner Cover.**



CAUTION:
Be sure that the 2 hooks [1] of the Process Unit Inner Cover are hooked to the 2 Hinges Shafts [2] of the machine so that the cover is locked.



4. **Install the Process Unit Front Cover.**
5. **Turn the ITB Pressure Release Lever to apply pressure.**

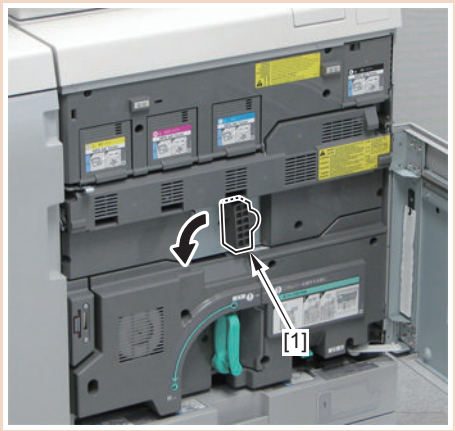
CAUTION:
When releasing pressure from the ITB Unit (when turning the ITB Pressure Release Lever), perform “Actions when releasing the pressure from the ITB” on page 548.

6. **Install the ITB Front Middle Cover.**
7. **Install the Toner Replacement Cover.**
8. **Close the Front Cover.**

Actions when releasing the pressure from the ITB

■ Procedure

CAUTION:
If the pressure is released from the ITB by turning the ITB Pressure Release Lever [1], be sure to perform the adjustment described in this procedure.



1. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
2. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

CAUTION:
1. Be sure to turn OFF the power of the host machine before releasing pressure from the ITB Unit.
2. When releasing the pressure from the ITB Unit and pulling out the Fixing Feed Unit at the same time, be sure to pull out the Fixing Feed Unit for 50 mm or more in advance.

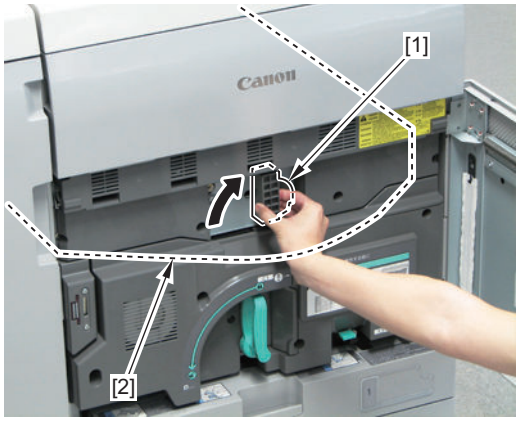
When the ITB Pressure Release Lever is turned without performing the foregoing steps 1 and 2, the Secondary Transfer Outer Roller is put in the engaged position, and comes in contact with the ITB whose pressure has been released. Pulling out the Fixing Feed Unit in the above state causes the Secondary Transfer Outer Roller to interfere with the ITB Unit, resulting in the risk of deformed Secondary Transfer Outer Roller and the damaged ITB.

- If the ITB Pressure Release Lever was turned without performing the foregoing step 1, be sure to assemble the machine in the reverse order, and turn OFF and then ON the host machine power (turning OFF and then ON the power puts the Secondary Transfer Outer Roller back in the disengaged state).
- If the ITB Pressure Release Lever was turned and the Fixing Feed Unit was pulled out without performing the foregoing steps 1 and 2, follow “How to disengage the Secondary Transfer Outer Roller manually from the engaged position” on page 548.

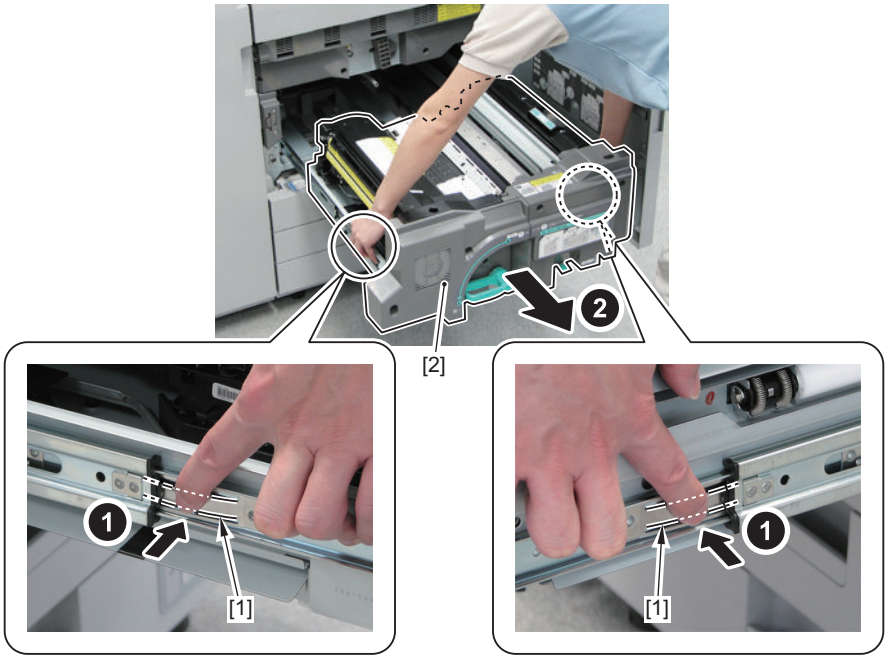
● How to disengage the Secondary Transfer Outer Roller manually from the engaged position

1. **Turn OFF the power.**

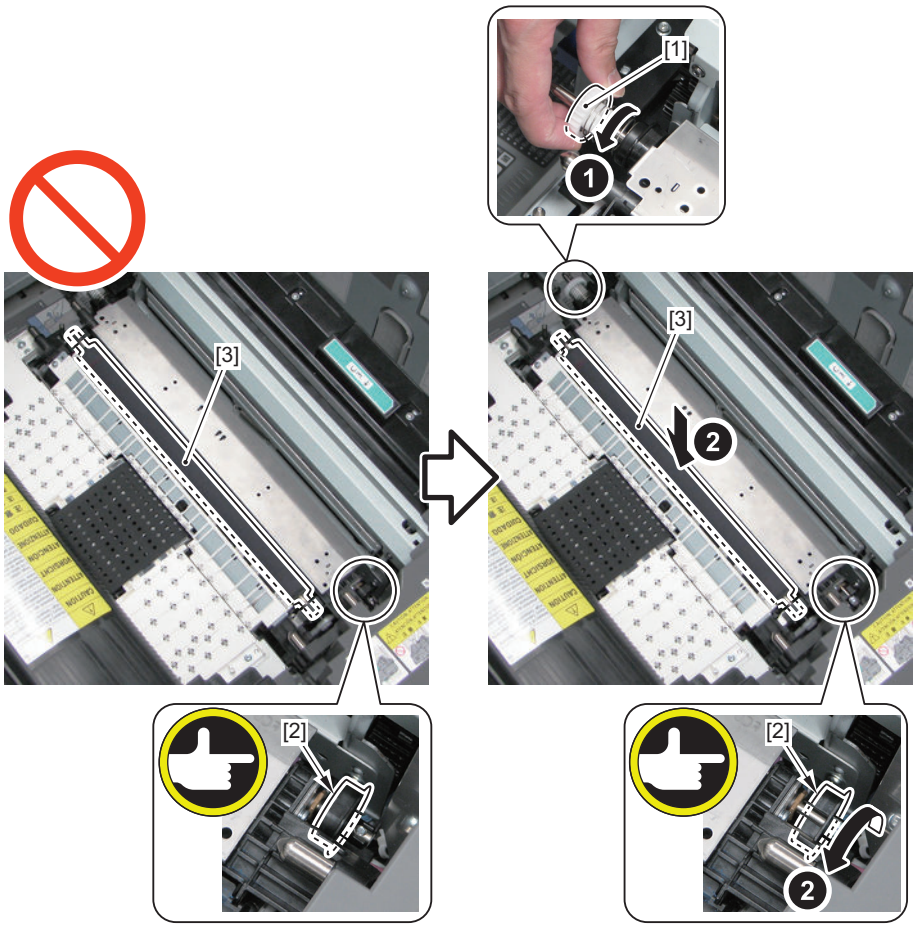
2. **Turn the ITB Pressure Release Lever [1], and put the ITB Unit [2] into the engaged state.**



3. **Press the 2 Release Springs [1] at both sides of the rail to release the locks, and further pull out the Fixing Feed Unit [2] until it stops.**



4. **Put the Secondary Transfer Outer Roller [3] into the disengaged state by turning the gear [1] and changing the direction of the cam [2].**



5. **Put the Fixing Feed Unit back in the host machine in reverse order.**
6. **Assemble the host machine in the reverse order of removal, and turn OFF and then ON the host machine power (turning OFF and then ON the power puts the Secondary Transfer Outer Roller back in the disengaged state).**

CAUTION:
Be sure to replace parts as needed since the Secondary Transfer Outer Roller may be deformed and the ITB may be damaged.

Pulling out the ITB Unit

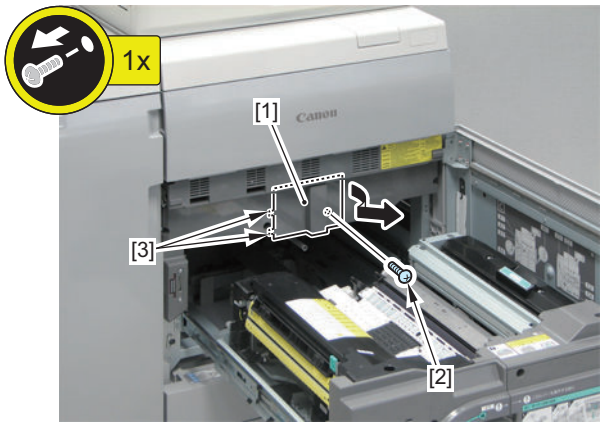
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

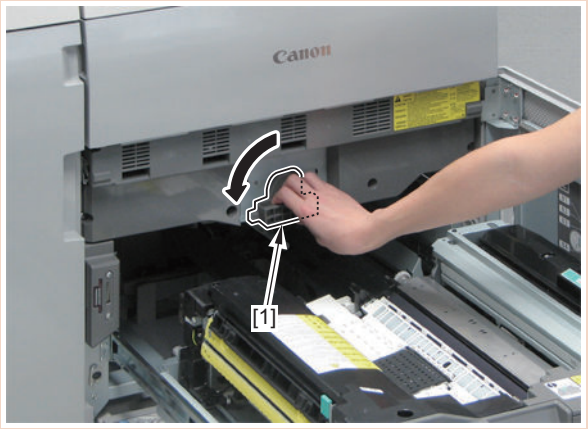
■ Procedure

CAUTION:
Be careful not to touch the ITB with fingers or damage it. (Otherwise failure may occur in the output image.)

1. **Remove the ITB Front Middle Cover [1].**
   - 1 Screw [2]
   - 2 Hooks [3]



CAUTION:
If the pressure is released from the ITB by turning the ITB Pressure Release Lever [1], be sure to perform “Actions when releasing the pressure from the ITB” on page 548.

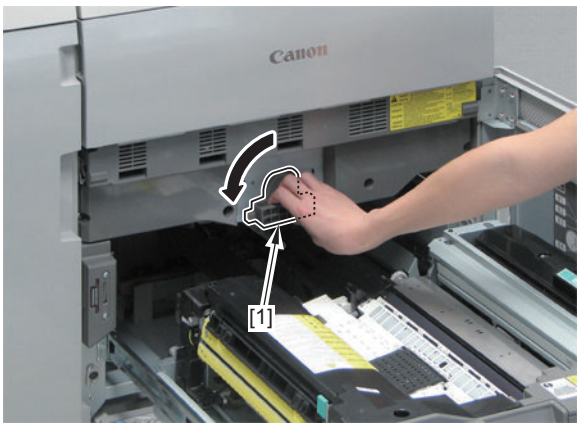


CAUTION:
1. Be sure to turn OFF the power of the host machine before releasing pressure from the ITB Unit.
2. When releasing the pressure from the ITB Unit and pulling out the Fixing Feed Unit at the same time, be sure to pull out the Fixing Feed Unit for 50 mm or more in advance.

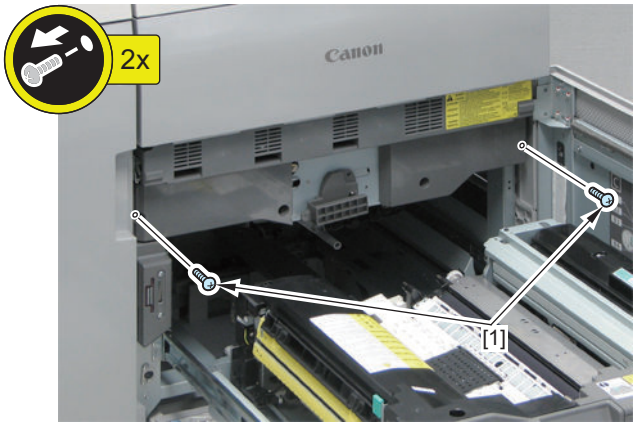
When the ITB Pressure Release Lever is turned without performing the foregoing steps 1 and 2, the Secondary Transfer Outer Roller is put in the engaged position, and comes in contact with the ITB whose pressure has been released. Pulling out the Fixing Feed Unit in the above state causes the Secondary Transfer Outer Roller to interfere with the ITB Unit, resulting in the risk of deformed Secondary Transfer Outer Roller and the damaged ITB.

- If the ITB Pressure Release Lever was turned without performing the foregoing step 1, be sure to assemble the machine in the reverse order, and turn OFF and then ON the host machine power (turning OFF and then ON the power puts the Secondary Transfer Outer Roller back in the disengaged state).
- If the ITB Pressure Release Lever was turned and the Fixing Feed Unit was pulled out without performing the foregoing steps 1 and 2, follow “How to disengage the Secondary Transfer Outer Roller manually from the engaged position” on page 548.

2. **Turn the ITB Pressure Release Lever [1] in the direction of the arrow to release the pressure.**

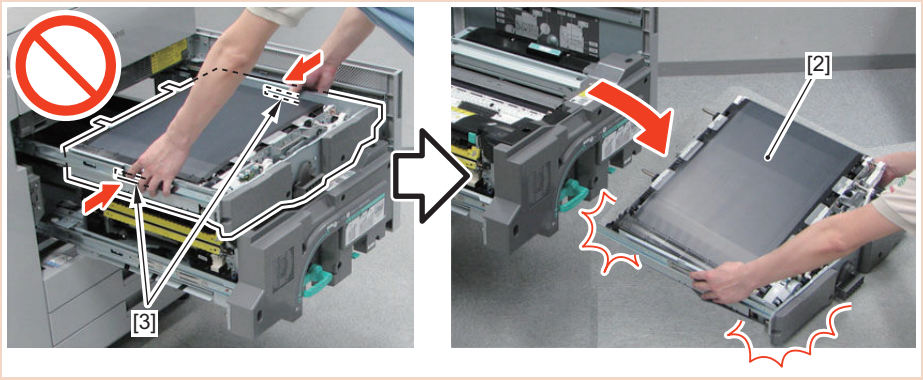


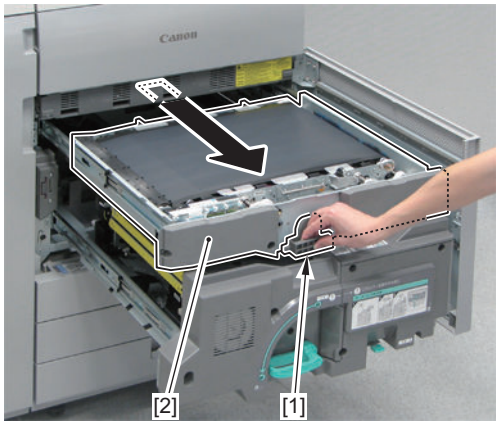
3. **Remove the 2 screws [1] of the ITB Frame.**



4. **Hold the handle [1], and pull out the ITB Unit [2].**

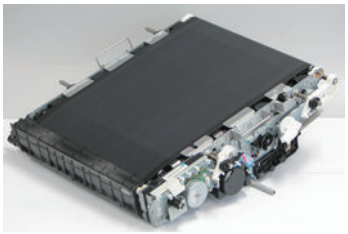
⚠ CAUTION:
Do not release the locks by pressing the 2 ITB Frame Release Springs [3] on the rails of both sides while the ITB Unit [2] is mounted. Otherwise, the ITB Unit [2] may fall.





CAUTION:
Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) and the Drum Unit (Bk) inside the machine if the ITB Unit is pulled out for 5 minutes or more.
Be sure to either install the Lightproof Sheet, or store the ITB Frame and the Fixing Feed Unit in the machine and close the Front Cover within 5 minutes.

Removing the ITB Unit



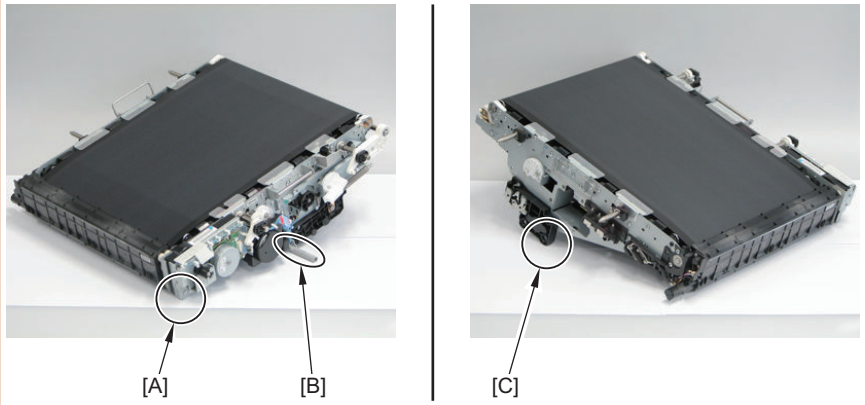
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**

■ Procedure

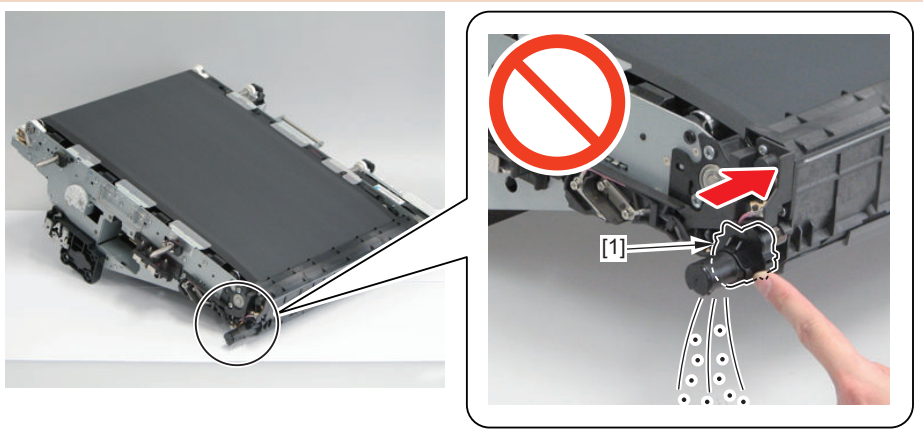
CAUTION:

- Be careful not to touch the ITB with fingers or damage it. (Otherwise failure may occur in the output image.)
- Place the ITB Unit on a sheet of paper. Allowing the ITB to directly contact with floor may cause adhesion of foreign matters on the ITB.
- Support the ITB Unit at the 3 locations: the lower left [A] of the ITB Unit Front Plate, the foot [B] of the ITB, and molded area [C] of the Secondary Transfer Inlet Upper Guide.



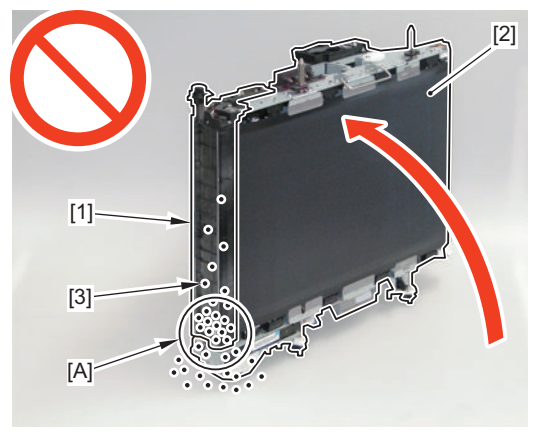
CAUTION:

- Do not push the Toner Collection Mouth Cap [1] of the Transfer Cleaning Unit, or toner may spill out.

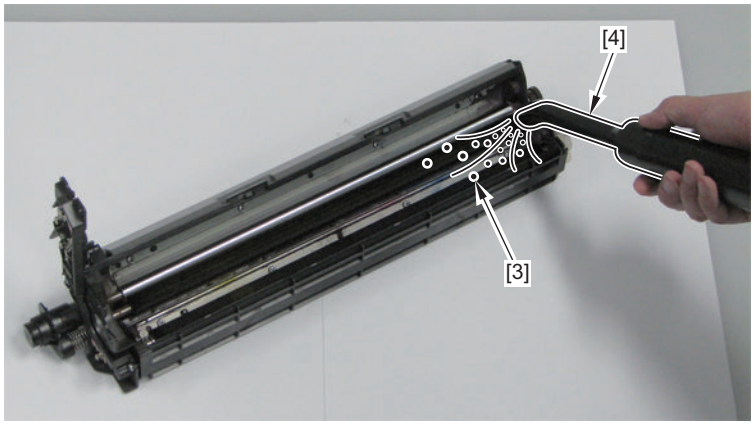


CAUTION:
Be sure not to stand the ITB Unit [2] with the Transfer Cleaning Unit [1] installed.

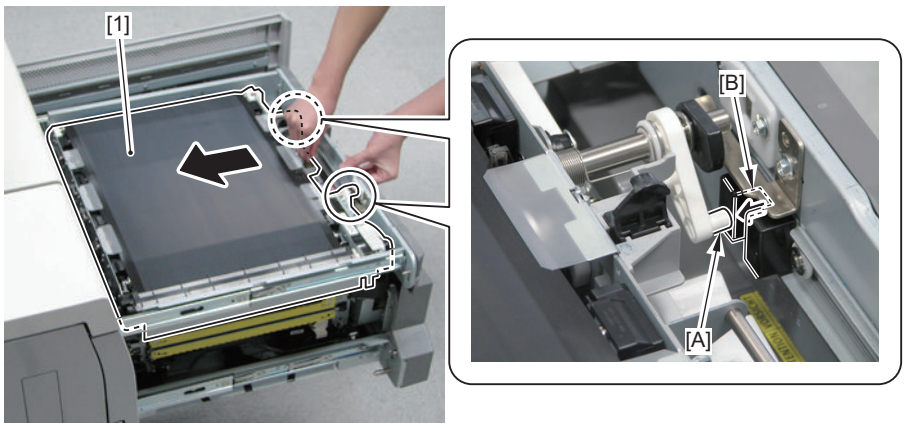
- Otherwise, waste toner [3] inside the unit may scatter.
- Operating the host machine while waste toner [3] inside is aggregated on the lower side [A] may cause abnormal noise and damage of gears.



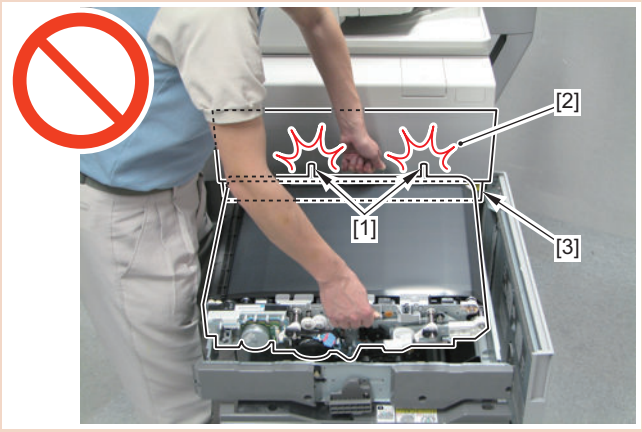
If you stand the ITB Unit with the Transfer Cleaning Unit installed, refer to “Removing the Transfer Cleaning Unit” on page 564 to remove the Transfer Cleaning Unit and remove the aggregated waste toner [3] with a vacuum cleaner [4] for sucking toner dust.



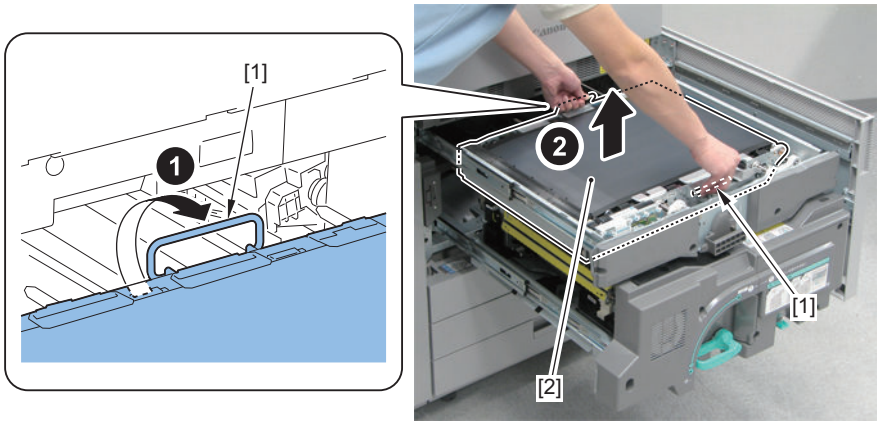
1. **Move the ITB Unit [1], and free the end [A] of the ITB Pressure Arm from the hole [B] of the frame.**



CAUTION:
When installing/removing the unit, do not hit the 2 protrusions [1] of the ITB Unit with the Front Cover [2] or the Inner Cover [3].

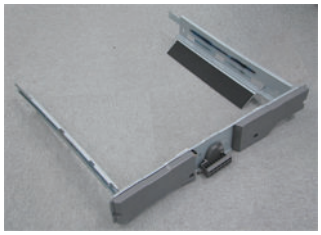


2. **Hold the 2 handles [1], and remove the ITB Unit [2].**



CAUTION:
Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) and the Drum Unit (Bk) inside the machine if the ITB Unit is removed for 5 minutes or more.
Be sure to either install the Lightproof Sheet, or store the ITB Frame and the Fixing Feed Unit in the machine and close the Front Cover within 5 minutes.

Removing the ITB Frame

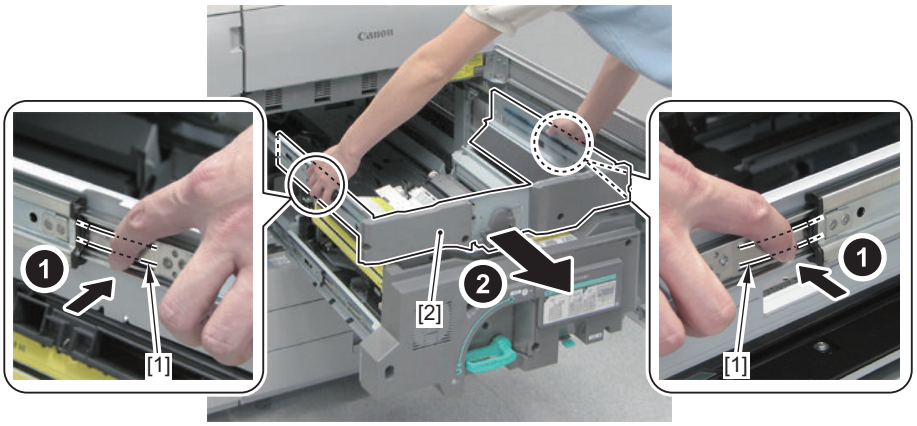


■ Preparation

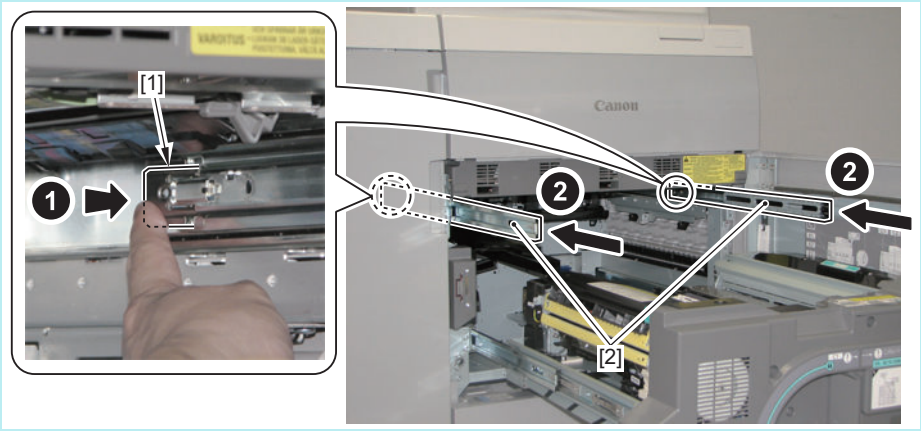
1. Open the Front Cover.
2. Pull out the Fixing Feed Unit.“Pulling out the Fixing Feed Unit” on page 859
3. Pulling out the ITB Unit“Pulling out the ITB Unit” on page 550
4. Removing the ITB Unit“Removing the ITB Unit” on page 553

■ Procedure

1. **Press the 2 Release Springs [1] at the rear of both sides of the rail to release the locks, and pull out the ITB Frame [2].**

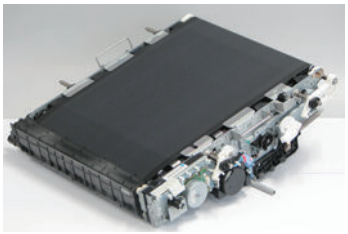


NOTE:
Release the 2 Rail Lock Levers [2], and store the 2 rails [2] pulled out in the machine as needed.



CAUTION:
Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) and the Drum Unit (Bk) inside the machine if the ITB Frame is removed for 5 minutes or more.
Be sure to either install the Lightproof Sheet, or store the 2 rails and the Fixing Feed Unit which were pulled out in the machine and close the Front Cover within 5 minutes.

Installing the ITB Unit



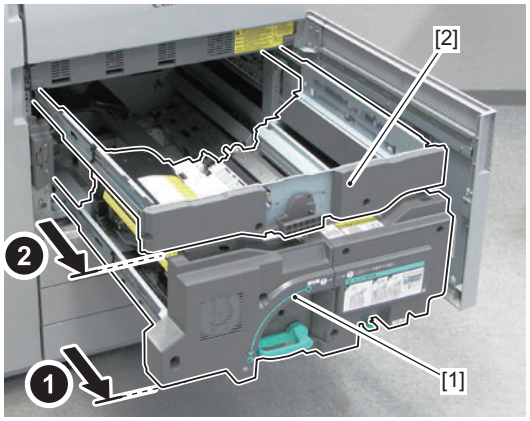
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

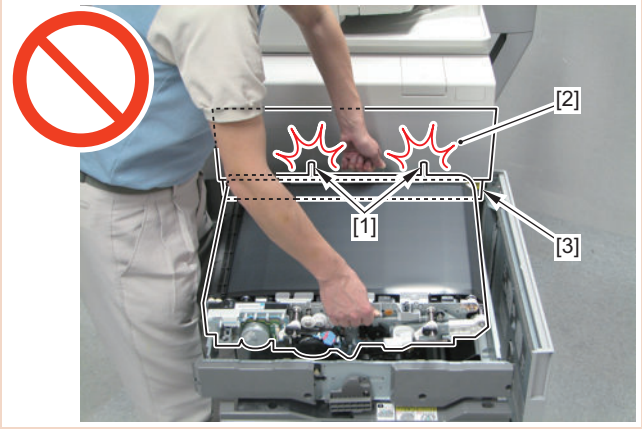
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**

■ Procedure

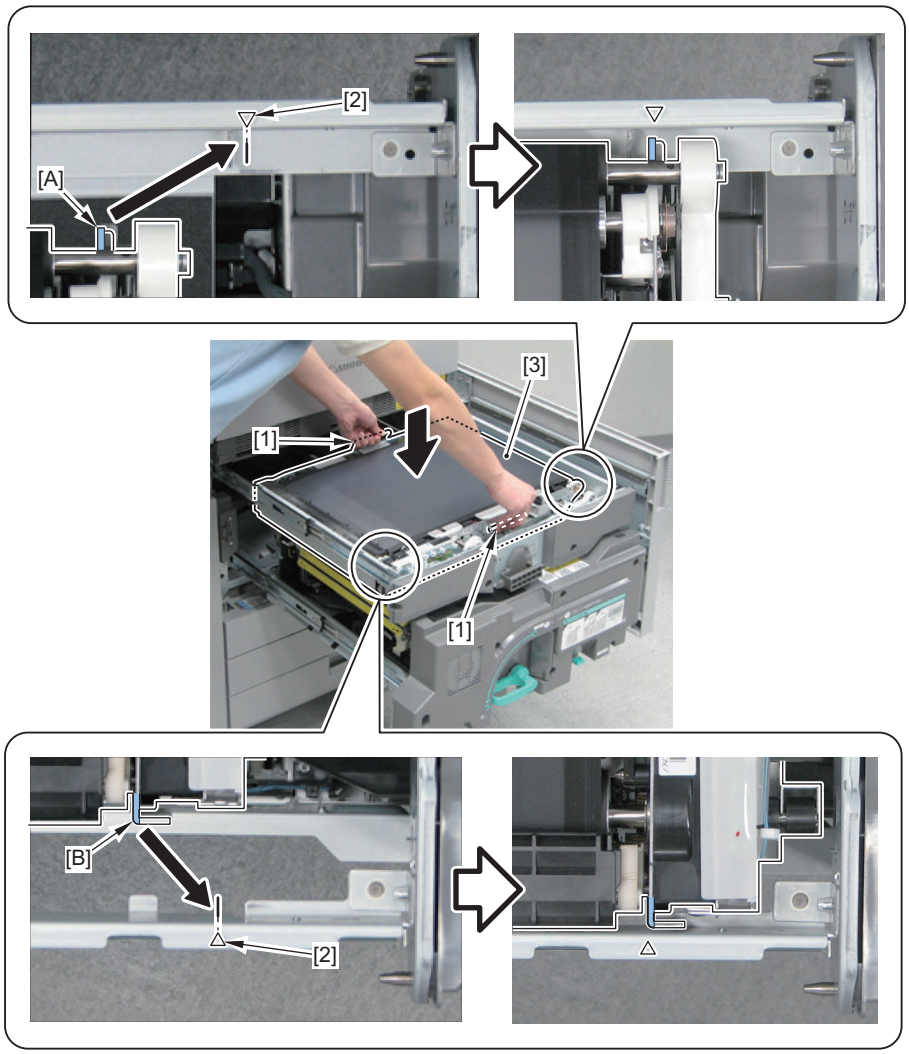
1. **Pull out the ITB Frame [1] and the Fixing Feed Unit [2] until they stop.**



CAUTION:
Be careful not to hit the 2 protrusions [1] of the ITB Unit with the Front Cover [2] and the Inner Cover [3] when installing/removing the unit.

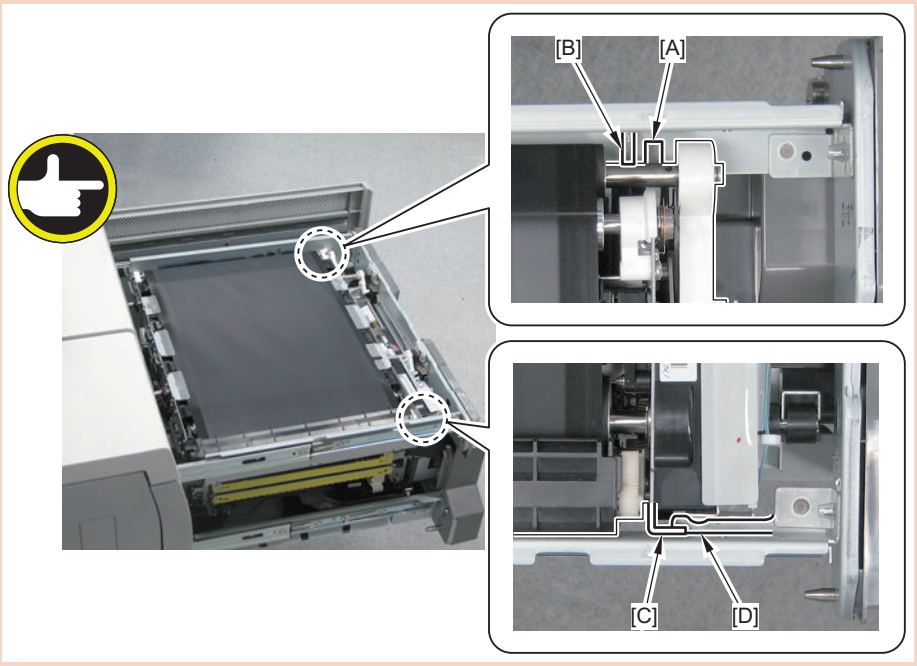


2. **Hold the 2 handles [1], align the right edge [A] and left edge [B] of the ITB Unit with the 2 marks [2] on the ITB Frame, and then place the ITB Unit [3] horizontally.**



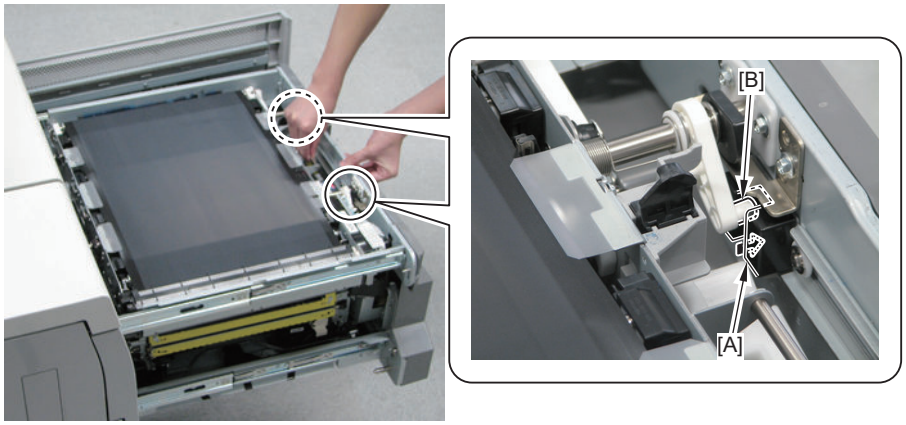
CAUTION:

- After placing the ITB Unit on the ITB Frame, check that the right edge [A] of the ITB Unit is located to the right of the bended part [B] of the plate of the ITB Frame.
- Check that the bended part [C] on the left edge of the ITB Unit is on top of the bended part [D] of the plate of the ITB Frame.

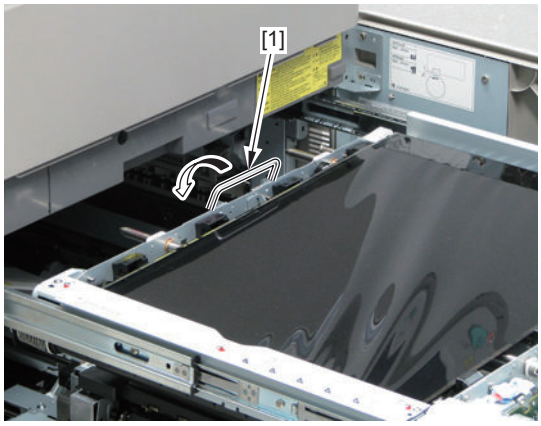


3. **Fit the 2 edges [B] of the ITB Pressure Arm to the 2 grooves [A] of the ITB Frame.**

NOTE:
If the 2 edges [B] of the ITB Pressure Arm are not fitted to the grooves [A] of the ITB Frame, the pressure will not be transmitted to the ITB Unit after storing.
If the machine is operated in this condition, an error due to ITB pressure failure (E074-0002) occurs.



4. **Store the handle [1] of the ITB Unit.**



Storing the ITB Unit

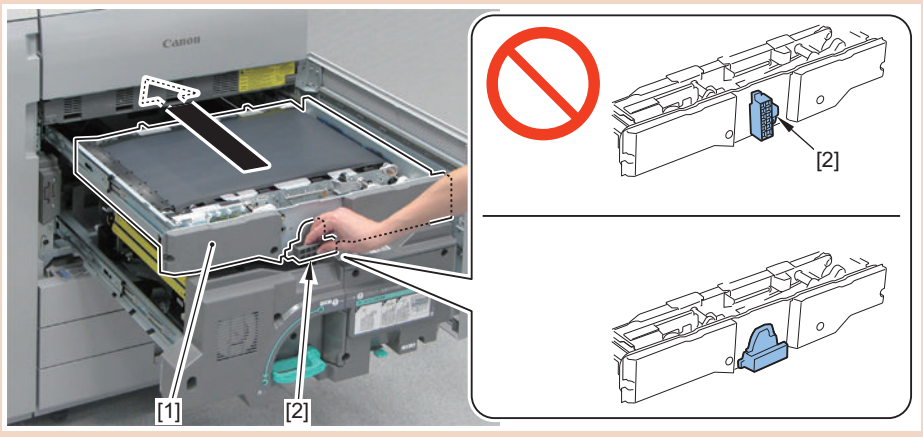
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**

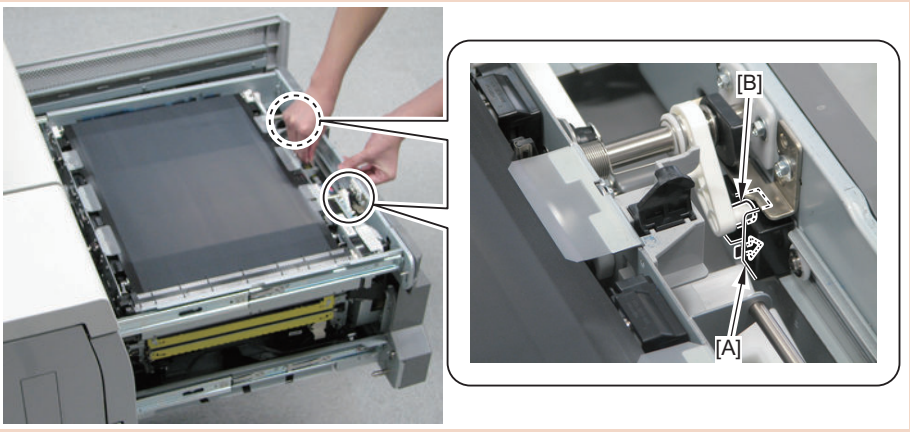
■ Procedure

CAUTION:

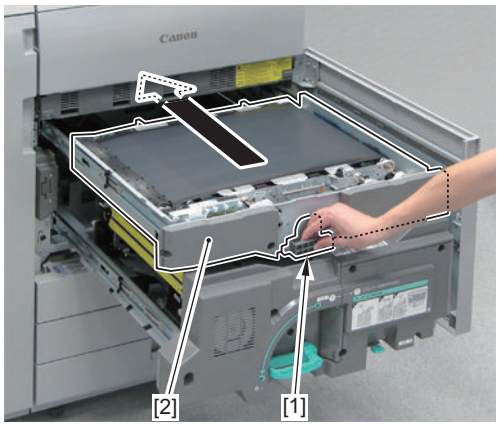
- When installing/removing the ITB Unit by operating the ITB Pressure Release Lever, perform "Actions when releasing the pressure from the ITB" on page 548.
- When putting the ITB Unit [1] back in the host machine, be sure that the ITB Pressure Release Lever [2] is released (horizontal) and then push in the unit. (If the unit is pushed in while the ITB Pressure Release Lever is in the engaged state (not horizontal), pressure will not be applied to the ITB Unit even by turning the ITB Pressure Release Lever. When the host machine operates in this state, the ITB pressure failure error E074-0002 or the belt displacement error E075 occurs.)



CAUTION:
- Fit the 2 edges [B] of the ITB Pressure Arm to the 2 grooves [A] of the ITB Frame.

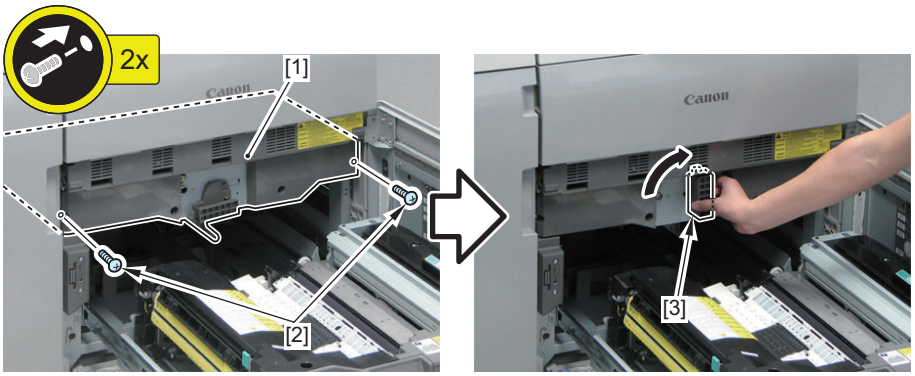


1. **Hold the handle [1], and store the ITB Unit [2] in the machine.**

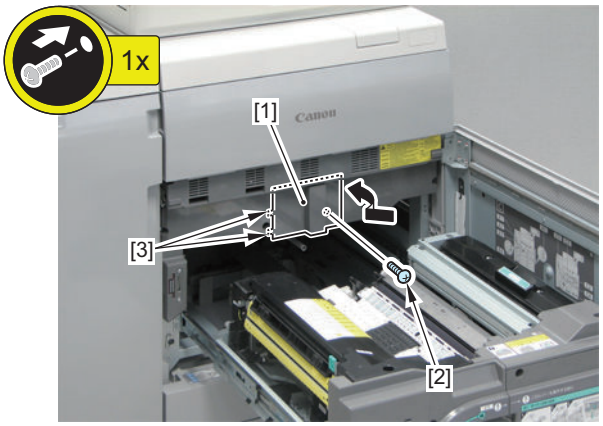


2. **Secure the ITB Unit [1] with the 2 screws [2], and turn the ITB Pressure Release Lever [3] in the direction of the arrow to apply pressure.**

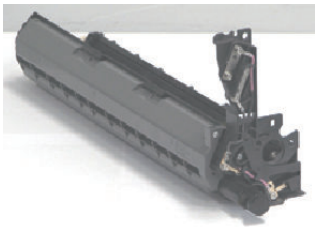
CAUTION:
Tighten the 2 screws of the ITB Frame to secure the ITB Unit, and then turn the ITB Pressure Release Lever. (If pressure is not applied at the proper position, the ITB Unit may be pushed up in the machine, causing damage to the ITB.)



3. **Install the ITB Inner Middle Cover [1].**
   - 1 Screw [2]
   - 2 Hooks [3]



Removing the Transfer Cleaning Unit



■ Preparation

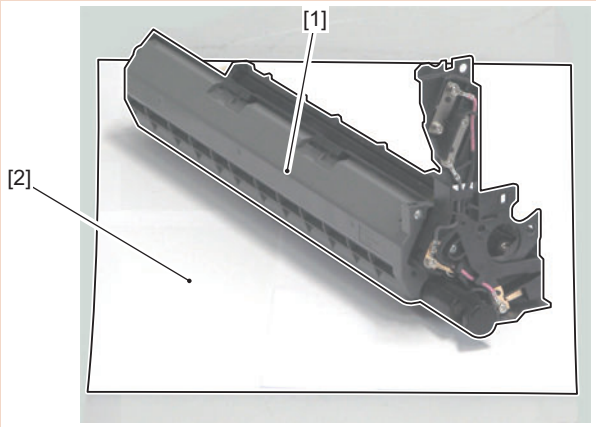
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**

■ Procedure

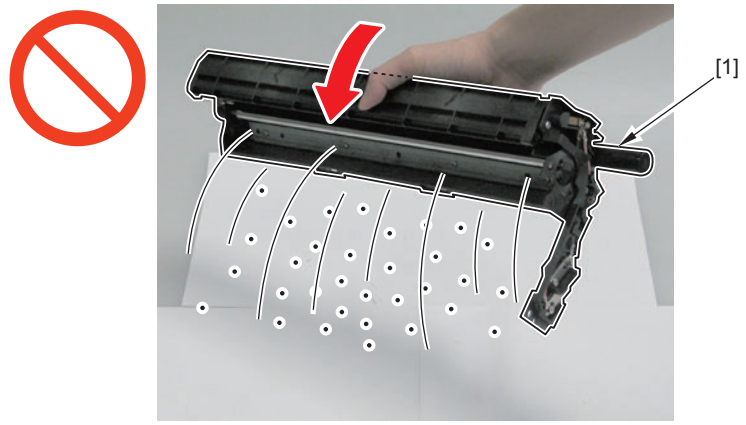
CAUTION:
When replacing this part, execute "When Replacing the Transfer Cleaning Unit" on page 570.

CAUTION:

- Be careful not to touch the ITB with fingers or damage it.
  (Otherwise failure may occur in the output image.)
- Be sure to place the Transfer Cleaning Unit [1] on a sheet of paper [2] because toner is attached on the unit.

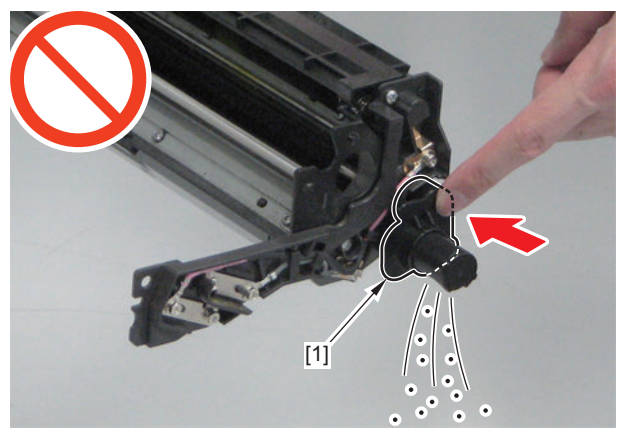


- Do not turn the Transfer Cleaning Unit [1] upside down to prevent toner from scattering around.

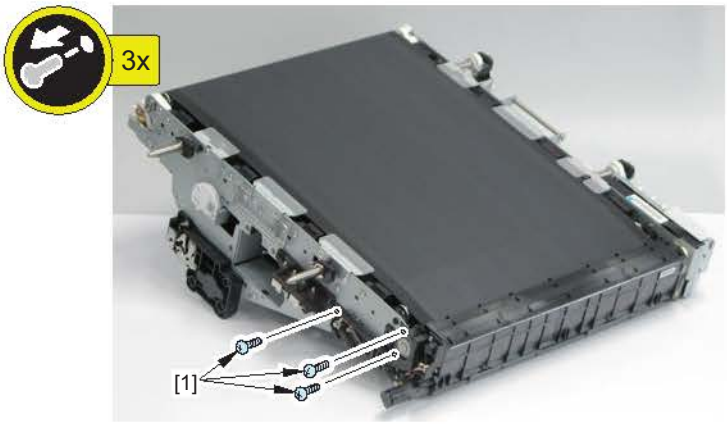


CAUTION:

Do not push the Toner Collection Mouth Cap [1] of the Transfer Cleaning Unit, or toner may spill out.

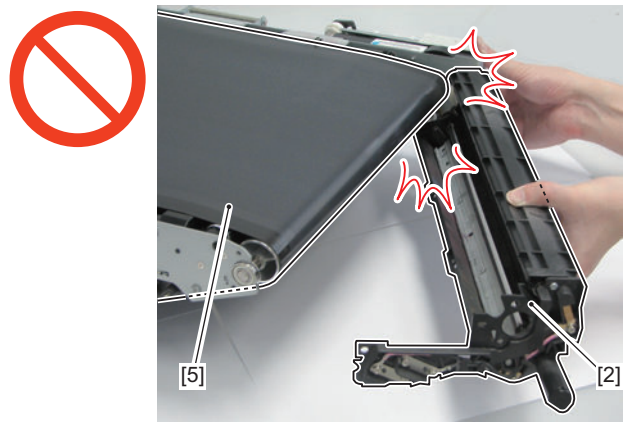


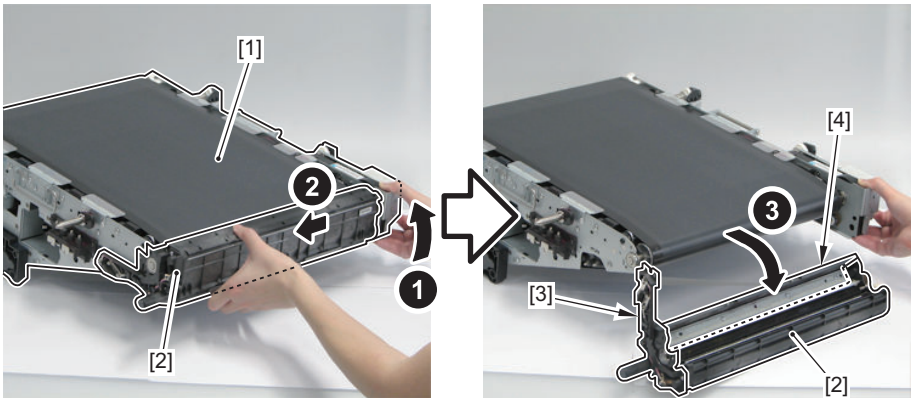
1. **Remove the 3 screws [1].**



2. **While lifting the ITB Unit [1], remove the Transfer Cleaning Unit [2], Contact Unit [3] and Heat Absorbing Cover [4] as a whole.**

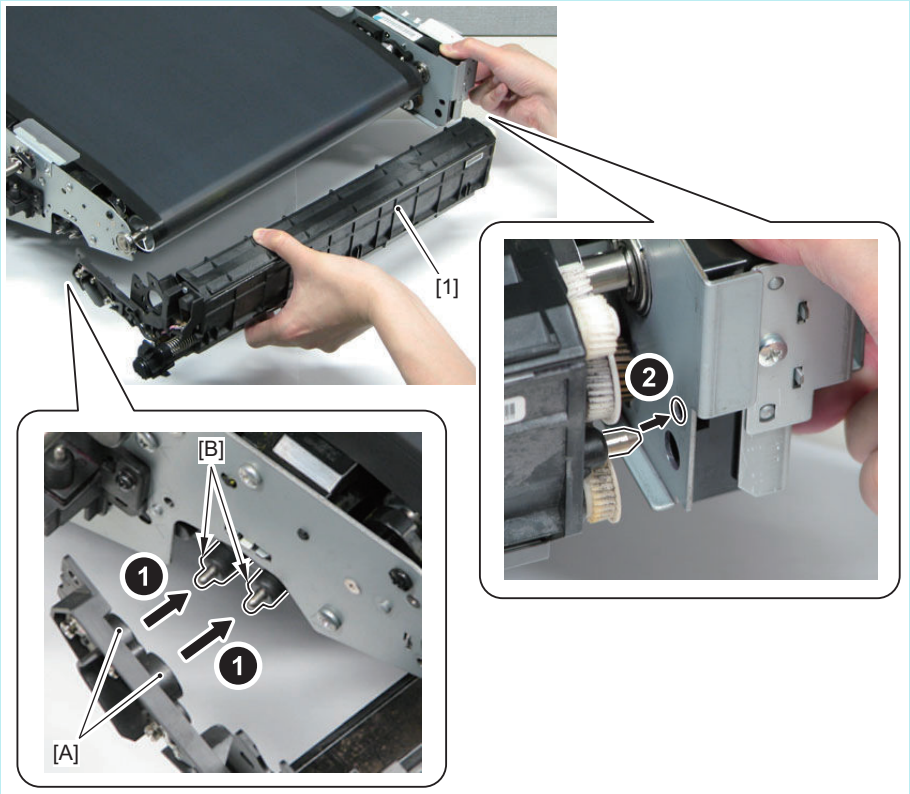
CAUTION:
When installing/removing, be careful not to hit the Transfer Cleaning Unit [2] with the ITB [5].



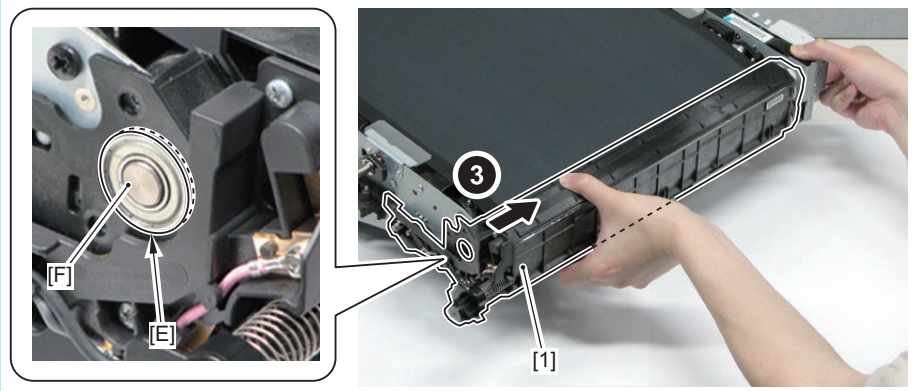


NOTE:
How to install the Transfer Cleaning Unit [1]

1. Align the 2 receptacle holes for the contact points [A] of the Transfer Cleaning Unit with the 2 contact points [B} of the ITB Unit.
2. Align the protrusion [C] of the Transfer Cleaning Unit with the hole [D] of the ITB Unit.

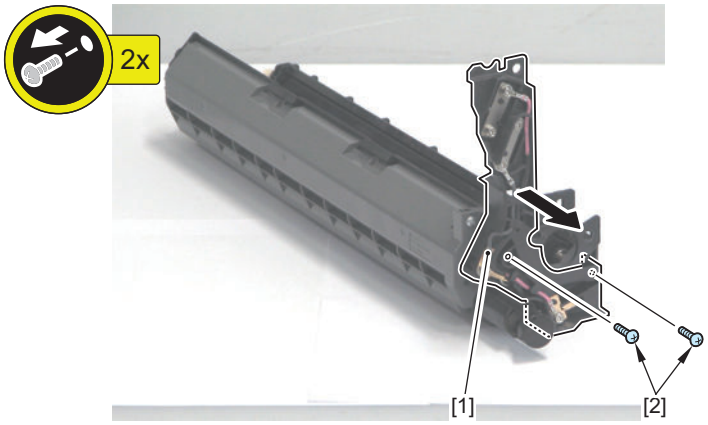


3. Push the Transfer Cleaning Unit all the way in while aligning the hole [E] of the Transfer Cleaning Unit with the bearing [F] of the ITB Unit.

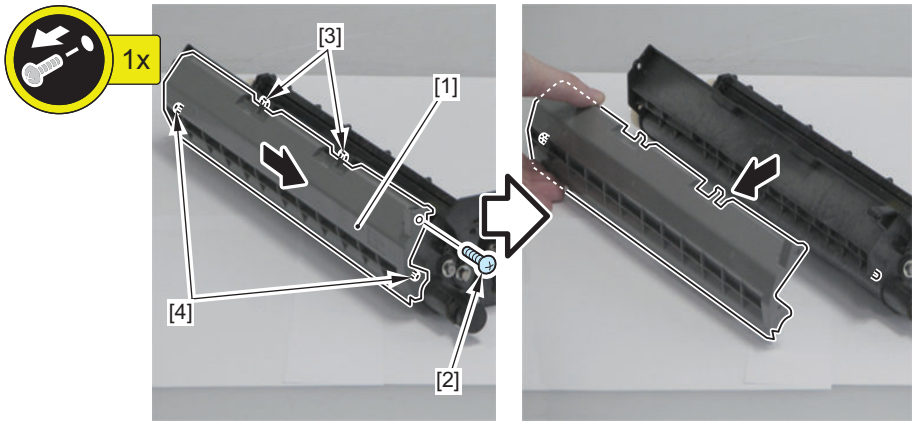


NOTE:
The ITB can be removed “Removing the ITB” on page 570 after removing the Transfer Cleaning Unit [2], Contact Unit [3] and Heat Absorbing Cover [4] as a whole from the ITB Unit [1].
To replace the Transfer Cleaning Unit, which is a periodically replaced part, proceed to the procedure shown below.

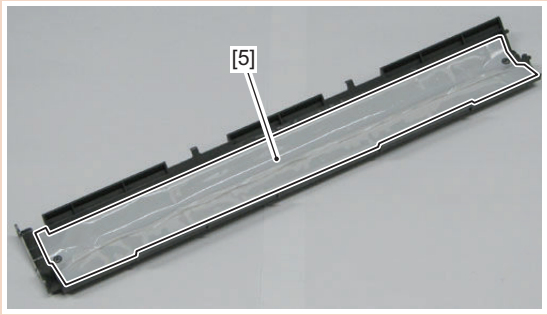
3. **Remove the Contact Unit [1].**
   - 2 Screws [2]



4. **Remove the Heat Absorbing Cover [1].**
   - 1 Screw [2]
   - 2 Hooks [3]
   - 2 Bosses [4]



CAUTION:
Heat absorbing material is attached onto the inner surface of the Heat Absorbing Cover [1].
Be careful not to damage the package [5] of the heat absorbing material. In case the package is damaged, do not use it again. There is a possibility of leakage of the heat absorbing material from the inside.
Be sure not to put the Heat Absorbing Cover [1] in an environment where temperature is 50 deg C or higher while it is removed from the Transfer Cleaning Unit. The state of the heat absorbing material is changed to the liquid state when temperature is 50 deg C or higher. In contrast, the state is changed to the solid state when the material is cooled down. Once state of the material is changed to the liquid state, its shape is changed so that it may not be possible to attach it again.

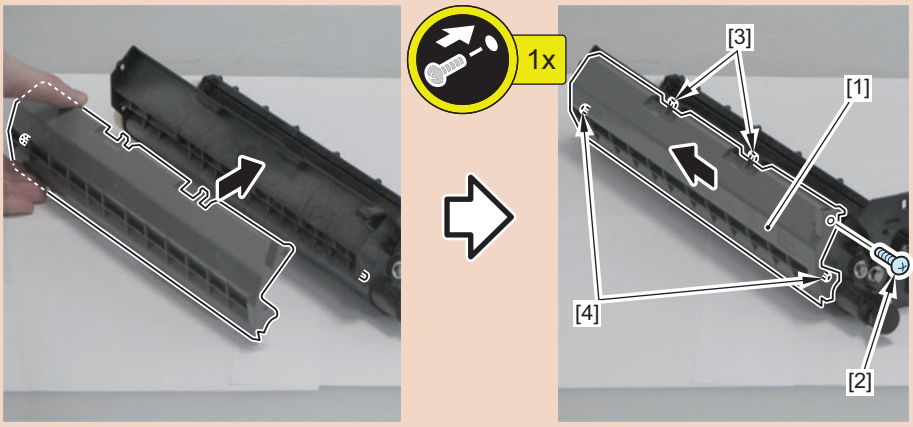


When Replacing the Transfer Cleaning Unit

■ Procedure

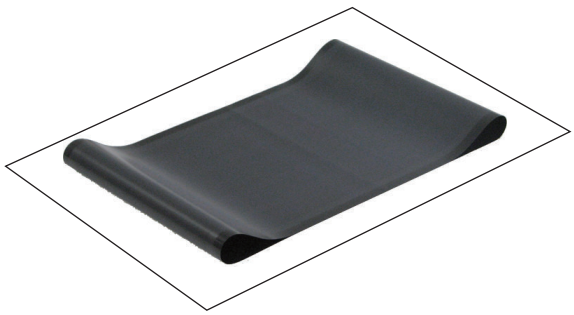
CAUTION:
The Heat Absorbing Cover is not installed in the new Transfer Cleaning Unit.
When replacing the Transfer Cleaning Unit, be sure to remove the Heat Absorbing Cover from the old unit and install it to the new unit.

- 1 Screw [2]
- 2 Hooks [3]
- 2 Bosses [4]



1. **Clear the counter.**
   COPIER > COUNTER > DRBL-1 > ITBCLN-U
2. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
3. **Execute the primary transfer ATVC.**
   COPIER > FUNCTION > MISC-P > 1ATVC-EX
4. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the ITB



■ Preparation

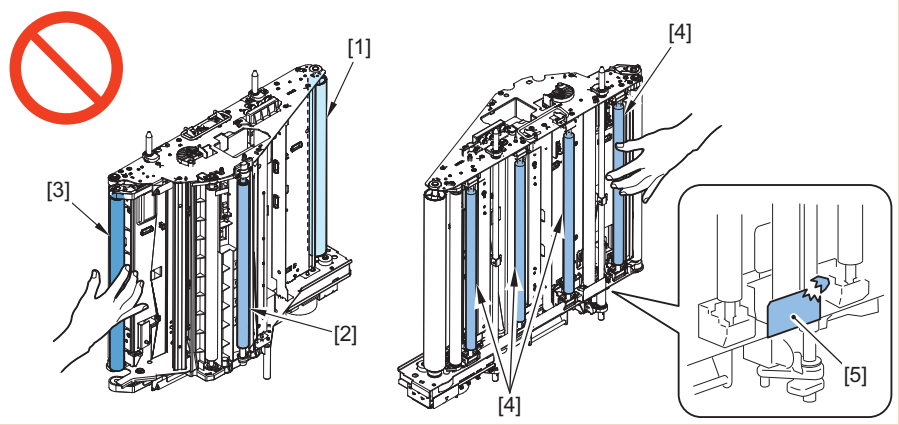
1. **Open the Front Cover.**

2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
5. **Removing the Transfer Cleaning Unit****"Removing the Transfer Cleaning Unit" on page 564**

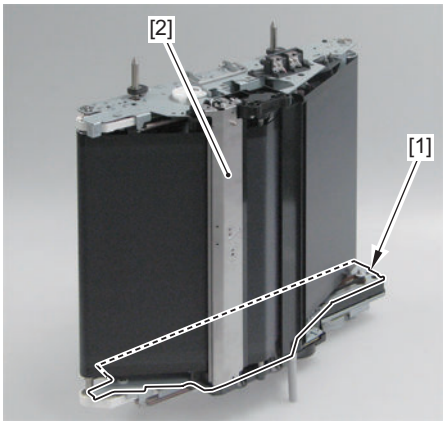
■ Procedure

CAUTION:

- When replacing this part, execute "When Replacing the ITB" on page 582, "Cleaning When Replacing the ITB" on page 582, and "Cleaning the Thin Paper Wraparound Prevention Guide and the Secondary Transfer Inlet Upper Guide" on page 585.
- Be careful not to touch any part of the ITB other than the specified part with finger or damage the ITB. (Otherwise failure may occur in the output image.)
- Do not touch the surfaces of the ITB Drive Roller [1], Secondary Transfer Inner Roller [2], ITB Steering Roller [3], and Primary Transfer Roller (Y/M/C/Bk) [4]. (Otherwise, it may cause image failure.)
- Be sure not to damage the 6 ITB Retainer Sheets [5].
- Place the ITB Unit on a sheet of paper. Allowing the ITB to directly contact with floor may cause adhesion of foreign matters on the ITB.

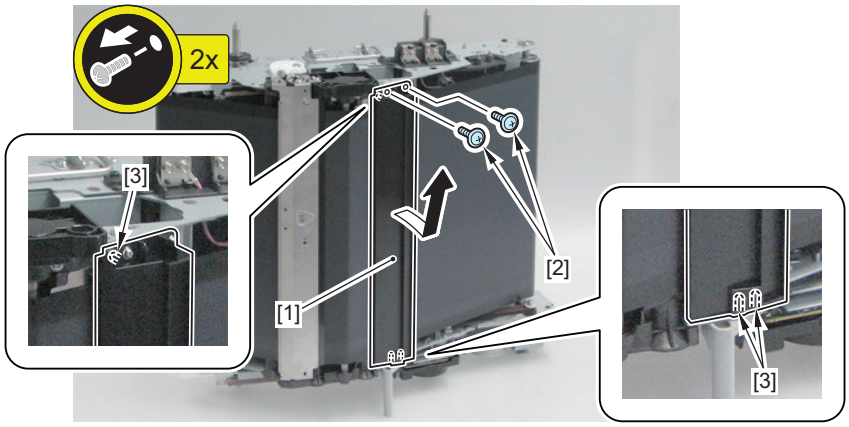


1. **Turn the ITB Unit Front Plate [1] downward, and stand the ITB Unit [2] horizontally.**



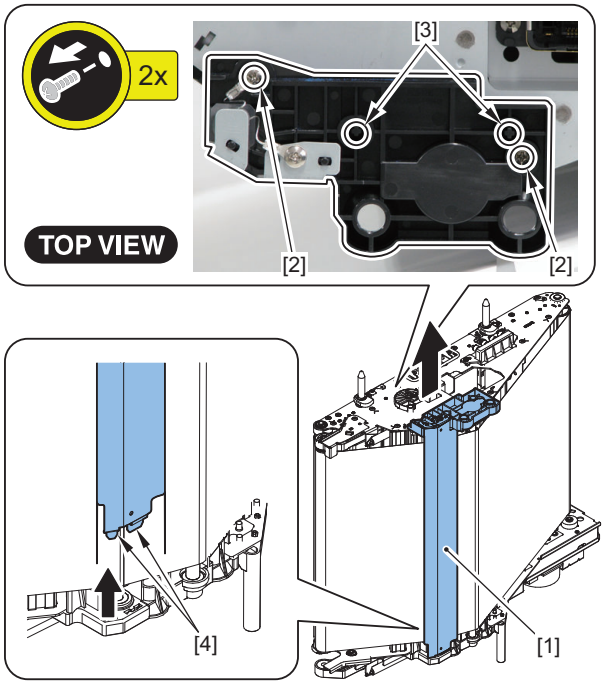
2. Remove the Thin Paper Wraparound Prevention Guide [1].

- 2 Screws [2]
- 2 Bosses [3]

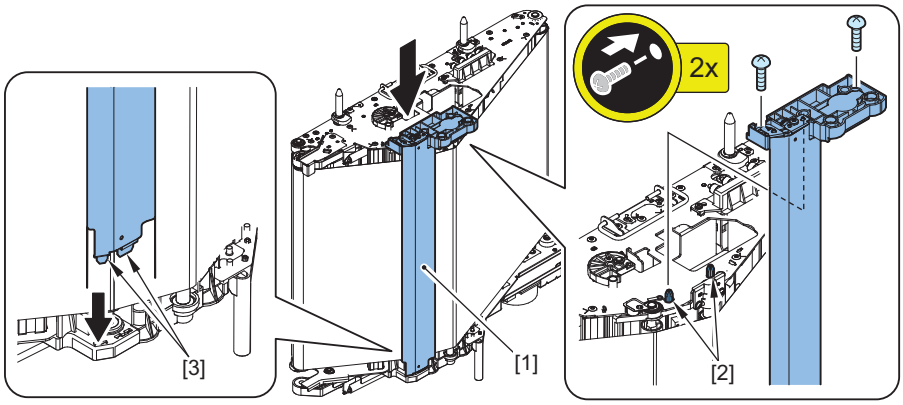


3. **Remove the Secondary Transfer Inlet Upper Guide [1].**
   - 2 Screws [2]
   - 2 Bosses [3]
   - 2 Protrusions [4]

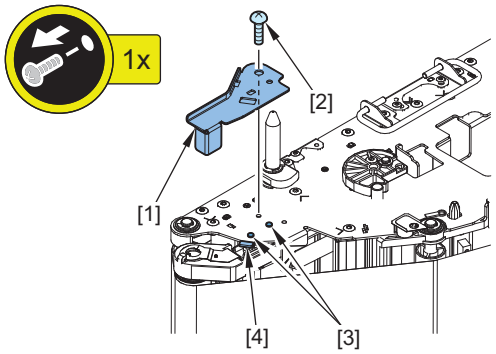
NOTE:
One of the screws [2] tightens the grounding together.



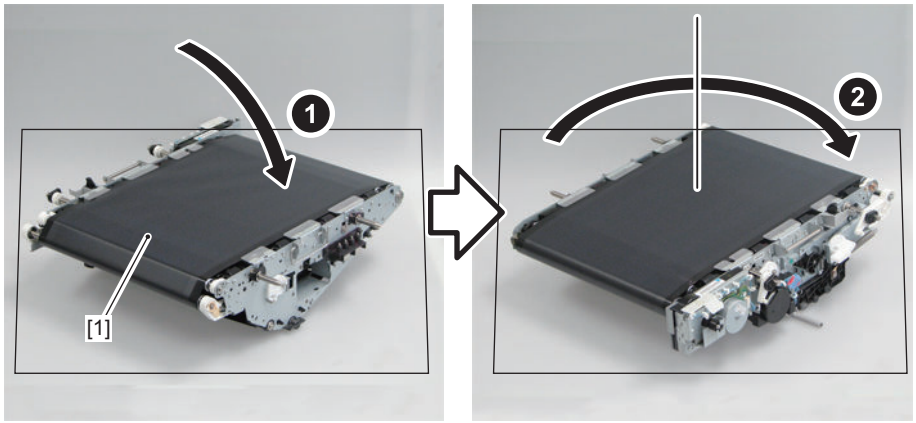
NOTE:
When installing the Secondary Transfer Inlet Upper Guide [1], align it with the 2 bosses [2], and then insert the 2 protrusions [3] of the Secondary Transfer Inlet Upper Guide in the ITB Unit to make the work easy.



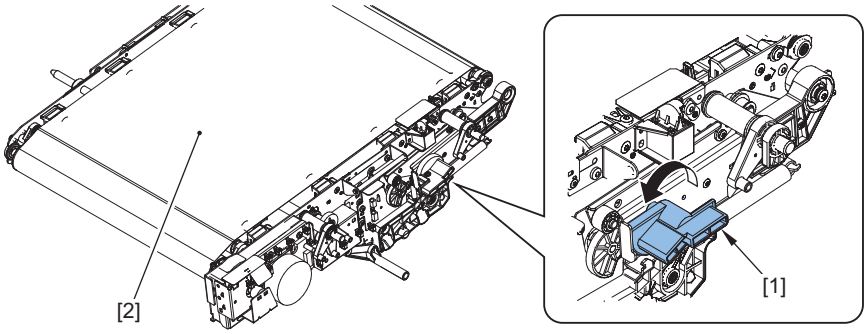
4. **Remove the ITB Unit Right Rear Small Plate [1].**
   - 1 Screw [2]
   - 2 Bosses [3]
   - 1 Hook [4]



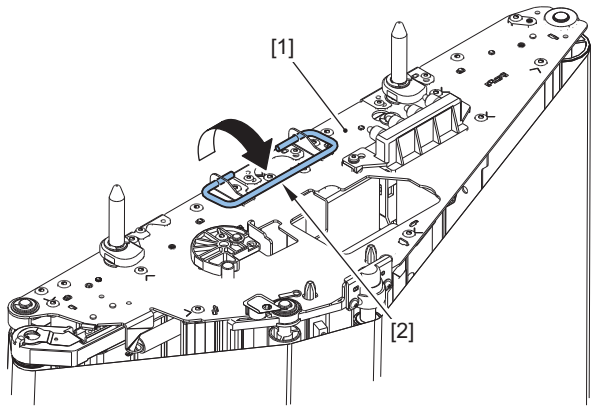
5. **Change the direction of the ITB Unit [1] so that it is turned sideways.**



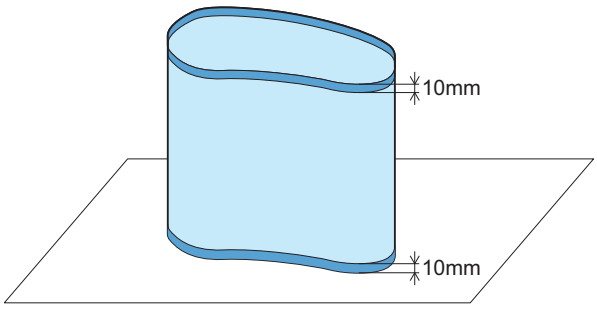
6. **Turn the ITB Tension Lever [1] in the direction of the arrow to release the pressure applied on the ITB [2].**



7. Place the ITB Unit [1] vertically, and turn the handle [2] toward the Rear Plate of the ITB Unit.



CAUTION:
- The ITB is thinner than the existing ones, so it can be easily bent. Be sure to handle it with care not to bend when working.
- Be sure to hold within 10mm from both edges of the ITB. It is for not to touch the image area of the ITB.
- Be sure to place the ITB on a sheet of paper.

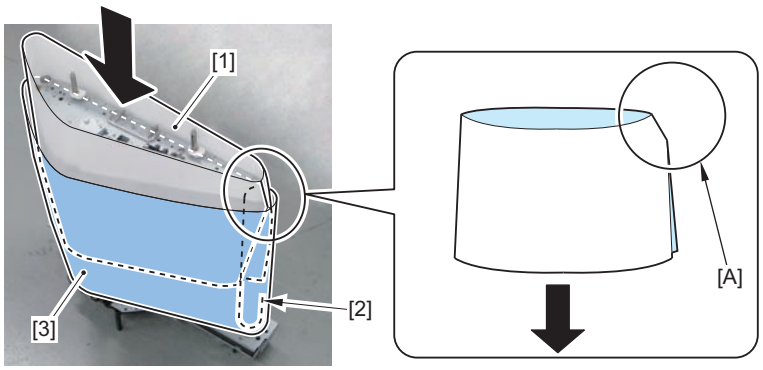


NOTE:
- If the ITB of the service parts is available for the purpose of replacement, use the ITB Installation Auxiliary Sheet included in the package to prevent the ITB from being damaged.
- If the ITB of the service parts is not available, use 2 sheets of A3 paper instead of the ITB Installation Auxiliary Sheet.

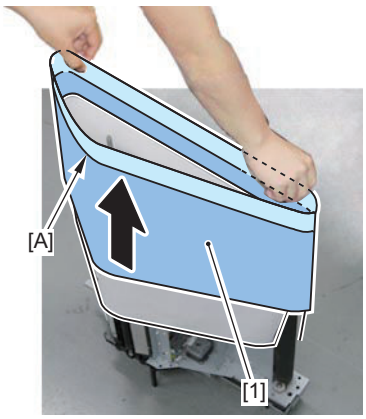
8. Remove the ITB.

- When removing the ITB using the ITB Installation Auxiliary Sheet

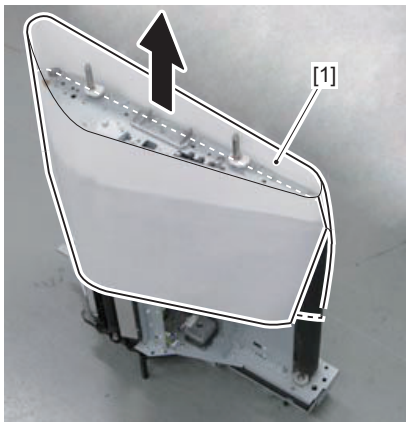
1. Insert the ITB Installation Auxiliary Sheet [1] included in the package between the ITB [3] and the ITB Unit, with the folded slant area [A] of the sheet coming on the upper side of the ITB Drive Roller [2].



2. Hold the edge [A] of the ITB, and remove the ITB [1] while paying attention not to damage it.

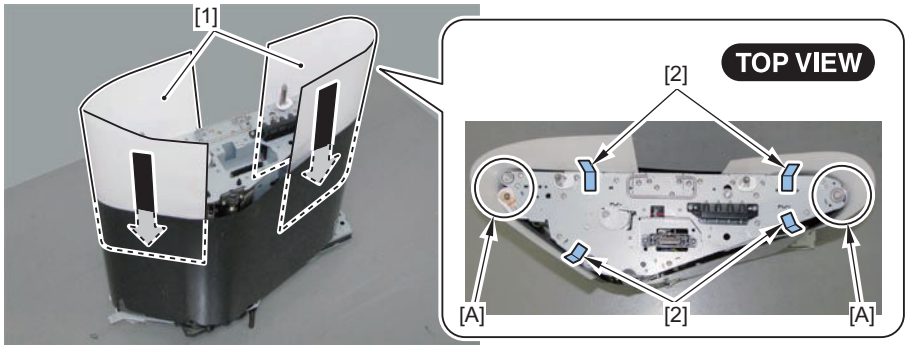


3. Remove the ITB Installation Auxiliary Sheet [1].

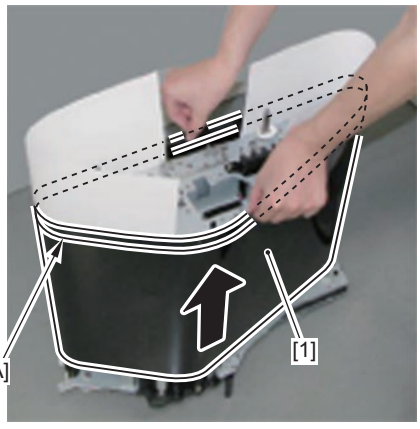


- When removing the ITB using the 2 sheets of A3 paper

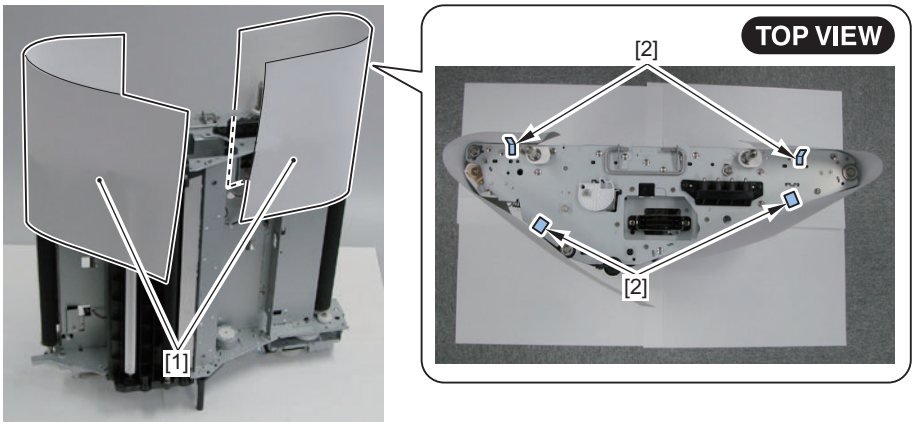
1. Insert the 2 sheets of A3 paper [1] between the ITB and the ITB Unit to wrap around the 2 ends [A] of the ITB Unit, and then use the tapes [2] to secure them to the ITB Front Plate.



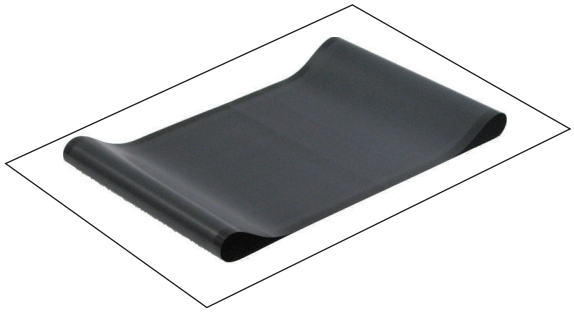
2. Hold the edge [A] of the ITB, and remove the ITB [1] while paying attention not to damage it.



3. Remove the 2 sheets of A3 paper [1] and 4 tapes [2] from the ITB Front Plate.



Installing the ITB



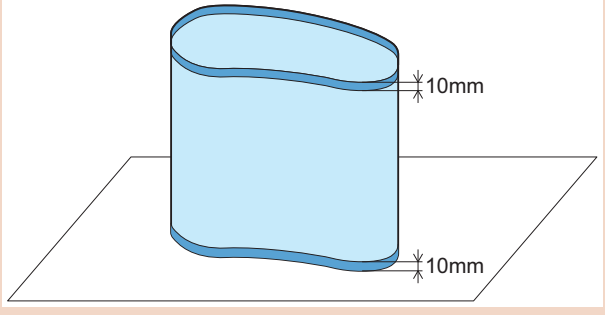
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
5. **Removing the Transfer Cleaning Unit****"Removing the Transfer Cleaning Unit" on page 564**
6. **Removing the ITB****"Removing the ITB" on page 570**

■ Procedure

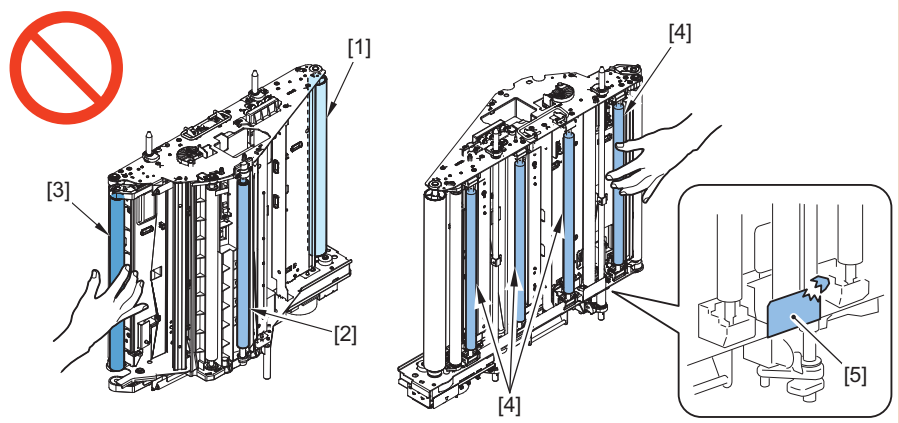
CAUTION:

- The ITB is thinner than the existing ones, so it can be easily bent. Be sure to handle it with care not to bend when working.
- Be sure to hold within 10mm from both edges of the ITB. It is for not to touch the image area of the ITB.
- Be sure to place the ITB on a sheet of paper.



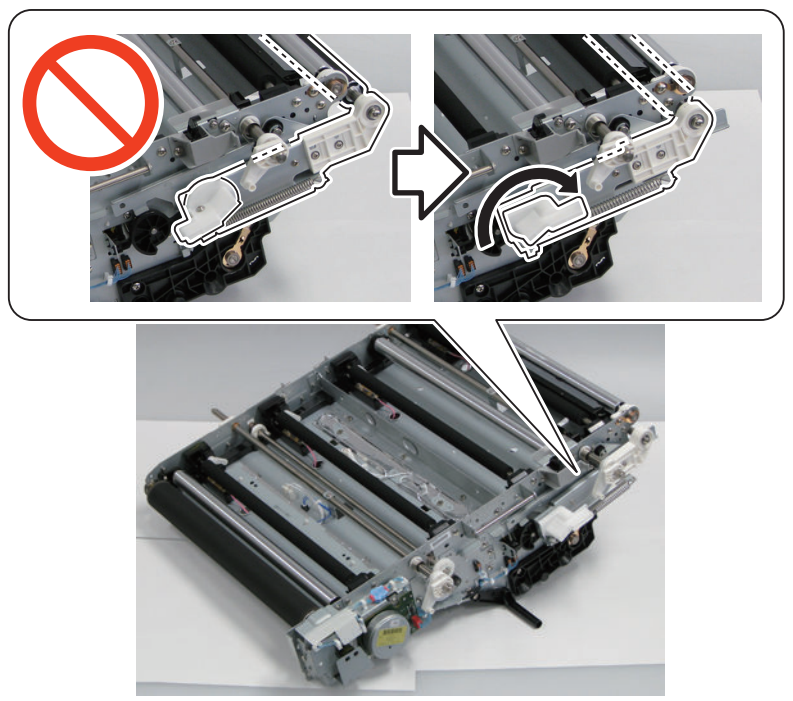
CAUTION:

- Do not touch the surfaces of the ITB Drive Roller [1], Secondary Transfer Inner Roller [2], ITB Steering Roller [3], and Primary Transfer Roller (Y/M/C/Bk) [4].
  (Otherwise, it may cause image failure.)
- Be sure not to damage the 6 ITB Retainer Sheets [5].
- Place the ITB Unit on a sheet of paper. Allowing the ITB to directly contact with floor may cause adhesion of foreign matters on the ITB.

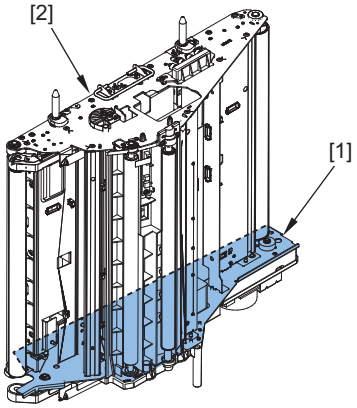


CAUTION:

When installing the ITB to the ITB Unit, be sure that the pressure applied to the ITB is released.



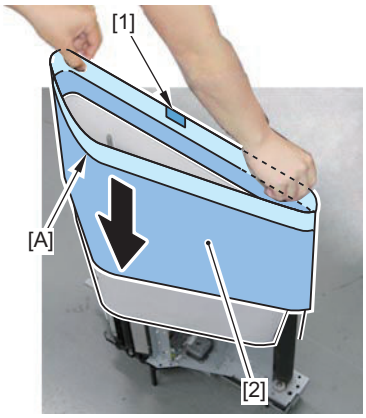
1. **Stand the ITB Unit [2] with the Front Plate side [1] of the unit down.**



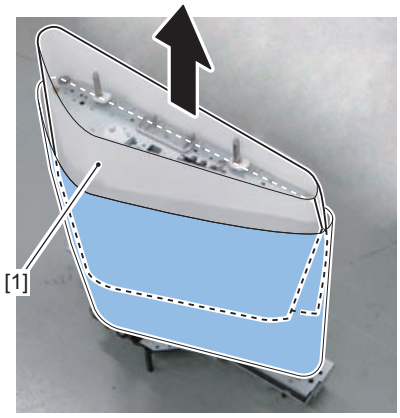
NOTE:
- If the ITB of the service parts is available for the purpose of replacement, use the ITB Installation Auxiliary Sheet included in the package to prevent the ITB from being damaged.
- If the ITB of the service parts is not available, use 2 sheets of A3 paper instead of the ITB Installation Auxiliary Sheet.

2. **Install the ITB.**
   - When using the ITB Installation Auxiliary Sheet
   1. Insert the ITB Installation Auxiliary Sheet [2] included in the package with the folded slant area [A] of the sheet coming on the upper side of the ITB Driver Roller [1].

   2. Hold the edge [A] of the ITB to place the white sheet [1] on top of it, and install while paying attention not to damage the ITB [2].

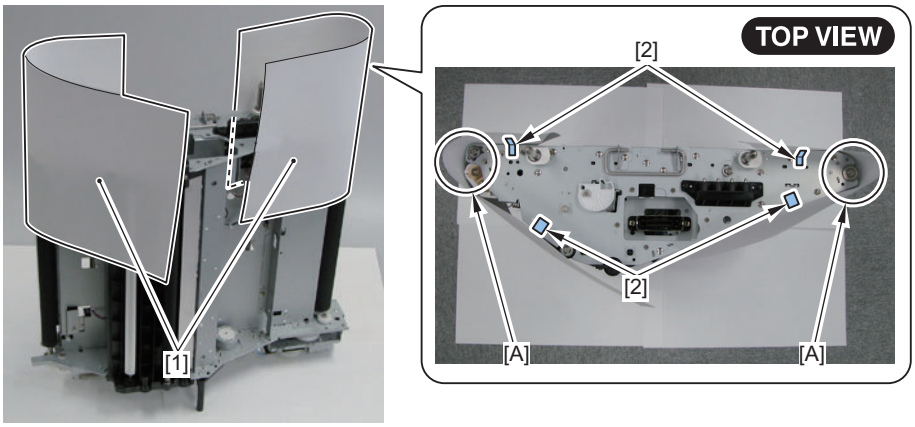


3. Remove the ITB Installation Auxiliary Sheet [1].

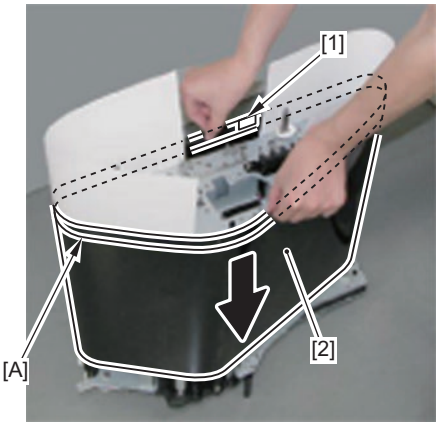


- When using the 2 sheets of A3 paper

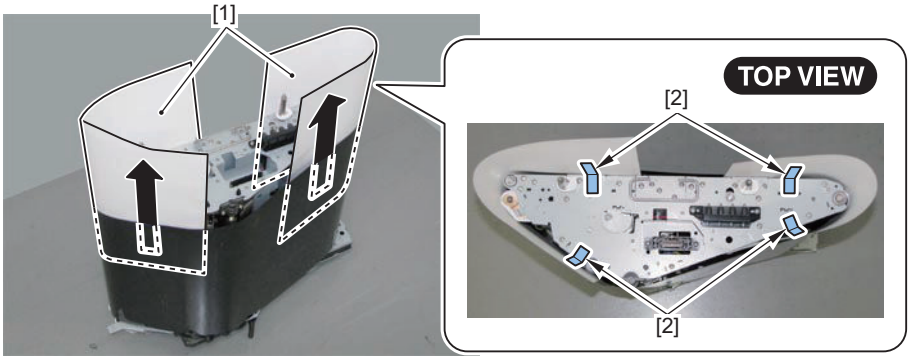
1. Use the 4 tapes [2] to secure the 2 sheets of A3 paper [1] to the ITB Front Plate to wrap around the 2 ends [A] of the ITB Unit.



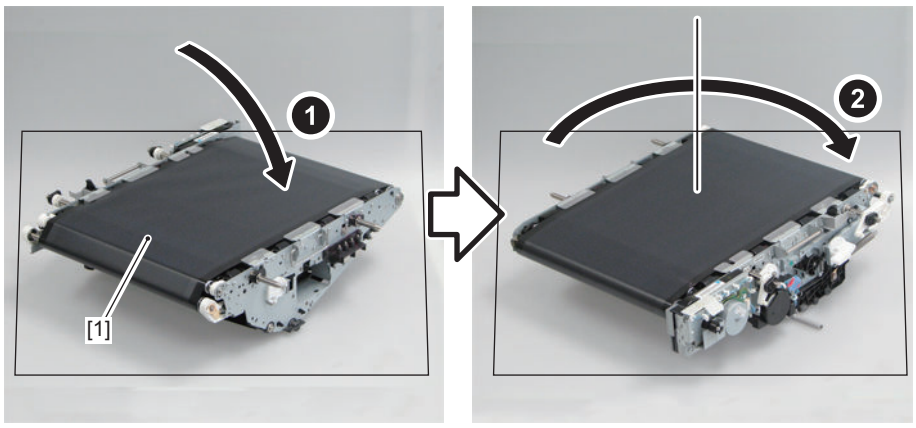
2. Hold the edge [A] of the ITB to place the white sheet [1] inside the ITB on the top, and install while paying attention not to damage the ITB [2].



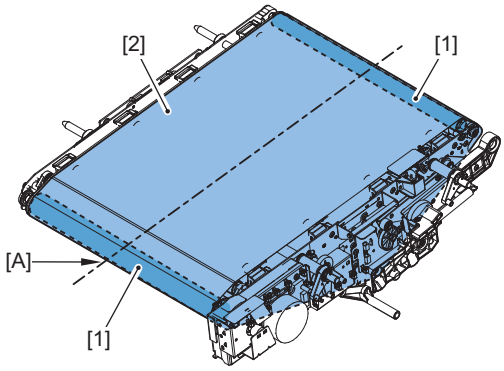
3. Remove the 2 sheets of A3 paper [1] and tapes [2] from the ITB Front Plate.



3. **Change the direction of the ITB Unit [1] so that it is turned sideways.**

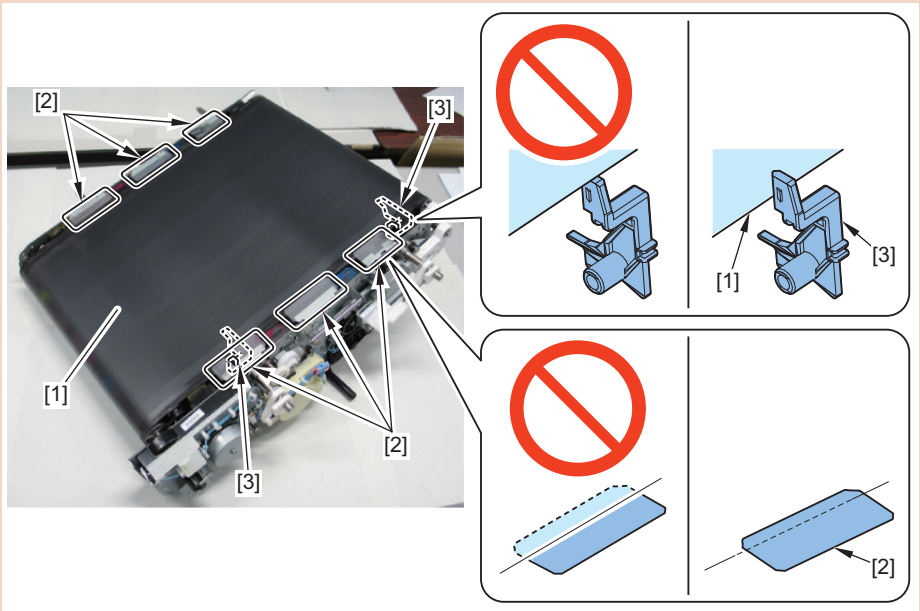


4. **Align the center of the ITB [2] with the center [A] of the left and right rollers [1] of the ITB Unit.**



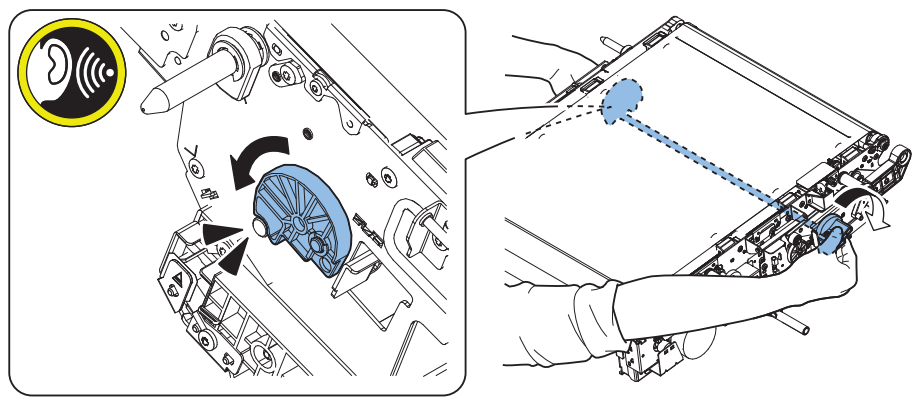
CAUTION:

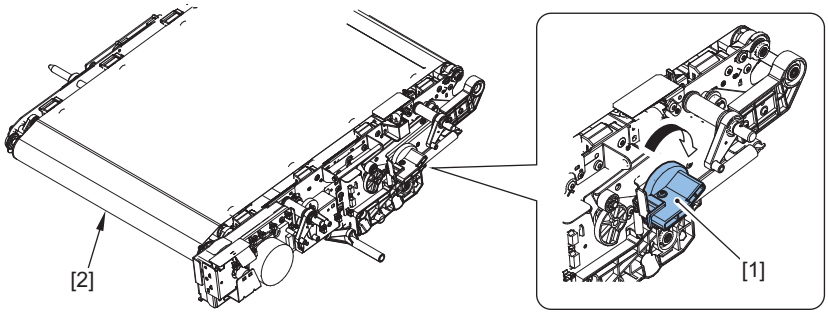
- Install the ITB [1] and place the 6 ITB Retainer Sheets [2] on the ITB while paying attention not to bend them.
- Be sure to place the ends of the 2 ITB Position Flags [3] on the ITB [1].



5. **Turn the ITB Tension Lever [1] in the direction of the arrow to apply tension to the ITB [2].**

CAUTION:
- To avoid applying tension quickly, hold the ITB Tension Lever and the Stopper Cam at the rear side with both hands and then turn them slowly.
- After applying tension to the ITB with the ITB Tension Lever, be sure to hook the Stopper Cam to the shaft at the rear side of the ITB Unit to lock it. At this time, be sure that a click sound is heard.





When Replacing the ITB

■ Procedure

1. **Clear the counter.**
   COPIER > COUNTER > DRBL-1 > TR-BLT
2. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
3. **Execute the primary transfer ATVC.**
   COPIER > FUNCTION > MISC-P > 1ATVC-EX
4. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Cleaning When Replacing the ITB

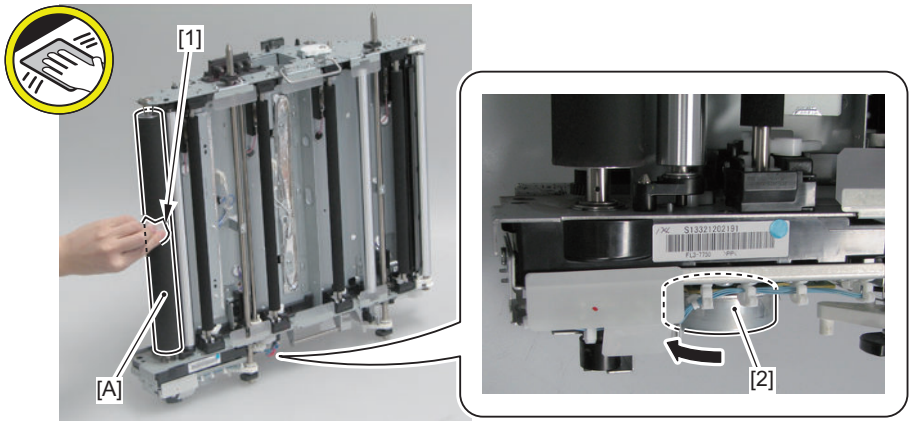
■ Preparation

1. **Open the Front Cover.**

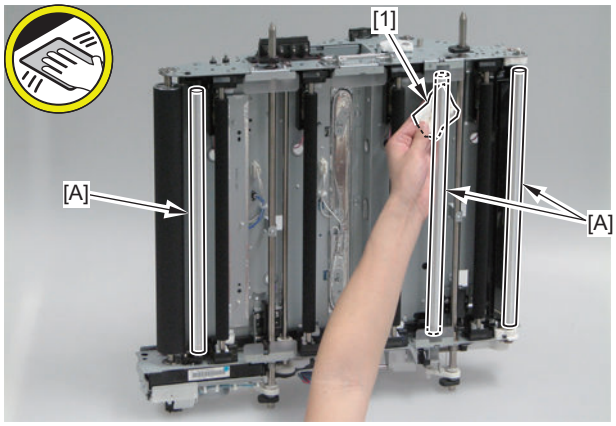
2. Pull out the Fixing Feed Unit.“Pulling out the Fixing Feed Unit” on page 859
3. Pulling out the ITB Unit“Pulling out the ITB Unit” on page 550
4. Removing the ITB Unit“Removing the ITB Unit” on page 553
5. Removing the Transfer Cleaning Unit“Removing the Transfer Cleaning Unit” on page 564
6. Removing the ITB“Removing the ITB” on page 570

■ Procedure

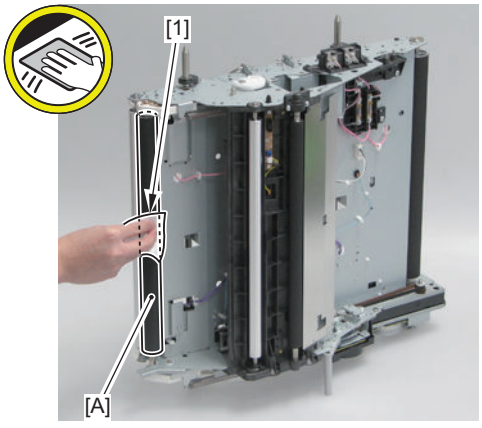
1. While rotating the Drive Motor [2] in the direction of the arrow, clean the whole circumference [A] of the surface of the Drive Roller with lint-free paper [1] moistened with alcohol.



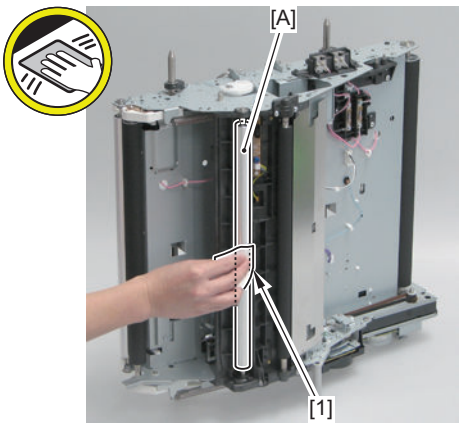
2. Clean the whole circumference [A] of the surface of the 3 ITB Idler Rollers with lint-free paper [1] moistened with alcohol.



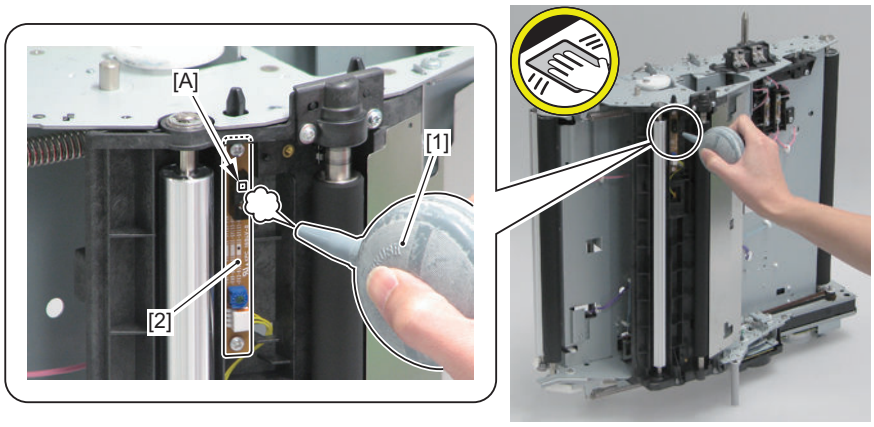
3. Clean the whole circumference [A] of the surface of the ITB Steering Roller with lint-free paper [1] moistened with alcohol.



4. **Clean the whole circumference [A] of the surface of the ITB Idler Roller with lint-free paper [1] moistened with alcohol.**

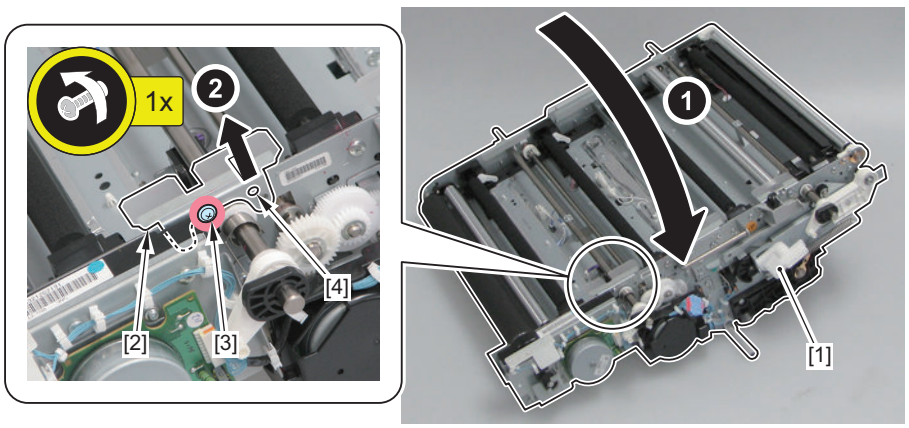


5. **Clean the soiling on the hole [A] of the HP Sensor PCB [2] with a blower [1].**



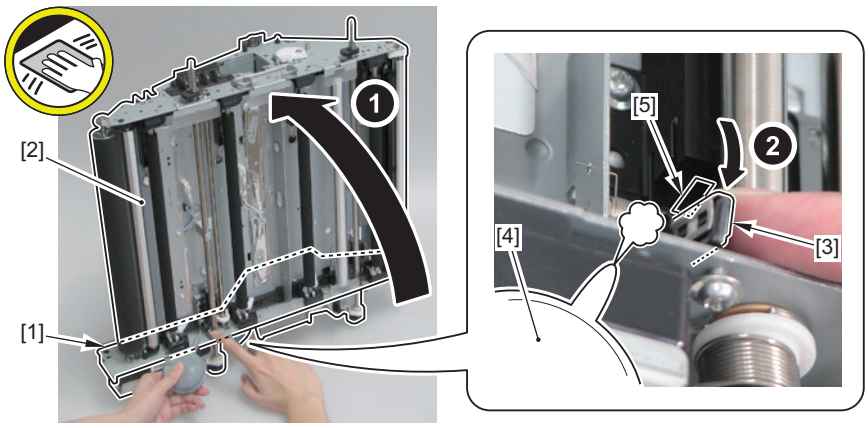
6. **Change the direction of the ITB Unit [1] so that it is turned sideways.**

7. **Remove the ITB Retainer Sheet [2].**
   - 1 Screw [3] (to loosen)
   - 1 Boss [4]

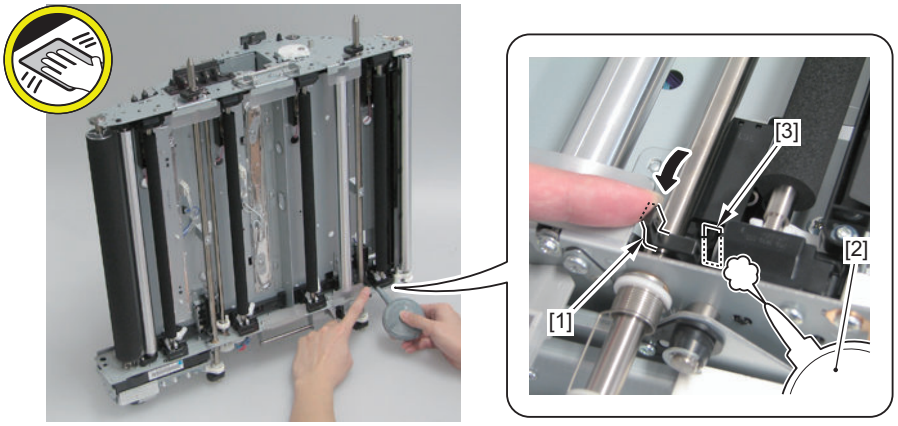


8. **Stand the ITB Unit [2] with the Front Plate side [1] of the unit down.**

9. **While bringing down the flag [3], clean the soiling on the ITB Displacement Sensor (Right) [5] with a blower [4].**



10. **While bringing down the flag [1], clean the soiling on the ITB Displacement Sensor (Left) [3] with a blower [2].**



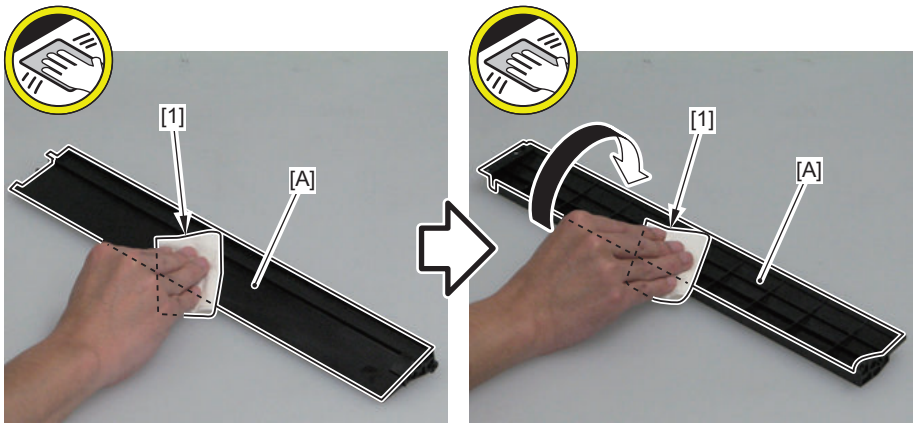
Cleaning the Thin Paper Wraparound Prevention Guide and the Secondary Transfer Inlet Upper Guide

■ Preparation

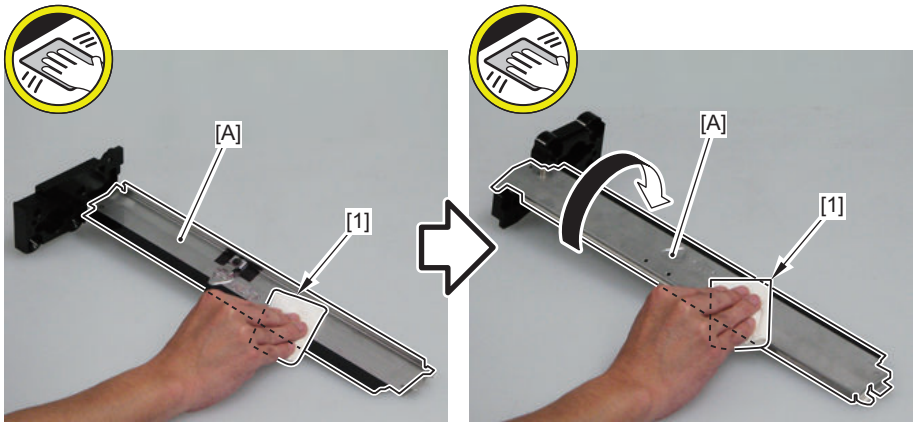
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
5. **Removing the Transfer Cleaning Unit****"Removing the Transfer Cleaning Unit" on page 564**
6. **Removing the ITB****"Removing the ITB" on page 570**

■ Procedure

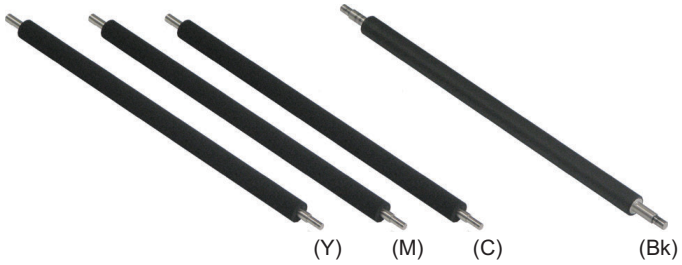
1. **Clean the front and the back surface [A] of the Thin Paper Wraparound Prevention Guide with lint-free paper [1] moistened with alcohol.**



2. **Clean the front and back surface [A] of the Secondary Transfer Inlet Upper Guide with lint-free paper [1] moistened with alcohol.**



Removing the Primary Transfer Roller



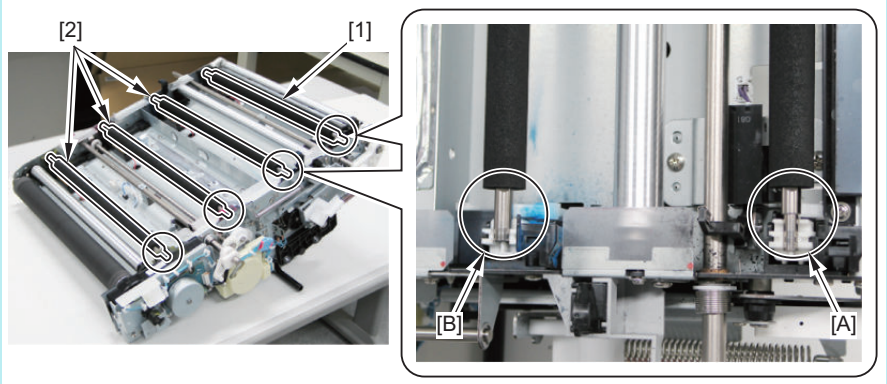
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
5. **Removing the Transfer Cleaning Unit****"Removing the Transfer Cleaning Unit" on page 564**
6. **Removing the ITB****"Removing the ITB" on page 570**

■ Procedure

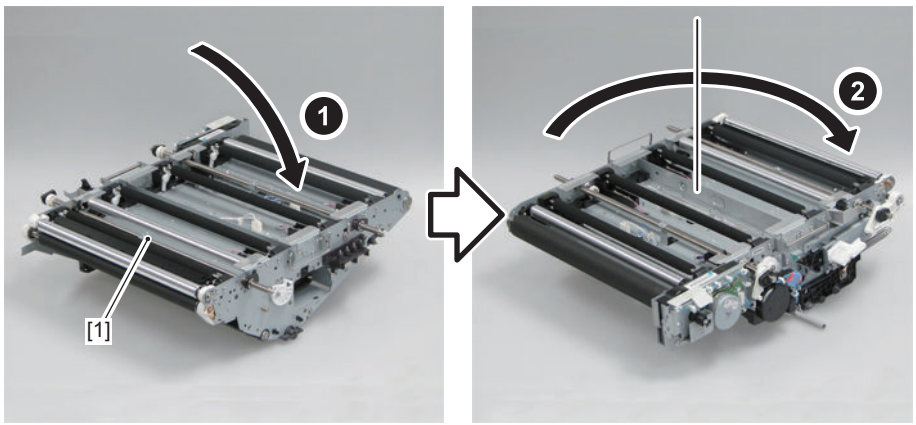
CAUTION:
- When replacing this part, execute “Cleaning When Replacing the ITB” on page 582, “Cleaning the Thin Paper Wraparound Prevention Guide and the Secondary Transfer Inlet Upper Guide” on page 585, and “When Replacing the Primary Transfer Roller” on page 589.
- Do not touch the surface of the roller when disassembling/assembling.

NOTE:
How to distinguish the Primary Transfer Roller (Bk) from the Primary Transfer Roller (Y), (M), and (C)
- The [A] part of the shaft on the front side of the Primary Transfer Roller (Bk) [1] is stepped; the roller side is thicker and the end side is thinner.
- The size of the shaft [B] on front of the Primary Transfer Roller (Y), (M), or (C) [2] is constant.

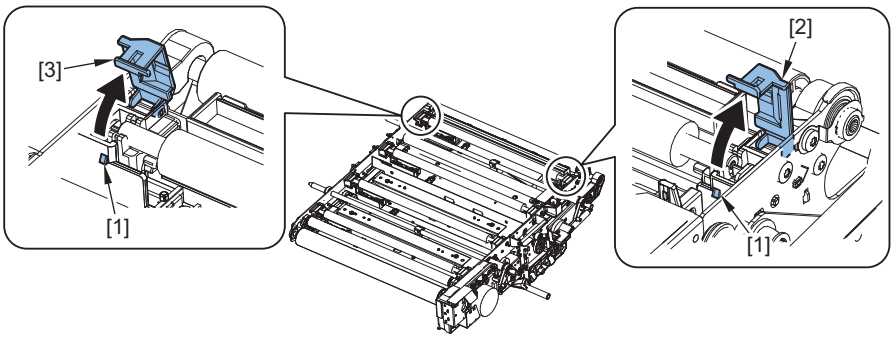


NOTE:
This procedure indicates the location of the Primary Transfer Roller (Bk).
Be sure to perform the same procedure for the Primary Transfer Roller (Y), (M), and (C).

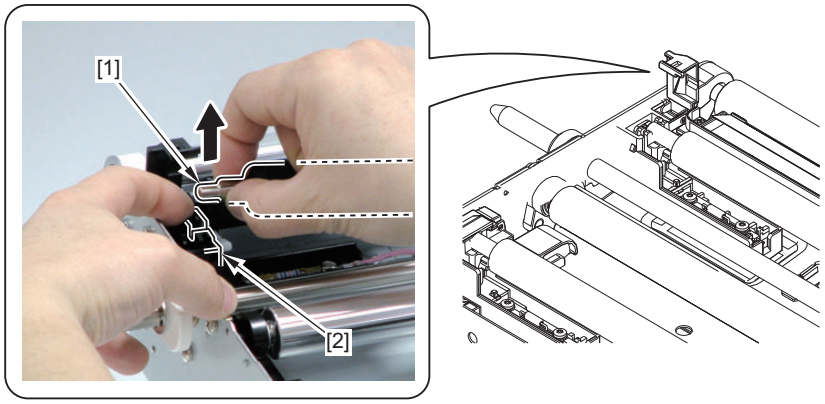
1. **Change the direction of the ITB Unit [1] so that it is turned sideways.**



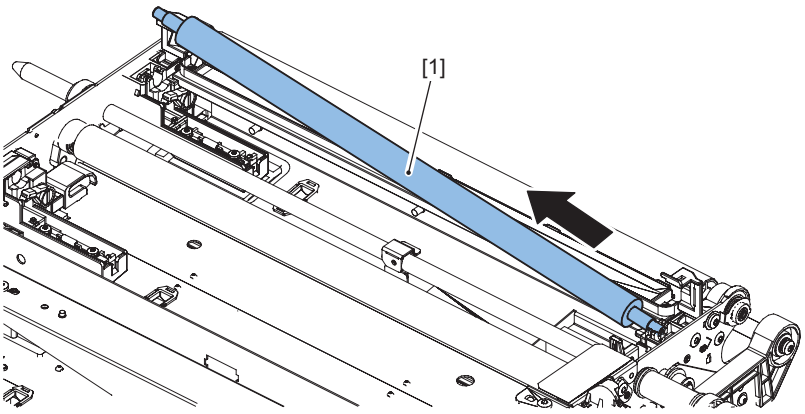
2. **Open the Shaft Support Cover (Front) [2] and the Shaft Support Cover (Rear) [3] by releasing them from the protrusions [1].**



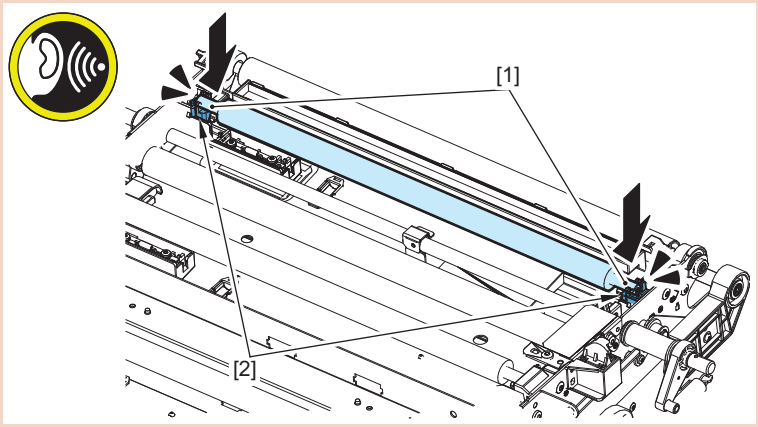
3. **Release the rear shaft of the Primary Transfer Roller by holding the shaft [1] of the Primary Transfer Roller and pushing down the Shaft Support [2] at the rear side.**



4. **Remove the Primary Transfer Roller [1] in the direction of the arrow.**



CAUTION:
Be sure to push the shafts [1] at front and rear sides of the Primary Transfer Roller into the Shaft Support [2] from above.
If no click sound is heard at this time, reinstall the roller.



When Replacing the Primary Transfer Roller

■ Procedure

1. **Clear the counter.**
   COPIER > COUNTER > DRBL-1 > 1TR-RL-Y/M/C/K
2. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
3. **Execute the primary transfer ATVC.**
   COPIER > FUNCTION > MISC-P > 1ATVC-EX
4. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Secondary Transfer Inner Roller

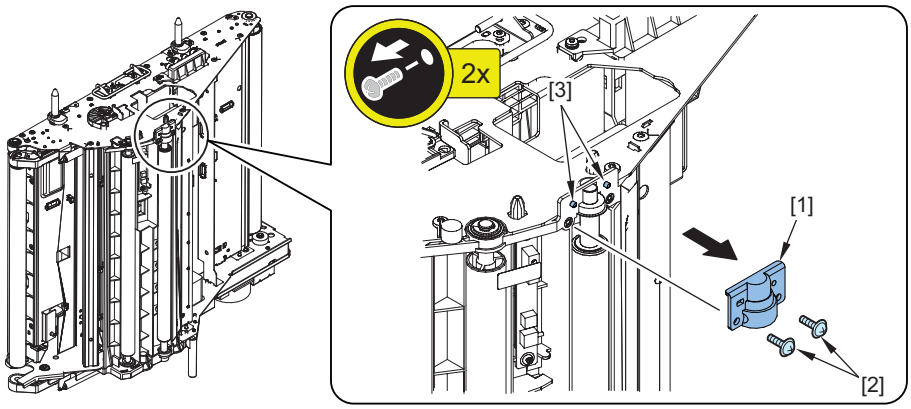
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
5. **Removing the Transfer Cleaning Unit****"Removing the Transfer Cleaning Unit" on page 564**
6. **Removing the ITB****"Removing the ITB" on page 570**

■ Procedure

CAUTION:
- When replacing this part, execute "When Replacing the Secondary Transfer Inner Roller" on page 592, "Cleaning When Replacing the ITB" on page 582, and "Cleaning the Thin Paper Wraparound Prevention Guide and the Secondary Transfer Inlet Upper Guide" on page 585.
- Do not touch the surface of the roller when disassembling/assembling.

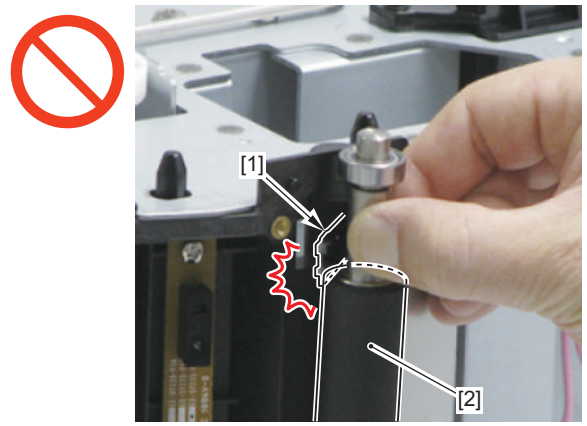
1. **Remove the Bearing Cover [1].**
   - 2 Screws [2]
   - 2 Bosses [3]

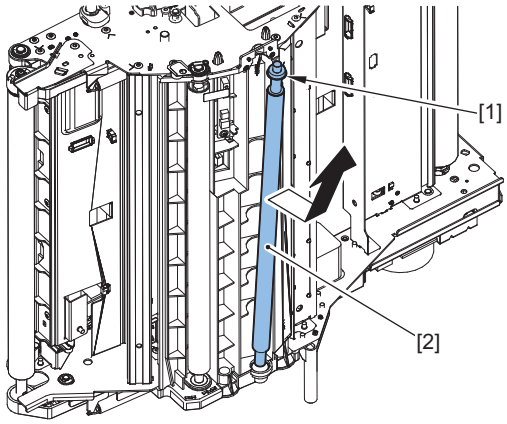


2. **Remove the bearing [1] and the Secondary Transfer Roller [2] in the direction of the arrow.**

CAUTION:

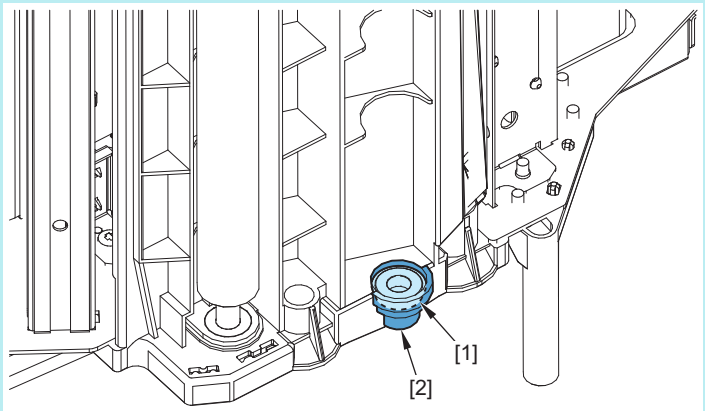
- Be sure not to deform the Grounding Spring [1].
- Be sure to keep the Secondary Transfer Inner Roller [2] from coming in contact with the Grounding Spring [1] to prevent it from being damaged.



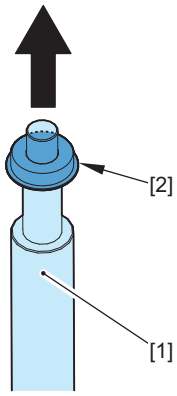


NOTE:

If replacement is not required, there is no need to remove the bearing [1] at the lower side. If it is removed, place it in the Bearing Holder [2].



3. **Remove the bearing [2] from the Secondary Transfer Inner Roller [1].**



When Replacing the Secondary Transfer Inner Roller

■ Procedure

1. **Clear the counter.**
   COPIER > COUNTER > DRBL-1 > 2TR-INRL
2. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
3. **Execute the primary transfer ATVC.**
   COPIER > FUNCTION > MISC-P > 1ATVC-EX
4. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

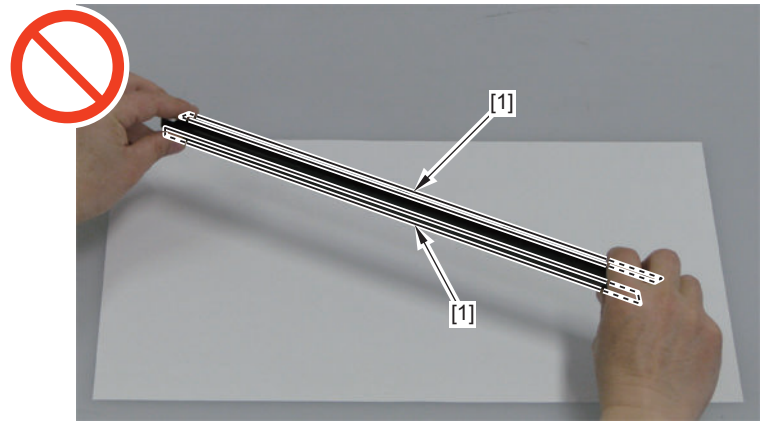
Removing the ITB Inner Scraper Holder

■ Preparation

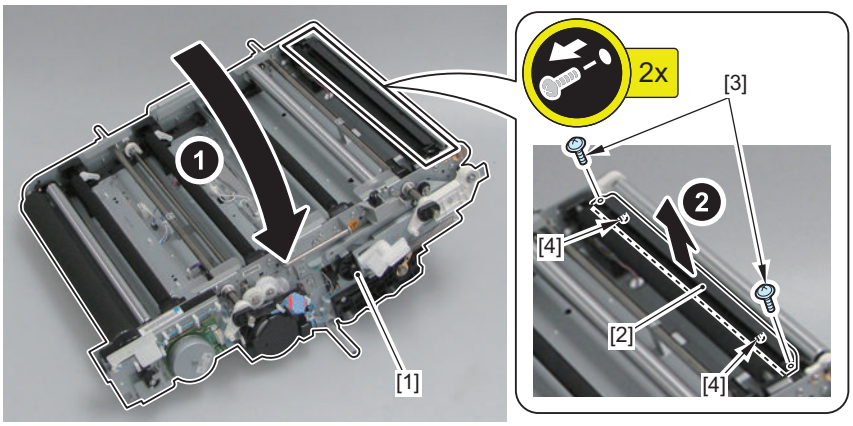
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
5. **Removing the Transfer Cleaning Unit****"Removing the Transfer Cleaning Unit" on page 564**
6. **Removing the ITB****"Removing the ITB" on page 570**

■ Procedure

CAUTION:
- When replacing this part, execute “When Replacing the ITB Inner Scraper” on page 593.
- Do not touch or bend the 2 sheets [1] in the ITB Inner Scraper Holder.



1. **Lay the ITB Unit [1] on its side.**
2. **Remove the ITB Inner Scraper Holder [2].**
   - 2 Screws [3]
   - 2 Bosses [4]



When Replacing the ITB Inner Scraper

■ Procedure

1. **Clear the counter.**
   COPIER > COUNTER > DRBL-1 > ITB-SCRP
2. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
3. **Execute the primary transfer ATVC.**
   COPIER > FUNCTION > MISC-P > 1ATVC-EX
4. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

6. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Cleaning the ITB Inner Scraper

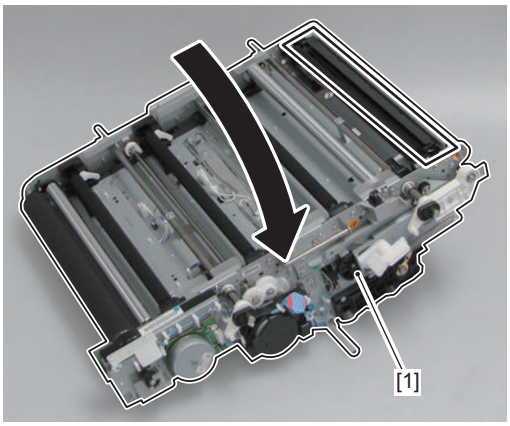
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
5. **Removing the Transfer Cleaning Unit****"Removing the Transfer Cleaning Unit" on page 564**
6. **Removing the ITB****"Removing the ITB" on page 570**

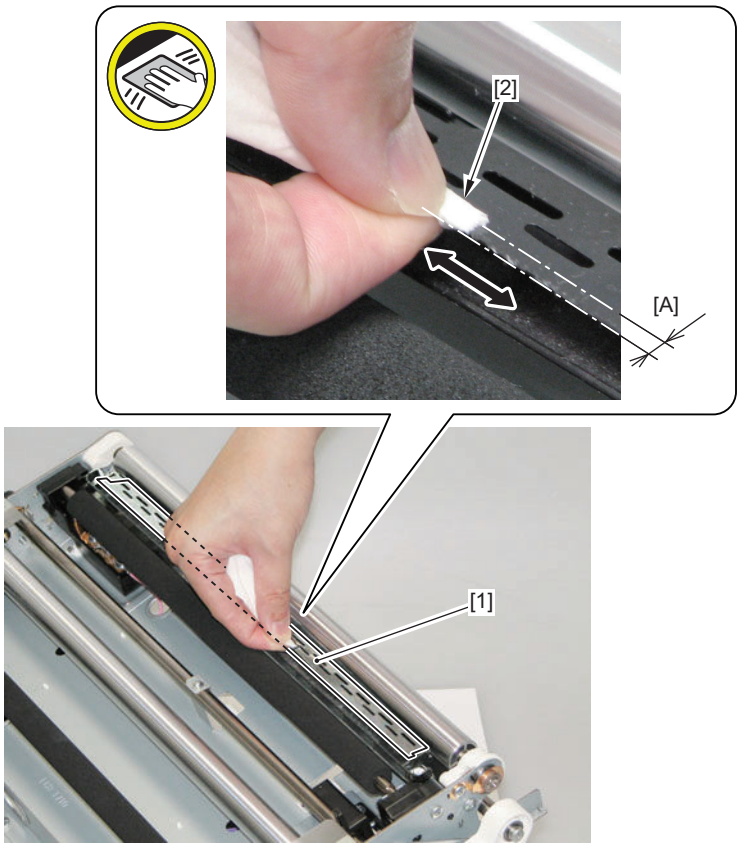
■ Procedure

CAUTION:
If the ITB Inner Scraper is soiled when the ITB is removed, be sure to perform the following procedure to clean it.

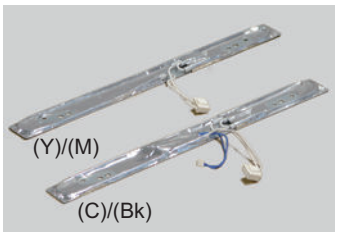
1. **Place the ITB Unit [1] sideways.**



2. **Clean the soiling attached to both sides (front and back) of the leading edge [A] of the ITB Inner Scraper [1] with lint-free paper [2] moistened with alcohol.**



Removing the ITB Heater (Y)/(M) unit, ITB Heater (C)/(Bk) unit



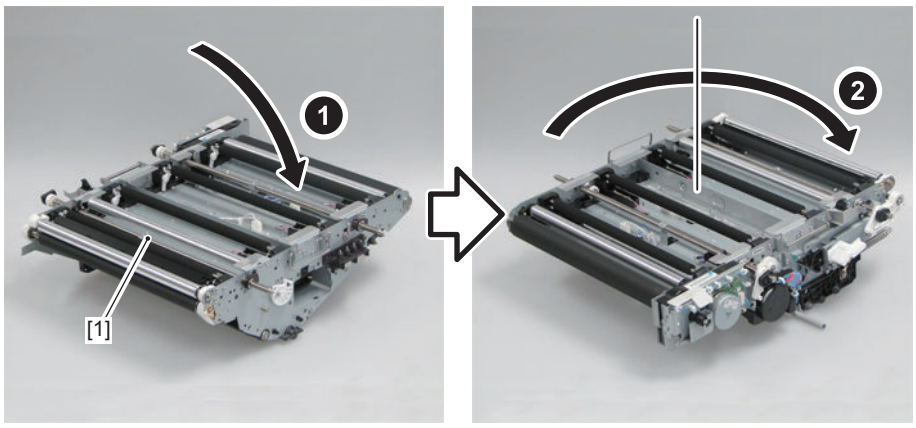
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
5. **Removing the Transfer Cleaning Unit****"Removing the Transfer Cleaning Unit" on page 564**
6. **Removing the ITB****"Removing the ITB" on page 570**

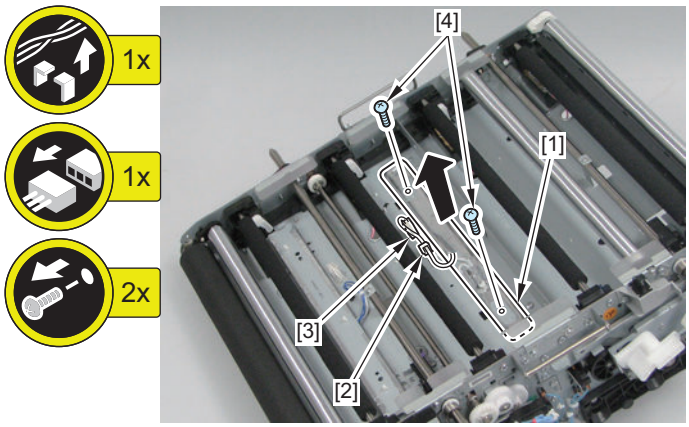
■ Procedure

CAUTION:
Because the ITB Heater is hot, be sure to perform disassembly/assembly after it is cooled down.

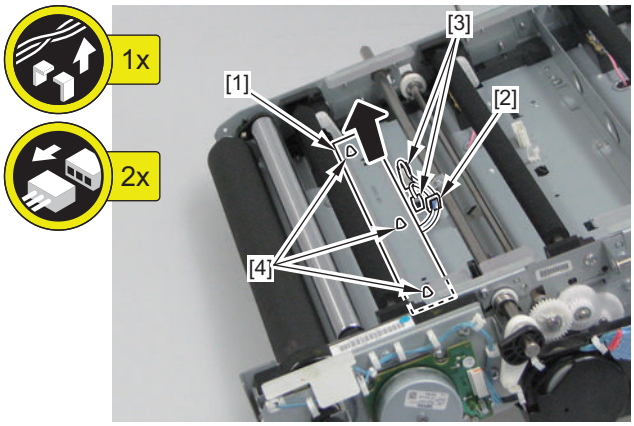
1. **Place the ITB Unit [1] sideways to change its orientation.**



2. **Remove ITB Heater (C)/(Bk) [1].**
   - 1 Wire Saddle [2]
   - 1 Connector [3]
   - 2 Screws [4]



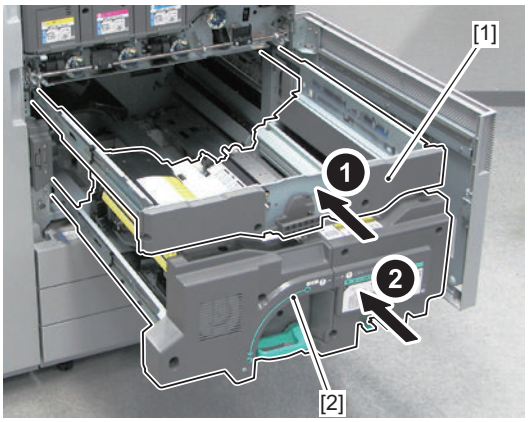
3. **Remove the ITB Heater (Y)/(M) unit [1].**
   - 1 Wire Saddle [2]
   - 2 Connectors [3]
   - 3 Spacers [4]



Removing the Registration Patch Sensor Unit

■ Preparation

1. Removing the Right Middle Front Cover 1“Removing the Right Middle Front Cover 1” on page 944
2. Open the Front Cover.
3. Pull out the Fixing Feed Unit.“Pulling out the Fixing Feed Unit” on page 859
4. Pulling out the ITB Unit“Pulling out the ITB Unit” on page 550
5. Removing the ITB Unit“Removing the ITB Unit” on page 553
6. Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.

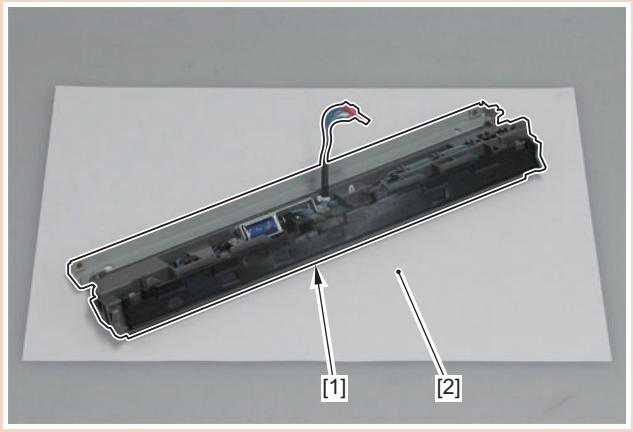


7. Removing the Toner Replacement Cover“Removing the Toner Replacement Cover” on page 941
8. Open the Process Unit Inner Cover.“Opening the Process Unit Inner Cover” on page 542
9. Removing the Primary Charging Assembly“Removing the Primary Charging Assembly” on page 627
10. Removing the Pre-transfer Charging Assembly“Removing the Pre-transfer Charging Assembly” on page 649
11. Removing the Drum Unit (Bk)“Removing the Drum Unit (Bk)” on page 662

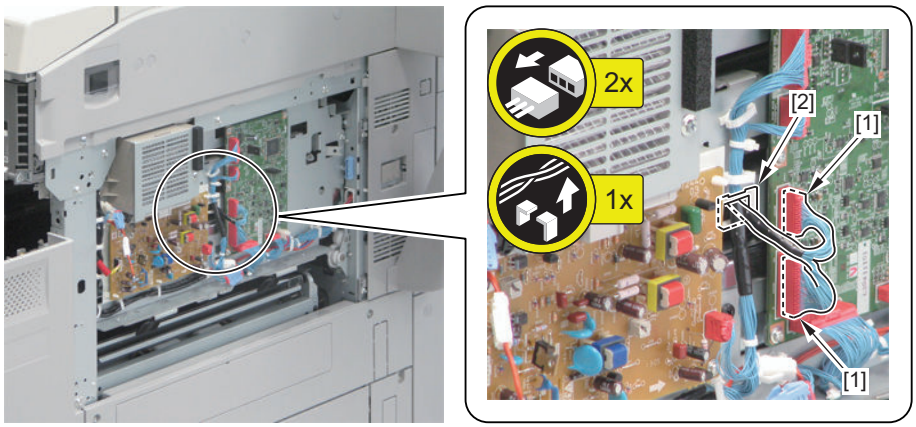
■ Procedure

CAUTION:
When replacing this part, execute “When Replacing the Registration Patch Sensor Unit” on page 600.

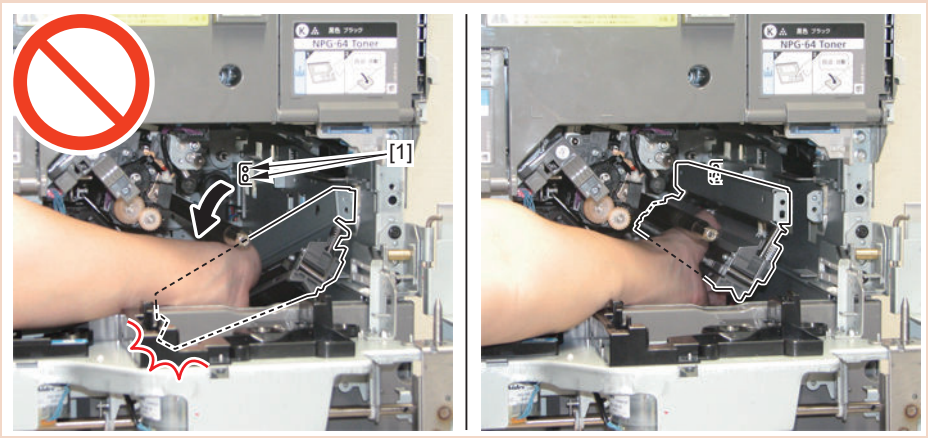
CAUTION:
Be sure to place the Registration Patch Sensor Unit [1] on a sheet of paper [2] because toner is attached on the unit.



1. **Disconnect the 2 connectors [1].**
   - 1 Edge Saddle [2]

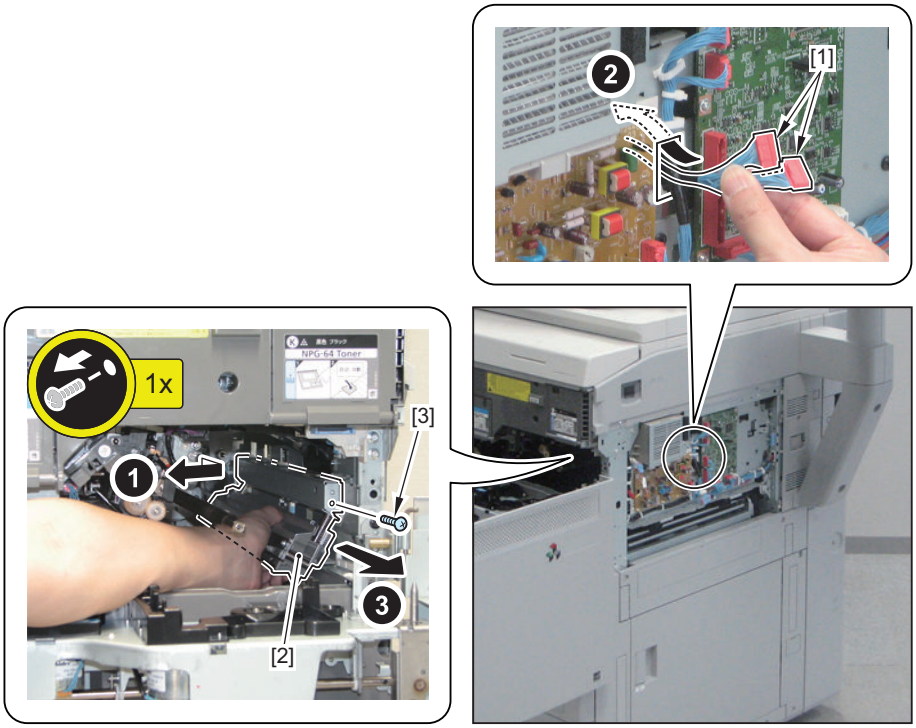


CAUTION:
If the Positioning Pins at the rear side are disengaged from the 2 holes [1] when removing the Registration Patch Sensor Unit, the unit may fall off inside the machine. Therefore, be sure to firmly support the unit during the work.



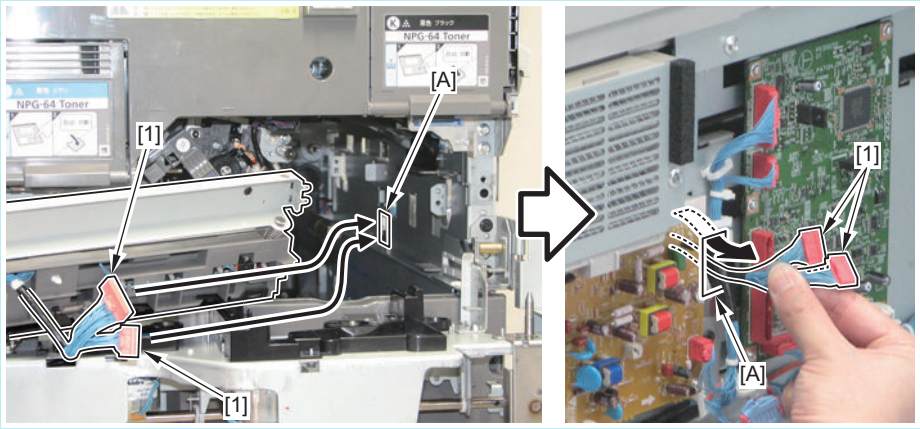
2. Put the 2 connectors [1] inside the machine, and remove the Registration Patch Sensor Unit [2].

- 1 Screw [3]

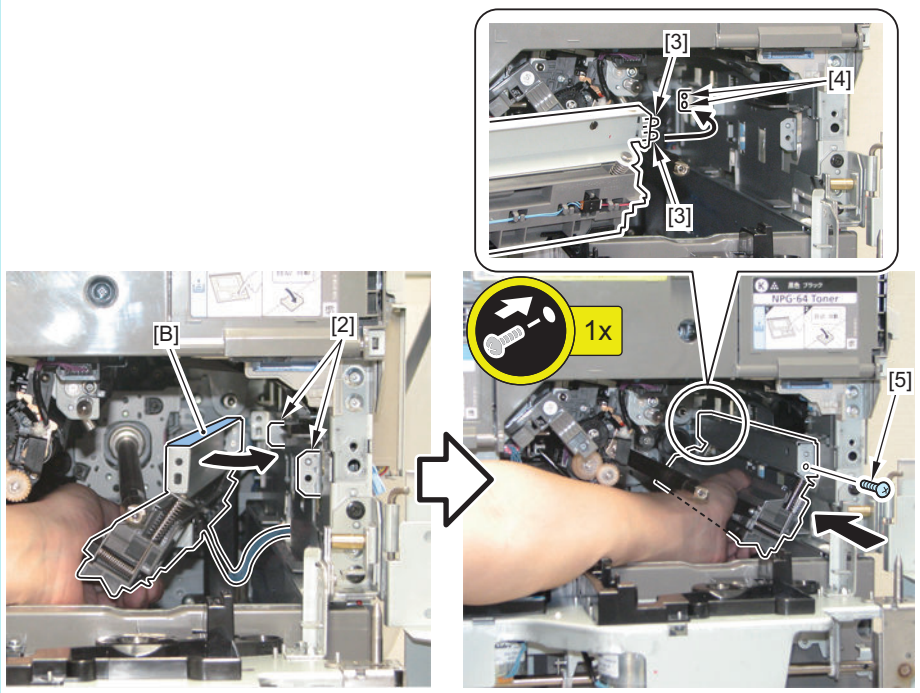


NOTE:
How to remove the Registration Patch Sensor Unit

1. Put the 2 connectors [1] through the hole [A] of the plate.



2. Put the plate [B] of the Registration Patch Sensor Unit on the 2 protrusions [2] on the host machine side, and install the 2 Positioning Pins [3] on the rear side into the 2 holes [4] on the Rear Plate.
   - 1 Screw [5]



When Replacing the Registration Patch Sensor Unit

■ Procedure

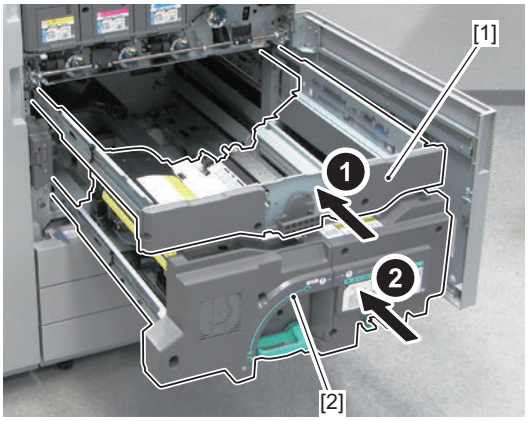
1. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
2. **Adjust the Patch Sensor Light Intensity.**
   COPIER > FUNCTION > MISC-P > PT-LPADJ
3. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
4. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

5. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Cleaning the Registration Patch Sensor Unit

■ Preparation

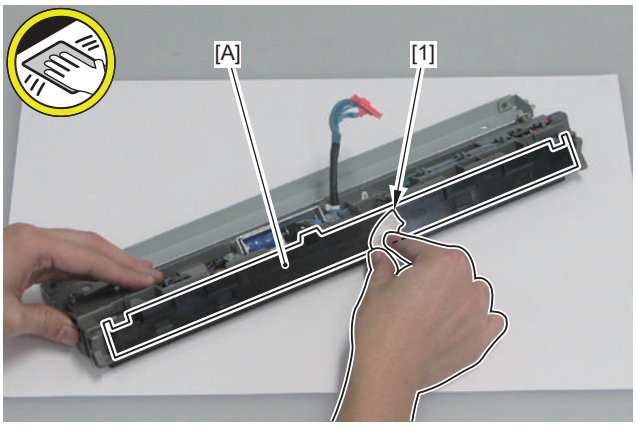
1. **Removing the Right Middle Front Cover 1****"Removing the Right Middle Front Cover 1" on page 944**
2. **Open the Front Cover.**
3. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
4. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
5. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
6. **Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.**



7. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
8. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
9. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
10. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
11. **Removing the Drum Unit (Bk)****"Removing the Drum Unit (Bk)" on page 662**
12. **Removing the Registration Patch Sensor Unit****"Removing the Registration Patch Sensor Unit" on page 597**

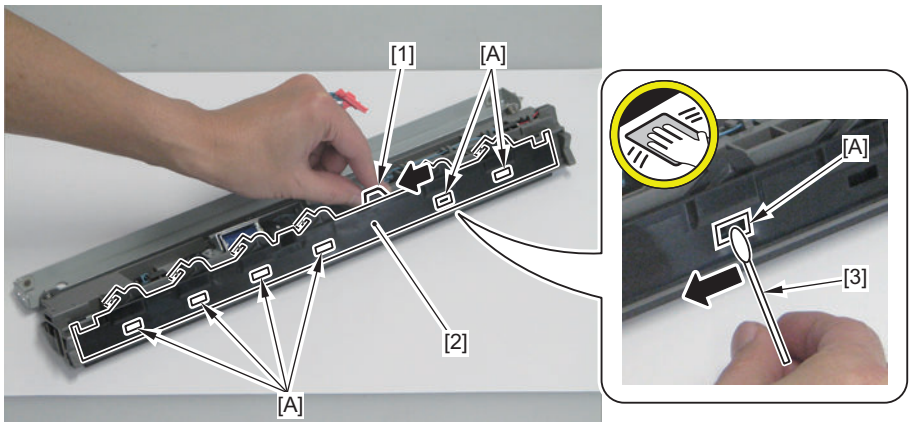
■ Procedure

1. **Clean the surface [A] of the shutter with lint-free paper [1] moistened with alcohol.**

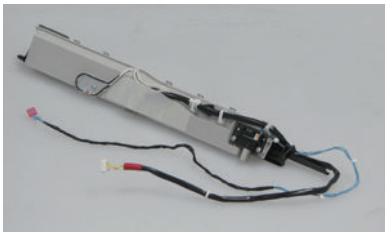


2. **Hold the Shutter Lever [1], open the shutter [2], and clean the 6 locations of the surface [A] of the Registration Patch Sensor in the single direction with wet and tightly-wrung cotton swab [3]. After cleaning, check that there is no soiling caused by toner on the surface [A] of the sensor.**

CAUTION:
- Do not use alcohol because it causes melting and clouding of the sensor window.
- Do not dry wipe the sensor window because it is charged to attract toner.
- Be sure to clean it in the single direction in order to prevent uneven wiping.

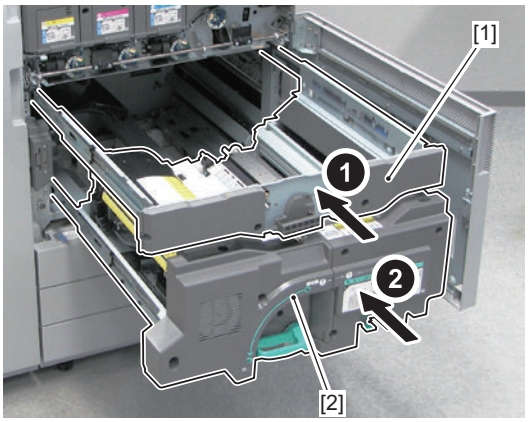


Removing the Primary Charging Rail



■ Preparation

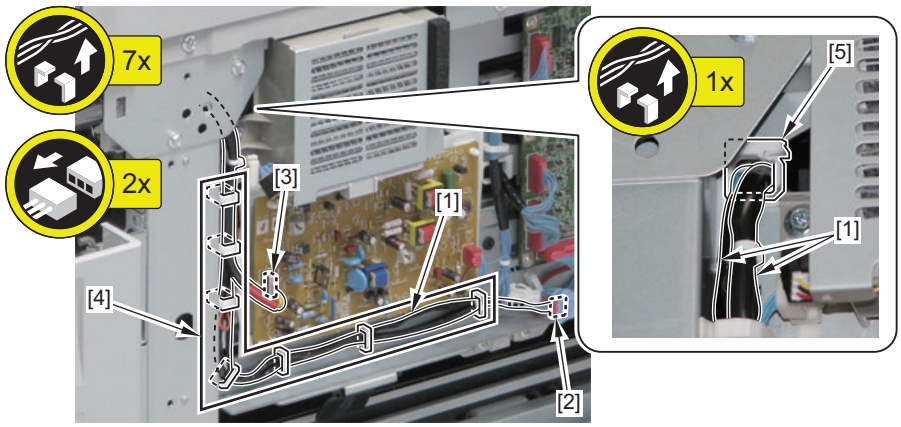
1. **Removing the Right Middle Front Cover 1****"Removing the Right Middle Front Cover 1" on page 944**
2. **Open the Front Cover.**
3. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
4. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
5. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
6. **Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.**



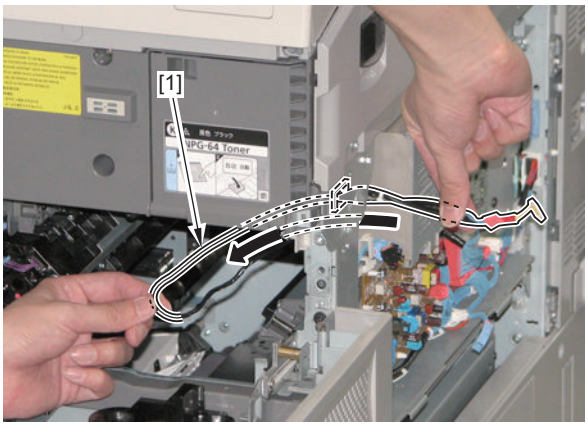
7. **Removing the Toner Replacement Cover**"Removing the Toner Replacement Cover" on page 941
8. **Open the Process Unit Inner Cover.**"Opening the Process Unit Inner Cover" on page 542
9. **Removing the Primary Charging Assembly**"Removing the Primary Charging Assembly" on page 627
10. **Removing the Pre-transfer Charging Assembly**"Removing the Pre-transfer Charging Assembly" on page 649
11. **Removing the Developing Assembly (Bk)**"Removing the Drum (Bk)" on page 682
12. **Removing the Drum Unit (Bk)**"Removing the Drum Unit (Bk)" on page 662

■ Procedure

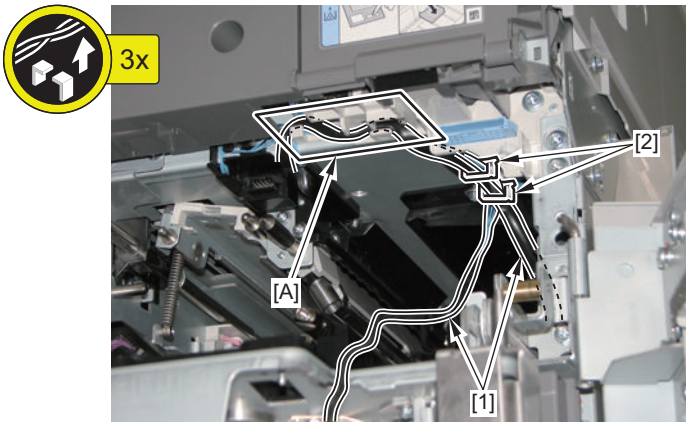
1. **Free the 2 harnesses [1].**
   - 1 Relay Connector [2]
   - 1 Connector [3]
   - 7 Wire Saddles [4]
   - 1 Edge Saddle [5]



2. **Put the removed harness [1] inside the host machine.**

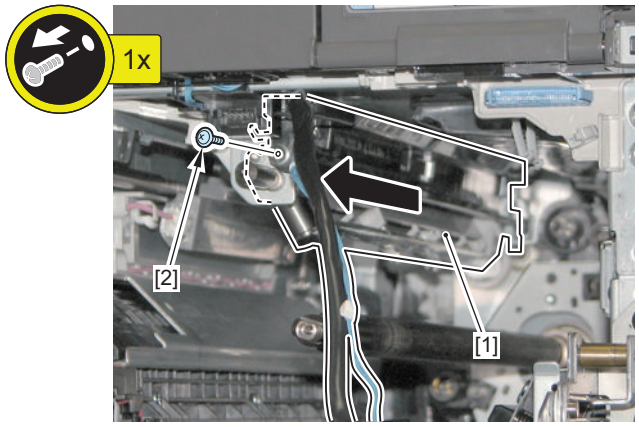


3. **Free the 2 harnesses [1].**
   - 2 Wire Saddles [2]
   - Harness Guide [A]

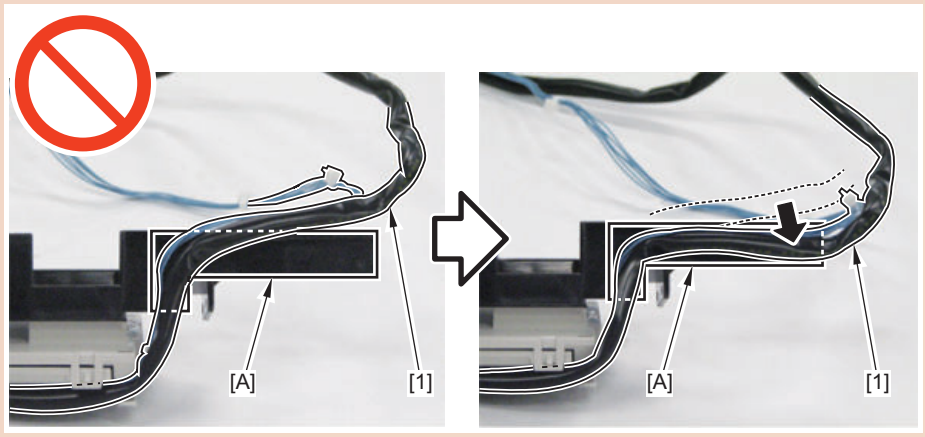


4. Remove the Primary Charging Rail [1].

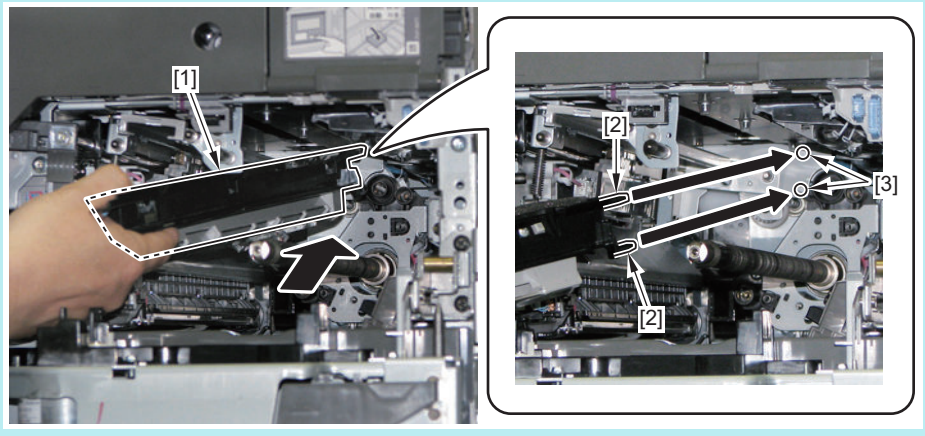
- 1 Screw [2]



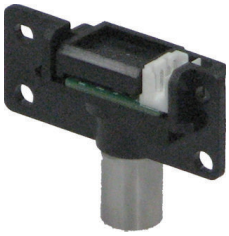
CAUTION:
Install the wiring [1] of the Potential Sensor PCB Unit along the Harness Guide [A] of the Primary Charging Rail.



NOTE:
When installing, insert the Primary Charging Rail [1] at the angle as shown in the figure, and then insert the 2 bosses [2] in the boss holes [3] of the host machine.

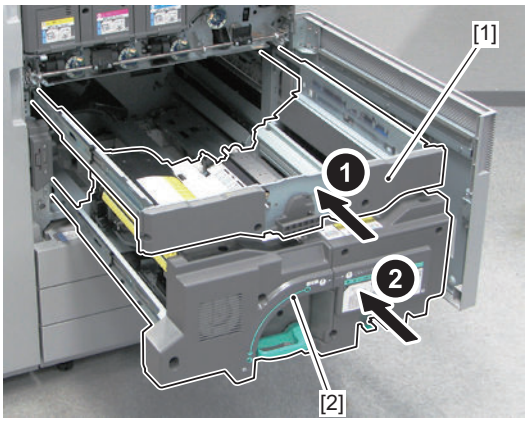


Removing the Drum Thermopile



■ Preparation

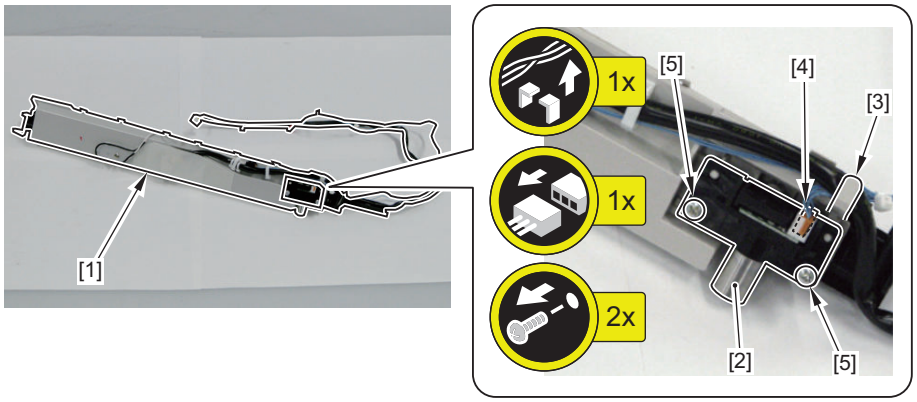
1. Removing the Right Middle Front Cover 1"Removing the Right Middle Front Cover 1" on page 944
2. Open the Front Cover.
3. Pull out the Fixing Feed Unit."Pulling out the Fixing Feed Unit" on page 859
4. Pulling out the ITB Unit"Pulling out the ITB Unit" on page 550
5. Removing the ITB Unit"Removing the ITB Unit" on page 553
6. Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.



7. Removing the Toner Replacement Cover"Removing the Toner Replacement Cover" on page 941
8. Open the Process Unit Inner Cover."Opening the Process Unit Inner Cover" on page 542
9. Removing the Primary Charging Assembly"Removing the Primary Charging Assembly" on page 627
10. Removing the Pre-transfer Charging Assembly"Removing the Pre-transfer Charging Assembly" on page 649
11. Removing the Developing Assembly (Bk)"Removing the Drum (Bk)" on page 682
12. Removing the Drum Unit (Bk)"Removing the Drum Unit (Bk)" on page 662
13. Removing the Primary Charging Rail"Removing the Primary Charging Rail" on page 602

■ Procedure

1. **Remove the Drum Thermopile [2] from the Primary Charging Rail [1].**
   - 1 Guide [3]
   - 1 Connector [4]
   - 2 Screws [5]

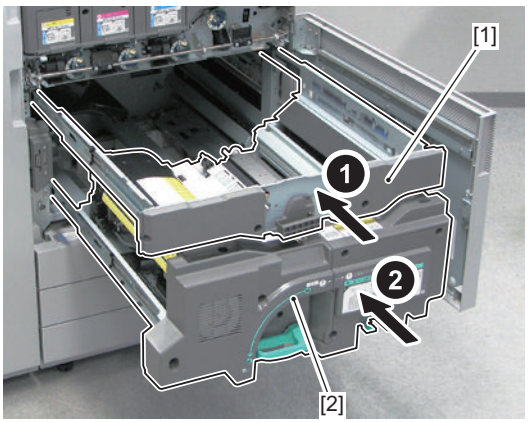


Removing the Potential Sensor PCB Unit (including Potential Sensor and Potential Control PCB)

■ Preparation

1. **Removing the Right Middle Front Cover 1****"Removing the Right Middle Front Cover 1" on page 944**
2. **Open the Front Cover.**
3. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
4. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
5. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**

6. **Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.**



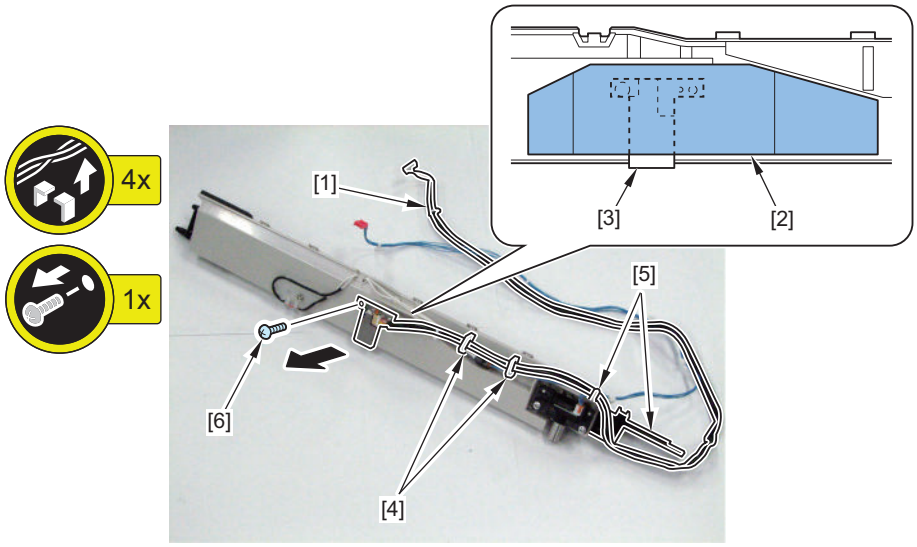
7. **Removing the Toner Replacement Cover****“Removing the Toner Replacement Cover” on page 941**
8. **Open the Process Unit Inner Cover.****“Opening the Process Unit Inner Cover” on page 542**
9. **Removing the Primary Charging Assembly****“Removing the Primary Charging Assembly” on page 627**
10. **Removing the Pre-transfer Charging Assembly****“Removing the Pre-transfer Charging Assembly” on page 649**
11. **Removing the Developing Assembly (Bk)****“Removing the Drum (Bk)” on page 682**
12. **Removing the Drum Unit (Bk)****“Removing the Drum Unit (Bk)” on page 662**
13. **Removing the Primary Charging Rail****“Removing the Primary Charging Rail” on page 602**

■ Procedure

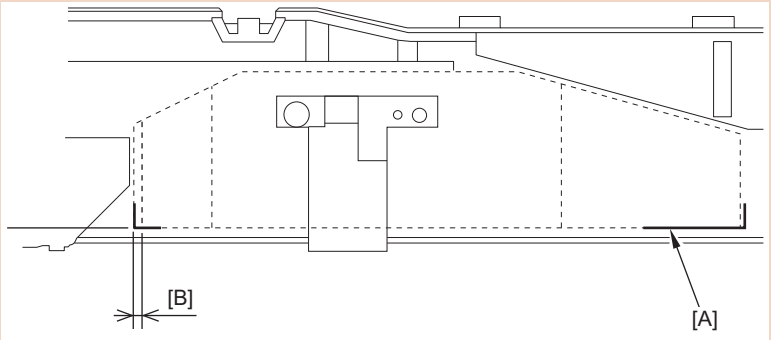
CAUTION:
When replacing this part, execute “When Replacing the Potential Sensor PCB Unit” on page 610.

NOTE:
If the Potential Sensor is replaced, also replace the harness connected to the Potential Sensor and the Potential Control PCB as a Potential Sensor PCB Unit.

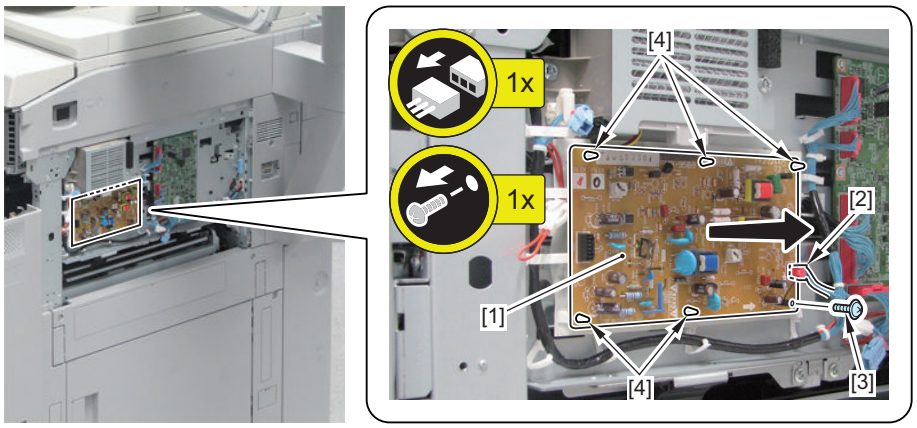
1. **Remove the harness [1] connected to the Potential Sensor, Potential Sensor Protection Sheet [2], and Potential Sensor [3].**
   - 2 Wire Saddles [4]
   - 2 Harness Guides [5]
   - 1 Screw [6]



CAUTION:
When installing, remove the release paper, and align the Potential Sensor Protection Sheet with the marking line [A] to affix it (be sure that the gap [B] between the marking line and the release paper is less than 0.5 mm).



2. **Remove the Potential Control PCB [1].**
   - 1 Connector [2]
   - 1 Screw [3]
   - 5 PCB Supports [4]

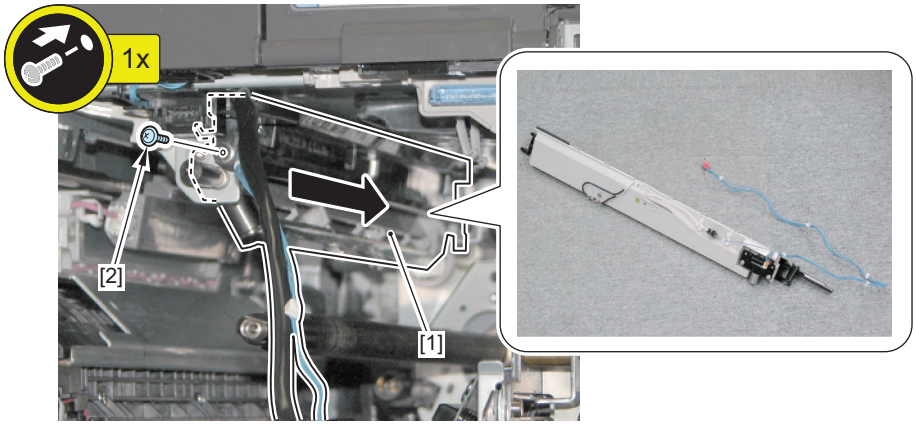


When Replacing the Potential Sensor PCB Unit

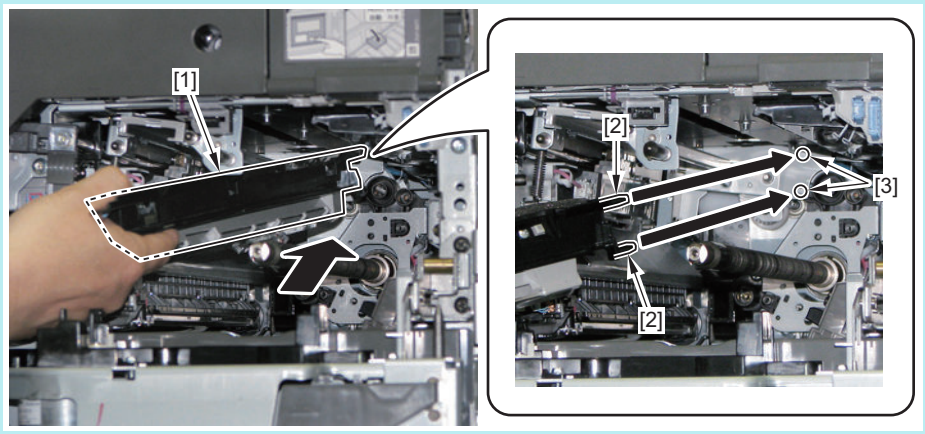
■ Procedure

NOTE:
When replacing the Potential Sensor, replace the Potential Sensor PCB Unit (including the Potential Sensor, harness and Potential Control PCB).

1. **Install the Primary Charging Rail [1] with the Potential Sensor removed to the host machine.**
   - 1 Screw [2]



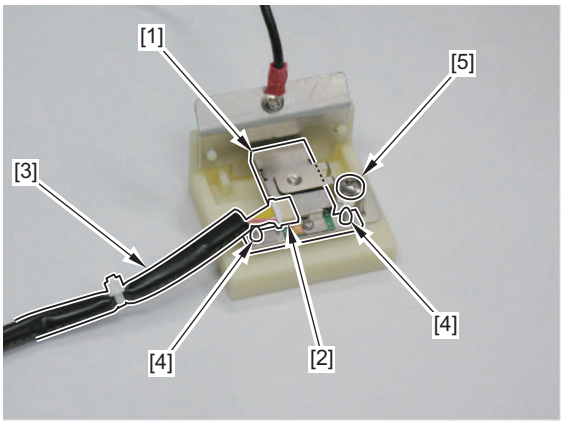
NOTE:
When installing, insert the Primary Charging Rail [1] at the angle as shown in the figure, and then insert the 2 bosses [2] in the boss holes [3] of the host machine.



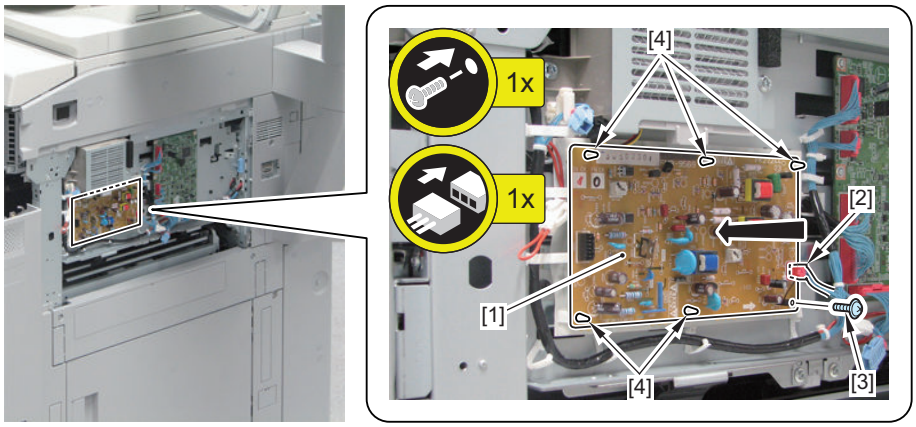
2. **Install the ITB Unit to the host machine.**
3. **Connect a new cable [3] to the connector [2] of a new Potential Sensor [1].**

4. **Install the Potential Sensor [1] to the 2 pin electrodes [4] for checking the Potential Sensor.**
   - 1 Connector [2]
   - 1 Screw [5]

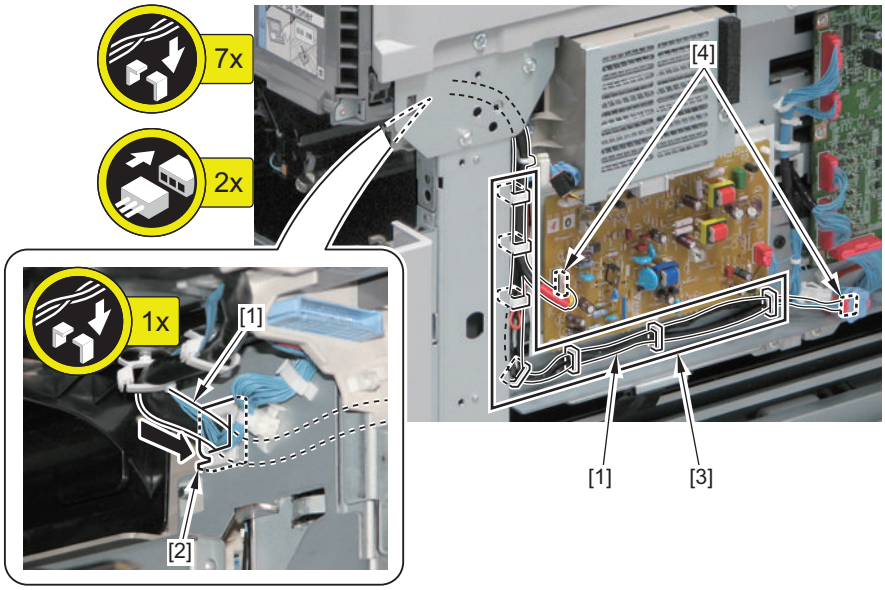
CAUTION:
Secure the screw firmly so that the Potential Sensor is not removed.



5. **Install a new Potential Control PCB [1].**
   - 1 Connector [2]
   - 1 Screw [3]
   - 5 PCB Supports [4]

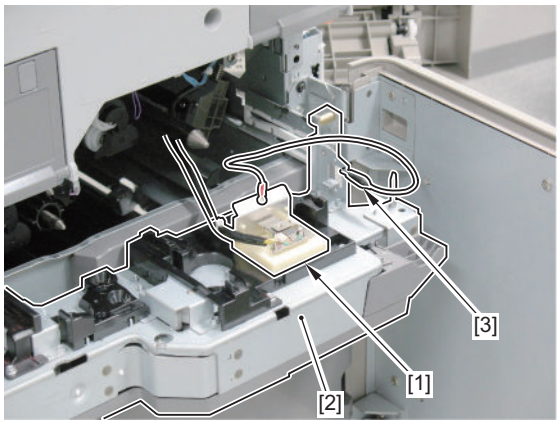


6. **Pass 2 harnesses [1] of the Primary Charging Rail and the electrode for checking the Potential Sensor from the Edge Saddle [2] of the Right Side Plate of the host machine, and connect the 7 Wire Saddles [3] and the 2 connectors [4].**

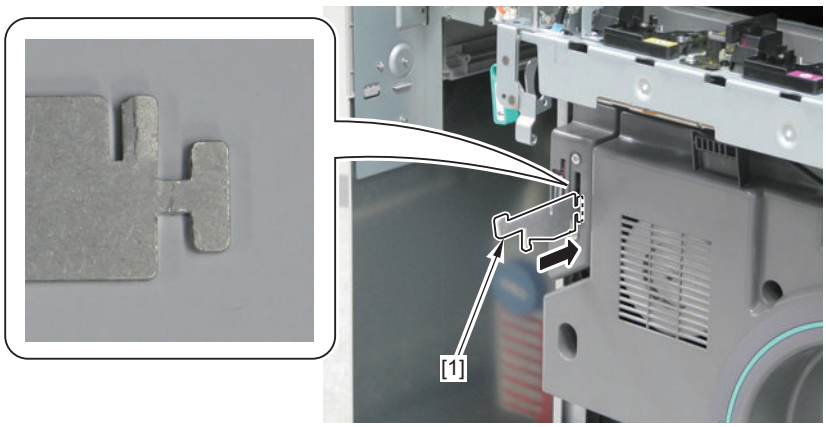


7. **Place the electrode [1] for checking the Potential Sensor on the Process Unit Inner Cover [2], and use the Electrode Clip [3] to pinch the plate of the hinge to ground.**

CAUTION:
Be careful not to drop the electrode for checking the Potential Sensor.

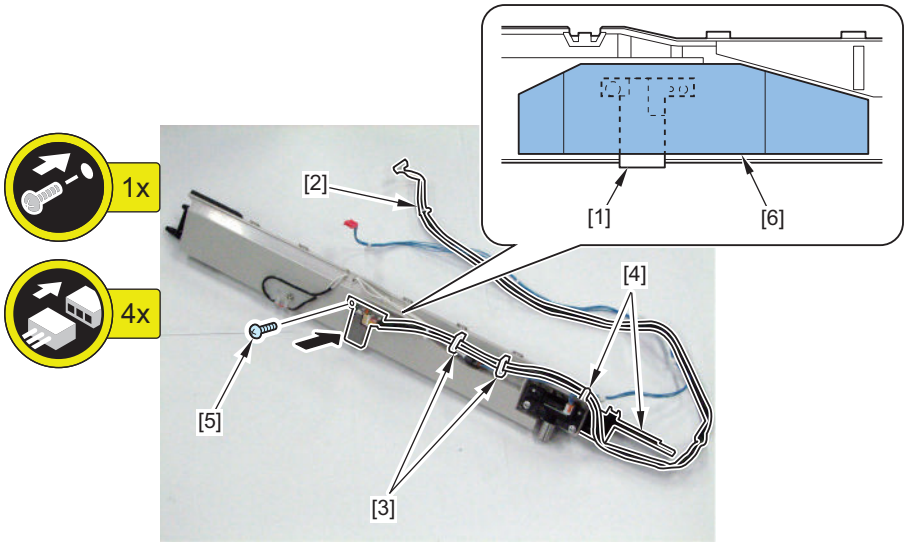


8. **Use a dedicated tool [1] to deactivate the Front Door Switch.**

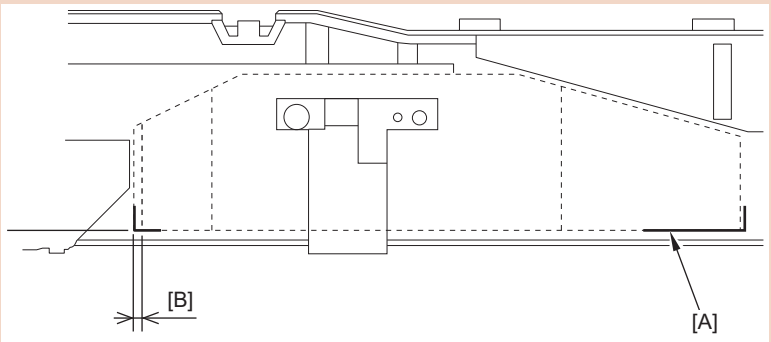


9. **Turn ON the main power switch.**

10. **Disable (OFF) the warm-up rotation immediately after turning ON the main power switch.**
    COPIER > FUNCTION > INSTALL > AINR-OFF = 1
11. **Execute the Potential Sensor adjustment.**
    COPIER > FUNCTION > DPC > OFST
12. **Enable (ON) the warm-up rotation.**
    COPIER > FUNCTION > INSTALL > AINR-OFF = 0
13. **Turn OFF the main power switch.**
14. **Install a new Potential Sensor [1] to the Primary Charging Rail.**
    - 1 Harness [2]
    - 2 Wire Saddles [3]
    - 2 Harness Guides [4]
    - 1 Screw [5]
15. **Install a new Potential Sensor Protection Sheet [6].**



CAUTION:
When installing, remove the release paper, and align the Potential Sensor Protection Sheet with the marking line [A] to affix it (be sure that the gap [B] between the marking line and the release paper is less than 0.5 mm).

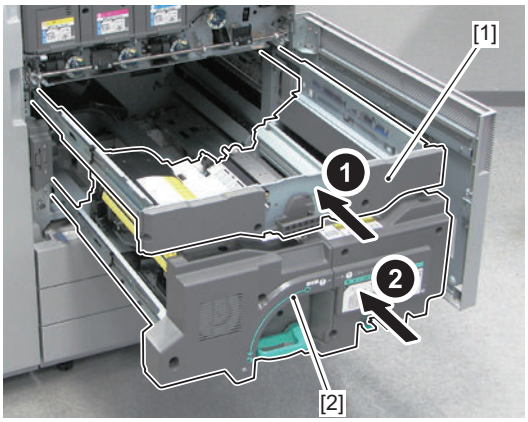


16. **Install the Primary Charging Rail to the host machine.**
17. **Install the removed parts in reverse order.**

Removing the Drum Thermistor

■ Preparation

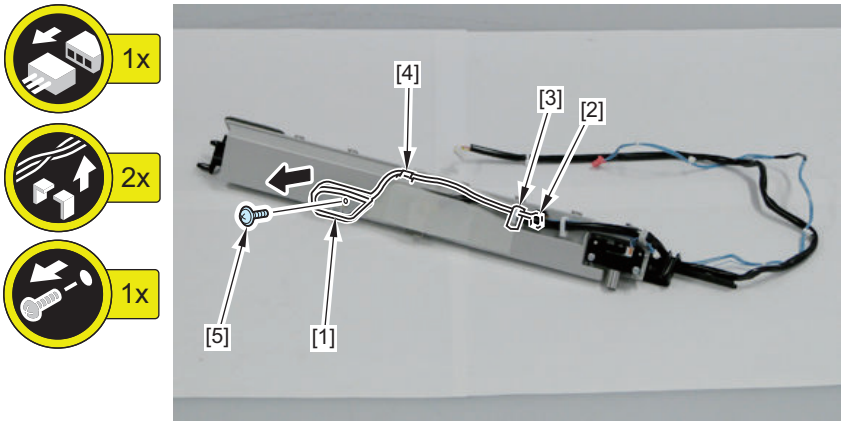
1. Removing the Right Middle Front Cover 1 “Removing the Right Middle Front Cover 1” on page 944
2. Open the Front Cover.
3. Pulling out the Fixing Feed Unit “Pulling out the Fixing Feed Unit” on page 859
4. Pulling out the ITB Unit “Pulling out the ITB Unit” on page 550
5. Removing the ITB Unit “Removing the ITB Unit” on page 553
6. Store the ITB Frame [1] and the Fixing Feed Unit [2].



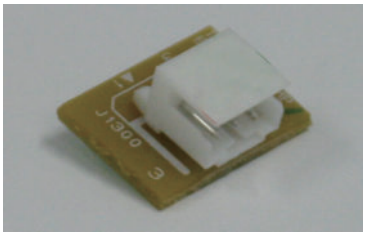
7. Removing the Toner Replacement Cover “Removing the Toner Replacement Cover” on page 941
8. Opening the Process Unit Inner Cover “Opening the Process Unit Inner Cover” on page 542
9. Removing the Primary Charging Assembly “Removing the Primary Charging Assembly” on page 627
10. Removing the Pre-transfer Charging Assembly “Removing the Pre-transfer Charging Assembly” on page 649
11. Removing the Developing Assembly (Bk) “Removing the Developing Assembly (Bk)” on page 701
12. Removing the Drum Unit (Bk) “Removing the Drum Unit (Bk)” on page 662
13. Removing the Primary Charging Rail “Removing the Primary Charging Rail” on page 602

■ Procedure

1. **Remove the Drum Thermistor [1].**
   - 1 Connector [2]
   - 1 Wire Saddle [3]
   - 1 Harness Guide [4]
   - 1 Screw [5]

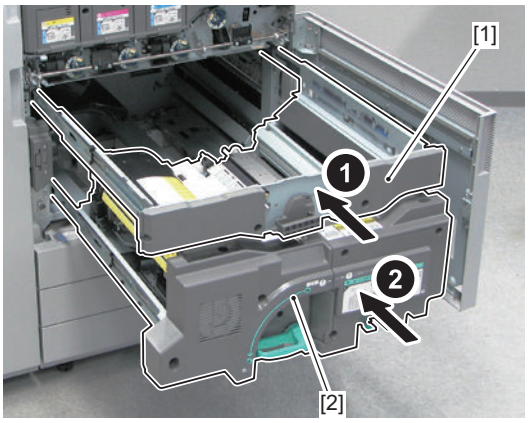


Removing the Main Body Inner Temperature Detection PCB (Y)/(M) and (C)/(Bk)



■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
5. **Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.**

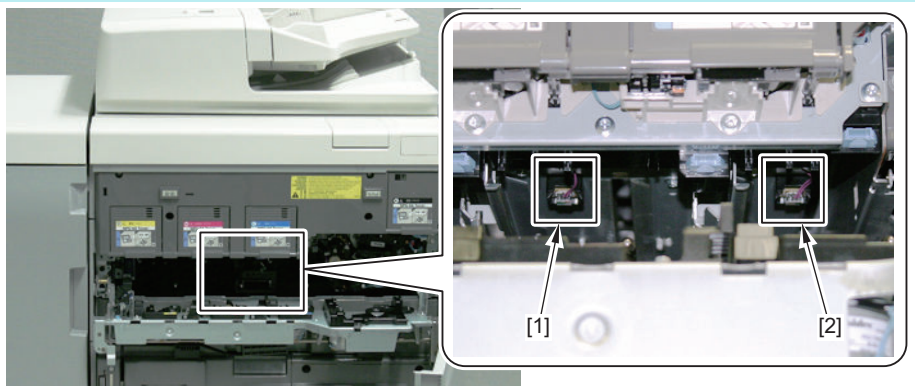


6. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**

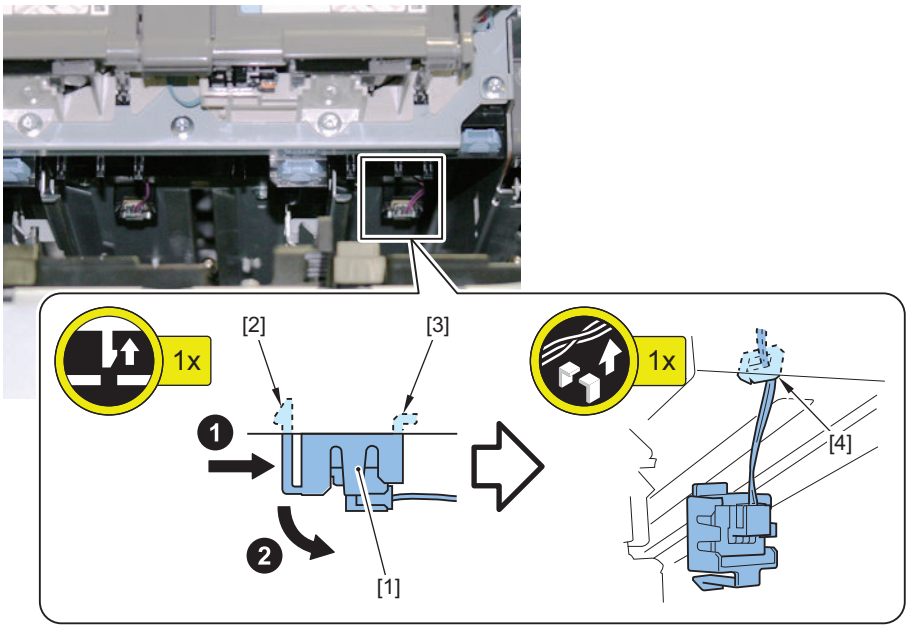
7. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
8. **Removing the Process Unit (Y)/(M)/(C)****"Removing the Process Unit (Y)/(M)/(C)" on page 712**

■ Procedure

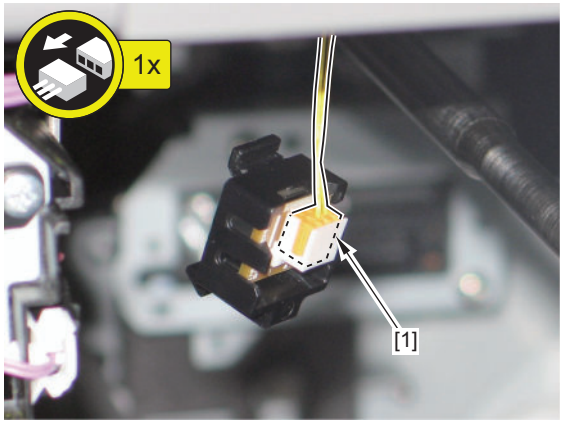
NOTE:
The 2 Main Body Inner Temperature Detection PCBs for (Y)/(M) [1] and (C)/(Bk) [2] are installed.
This procedure explains how to remove the Main Body Inner Temperature Detection PCB (C)/(Bk).
Be sure to perform the same procedure to remove the Main Body Inner Temperature Detection PCB (Y)/(M).



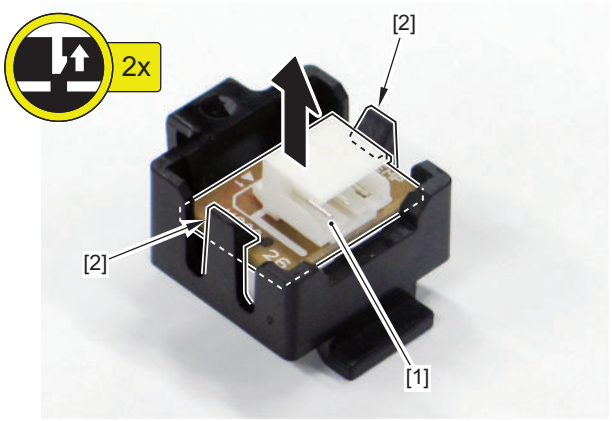
1. **Remove the Thermistor Holder [1].**
   - 1 Claw [2]
   - 1 Protrusion [3]
   - 1 Wire Saddle [4]



2. **Disconnect the connector [1].**



3. **Remove the Main Body Inner Temperature Detection PCB [1].**
   - 2 Claws [2]



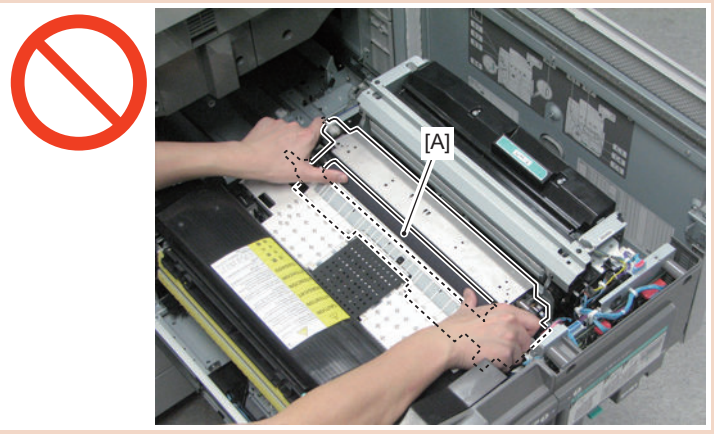
Removing the Secondary Transfer Unit

■ Preparation

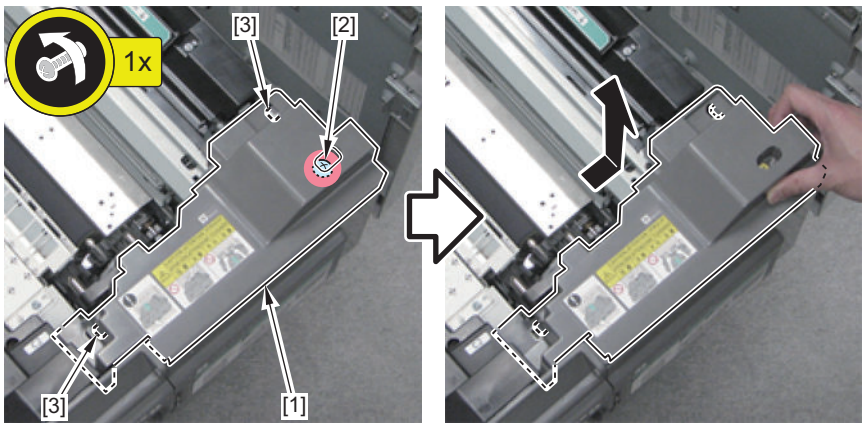
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

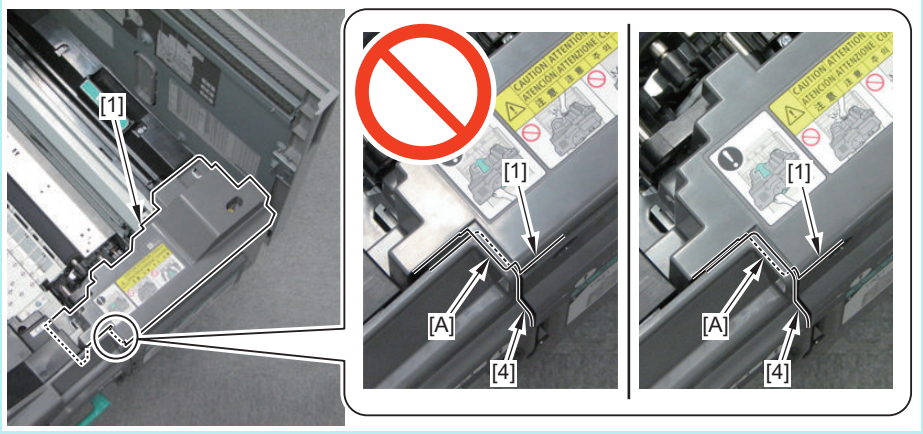
CAUTION:
Be sure not to touch the surface [A] of the Secondary Transfer Outer Roller when disassembling/assembling.



1. **Remove the Fixing Feed Sub Cover [1].**
   - 1 Screw [2] (to loosen)
   - 2 Hooks [3]

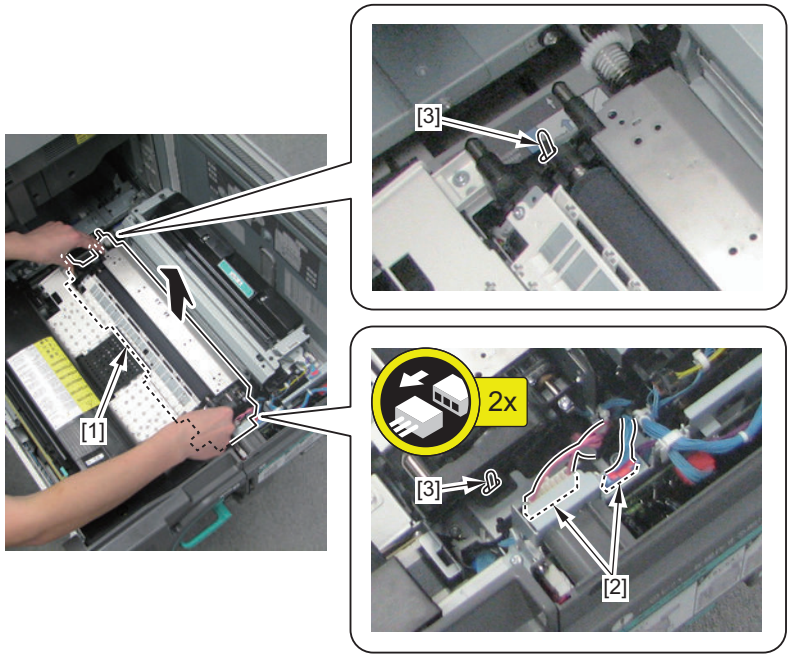


NOTE:
How to install the Fixing Feed Sub Cover
Put the [A] part of the Fixing Feed Sub Cover under the Fixing Feed Front Left Cover [4].

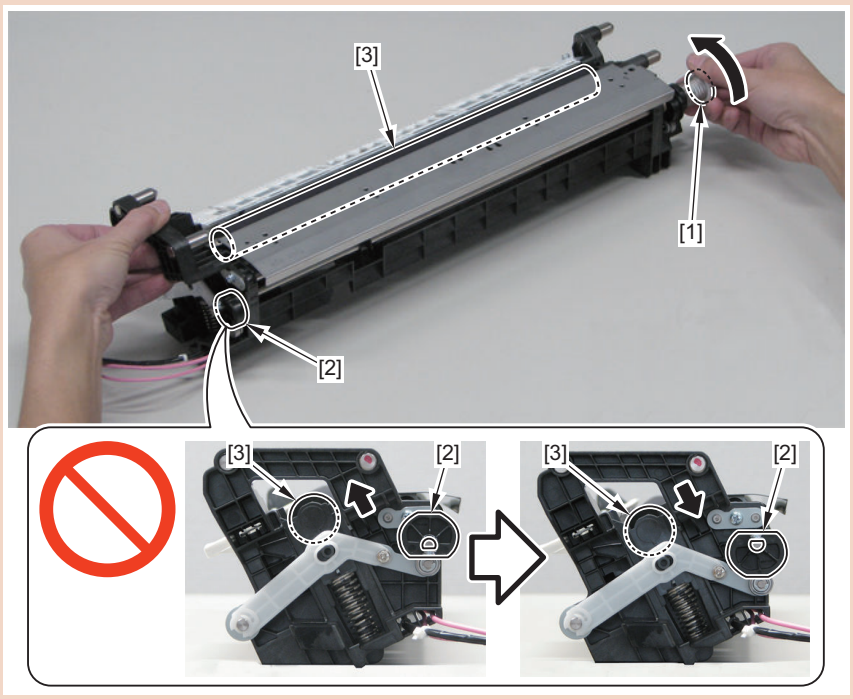


2. Remove the Secondary Transfer Unit [1].

- 2 Connectors [2]
- 2 Positioning Pins [3]



CAUTION:
When installing the Secondary Transfer Unit to the Fixing Feed Unit, be sure to do so after releasing the pressure applied on the Secondary Transfer Outer Roller.
(Otherwise, the Secondary Transfer Outer Roller may be deformed, or the ITB may be damaged.)
How to release the pressure applied on the Secondary Transfer Outer Roller
The pressure on the Secondary Transfer Outer Roller [3] can be released by turning the gear [1] and changing the direction of the cam [2]. Be sure to keep the Secondary Transfer Outer Roller lowered.



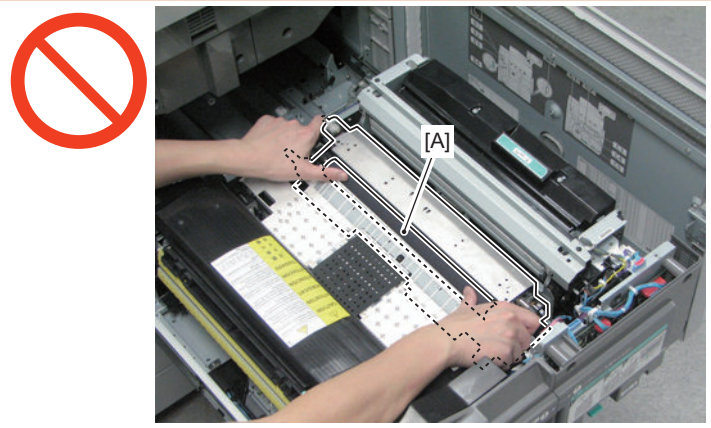
Cleaning the Post-secondary Transfer Guide

■ Preparation

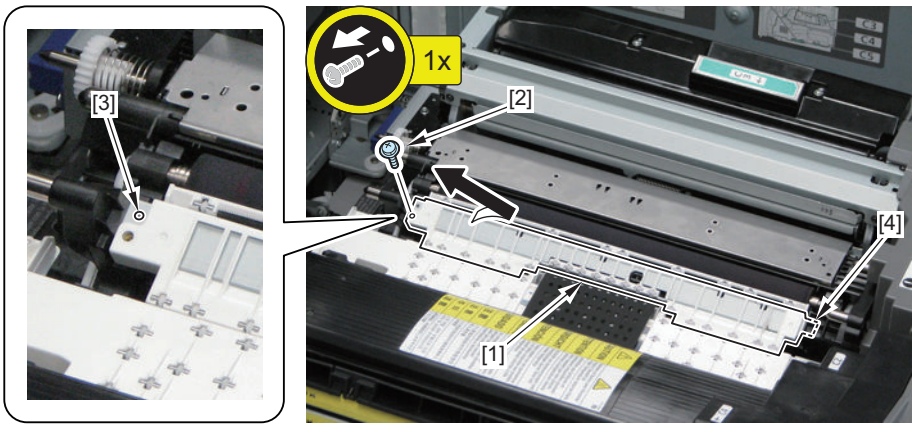
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

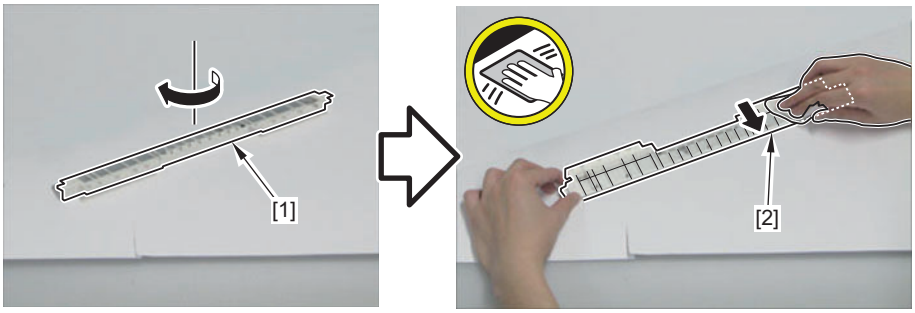
CAUTION:
Be sure not to touch the surface [A] of the Secondary Transfer Outer Roller when disassembling/assembling.



1. **Remove the Post-secondary Transfer Guide [1].**
   - 1 Screw (with washer) [2]
   - 1 Boss [3]
   - 1 Protrusion [4]



2. **Change the direction of the Post-secondary Transfer Guide [1], and clean it with lint-free paper [2] moistened with alcohol.**



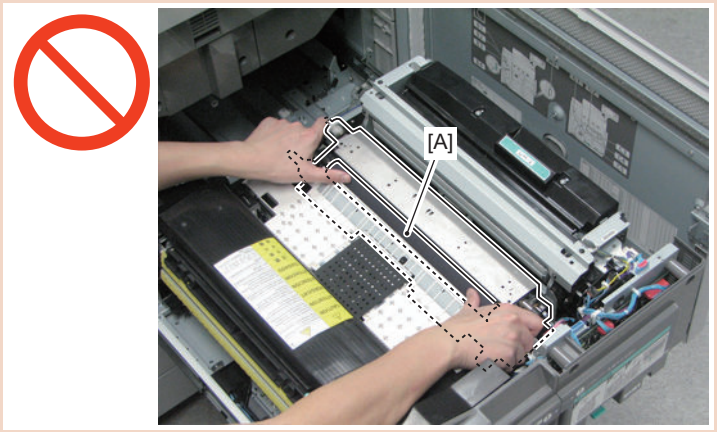
Removing the Secondary Transfer Static Eliminator

■ Preparation

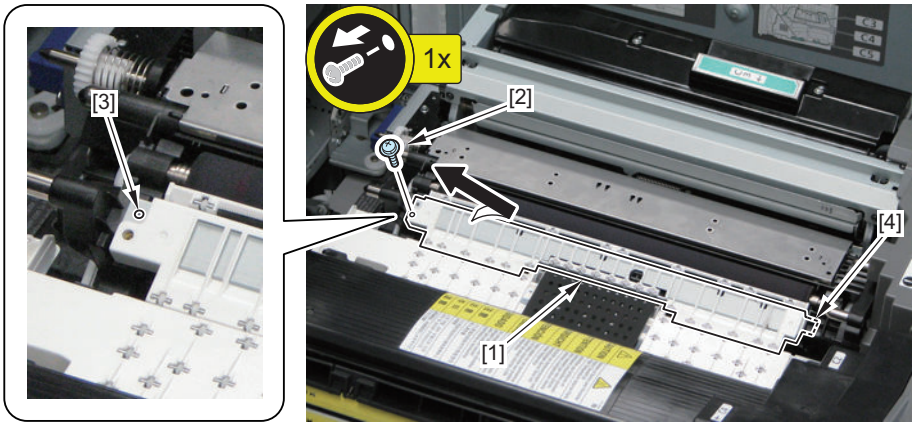
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

CAUTION:
Be sure not to touch the surface [A] of the Secondary Transfer Outer Roller when disassembling/assembling.

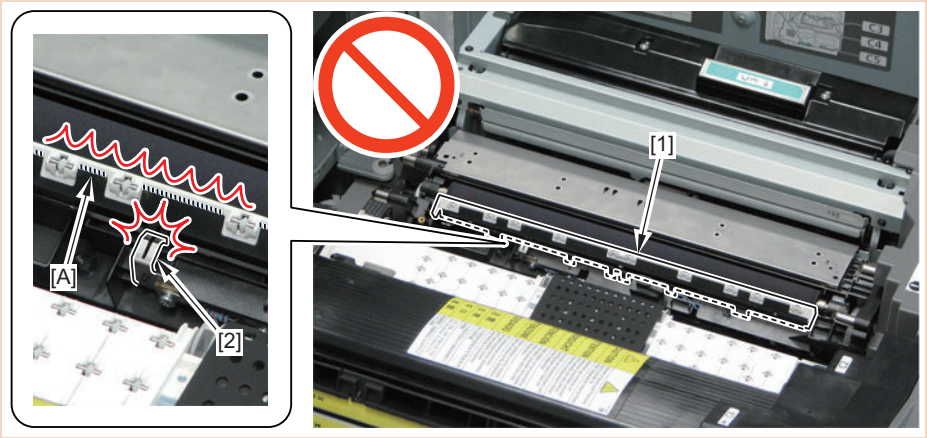


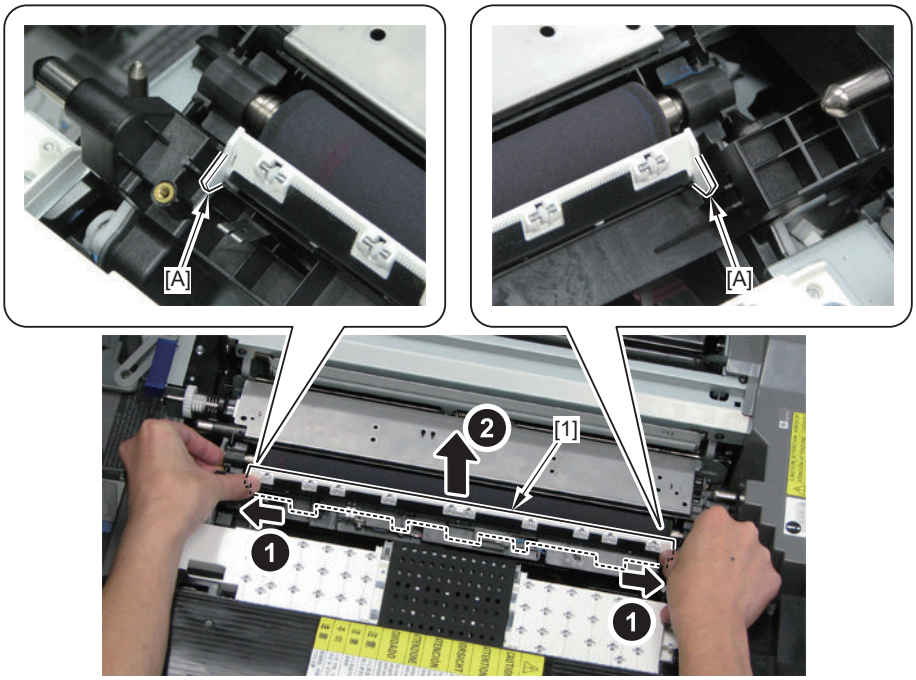
1. **Remove the Post-secondary Transfer Guide [1].**
   - 1 Screw (with washer) [2]
   - 1 Protrusion [3]



2. **Hold the 2 [A] parts, and remove the Secondary Transfer Static Eliminator [1] while pressing the parts outward.**

CAUTION:
- Do not to deform the leading edge [A] of the Secondary Transfer Static Eliminator [1].
- Be sure not to deform the Grounding Spring [2].





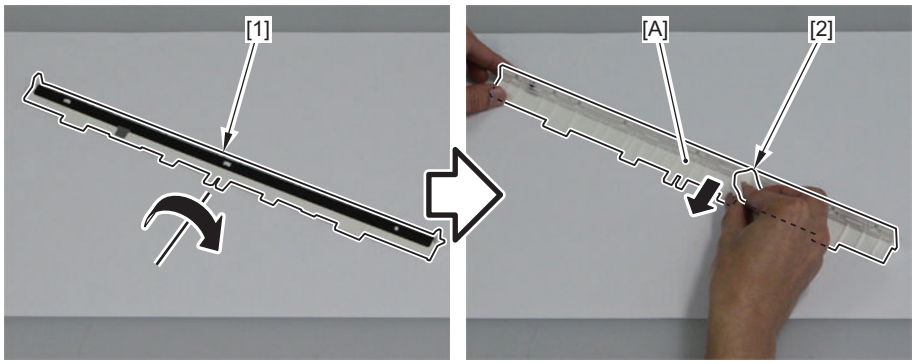
Cleaning the Secondary Transfer Static Eliminator

■ Preparation

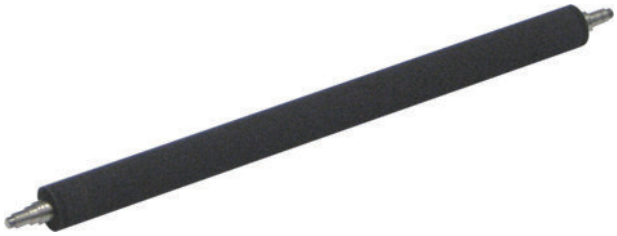
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Secondary Transfer Static Eliminator****"Removing the Secondary Transfer Static Eliminator" on page 621**

■ Procedure

1. **Turn over the Secondary Transfer Static Eliminator [1], and remove paper dust accumulated on the back [A] with dry lint-free paper [2].**



Removing the Secondary Transfer Outer Roller



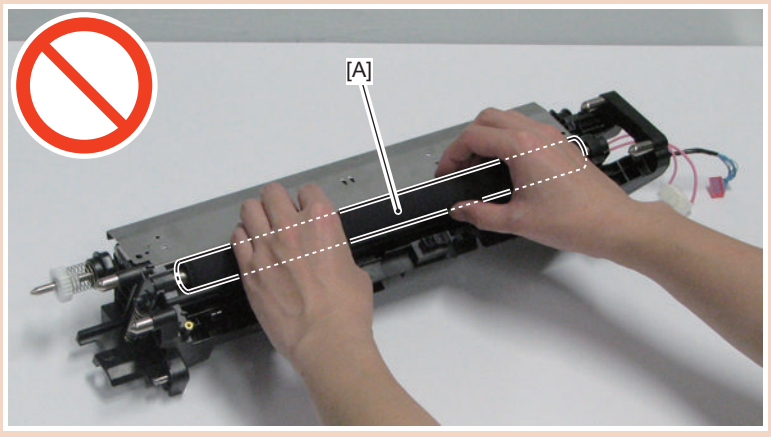
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Secondary Transfer Unit****"Removing the Secondary Transfer Unit" on page 617**
4. **Removing the Secondary Transfer Static Eliminator****"Removing the Secondary Transfer Static Eliminator" on page 621**

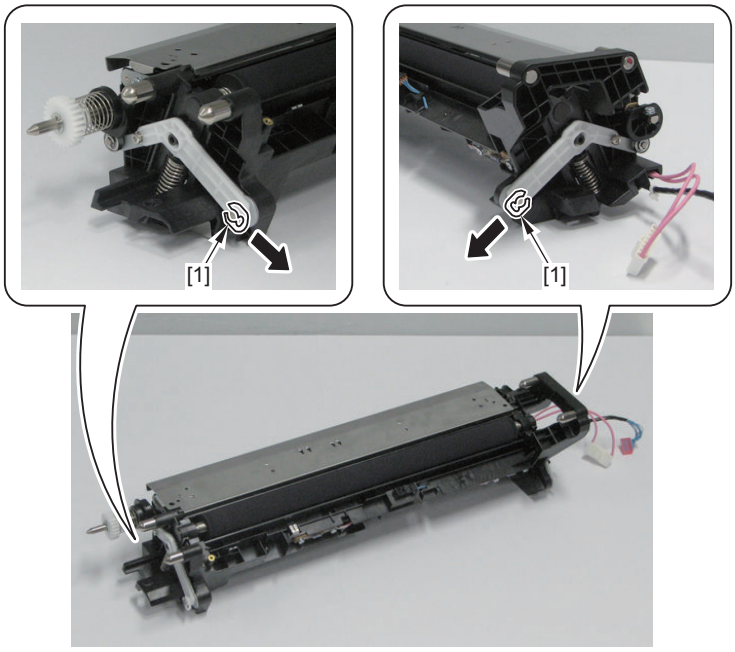
■ Procedure

CAUTION:

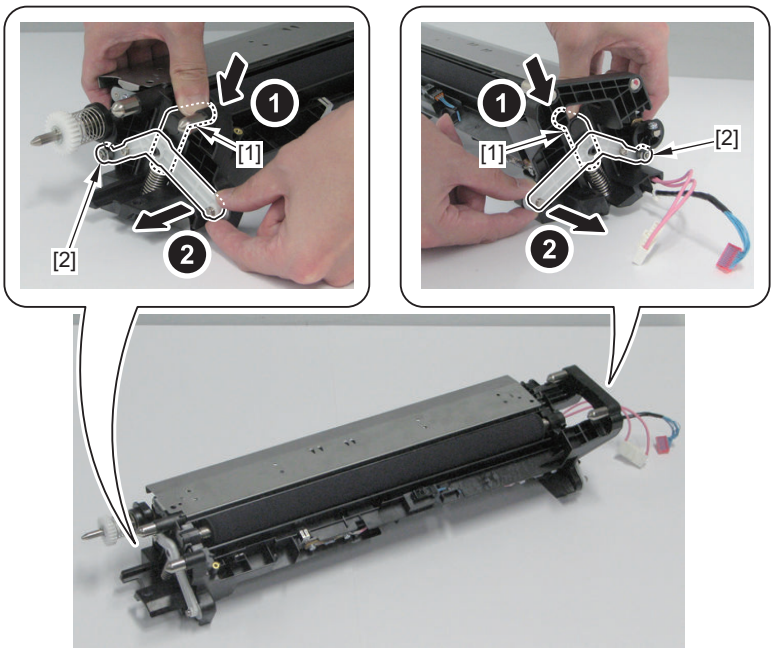
- If the Secondary Transfer Outer Roller is soiled when replacing it, execute"Cleaning the Secondary Transfer Unit" on page 625 and "Cleaning the Secondary Transfer Static Eliminator" on page 622.
- Be sure not to touch the surface [A] of the roller when disassembling/assembling.



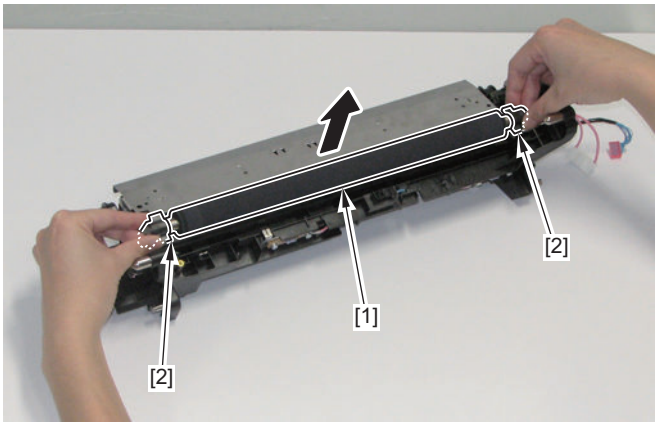
1. **Remove the 2 E-rings [1].**



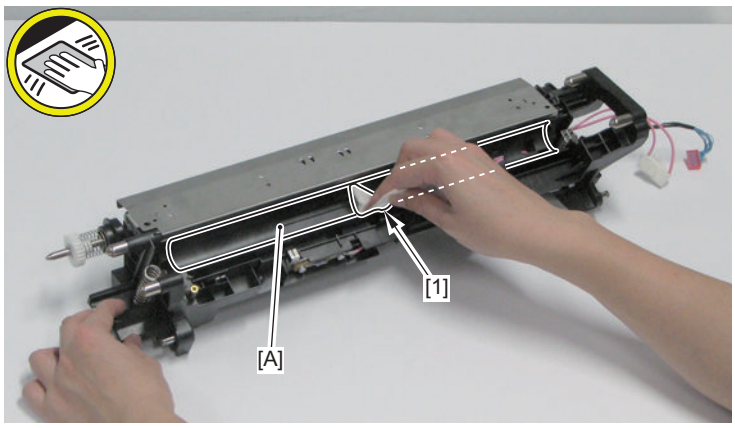
2. **While pressing the Secondary Transfer Holder [1], remove the 2 arms [2] one by one.**



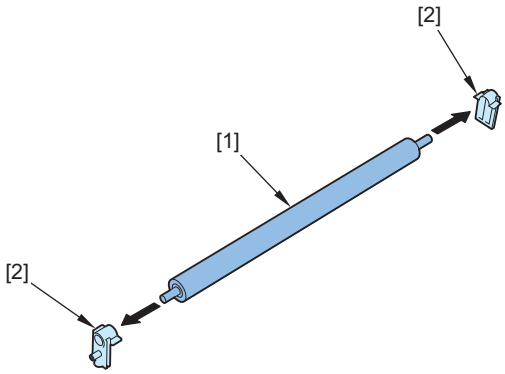
3. **Remove the Secondary Transfer Outer Roller [1] and the 2 Secondary Transfer Holders [2].**



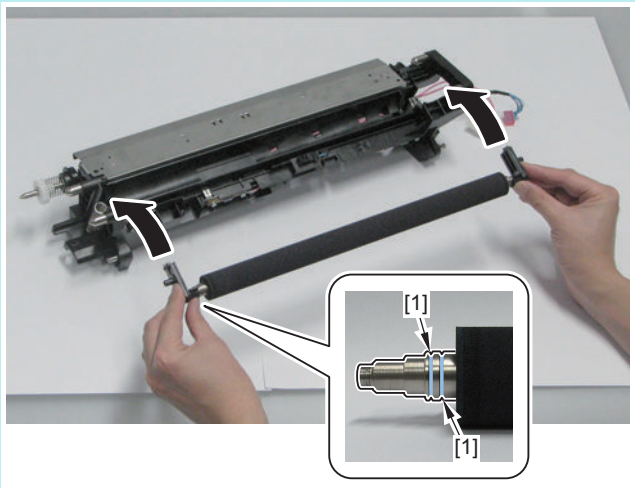
4. **Clean soiling on the groove [A] of the Secondary Transfer Unit with lint-free paper [1] moistened with alcohol.**



5. **Remove the 2 Secondary Transfer Holders [2] from the Secondary Transfer Outer Roller [1].**



NOTE:
How to install the Secondary Transfer Outer Roller
Be sure to install the Secondary Transfer Outer Roller so that the side with 2 grooves [1] is at the rear side of the Secondary Transfer Unit.



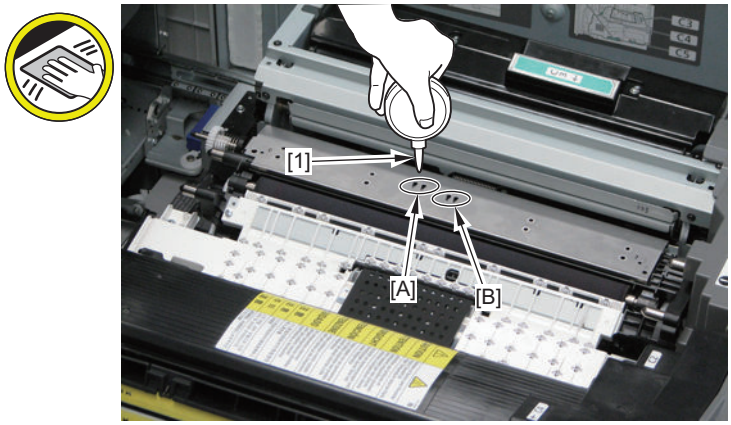
Cleaning the Secondary Transfer Unit

■ Preparation

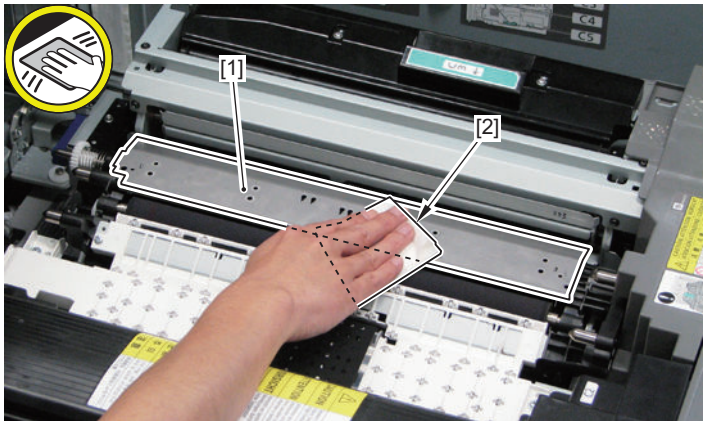
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

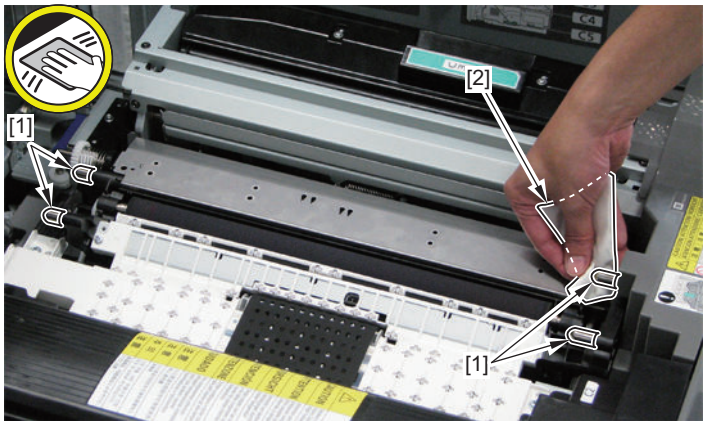
1. **While directing the edge of the blower [1], clean the soiling on the sensor surface [A] of the Transparency Sensor and the sensor surface [B] of the Post-registration Sensor with the blower [1].**



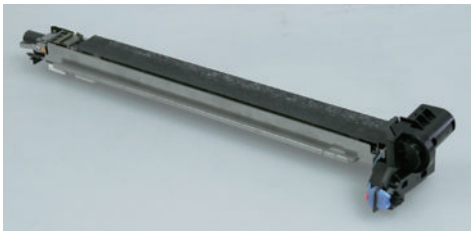
2. **Clean soiling on the Upper Guide [1] with lint-free paper [2] moistened with alcohol.**



3. **Clean the soiling (abrasion dust of the receptacle holes) attached to the 4 Positioning Pins [1] with lint-free paper moistened with alcohol [2].**



Removing the Primary Charging Assembly



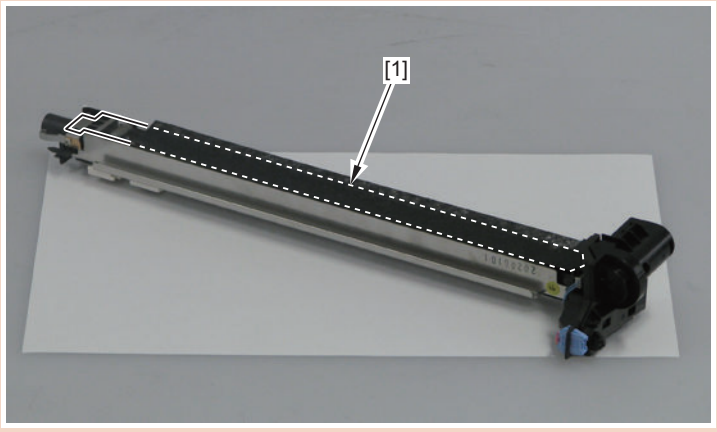
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**

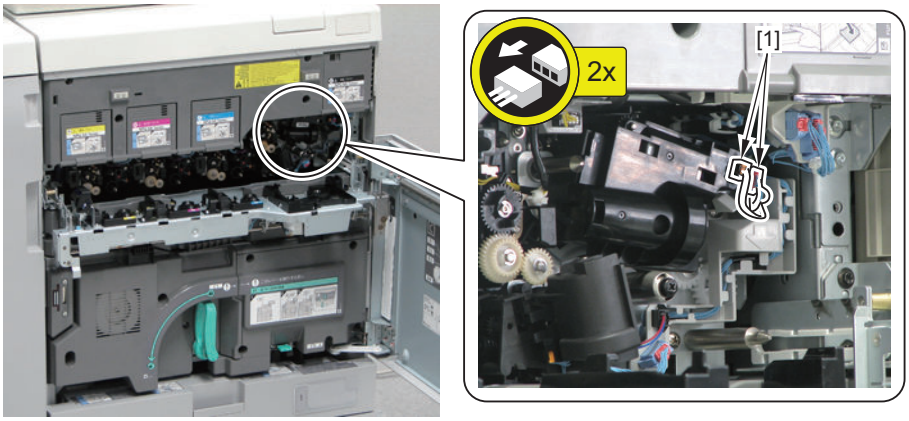
■ Procedure

CAUTION:

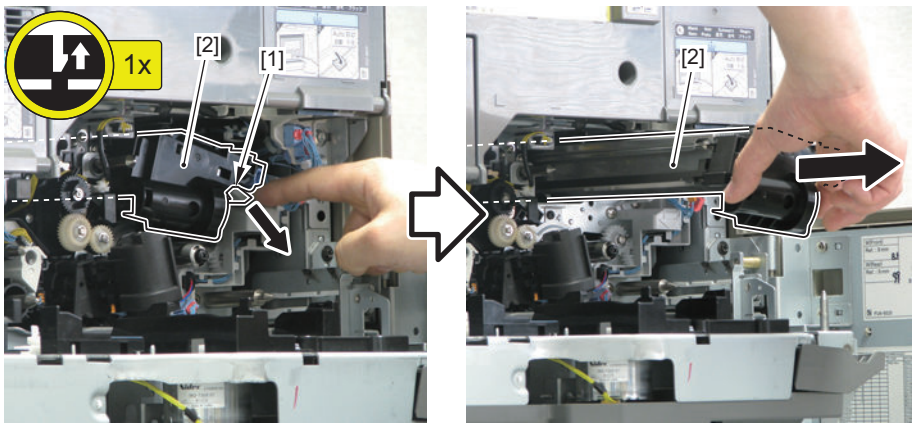
- When replacing this part, execute "When Replacing the Primary Charging Assembly" on page 628.
- Do not touch the surface [1] of the Grid Plate. Otherwise functional failure may occur.
- Do not place the side with the Grid down when placing the Primary Charging Assembly.



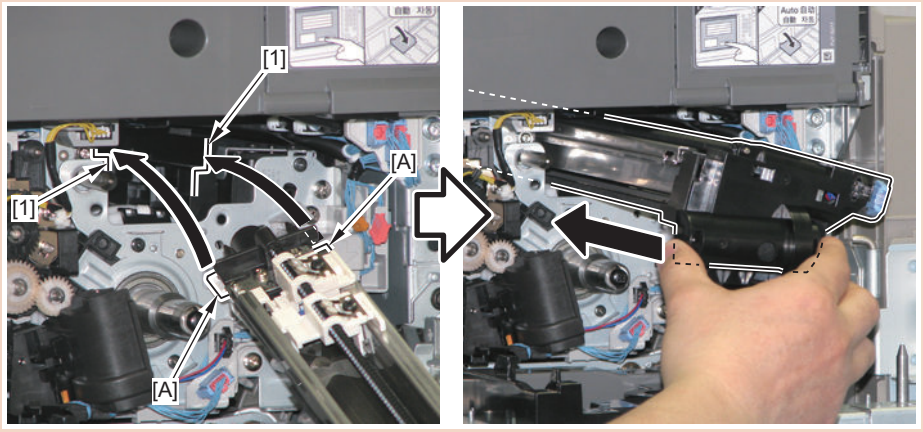
1. **Disconnect the 2 connectors [1].**



2. **While pressing down the claw [1], pull out the Primary Charging Assembly [2] horizontally.**



CAUTION:
When installing, align the 2 rails [1] of the Primary Charging Assembly with the 2 protrusions [A] of the Primary Charging Assembly, and then install it horizontally.



When Replacing the Primary Charging Assembly

■ Procedure

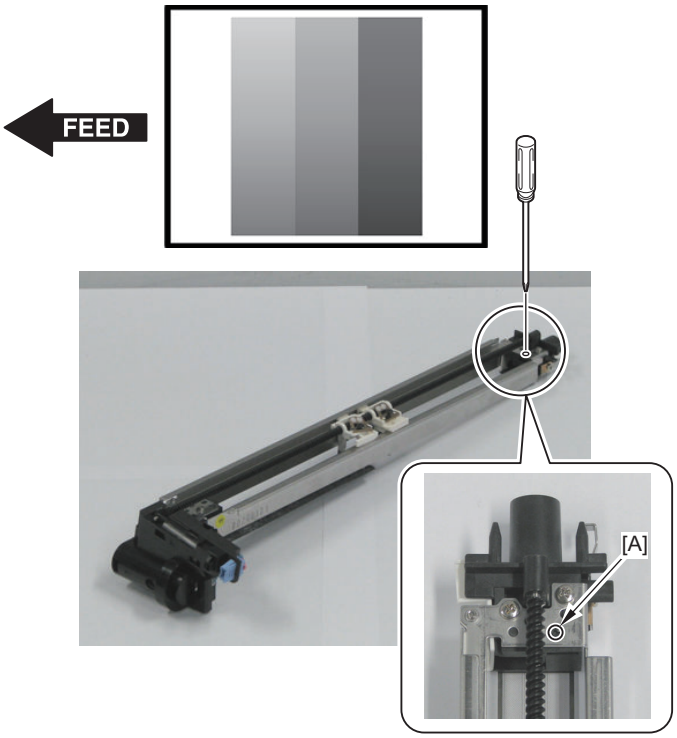
1. **Clear the counter.**
   COPIER > COUNTER > PRDC-1 > PRM-UNIT
2. **Execution of Charging Wire cleaning COPIER > FUNCTION > CLEANING > WIRE-EX**
3. **Execution of potential control**
   COPIER > FUNCTION > DPC > DPC
4. **Output pattern generator for adjustment of the wire hight.**
   COPIER > FUNCTION > MISC-P > GRID-ADJ

NOTE:
A3+ 329.0 mm x 483.0 mm (13" x 19") is recommended.
PG can be output only under the following conditions.
- Paper type: Plain paper 1/2
- Paper size: A3+ 329.0 mm x 483.0 mm (13" x 19")/A3/SRA3/Ledger 279.4 mm x 431.8 mm (11" x 17")*/A3+ 305.0 mm x 457.0 mm (12" x 18")
- Paper source: Cassette 1

Under conditions other than those mentioned above, "NG" is displayed and a blank paper is output.
* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 or later.

5. **In the case of density difference between the front and the rear on the test print image with the dark image on the front side of the test print, go to step 6) to make adjustments. With the dark image on the rear side of the test print, go to step 7) to make adjustments. If there is no density unevenness, execute the work in step 8) and later.**
6. **Adjust the Primary Charging Assembly (in the case of dark image at the front side on the test print).**

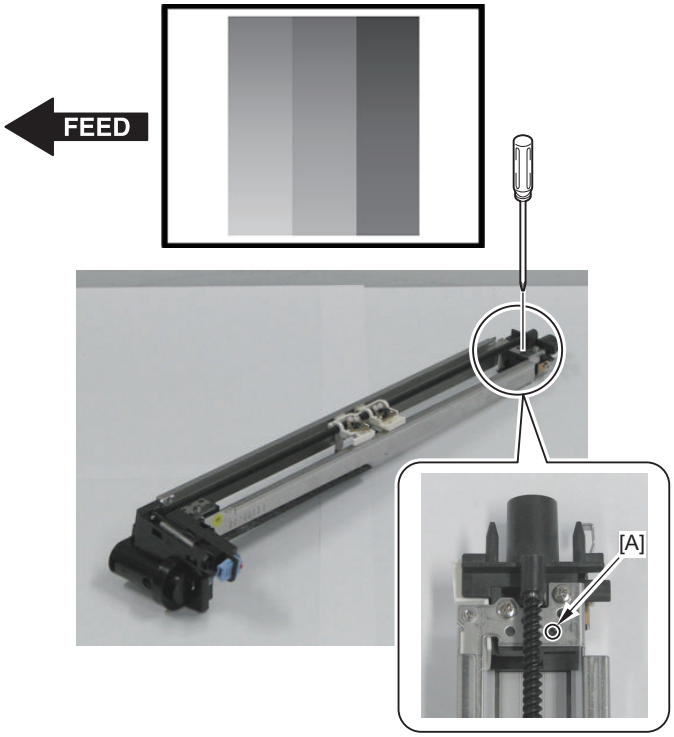
NOTE:
- In the case of dark image at the front side of the test print [1], execute step 6-1) through 6-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 5) and later.



1. Turn the plastic screw [A] clockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
2. If the image at the front side of test print image is still dark, turn the plastic screw [A] clockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
3. If the image at the front side of the test print is still dark, turn the plastic screw [A] clockwise to make a half round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image

7. **Adjust the Primary Charging Assembly (in the case of dark image at the rear side on the test print).**

NOTE:
- In the case of dark image at the rear side of the test print [2], execute step 7-1) through 7-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 8) and later.



1. Turn the plastic screw [A] counterclockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
2. If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
3. If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make a half turn. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.

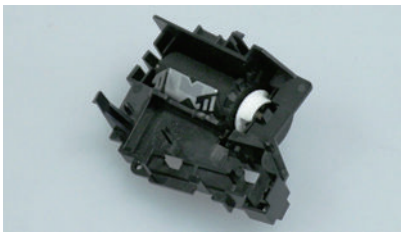
8. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB

9. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]

10. **Execute color displacement correction.**
    [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

11. **Execute uneven density correction.**
    [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Primary Charging Assembly Shutter Unit

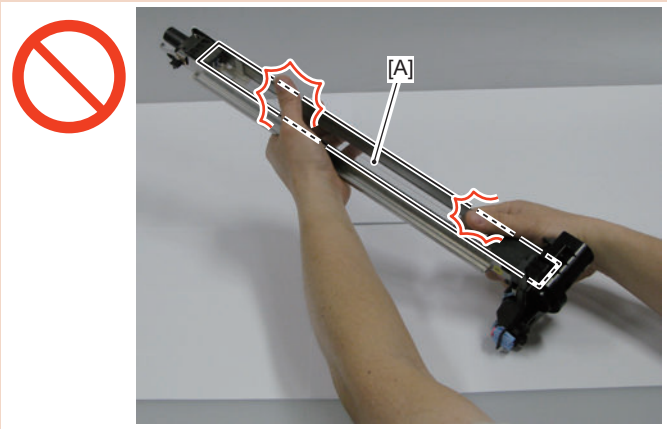


■ Preparation

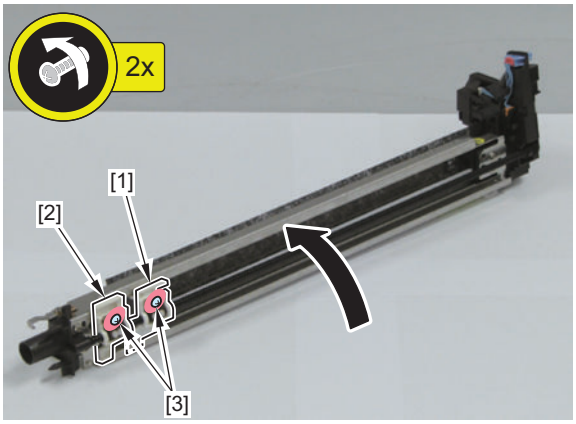
1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**

■ Procedure

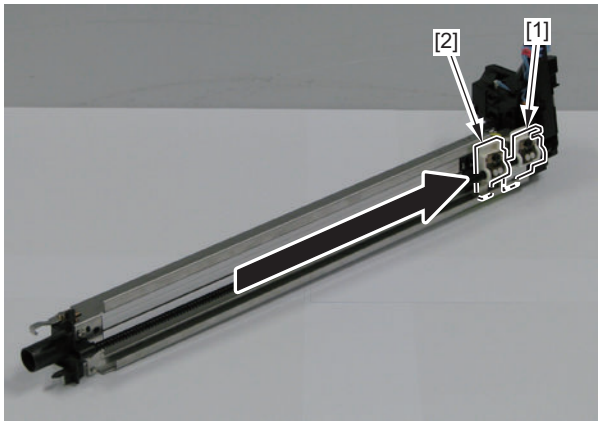
CAUTION:
Do not touch the surface [A] of the Grid when disassembling/assembling.



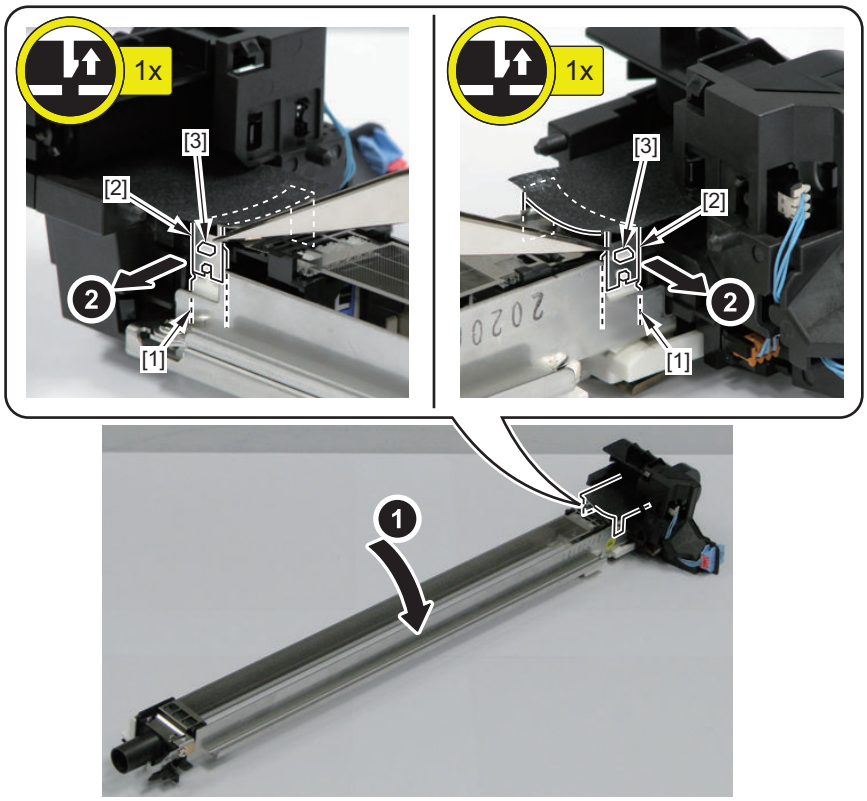
1. **Loosen the 2 screws [3] of the Shutter Arm [1] and the Cleaning Pad Arm [2].**



2. **Move the Shutter Arm [1] and the Cleaning Pad Arm [2] until they stop.**



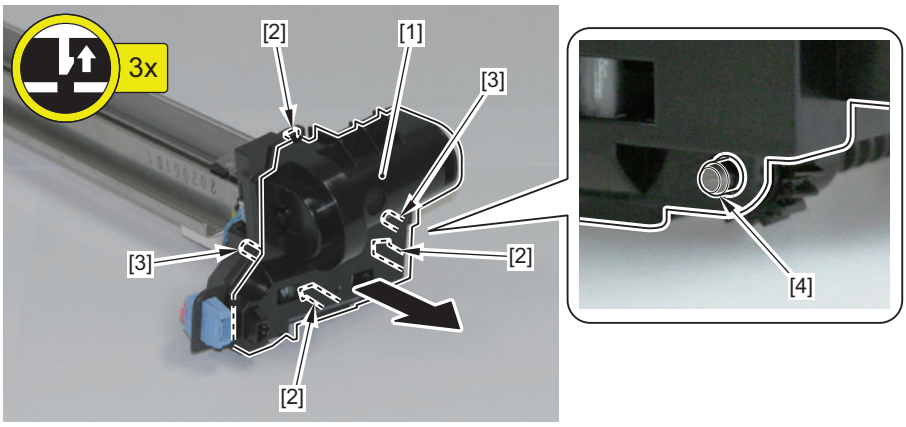
3. **Remove the Shutter Sheet Installation Fixtures [2] from the Shutter Slider [1].**
   - 2 Claws [3]



CAUTION:
When installing the Shutter Sheet Installation Fixture, check that the Shutter Arm is engaged with the claw properly.
(Move the Shutter Sheet installation Fixture to the right and left to check that it does not come off.)

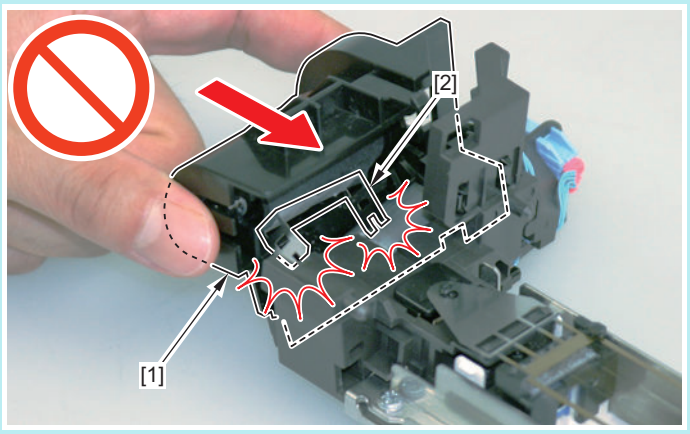
4. Remove the Primary Charging Assembly Shutter Unit [1].

- 3 Claws [2]
- 2 Bosses [3]
- 1 Shaft [4]

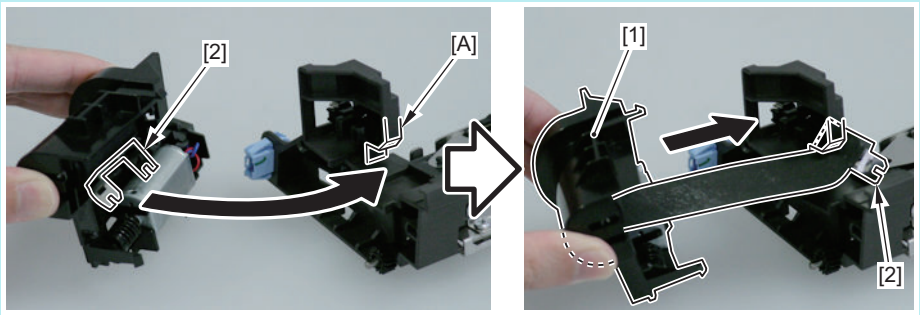


NOTE:
How to install the Primary Charging Assembly Shutter Unit

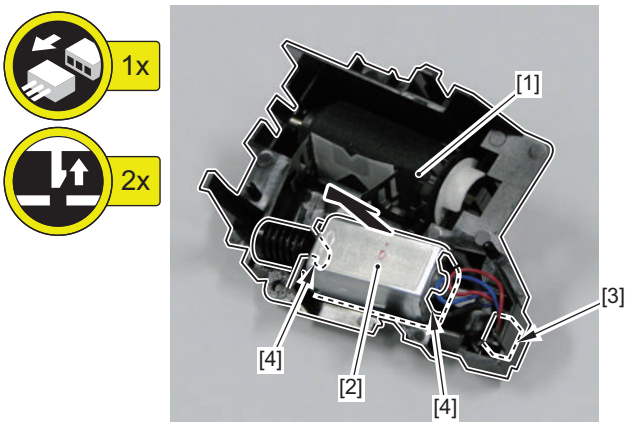
- Installing the Primary Charging Assembly Shutter Unit [1] without pulling out the Shutter Sheet Installation Fixture [2], the fixture [2] may be damaged.



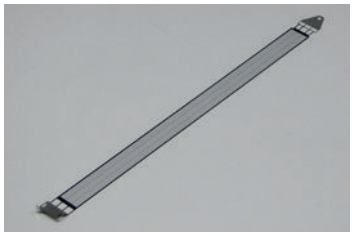
- Be sure to pull out the Shutter Sheet Installation Fixture [2], hook it on the [A] part of the Primary Charging Assembly, and then install the Primary Charging Assembly Shutter Unit [1].



5. **Remove the Primary Charging Wire Cleaning Motor [2] from the Primary Charging Assembly Shutter Unit [1].**
   - 1 Connector [3]
   - 2 Claws [4]



Removing the Grid Plate

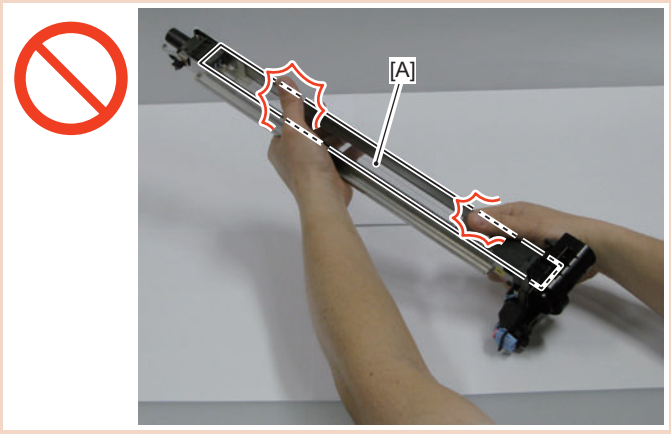


■ Preparation

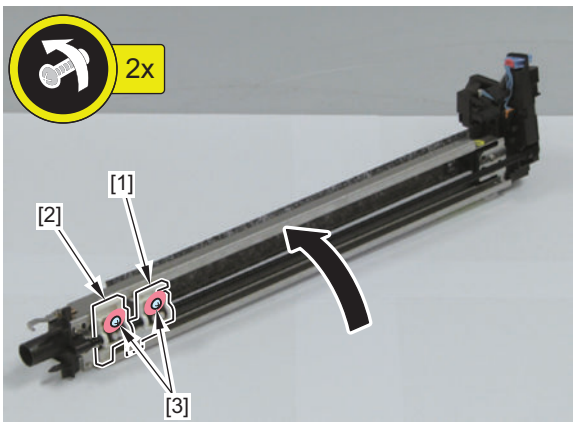
1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**

■ Procedure

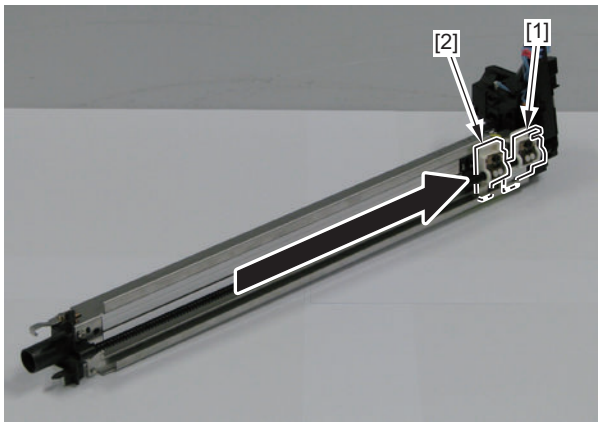
CAUTION:
- When replacing this part, execute "When Replacing the Grid Plate" on page 637.
- Do not touch the surface [A] of the Grid when disassembling/assembling.



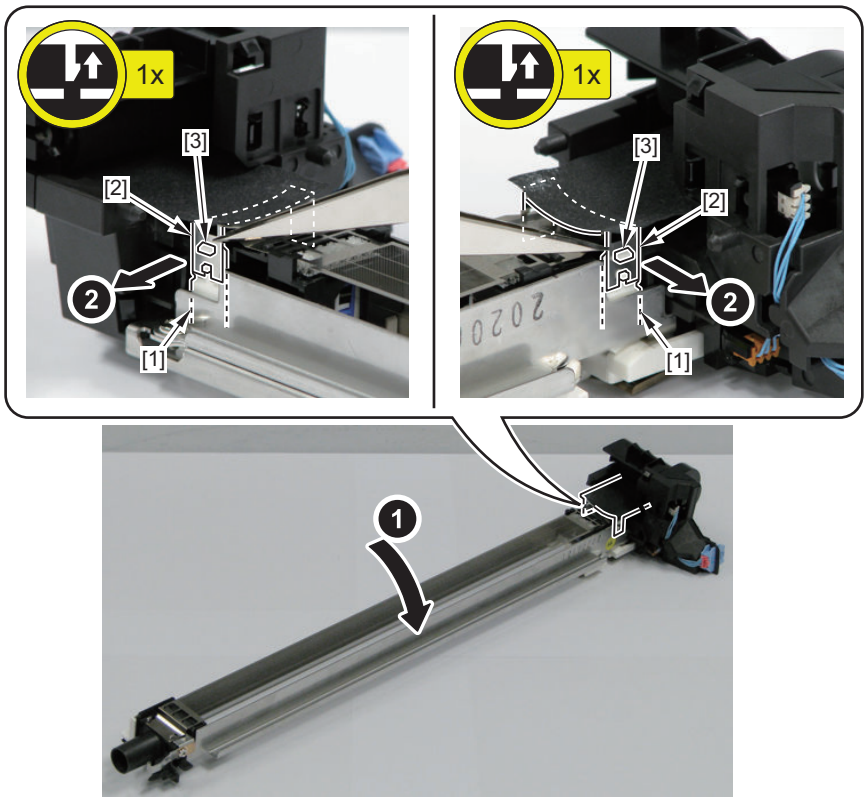
1. **Loosen the 2 screws [3] of the Shutter Arm [1] and the Cleaning Pad Arm [2].**



2. **Move the Shutter Arm [1] and the Cleaning Pad Arm [2] until they stop.**

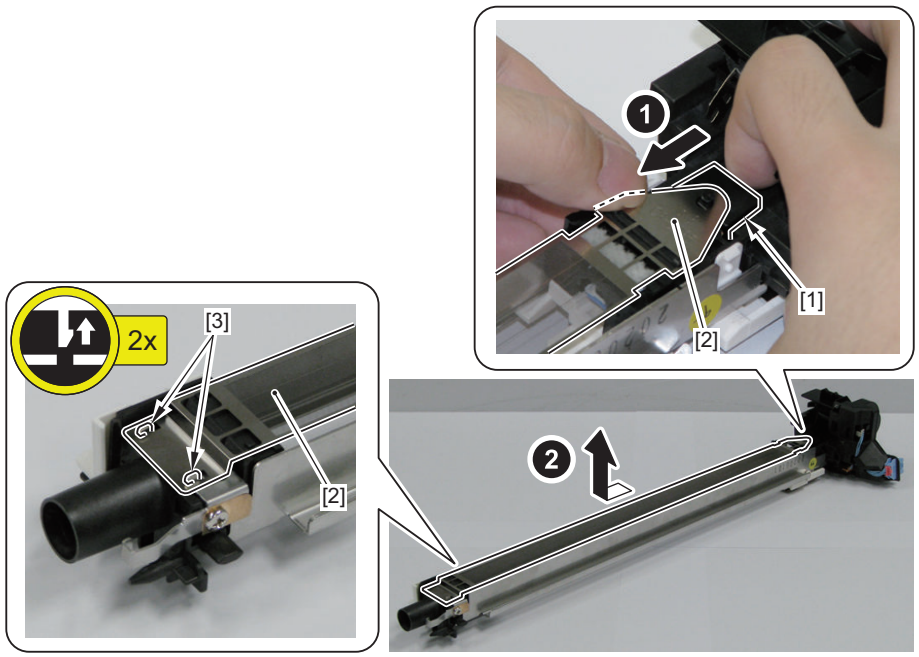


3. **Remove the Shutter Sheet Installation Fixtures [2] from the Shutter Slider [1].**
   - 2 Claws [3]

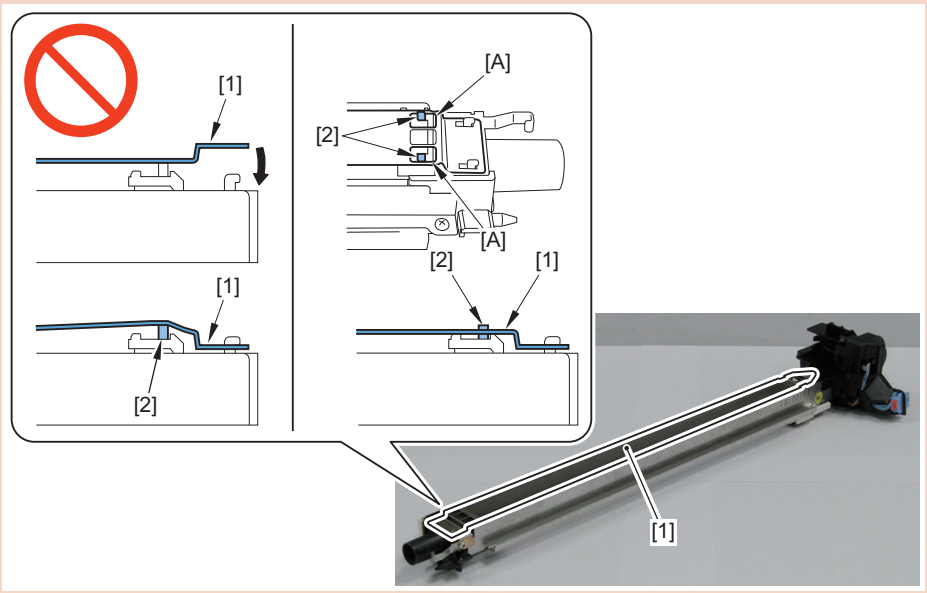


CAUTION:
When installing the Shutter Sheet Installation Fixture, check that the Shutter Arm is engaged with the claw properly.
(Move the Shutter Sheet installation Fixture to the right and left to check that it does not come off.)

4. **Press the lever [1] in the direction of the arrow to remove the Grid Plate [2].**
   - 2 Claws [3]



CAUTION:
Point to Note When Installing the Grid Plate
- The Grid Plate [1] has a front side and a rear side. Therefore, install it in the correct direction.
- Be sure that the Grid Plate [1] is not placed on the protrusions [2] of the Primary Charging Assembly when installing it.
- After installing the Grid Plate [1] on the Primary Charging Assembly, check that the protrusions [2] are fitted in the holes [A] of the Grid.



When Replacing the Grid Plate

■ Procedure

1. **Clear the counter.**
   COPIER > COUNTER > PRDC-1 > PRM-GRID
2. **Execution of Charging Wire cleaning COPIER > FUNCTION > CLEANING > WIRE-EX**

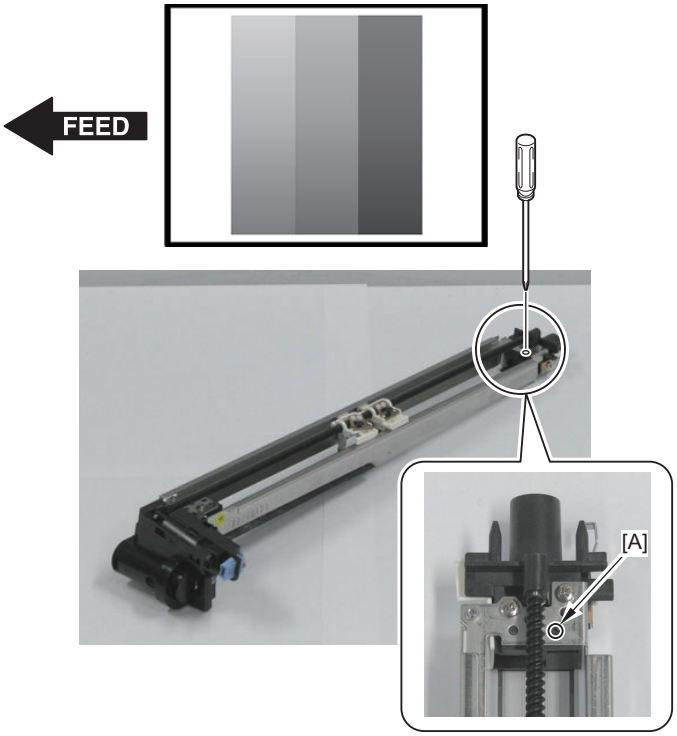
3. **Execution of potential control**
   COPIER > FUNCTION > DPC > DPC
4. **Output pattern generator for adjustment of the wire hight.**
   COPIER > FUNCTION > MISC-P > GRID-ADJ

NOTE:
A3+ 329.0 mm x 483.0 mm (13" x 19") is recommended.
PG can be output only under the following conditions.
- Paper type: Plain paper 1/2
- Paper size: A3+ 329.0 mm x 483.0 mm (13" x 19")/A3/SRA3/Ledger 279.4 mm x 431.8 mm (11" x 17")*/A3+ 305.0 mm x 457.0 mm (12" x 18")
- Paper source: Cassette 1

Under conditions other than those mentioned above, "NG" is displayed and a blank paper is output.
* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 or later.

5. **In the case of density difference between the front and the rear on the test print image with the dark image on the front side of the test print, go to step 6) to make adjustments. With the dark image on the rear side of the test print, go to step 7) to make adjustments. If there is no density unevenness, execute the work in step 8) and later.**
6. **Adjust the Primary Charging Assembly (in the case of dark image at the front side on the test print).**

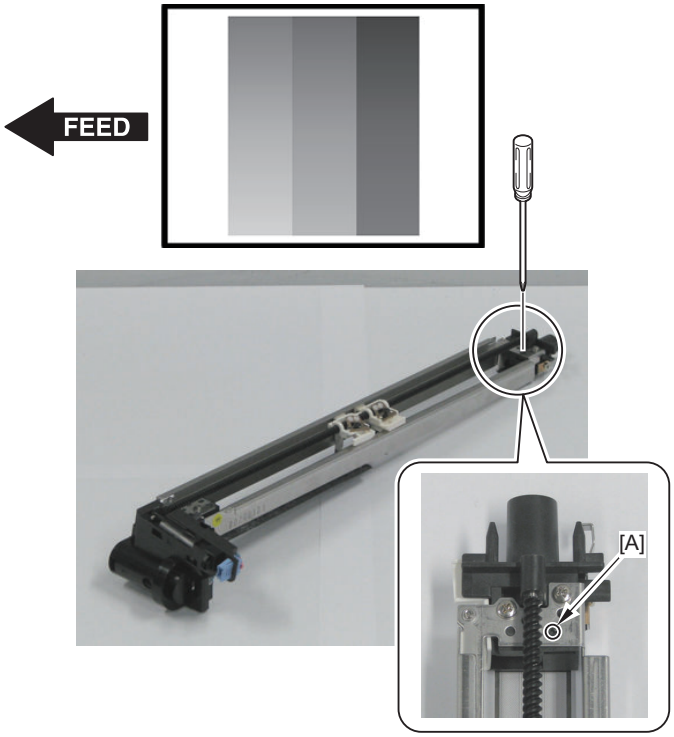
NOTE:
- In the case of dark image at the front side of the test print [1], execute step 6-1) through 6-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 5) and later.



1. Turn the plastic screw [A] clockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
2. If the image at the front side of test print image is still dark, turn the plastic screw [A] clockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
3. If the image at the front side of the test print is still dark, turn the plastic screw [A] clockwise to make a half round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image

7. **Adjust the Primary Charging Assembly (in the case of dark image at the rear side on the test print).**

NOTE:
- In the case of dark image at the rear side of the test print [2], execute step 7-1) through 7-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 8) and later.



1. Turn the plastic screw [A] counterclockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
2. If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
3. If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make a half turn. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.

8. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB

9. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]

10. **Execute color displacement correction.**
    [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

11. **Execute uneven density correction.**
    [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

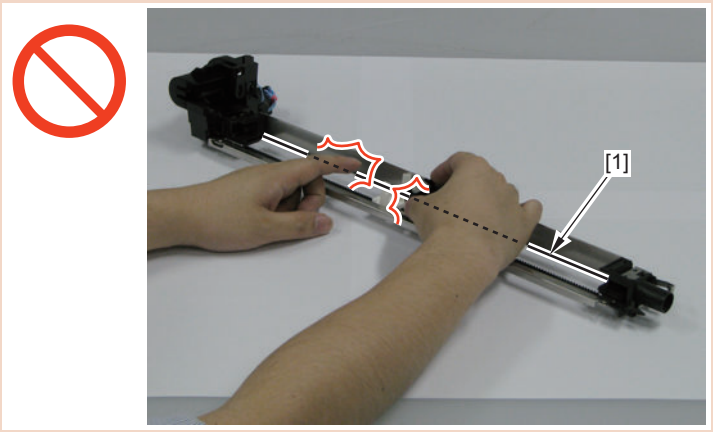
Removing the Grid Cleaning Pad

■ Preparation

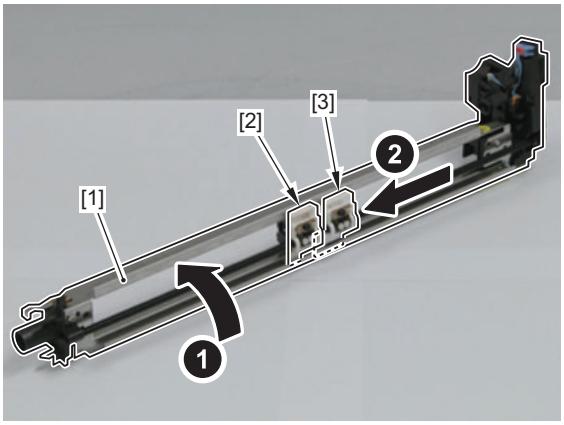
1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Grid Plate****"Removing the Grid Plate" on page 634**

■ Procedure

CAUTION:
Do not touch the Primary Charging Wire [1] when disassembling/assembling.

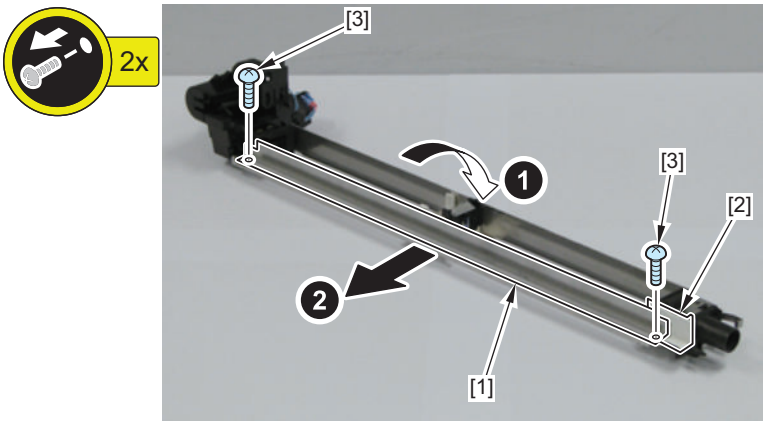


1. **Move the Cleaning Pad Arm [1] to the center of the Primary Charging Assembly [2].**

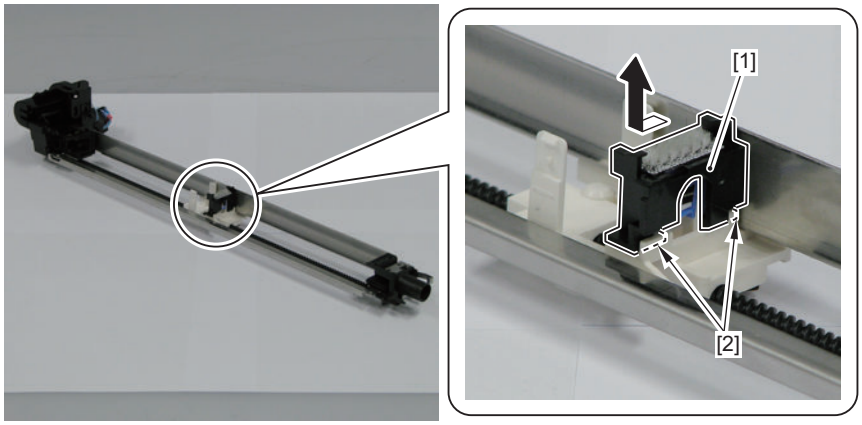


NOTE:
After the work, return the Cleaning Pad Arm to the front.
This is to shorten the Cleaning Pad Arm detection time after the power is turned ON.

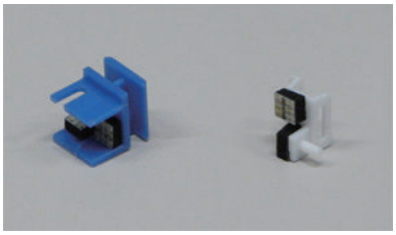
2. **Remove the Primary Charging Assembly Shield Plate (L) [1] and the Primary Charging Assembly Rear Cover [2].**
   - 2 Screws [3]



3. **Remove the Grid Cleaning Pad [1] in the direction of the arrow.**
   - 2 Protrusions [2]



Removing the Primary Charging Wire Cleaning Pad Holder and the Primary Charging Wire Cleaning Pad Slider



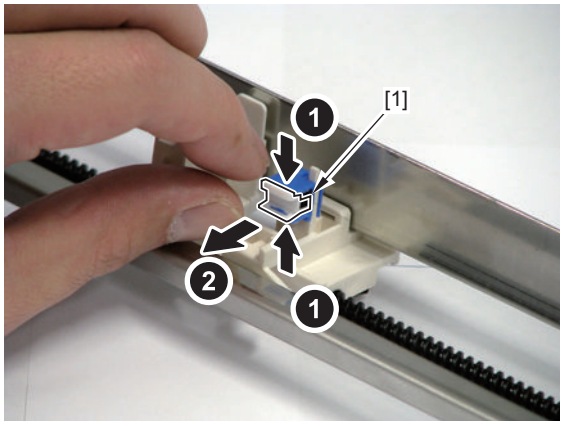
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Grid Plate****"Removing the Grid Plate" on page 634**
6. **Removing the Grid Cleaning Pad****"Removing the Grid Cleaning Pad" on page 639**

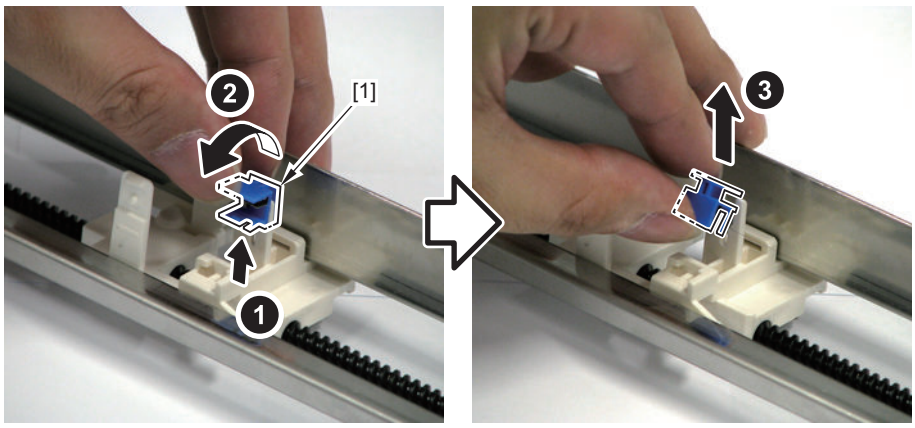
■ Procedure

CAUTION:
Do not damage the Primary Charging Wire when disassembling/assembling.

1. **Use your fingers to pinch and remove the Primary Charging Wire Cleaning Pad Holder [1].**

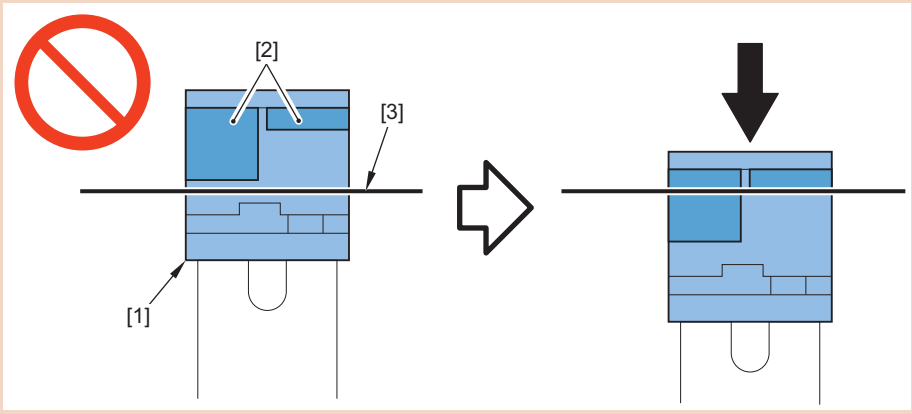


2. **Remove the Primary Charging Wire Cleaning Pad Slider [1].**

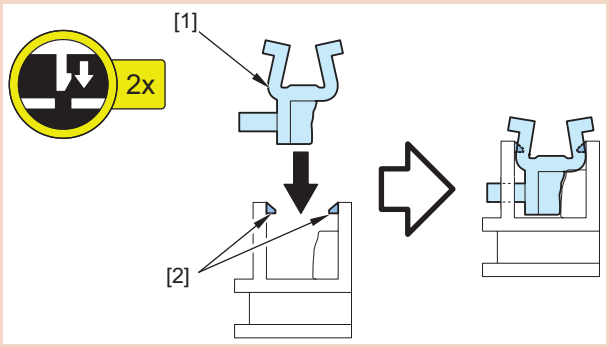


CAUTION:

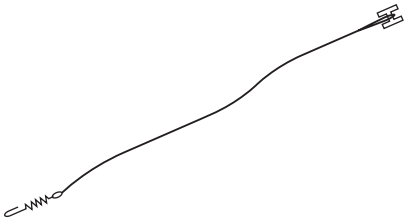
- Push the Charging Wire [3] against the 2 pads [2] of the Primary Charging Wire Cleaning Pad Slider [1] to install.



- Push in the Primary Charging Wire Cleaning Pad Holder [1] until it is secured to the 2 claws [2].



Replacing the Primary Charging Wire Unit / Cleaning the Primary Charging Assembly



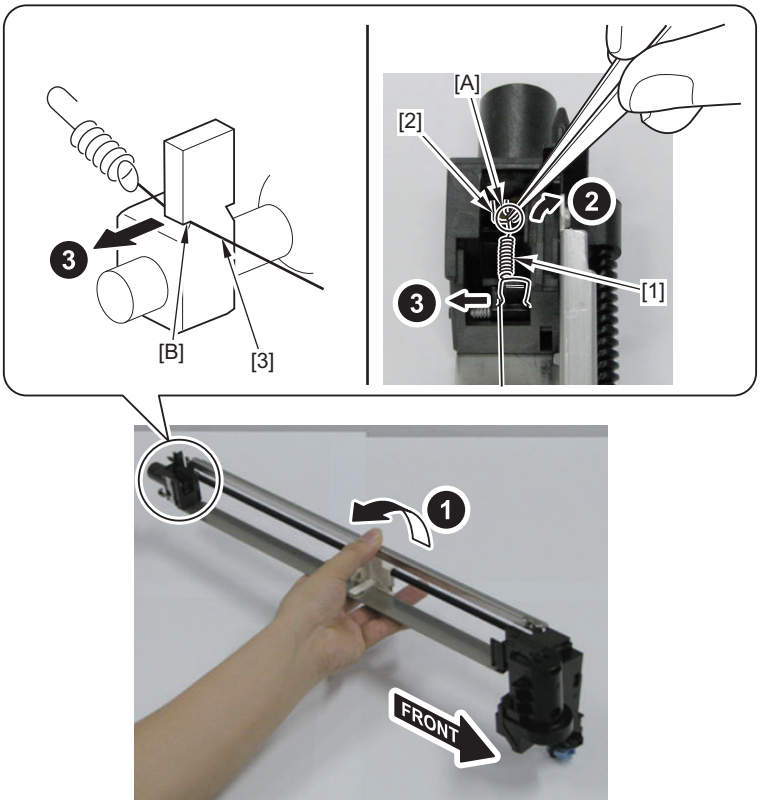
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Grid Plate****"Removing the Grid Plate" on page 634**
6. **Removing the Grid Cleaning Pad****"Removing the Grid Cleaning Pad" on page 639**
7. **Removing the Primary Charging Wire Cleaning Pad Holder and the Primary Charging Wire Cleaning Pad Slider****"Removing the Primary Charging Wire Cleaning Pad Holder and the Primary Charging Wire Cleaning Pad Slider" on page 641**

■ Disassembling Procedure

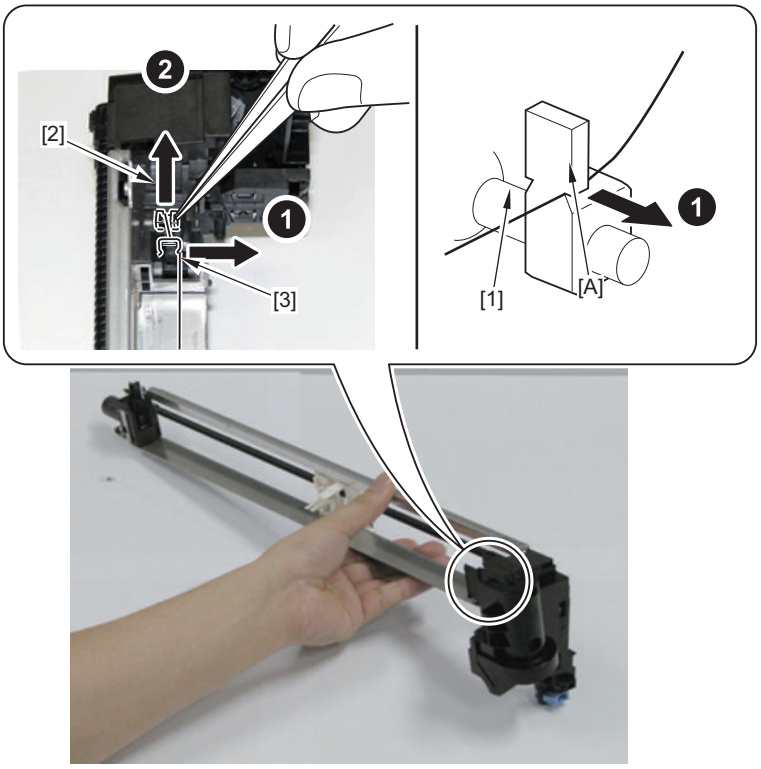
CAUTION:
When replacing this part, clean the Primary Charging Assembly, and perform "When Replacing the Primary Charging Wire Unit" on page 647.

1. **Use tweezers to hold the leading edge [A] of the spring [1] to remove it from the hook [2].**
2. **Remove the Primary Charging Wire [3] from the groove [B] in the direction of the arrow.**



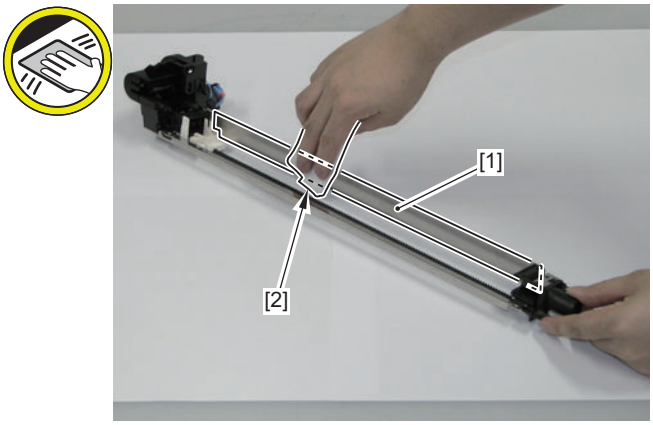
3. **Remove the Charging Wire [1] from the groove [A] in the direction of the arrow.**

4. **Remove the block [2] with tweezers by pulling it upward, and then remove the Charging Wire Unit [3].**

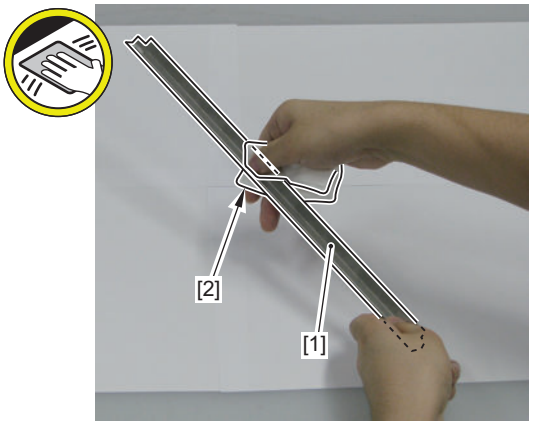


■ Cleaning Procedure

1. **Clean the Inner Shield Plate [1] of the Primary Charging Assembly with lint-free paper [2] moistened with alcohol.**

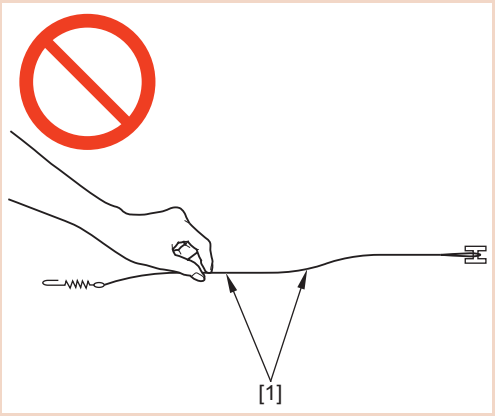


2. **Clean both sides of the Shield Plate (Right) [1] removed from the Primary Charging Assembly with lint-free paper [2] moistened with alcohol.**

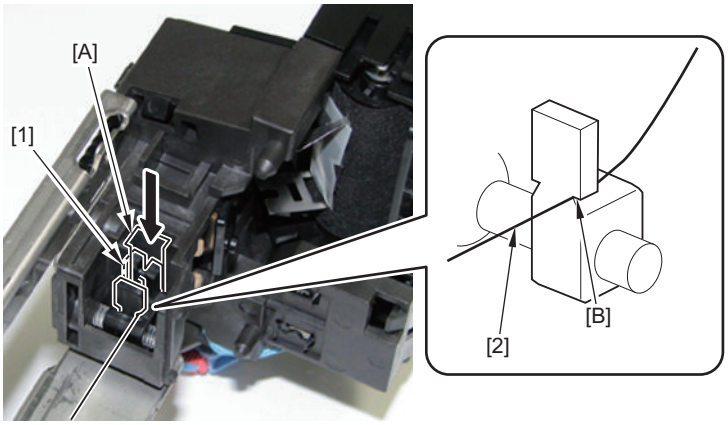


■ Assembling Procedure

CAUTION:
When replacing, do not touch the new Primary Charging Wire [1] directly with hand.

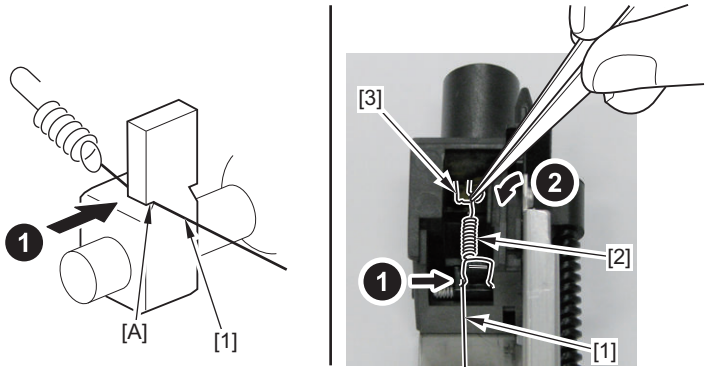


1. **Insert the block [1] into the groove [A] of the Primary Charging Assembly.**
2. **Pass the Charging Wire [2] through the lower part [B] of the groove.**



3. **Pass the Charging Wire [1] through the lower part [A] of the groove, and then use tweezers to hold the leading edge of the spring [2] and attach it to the hook [3].**

CAUTION:
The groove used for hooking the Charging Wire must be at the position shown in the figure (the side for installing the Grid).



CAUTION:
After hooking the Charging Wire, be sure that it is not broken or twisted.

4. **Clean the Charging Wire with lint-free paper moistened with alcohol.**

When Replacing the Primary Charging Wire Unit

■ Procedure

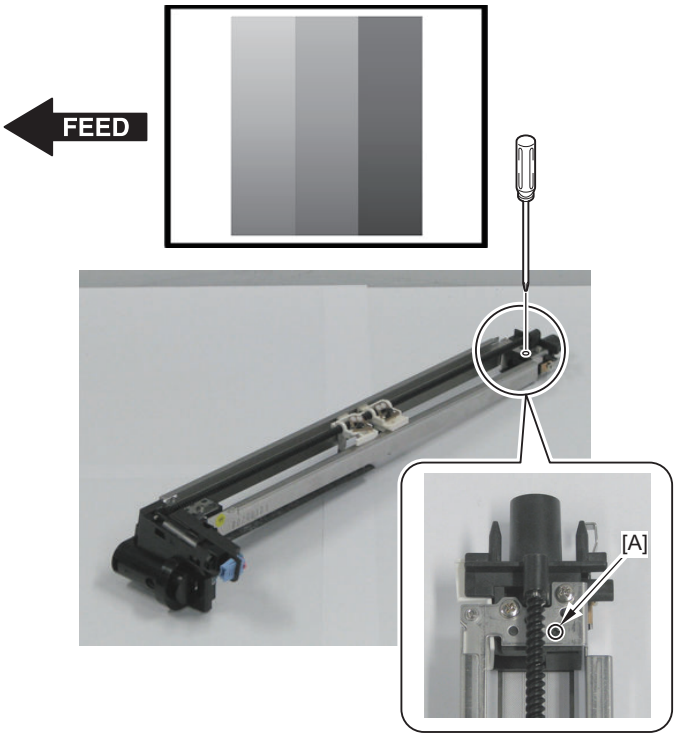
1. **Clear the counter.**
   COPIER > COUNTER > PRDC-1 > PRM-WIRE
2. **Execution of Charging Wire cleaning COPIER > FUNCTION > CLEANING > WIRE-EX**
3. **Execution of potential control**
   COPIER > FUNCTION > DPC > DPC
4. **Output pattern generator for adjustment of the wire hight.**
   COPIER > FUNCTION > MISC-P > GRID-ADJ

NOTE:
A3+ 329.0 mm x 483.0 mm (13" x 19") is recommended.
PG can be output only under the following conditions.
- Paper type: Plain paper 1/2
- Paper size: A3+ 329.0 mm x 483.0 mm (13" x 19")/A3/SRA3/Ledger 279.4 mm x 431.8 mm (11" x 17")*/A3+ 305.0 mm x 457.0 mm (12" x 18")
- Paper source: Cassette 1

Under conditions other than those mentioned above, "NG" is displayed and a blank paper is output.
* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 or later.

5. **In the case of density difference between the front and the rear on the test print image with the dark image on the front side of the test print, go to step 6) to make adjustments. With the dark image on the rear side of the test print, go to step 7) to make adjustments. If there is no density unevenness, execute the work in step 8) and later.**
6. **Adjust the Primary Charging Assembly (in the case of dark image at the front side on the test print).**

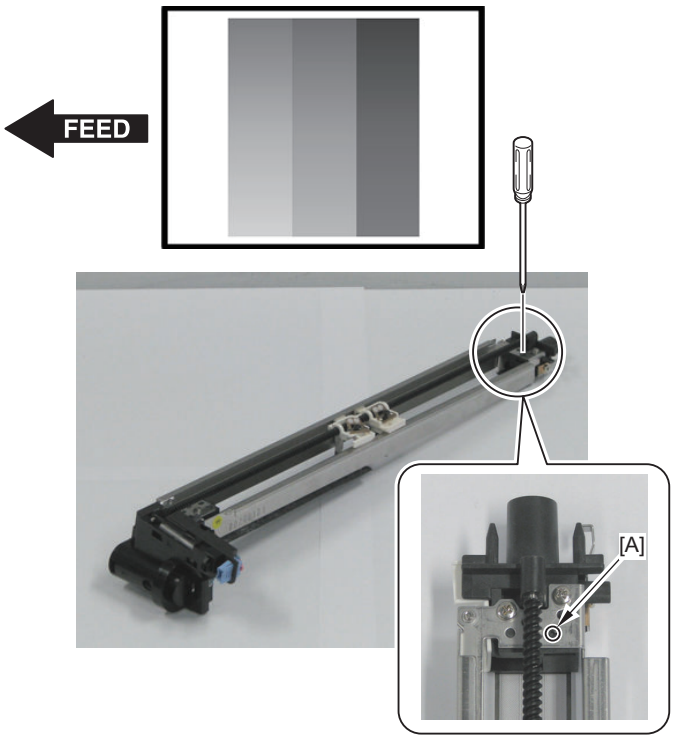
NOTE:
- In the case of dark image at the front side of the test print [1], execute step 6-1) through 6-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 5) and later.



1. Turn the plastic screw [A] clockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
2. If the image at the front side of test print image is still dark, turn the plastic screw [A] clockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
3. If the image at the front side of the test print is still dark, turn the plastic screw [A] clockwise to make a half round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image

7. Adjust the Primary Charging Assembly (in the case of dark image at the rear side on the test print).

NOTE:
- In the case of dark image at the rear side of the test print [2], execute step 7-1) through 7-3) below until the density gets even. Then, if there is no density unevenness, execute the work in step 8) and later.



1. Turn the plastic screw [A] counterclockwise to make a full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
2. If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make another full round. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.
3. If the image at the rear side of the test print is still dark, turn the plastic screw [A] counterclockwise to make a half turn. Refer to the replacement procedure of the Primary Charging Assembly to install the Primary Charging Assembly to the Host Machine, and then output the test print to check the image.

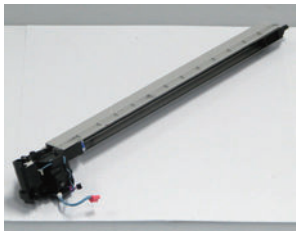
8. Execute the ITB neutral position adjustment.
COPIER > FUNCTION > INSTALL > INIT-ITB

9. Execute auto gradation adjustment.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]

10. Execute color displacement correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

11. Execute uneven density correction.
[Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Pre-transfer Charging Assembly



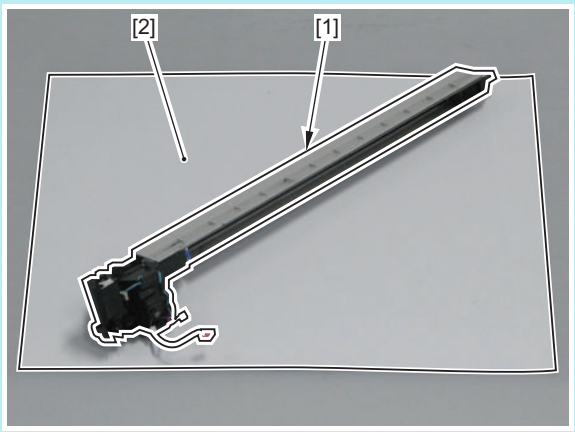
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**

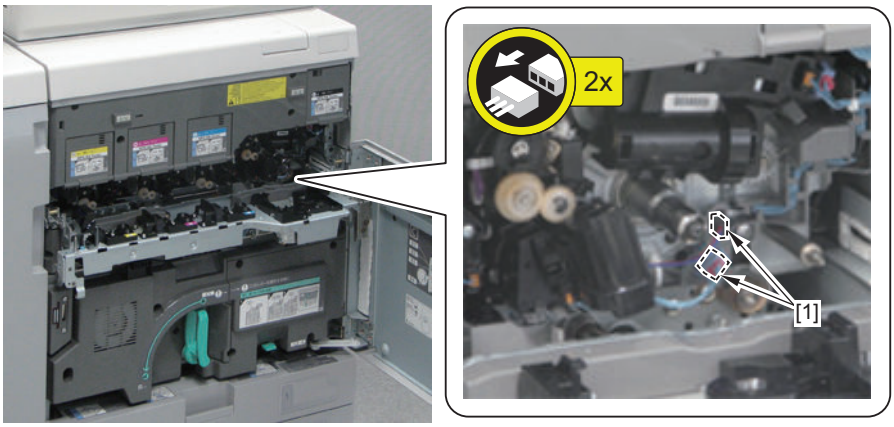
■ Procedure

CAUTION:
When replacing this part, execute "When Replacing the Pre-transfer Charging Assembly" on page 650.

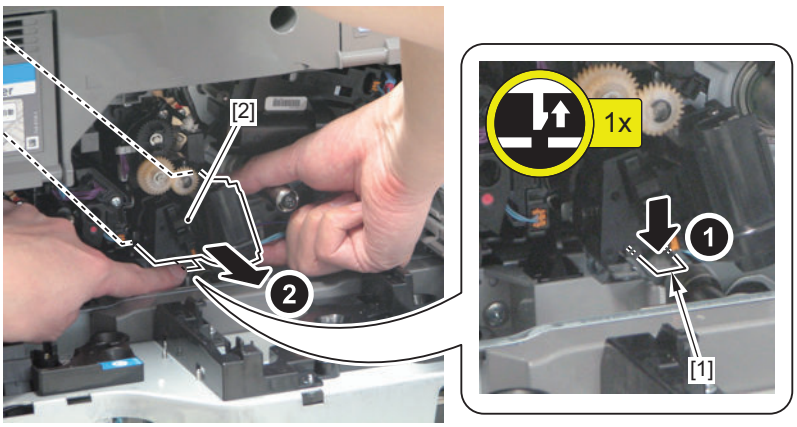
NOTE:
When handling the Pre-transfer Charging Assembly [1], be sure to place it on a sheet of paper [2].



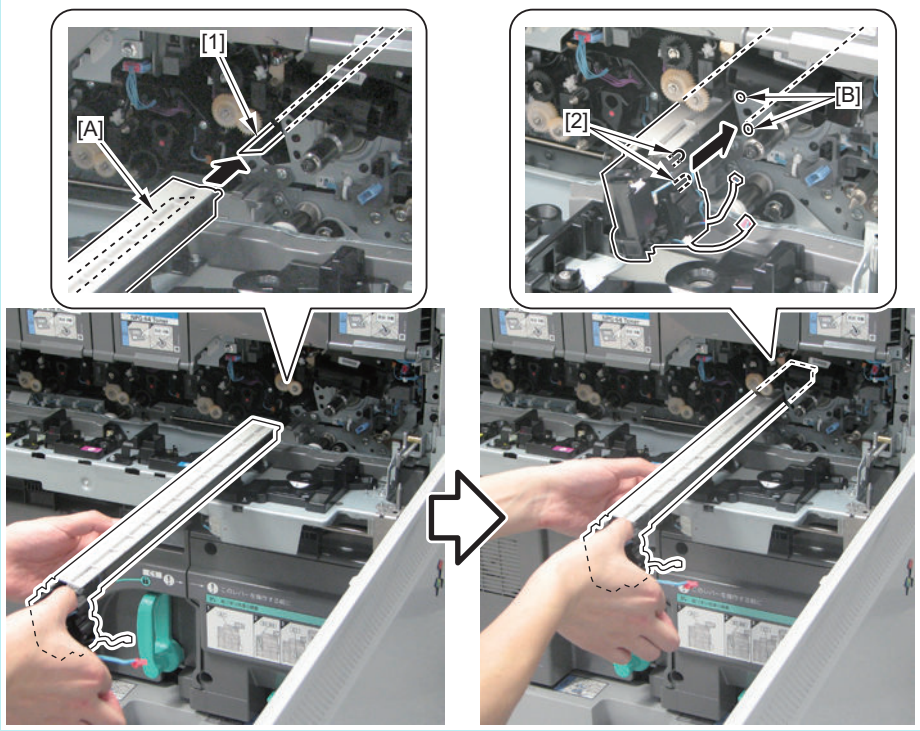
1. **Disconnect the 2 connectors [1].**



2. **While pressing down the claw [1], pull out the Pre-transfer Charging Assembly [2] horizontally.**



NOTE:
How to install the Pre-transfer Charging Assembly
1. Fit the bottom side [A] of the Pre-transfer Charging Assembly to the rail [3] and push it into the machine horizontally.
2. When installing it, fit the 2 bosses [4] into the holes [B].



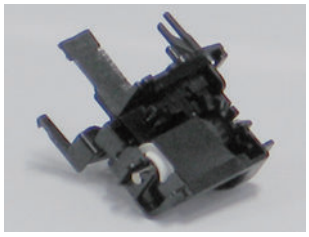
When Replacing the Pre-transfer Charging Assembly

■ Procedure

1. **Clear the counter.**
   COPIER > COUNTER > PRDC-1 > PO-UNIT
2. **Execution of Charging Wire cleaning**
   COPIER > FUNCTION > CLEANING > WIRE-EX
3. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
4. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]

5. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Pre-transfer Charging Assembly Shutter Unit

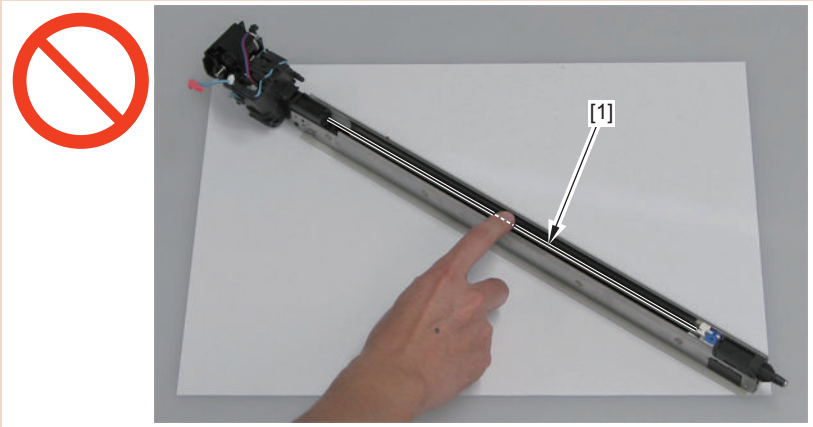


■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**

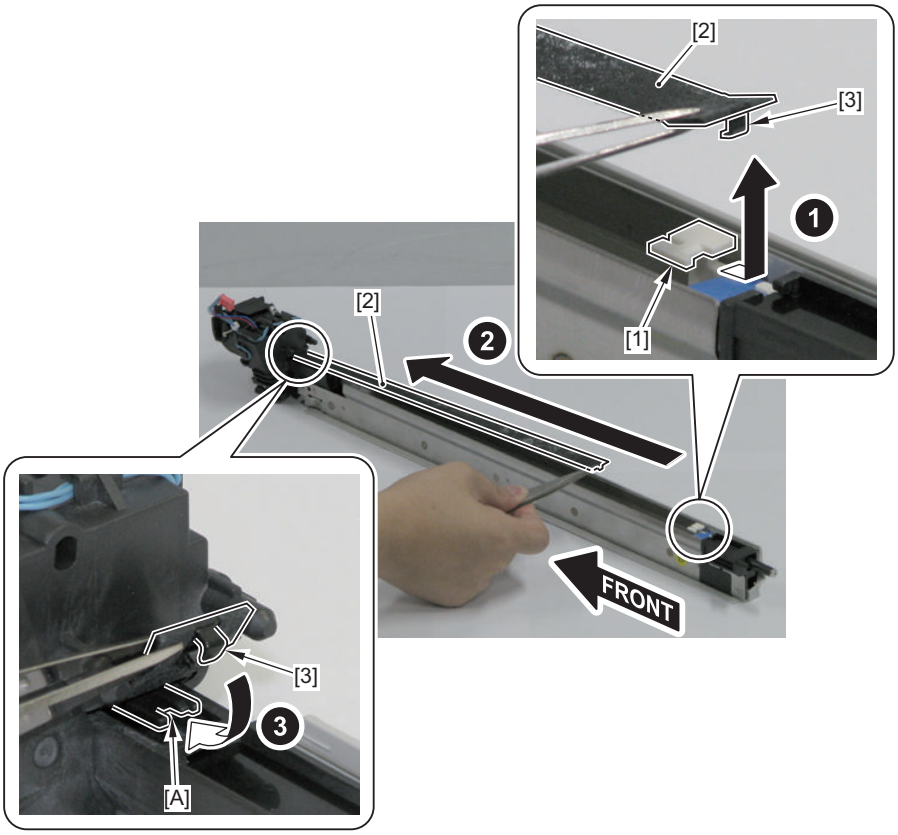
■ Procedure

CAUTION:
Do not touch the Charging Wire [1] directly with hand. Otherwise functional failure may occur.

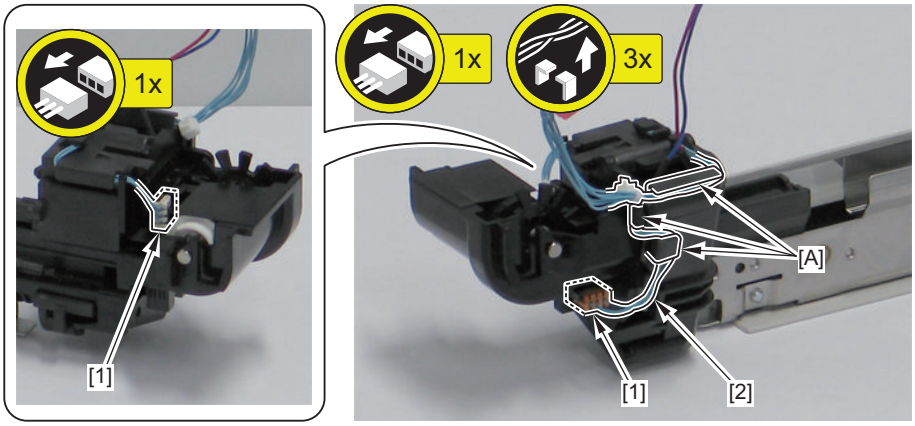


1. **Remove the Shutter Sheet Holder [2] from the Pre-transfer Charging Wire Cleaning Pad Slider [1].**
   - 1 Hook [3]

CAUTION:
Because the Shutter Sheet is taken up when the Shutter Sheet Holder [2] is removed from the Pre-transfer Charging Wire Cleaning Pad Slider [1], attach the hook [3] of the removed Shutter Sheet Holder to the [A] part of the Pre-transfer Charging Assembly Shutter in advance.

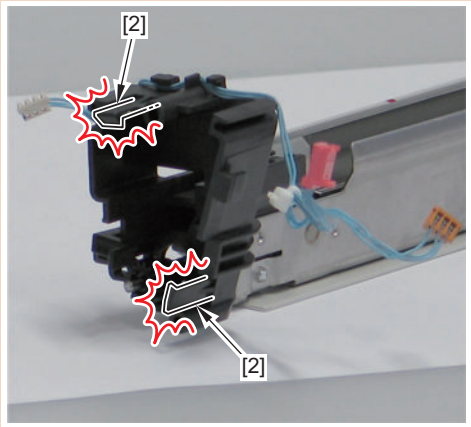


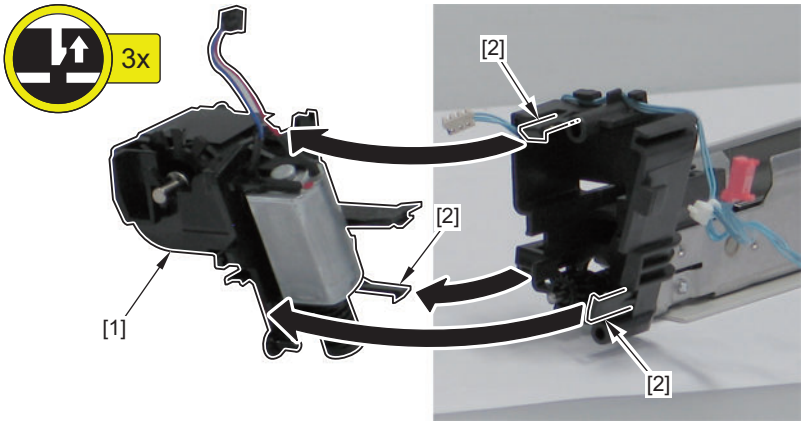
2. **Disconnect the 2 connectors [1], and free the harness [2] from the guide [A].**



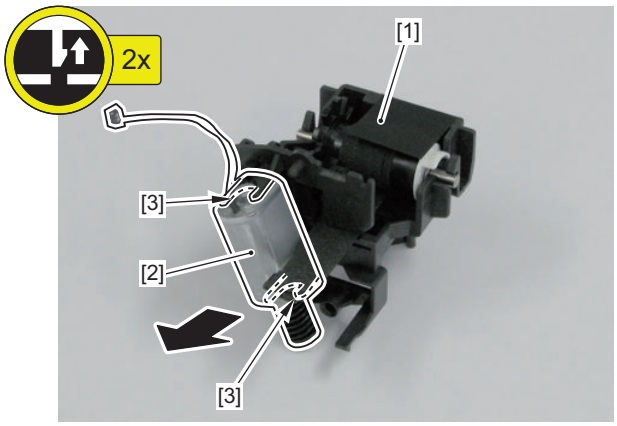
3. **Remove the Pre-transfer Charging Assembly Shutter Unit [1].**
   - 3 Claws [2]

CAUTION:
Be sure to remove the Pre-transfer Charging Assembly Shutter Unit carefully since material that can be easily damaged is used for the 2 claws [2] for the sake of the function of Pre-transfer Charging Assembly.

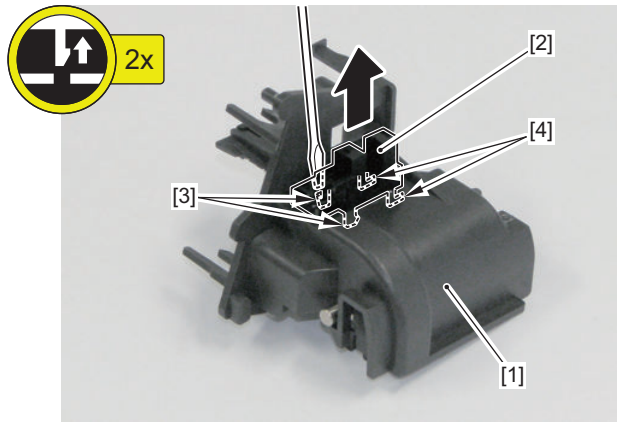




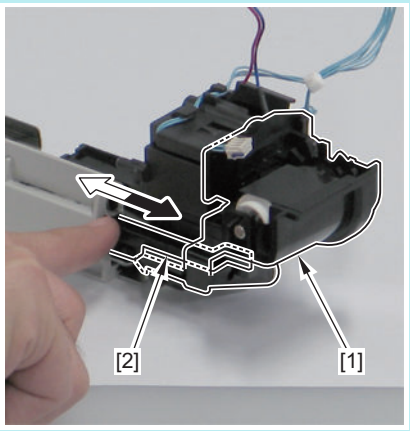
4. **Remove the Pre-transfer Charging Wire Cleaning Motor [2] from the Pre-transfer Charging Assembly Shutter Unit [1].**
   - 2 Claws [3]



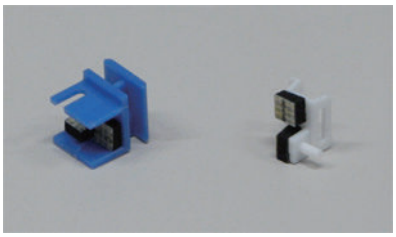
5. **Remove the Post Charging Wire HP Sensor [2] from the Pre-transfer Charging Assembly Shutter Unit [1].**
   - 2 Claws [3]
   - 2 Hooks [4]



NOTE:
How to install the Pre-transfer Charging Assembly Shutter Unit
Be sure to check that the flag [2] moves after installing the Pre-transfer Charging Assembly Shutter Unit [1].



Removing the Pre-transfer Charging Wire Cleaning Pad Holder and the Pre-transfer Charging Wire Cleaning Pad Slider

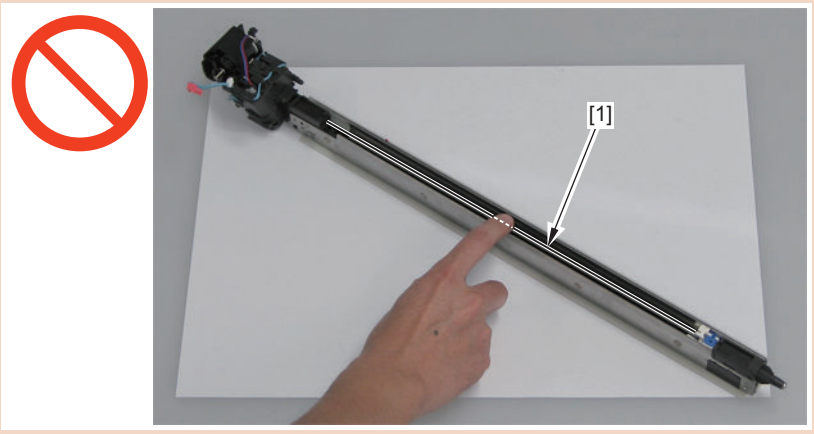


■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**

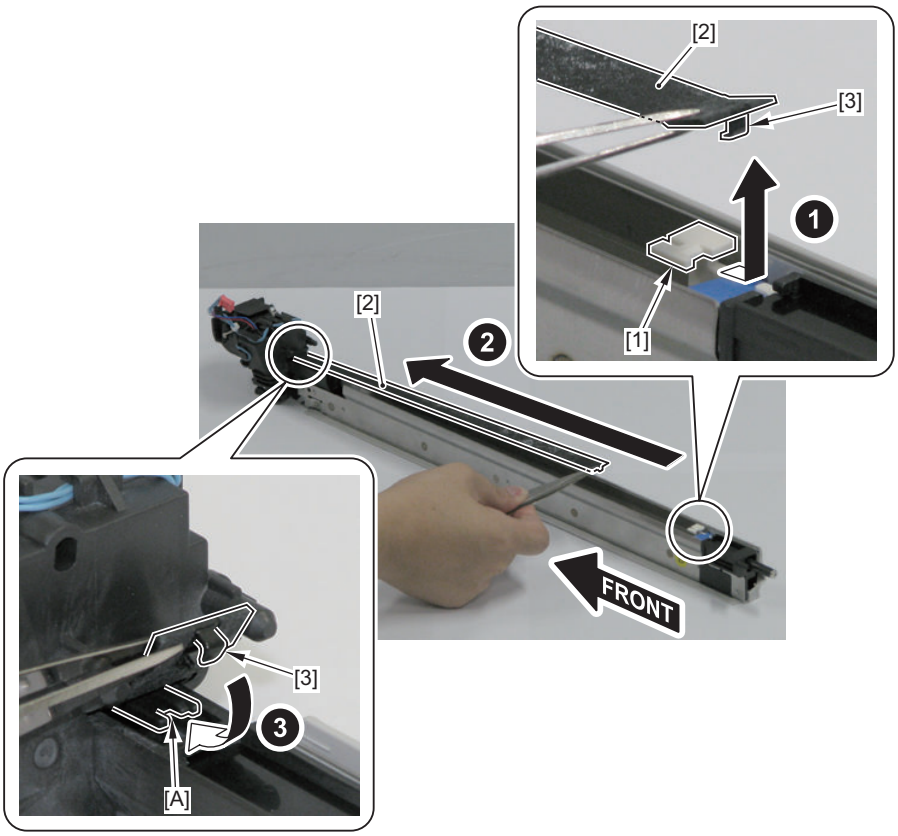
■ Procedure

CAUTION:
Do not touch the Charging Wire [1] directly with hand. Otherwise functional failure may occur.

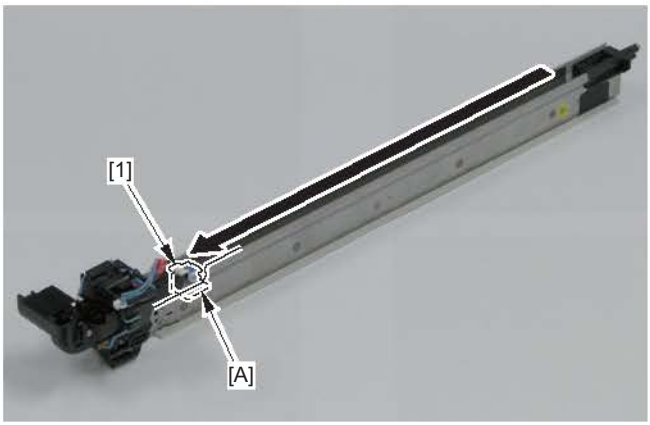


1. **Remove the Shutter Sheet Holder [2] from the Pre-transfer Charging Wire Cleaning Pad Slider [1].**
   - 1 Hook [3]

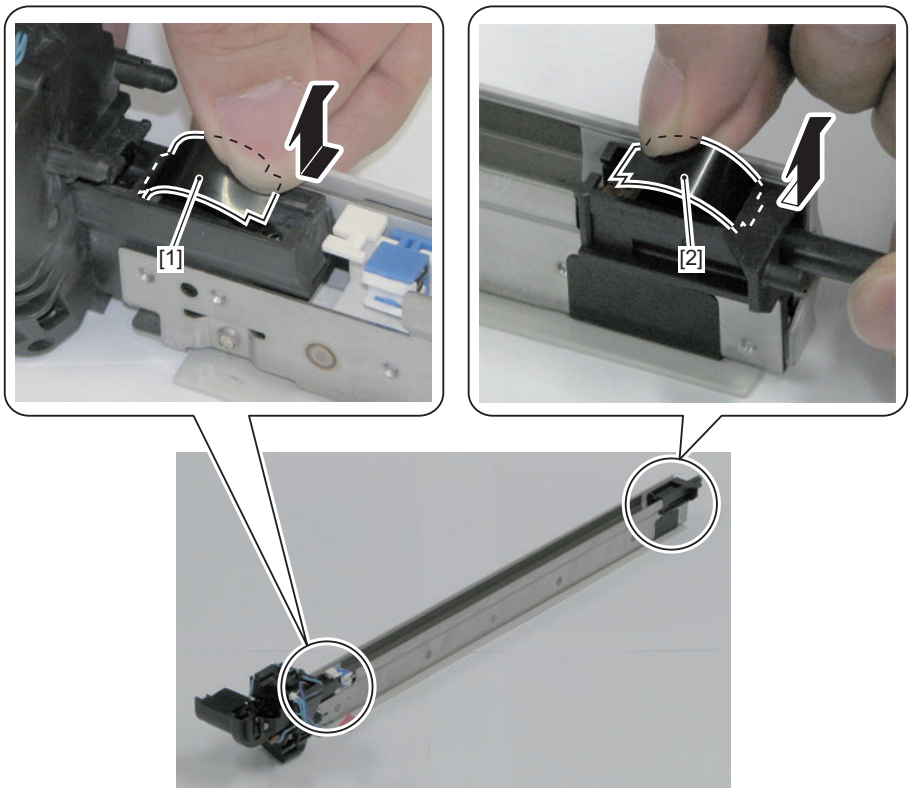
CAUTION:
Because the Shutter Sheet is taken up when the Shutter Sheet Holder [2] is removed from the Pre-transfer Charging Wire Cleaning Pad Slider [1], attach the hook [3] of the removed Shutter Sheet Holder to the [A] part of the Pre-transfer Charging Assembly Shutter in advance.



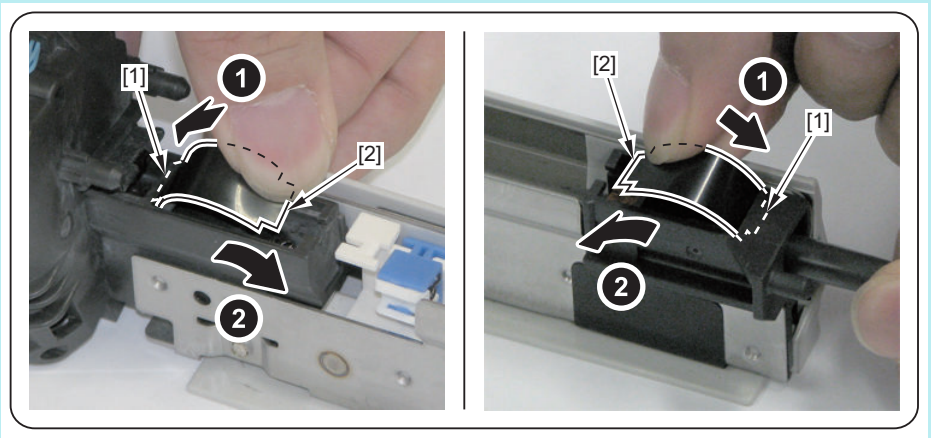
2. **Move the Pre-transfer Charging Wire Cleaning Pad Slider [1] to the cut-off [A] of the Shield Plate at the front side.**



3. **Remove the Pre-transfer Charging Assembly Cover (Front) [1] and Pre-transfer Charging Assembly Cover (Rear) [2].**

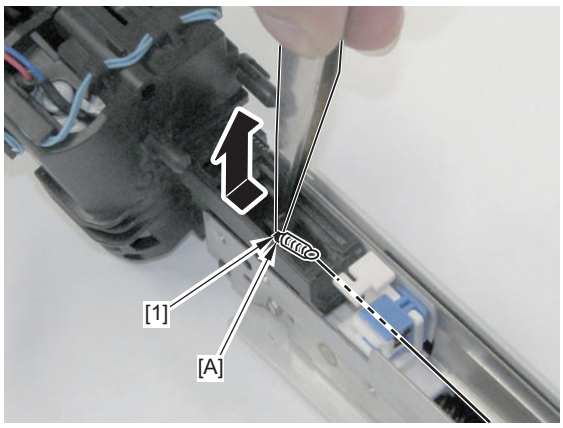


NOTE:
How to install the Pre-transfer Charging Assembly Cover
Insert the protrusion [1] of one side and bend the Pre-transfer Charging Assembly Cover, and then insert the protrusion [2] of the opposite side to install the cover.

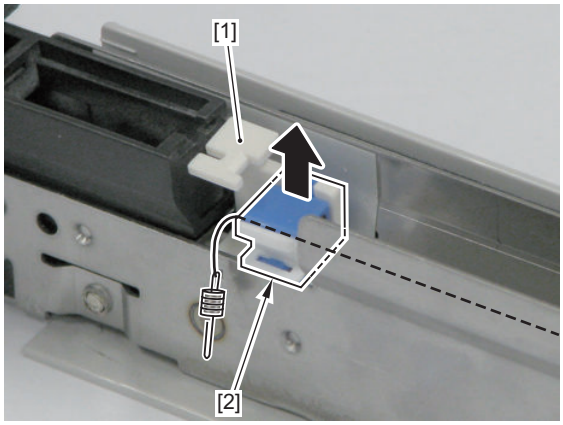


4. **Use tweezers to hold the leading edge [A] of the spring to remove it from the hook [1].**

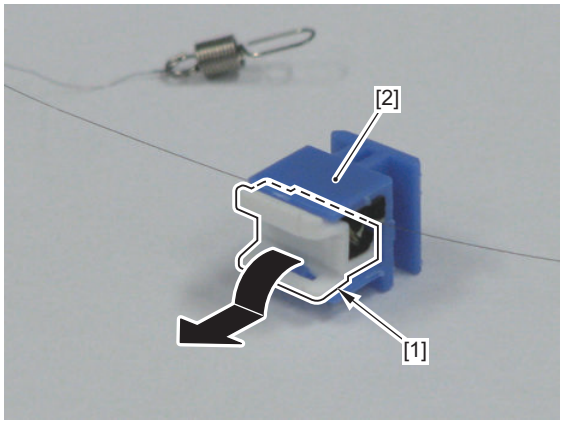
CAUTION:
When disassembling/assembling the Pre-transfer Charging Wire Cleaning Pad Holder and the Pre-transfer Charging Wire Cleaning Pad Slider, do not damage the Charging Wire.



5. **Remove the Pre-transfer Charging Wire Cleaning Pad Holder and the Pre-transfer Charging Wire Cleaning Pad Slider [2] from the Cleaning Pad Arm [1].**

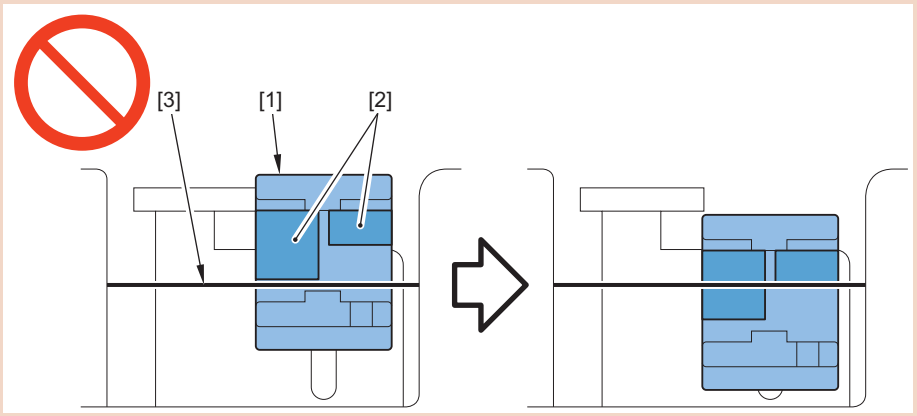


6. **Use your fingers to pinch and then remove the Pre-transfer Charging Wire Cleaning Pad Holder [1] and the Pre-transfer Charging Wire Cleaning Pad Slider [2].**

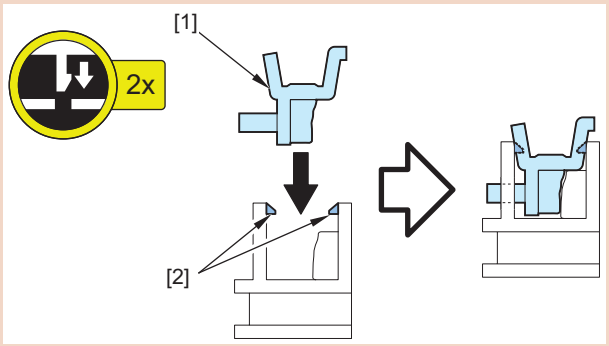


CAUTION:

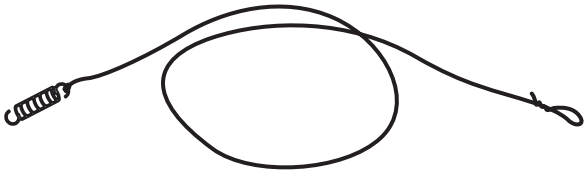
- When assembling, push the Charging Wire [3] against the 2 pads [2] of the Pre-transfer Charging Wire Cleaning Pad Slider [1] to install.



- When assembling, push in the Pre-transfer Charging Wire Cleaning Pad Holder [1] until it is secured with the 2 claws [2].



Replacing the Pre-transfer Charging Wire Unit/Cleaning the Pre-transfer Charging Assembly



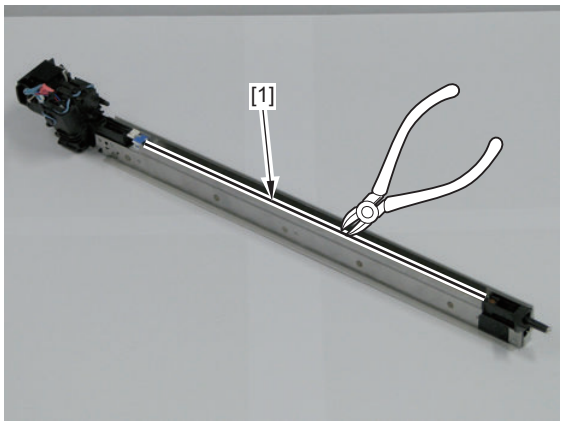
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
5. **Removing the Pre-transfer Charging Wire Cleaning Pad Holder and the Pre-transfer Charging Wire Cleaning Pad Slider****"Removing the Pre-transfer Charging Wire Cleaning Pad Holder and the Pre-transfer Charging Wire Cleaning Pad Slider" on page 654**

■ Disassembling Procedure

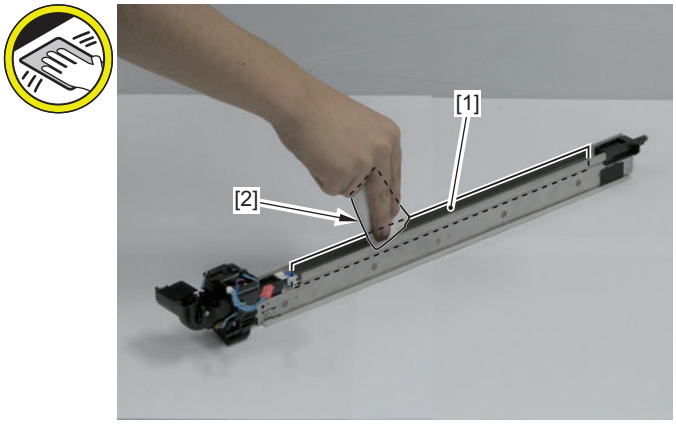
CAUTION:
When replacing this part, clean the Pre-transfer Charging Assembly, and perform "When Replacing the Pre-transfer Charging Wire Unit" on page 662.

1. **Cut off and remove the old Charging Wire [1] from the Pre-transfer Charging Assembly with nippers.**

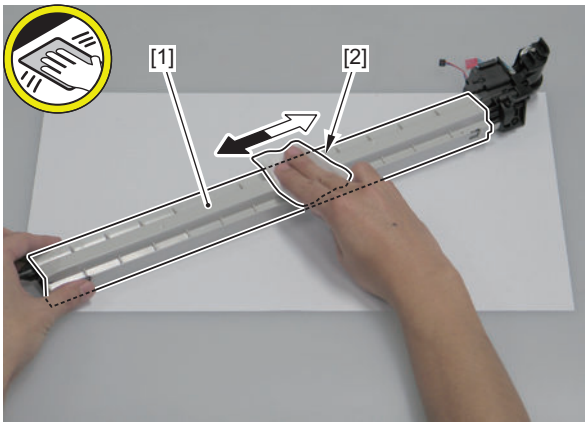


■ Cleaning Procedure

1. **Clean the Inner Shield Plate [1] of the Pre-transfer Charging Assembly with lint-free paper [2] moistened with alcohol.**

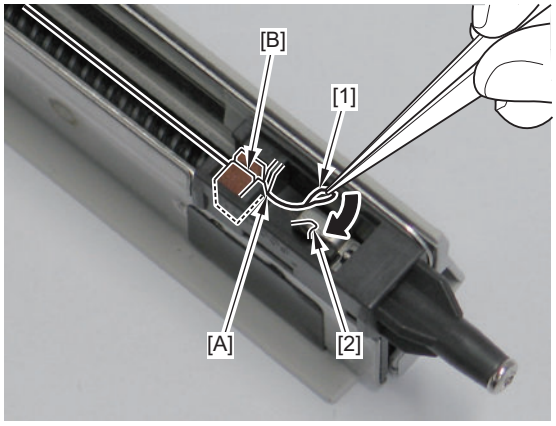


2. **Clean the Pre-transfer Upper Duct [1] with lint-free paper [2] moistened with alcohol.**

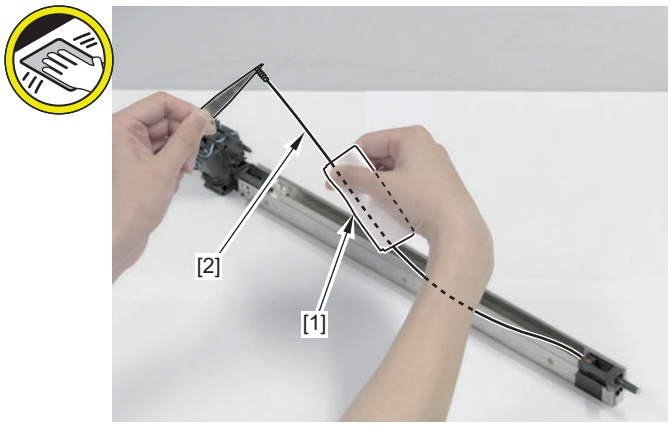


■ Assembling Procedure

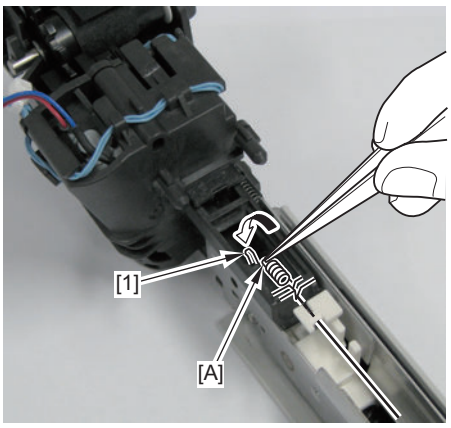
1. **Attach the ring [1] of the Charging Wire to the hook [2], and then pass it through the groove [A] of the rear side and the groove [B] of the sponge.**



2. **Clean the Charging Wire [2] with lint-free paper [1] moistened with alcohol.**



3. **Use tweezers to hold the leading edge [A] of the spring to attach it to the hook [1].**



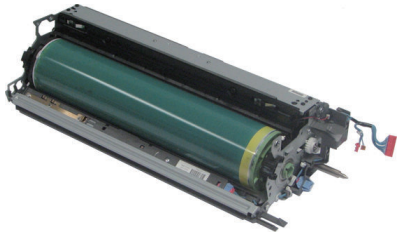
4. **Assemble the Pre-transfer Charging Wire Cleaning Pad Slider and the Pre-transfer Charging Wire Cleaning Pad Holder in reverse order.**

When Replacing the Pre-transfer Charging Wire Unit

■ Procedure

1. **Clear the counter.**
   COPIER > COUNTER > PRDC-1 > PO-WIRE
2. **Execution of Charging Wire cleaning**
   COPIER > FUNCTION > CLEANING > WIRE-EX
3. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
4. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

Removing the Drum Unit (Bk)



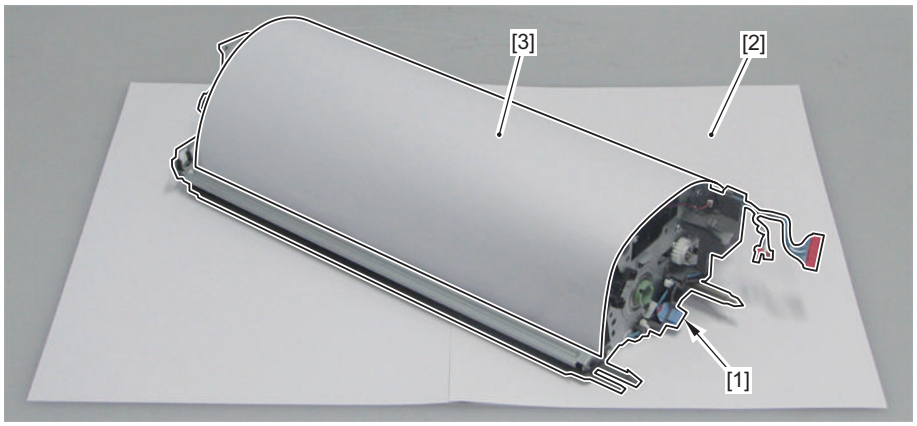
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**

■ Procedure

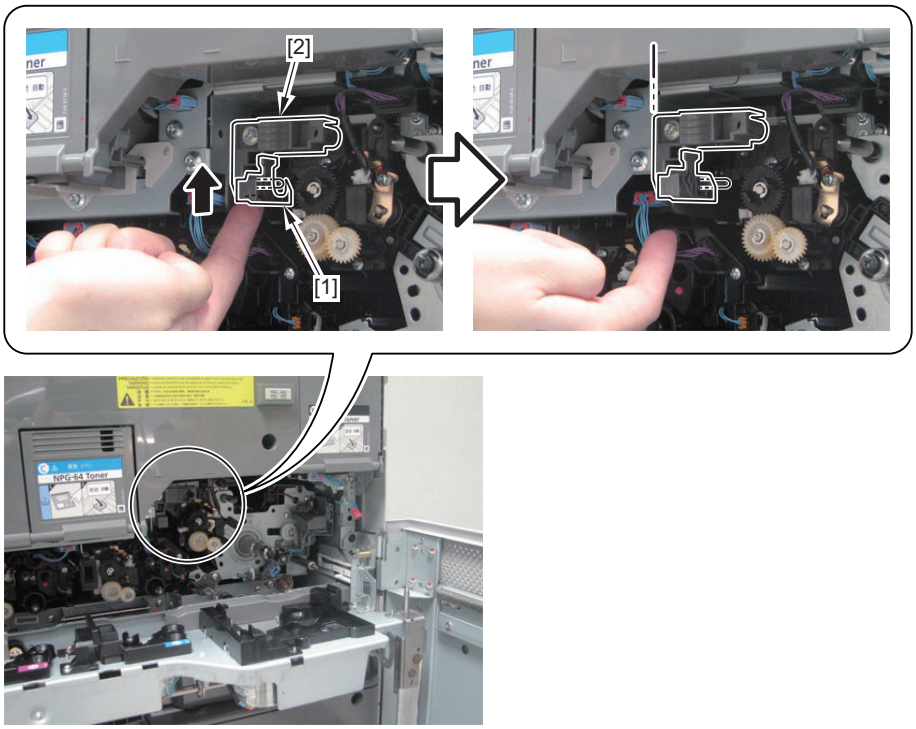
CAUTION:
When handling the Drum Unit (Bk), be sure to follow the following cautions.

- When handling the Drum Unit (Bk) [1], place it on a sheet of paper [2].
- After removing the Drum Unit (Bk), be sure to block light to the drum. Cover with the Drum Protection Sheet [3] or wrap 5 or more papers [3] around the drum to block light.

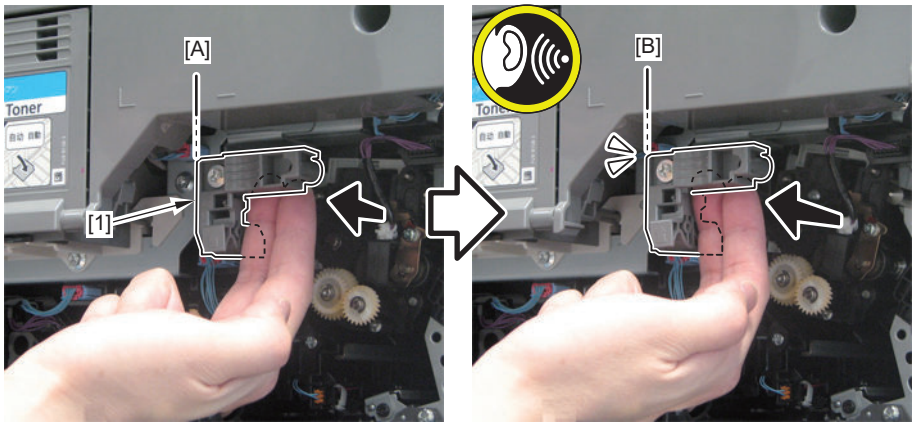


- Do not place the Drum Unit (Bk) in a location where is exposed to direct rays of the sun (e.g. near the window).
- Do not store in a location with high/low temperature/humidity, or in a location where temperature or humidity is dramatically changed.
- Do not store in a dusty area or in a location full of ammonia gas or organic solvent gas.

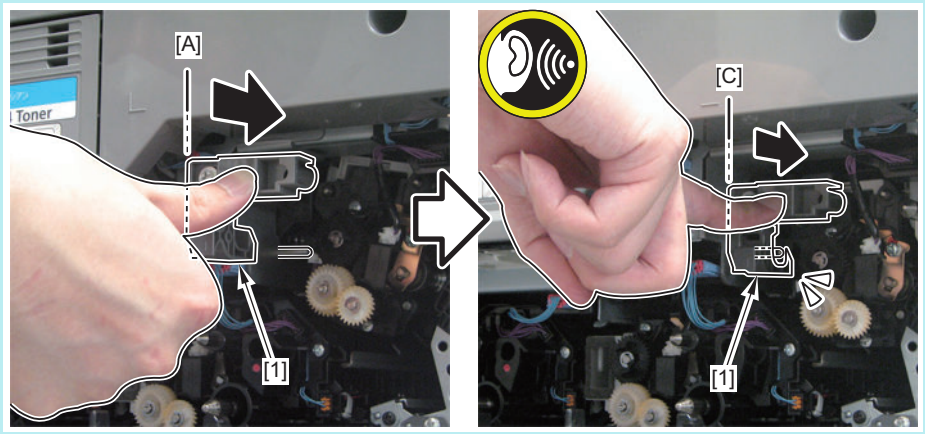
1. Lift the Lock Release Lever [1], and release the lock of the Black Developing Assembly Pressure Lever [2].



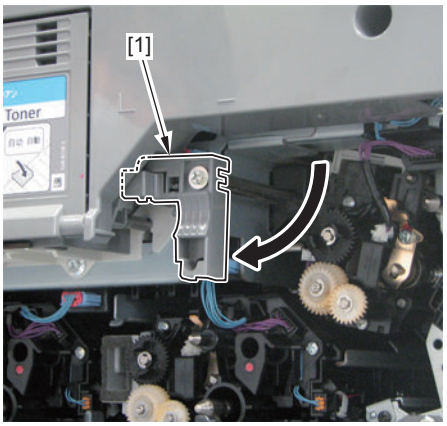
2. **Pull out the Black Developing Assembly Pressure Lever [1] until it stops [A], and then further pull out the lever to the position [B] where pressure applied to the Developing Assembly (Bk) is released.**



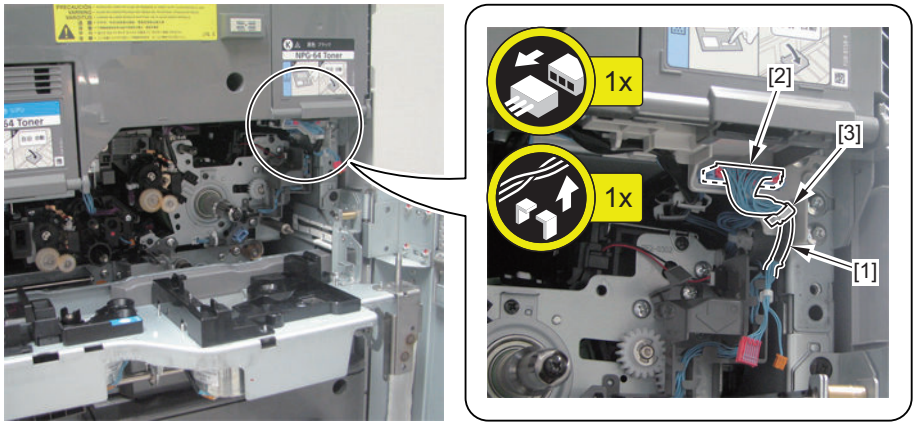
NOTE:
At installation, push the Black Developing Assembly Pressure Lever [1] to the position [A] where pressure is applied to the Developing Assembly (Bk), and then further push the lever [1] until it is locked [C].



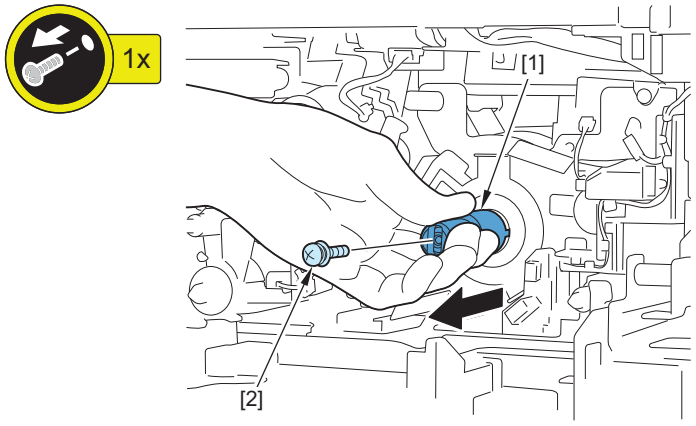
3. **Turn the Black Developing Assembly Pressure Lever [1].**



4. **Free the harness [1].**
   - 1 Connector [2]
   - 1 Wire Saddle [3]

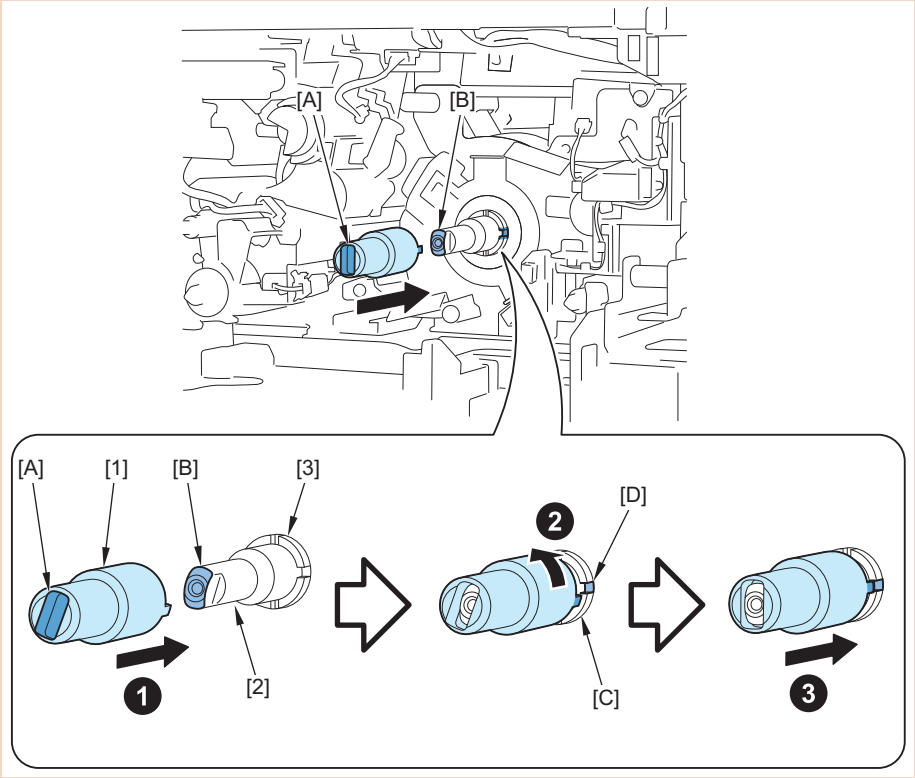


5. **Remove the screw [2] while holding the Drum Shaft Cap [1], and then remove the cap.**



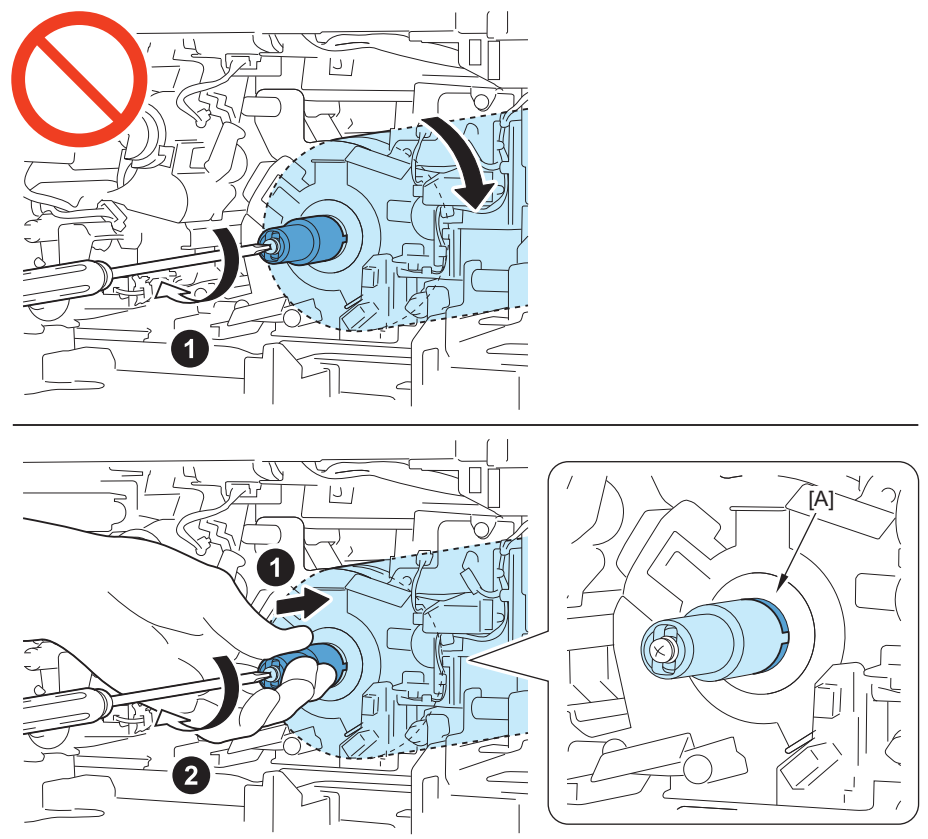
CAUTION:

- When installing the Drum Shaft Cap [1], be sure to install it in the phase where the hole [A] of the Drum Shaft Cap is aligned with the leading edge [B] of the Drum Drive Shaft [2], and at the same time the protrusion [C] of the Drum Shaft Cap is aligned with the groove [D] of the Drum Flange.
- If the phase is displaced, hook the protrusion of the Drum Shaft Cap to the groove of the Drum Flange, and then rotate the Drum Flange [3] counterclockwise so that the phase is matched.



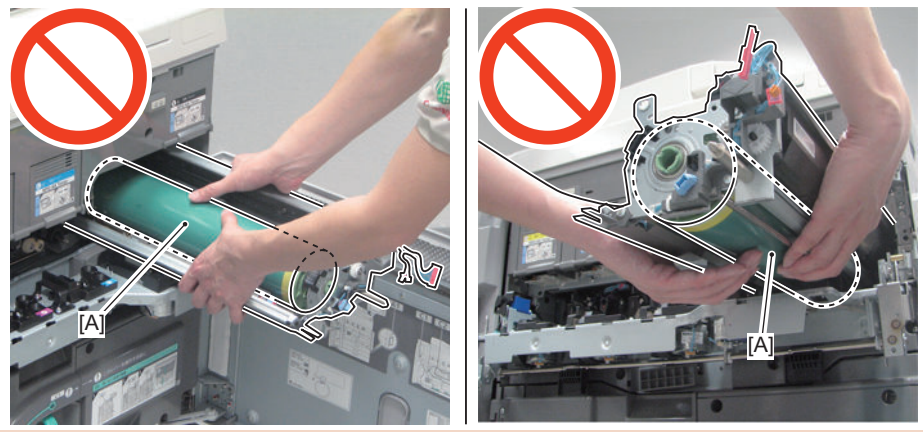
CAUTION:

- When tightening the screw of the Drum Shaft Cap, tighten the screw while pushing the Drum Shaft Cap against the rear side until it is no longer easy to turn the screwdriver so that it does not cause the drum to rotate clockwise together.
- After tightening the screw, check that the end face [A] of the Drum Shaft Cap touches the drum.
- Be sure to turn the screwdriver while holding the Drum Shaft Cap to prevent the drum from rotating together with the screwdriver.

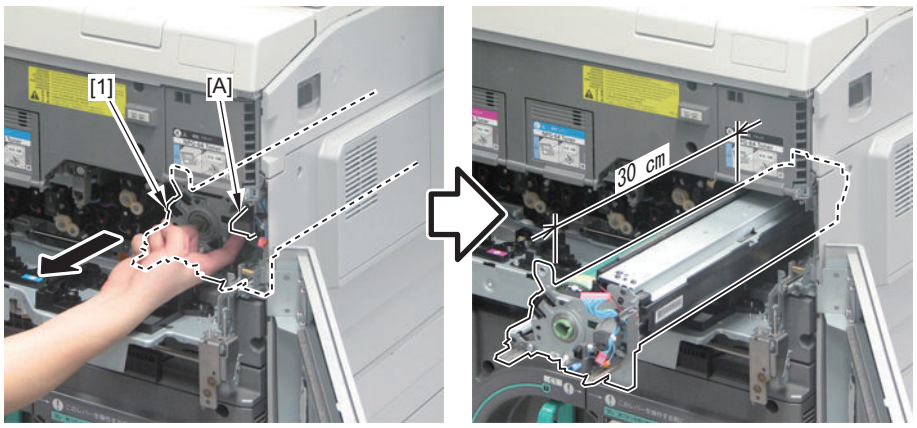


CAUTION:

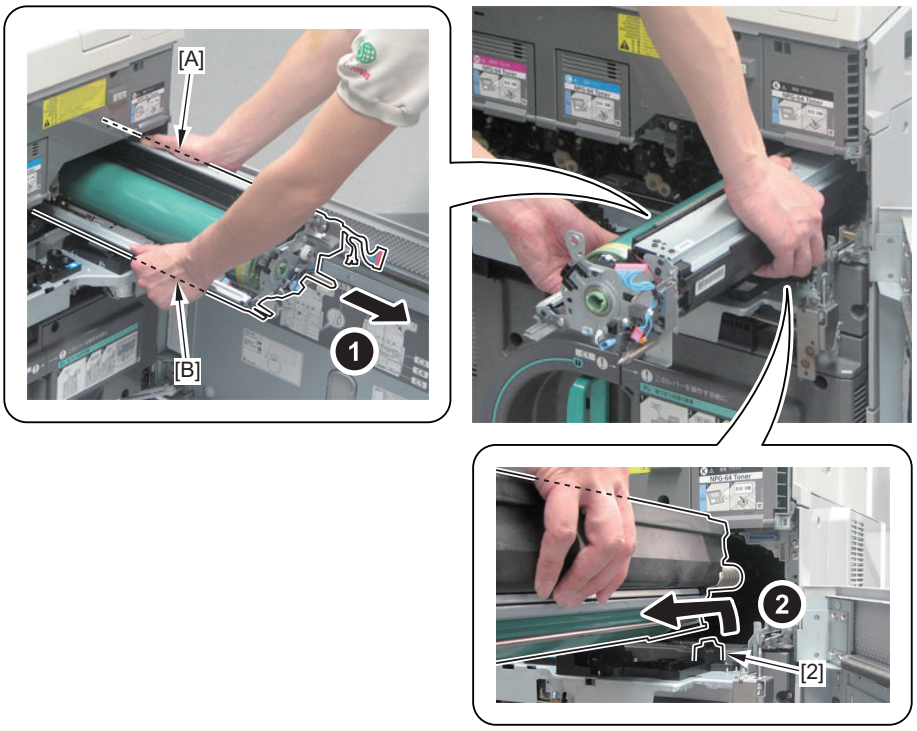
Do not touch the surface [A] of the Photosensitive Drum when installing/removing.



6. **Hold the handle [A], and pull out the Drum Unit (Bk) [1] for approx. 30 cm.**

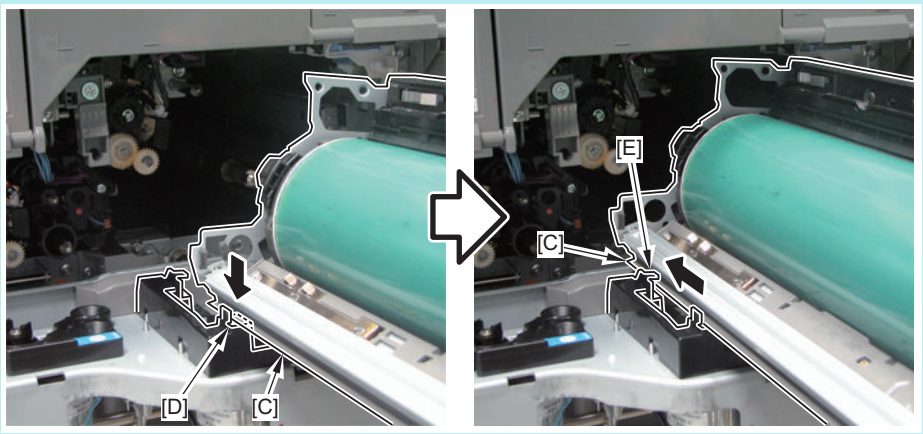


7. **Pull out the Drum Unit (Bk) by holding the upper part [A] and the left part [B], lift the right side, and then remove the unit while avoiding contact with the Rail Guide [2].**

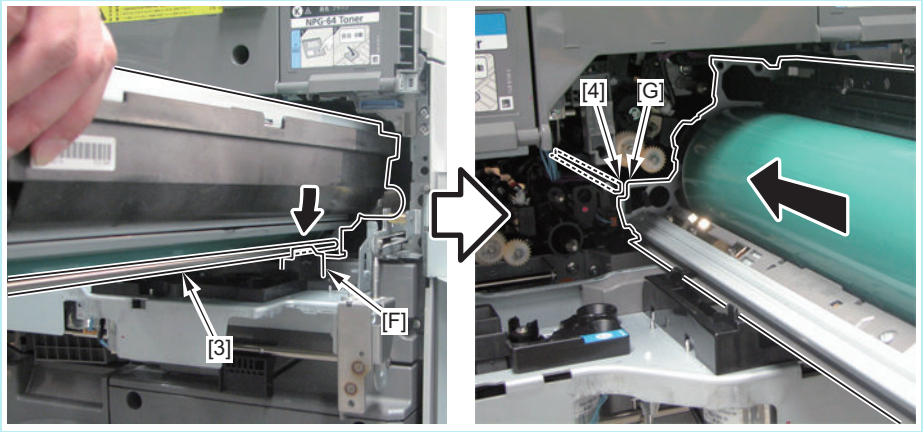


NOTE:
How to install the Drum Unit (Bk)

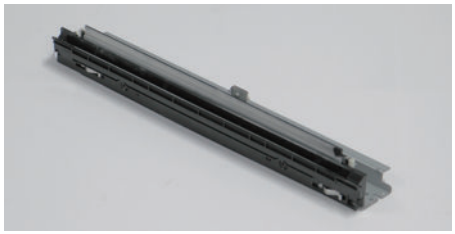
1. Place the left lower side [C] of the Drum Unit (Bk) on the guide [D] of the Process Unit Inner Cover, and then insert it under the guide [E].



2. Place the rail [3] of the Drum Unit (Bk) on the guide [F] of the Process Unit Inner Cover, fit the left front side [G] of the Drum Unit (Bk) to the rail [4] of the machine, and then push the unit into the machine slowly and horizontally.



Removing the Drum Cleaning Unit

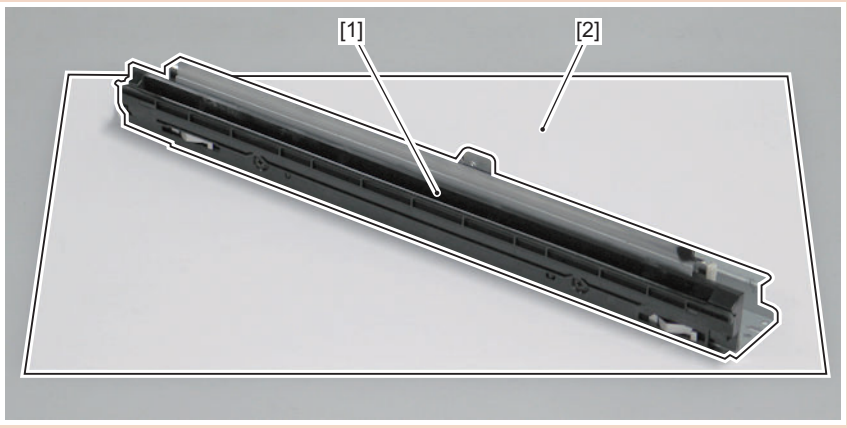


■ Preparation

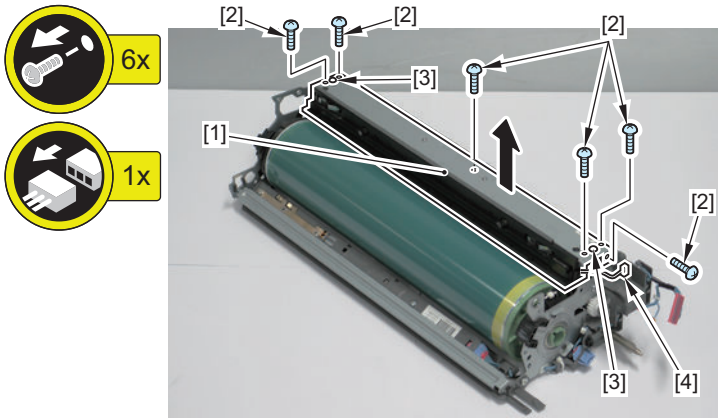
1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
6. **Removing the Drum Unit (Bk)****"Removing the Drum Unit (Bk)" on page 662**

■ Procedure

CAUTION:
Be sure to turn over the Drum Cleaning Unit [1] and place it on a sheet of paper [2] because toner is attached on the unit.



1. **Remove the Drum Cleaning Unit [1].**
   - 6 Screws [2]
   - 2 Bosses [3]
   - 1 Connector [4]

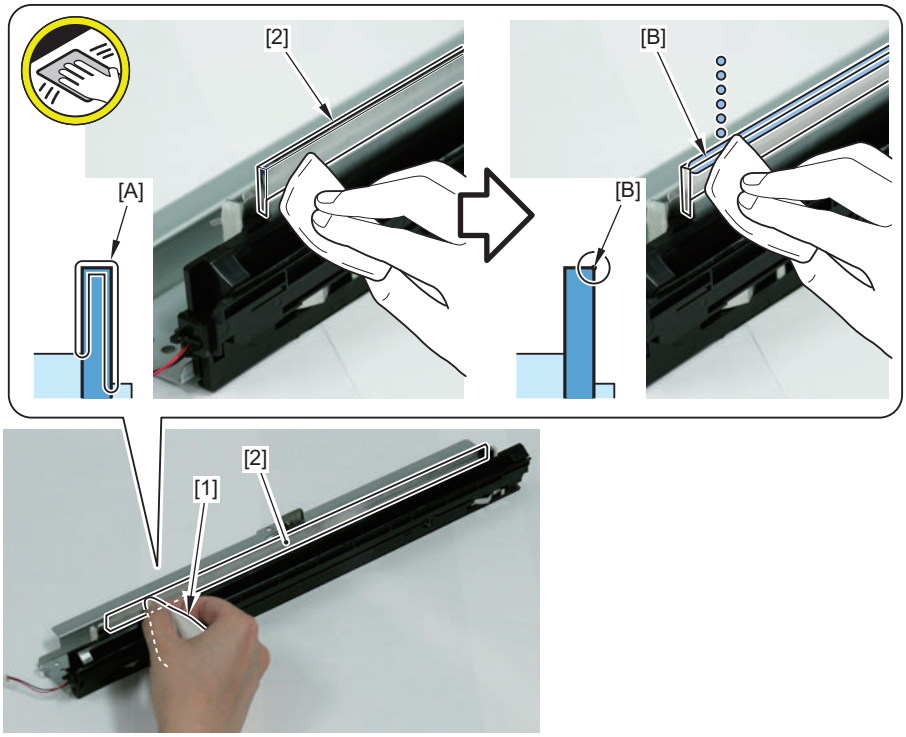


■ When removing/installing the Drum Cleaning Blade

When installing the removed Drum Cleaning Unit again to the Drum Unit (Bk), follow the steps 1 to 3 shown below to clean the edge of the Drum Cleaning Blade and apply lubricant (Tospearl) to the edge.

CAUTION:
Installing the Drum Cleaning Blade without cleaning the edge and applying lubricant (Tospearl) will cause a cleaning error.

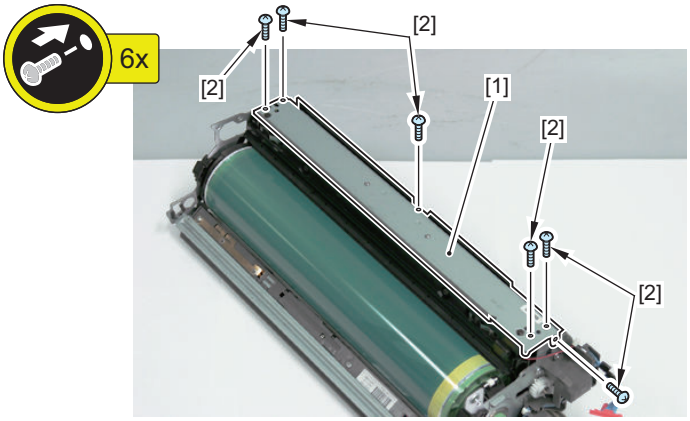
1. **Clean the surface [A] of the Drum Cleaning Blade [2] installed to the Drum Cleaning Unit with lint-free paper [1], and apply lubricant (Tospearl) to the edge [B] contacting the Drum after cleaning.**



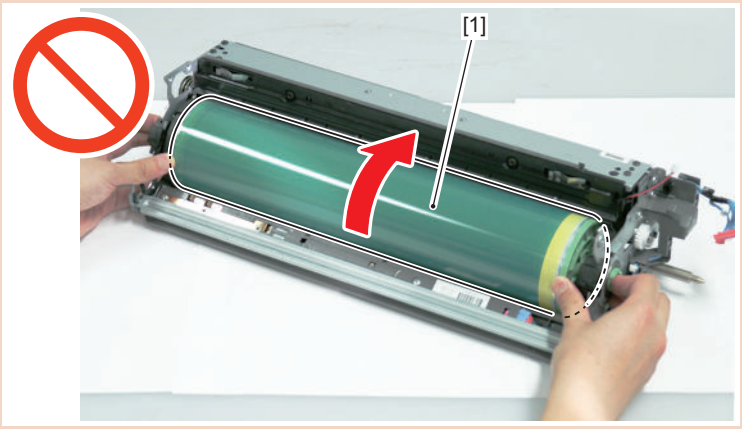
CAUTION:
Be careful not to scatter lubricant (Tospearl) when cleaning the edge of the Drum Cleaning Blade and when applying lubricant.
If lubricant (Tospearl) falls onto the Pre-exposure Unit, it will cause image failure.
If lubricant (Tospearl) scatters onto the Pre-exposure Unit, clean it with a blower, etc.

2. In order to rotate the Drum, temporarily secure the Drum Cleaning Unit [1] to the Drum Unit (Bk).

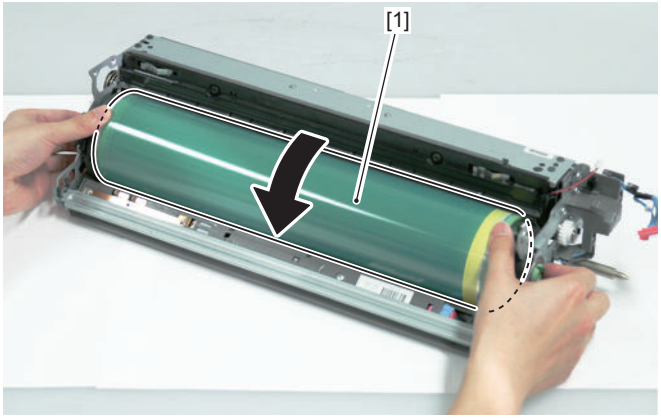
- 6 Screws [2]



CAUTION:
Do not rotate the Drum [1] in the reverse direction (clockwise as viewed from the front side).
This may cause the Drum Cleaning Blade to be everted, resulting in image failure.



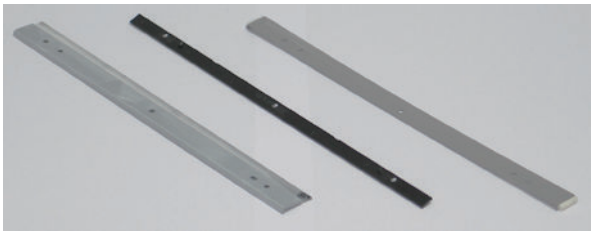
3. Hold both ends, and rotate the Drum [1] approx. one turn in the direction of the arrow.



CAUTION:
If you feel heavy load when you rotate the Drum, the Drum Cleaning Blade may be everted. Remove the Drum Cleaning Unit again, clean the edge of the Drum Cleaning Blade, and apply lubricant (Tospearl) to the edge.

4. Assemble the Drum Cleaning Unit in the reverse order of removal.

Removing the Drum Cleaning Blade (Bk) and the Side Seal (Front)/(Rear)

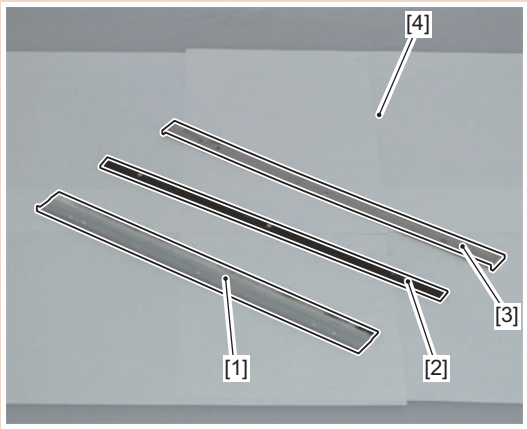


■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
6. **Removing the Drum Unit (Bk)****"Removing the Drum Unit (Bk)" on page 662**
7. **Removing the Drum Cleaning Unit****"Removing the Drum Cleaning Unit" on page 670**

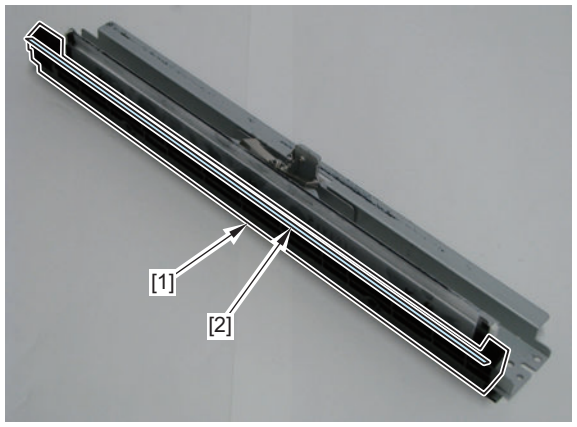
■ Procedure

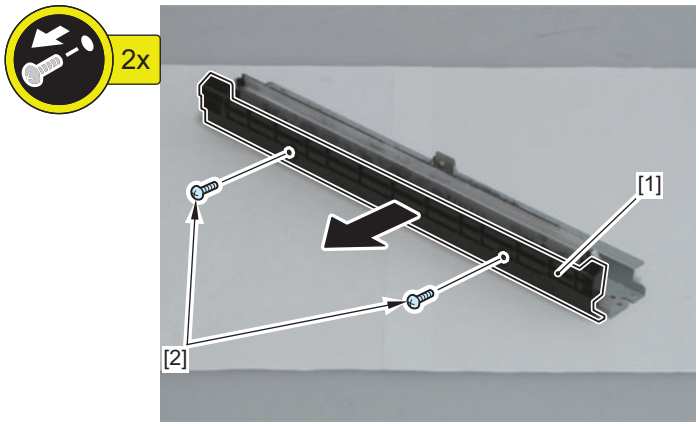
CAUTION:
Be sure to place the Drum Cleaning Blade (Bk) [1], Blade Spacer [2], and Side Seal (Front)/(Rear) [3] on a sheet of paper [4] because toner is attached on them.



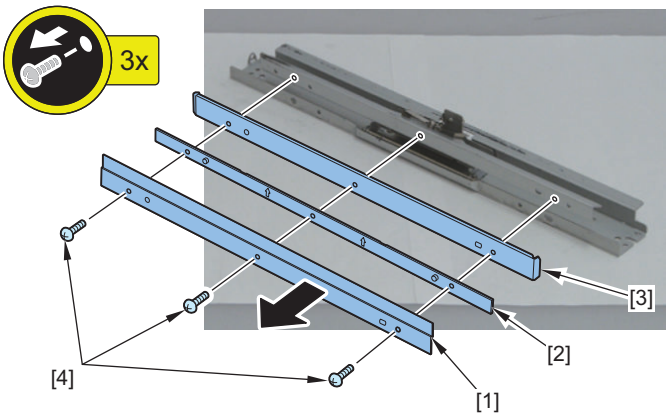
1. **Remove the Drum Cleaning Blade Cover [1].**
   - 2 Screws [2]

CAUTION:
Do not fold the sheet [2] when disassembling/assembling the Drum Cleaning Blade Cover [1].

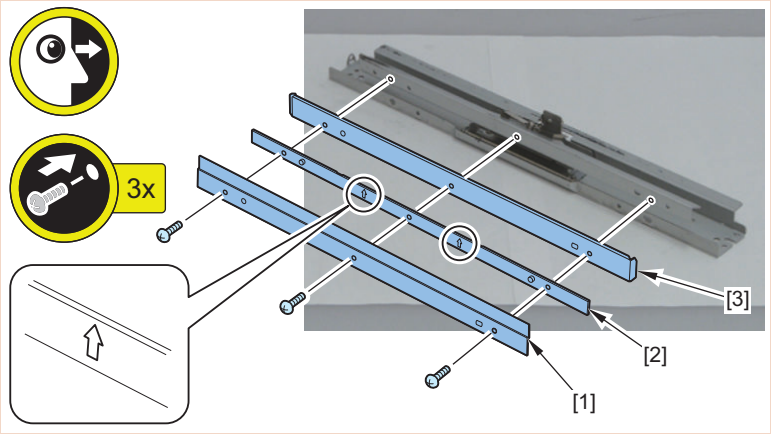




2. **Remove the Drum Cleaning Blade (Bk) [1], Blade Spacer [2], and Side Seal (Front)/(Rear) [3] from the Drum Cleaning Blade Unit.**
   - 3 Screws [4]



CAUTION:
When assembling the Drum Cleaning Blade Unit, be sure to pay attention to the directions of the Drum Cleaning Blade (Bk) [1], Blade Spacer [2], and Side Seal (Front)/(Rear) [3].

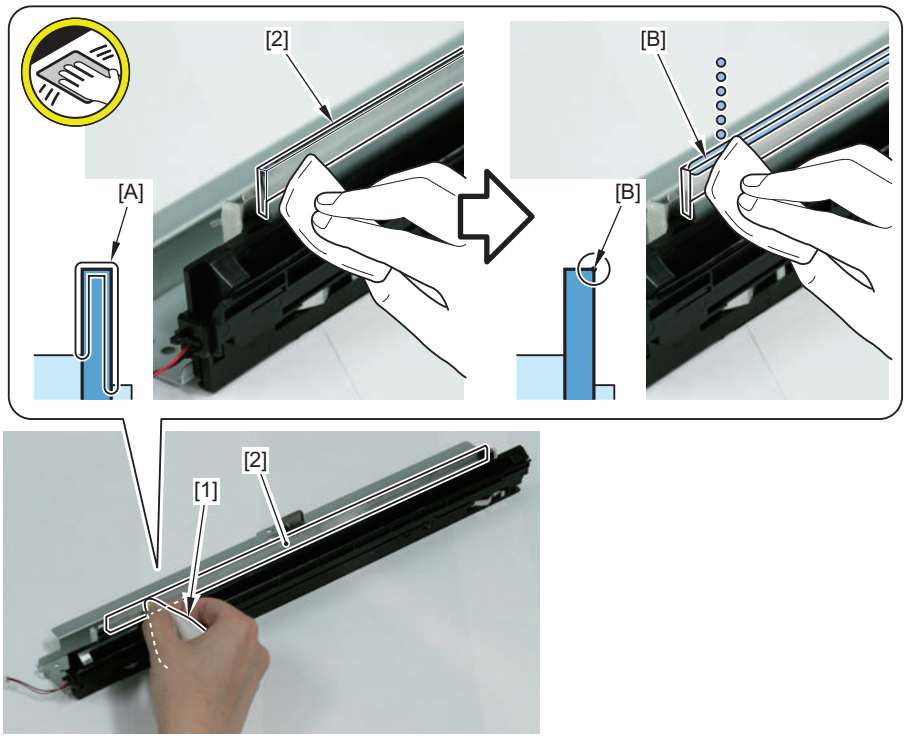


■ When removing/installing the Drum Cleaning Blade

When reusing the Drum Cleaning Blade, follow the steps 1 to 3 shown below to clean the edge of the Drum Cleaning Blade and apply lubricant (Tospearl) to the edge.

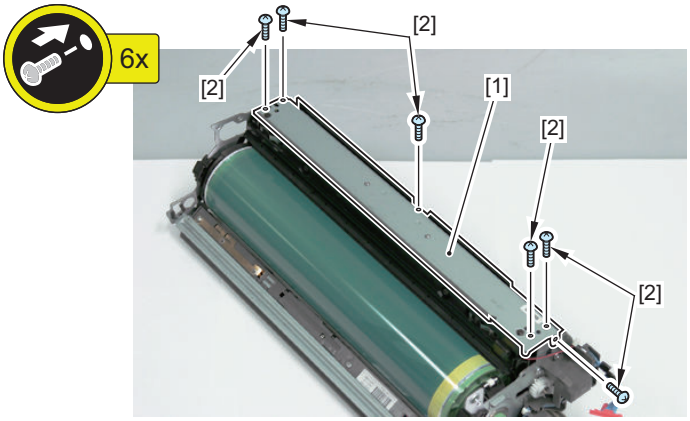
CAUTION:
Installing the Drum Cleaning Blade without cleaning the edge and applying lubricant (Tospearl) will cause a cleaning error.

1. **Clean the surface [A] of the Drum Cleaning Blade [2] installed to the Drum Cleaning Unit with lint-free paper [1], and apply lubricant (Tospearl) to the edge [B] contacting the Drum after cleaning.**

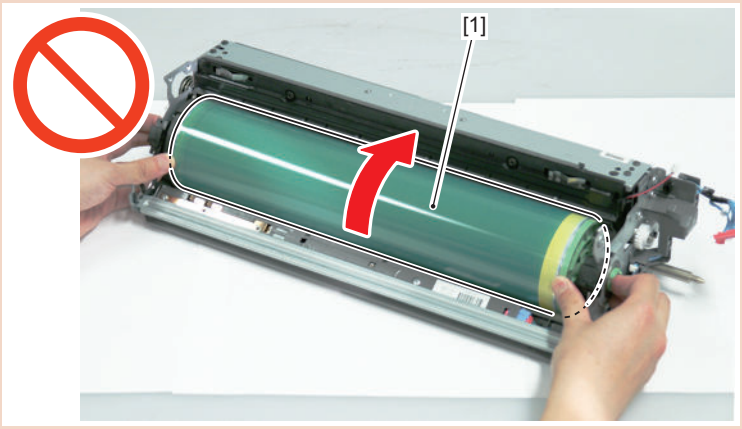


CAUTION:
Be careful not to scatter lubricant (Tospearl) when cleaning the edge of the Drum Cleaning Blade and when applying lubricant.
If lubricant (Tospearl) falls onto the Pre-exposure Unit, it will cause image failure.
If lubricant (Tospearl) scatters onto the Pre-exposure Unit, clean it with a blower, etc.

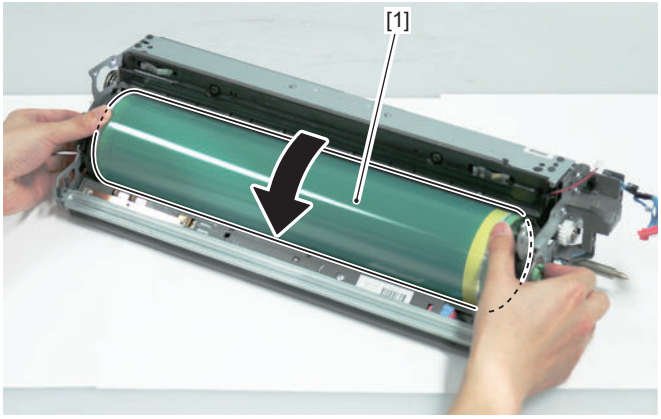
2. **In order to rotate the Drum, temporarily secure the Drum Cleaning Unit [1] to the Drum Unit (Bk).**
   - 6 Screws [2]



CAUTION:
Do not rotate the Drum [1] in the reverse direction (clockwise as viewed from the front side).
This may cause the Drum Cleaning Blade to be everted, resulting in image failure.



3. **Hold both ends, and rotate the Drum [1] approx. one turn in the direction of the arrow.**



CAUTION:
If you feel heavy load when you rotate the Drum, the Drum Cleaning Blade may be everted. Remove the Drum Cleaning Unit again, clean the edge of the Drum Cleaning Blade, and apply lubricant (Tospearl) to the edge.

4. **Assemble the Drum Cleaning Unit in the reverse order of removal.**

Removing the Drum Patch Sensor Unit (Bk)

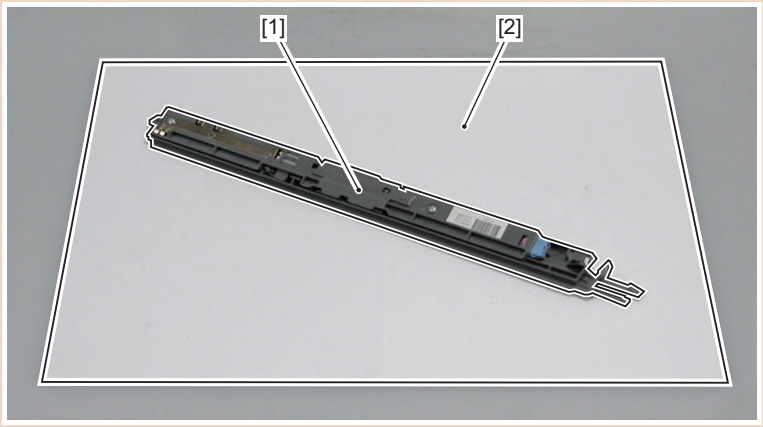
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
6. **Removing the Drum Unit (Bk)****"Removing the Drum Unit (Bk)" on page 662**

■ Procedure

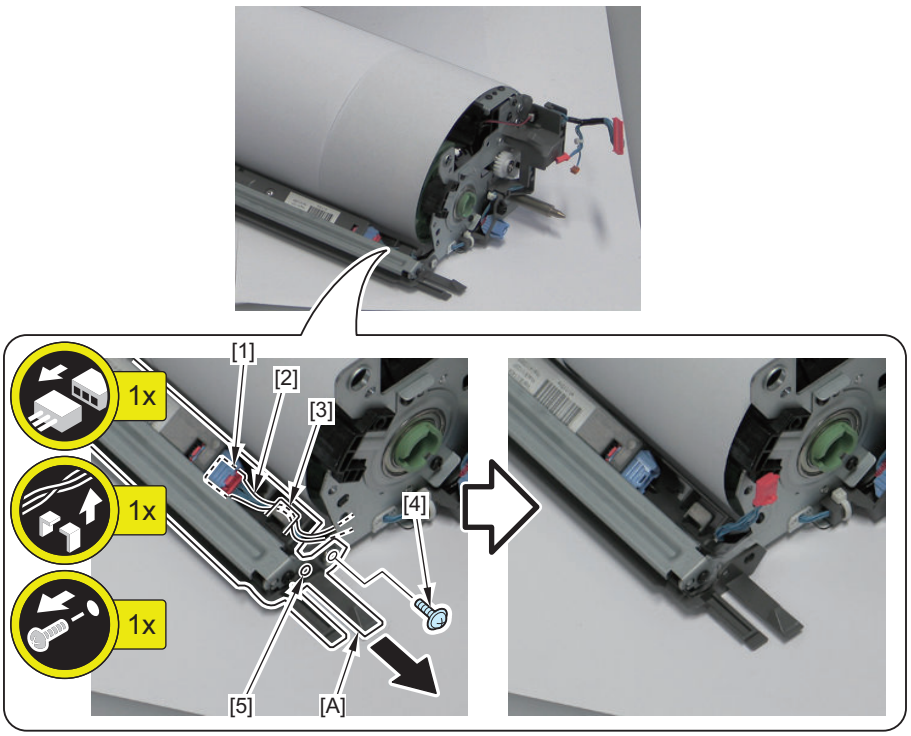
CAUTION:
When replacing this part, execute "When Replacing the Drum Patch Sensor Unit (Bk)" on page 681.

CAUTION:
Be sure to place the Drum Patch Sensor Unit (Bk) [1] on a sheet of paper [2] because toner is attached on the unit.

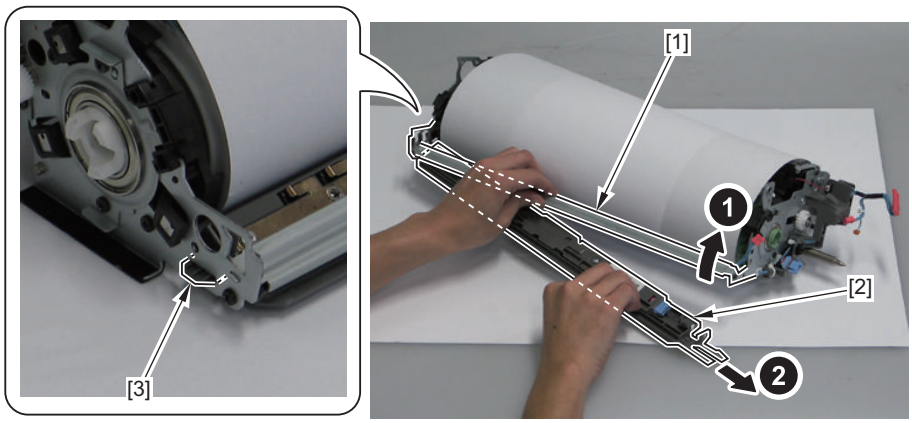


1. **Disconnect the connector [1], and free the harness [2] from the guide [3].**

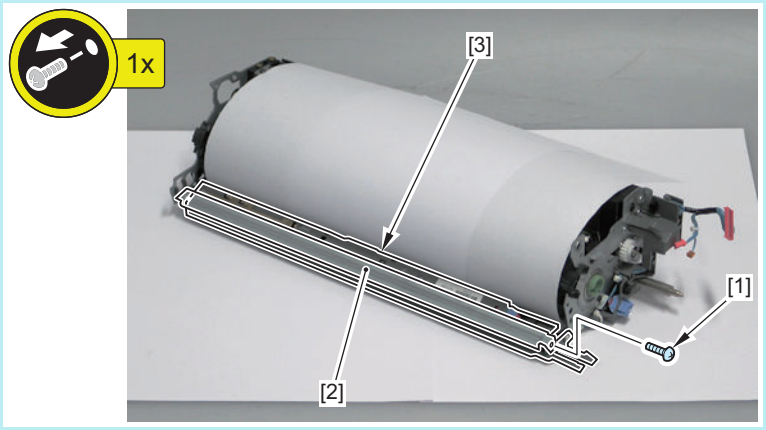
2. **Remove the screw [4] and pull the [A] part of the Drum Patch Sensor Unit (Bk) to remove the boss [5].**



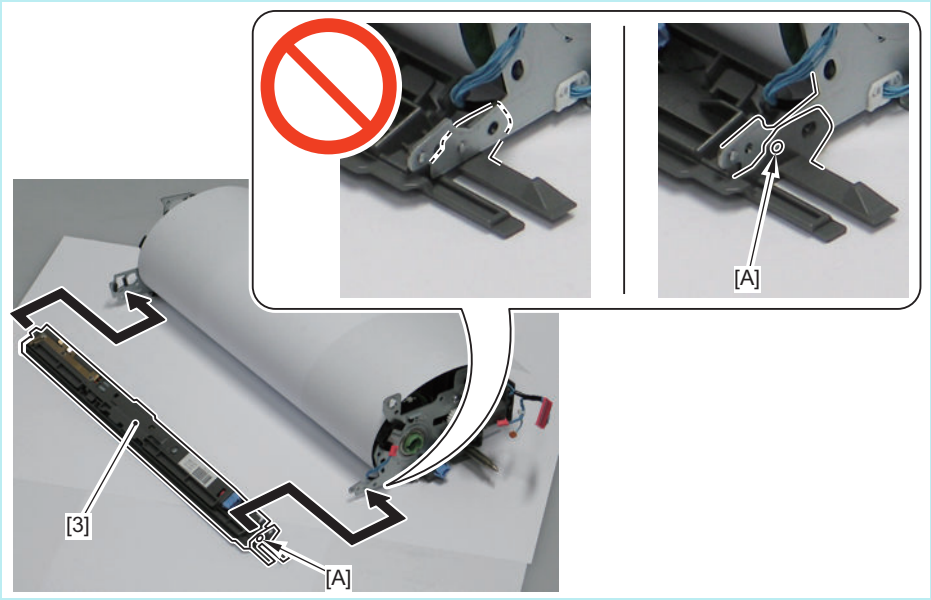
3. **Lift the frame [1] and remove the Drum Patch Sensor Unit (Bk) [2].**
   - 1 Protrusion [3]



NOTE:
How to remove the Drum Patch Sensor Unit (Bk)
The following shows the installation method when the screw [1] and the frame [2] were removed before removing the Drum Patch Sensor Unit (Bk) [3].



Be sure that the boss hole [A] of the Drum Patch Sensor Unit (Bk) [3] is positioned correctly when installing the unit.



When Replacing the Drum Patch Sensor Unit (Bk)

■ Procedure

1. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
2. **Enter the Patch Sensor Alpha Value.**
   COPIER > ADJUST > DENS > ALF-C
   (Enter the 4-digit number below the barcode of the Patch Image Read Sensor Unit in the following service mode: ALF-C.)

3. **Adjust the Patch Sensor Light Intensity.**
   COPIER > FUNCTION >MISC-P > PT-LPADJ
4. **Execute auto gradation adjustment.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute color displacement correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

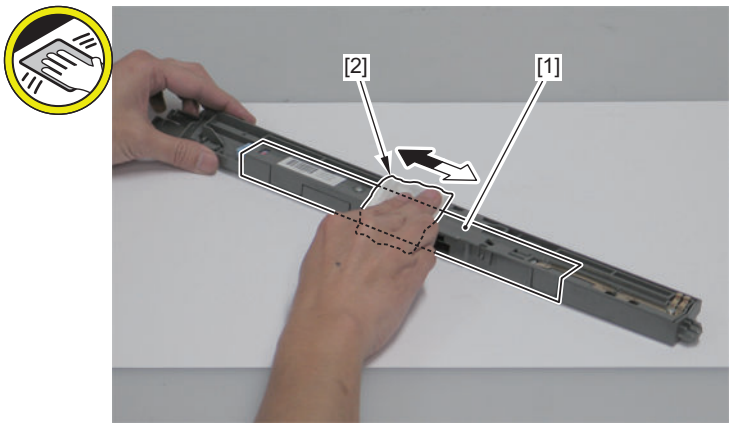
Cleaning the Drum Patch Sensor Cover (Bk) and Drum Patch Sensor (Bk)

■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
6. **Removing the Drum Unit (Bk)****"Removing the Drum Unit (Bk)" on page 662**
7. **Removing the Drum Patch Sensor Unit (Bk)****"Removing the Drum Patch Sensor Unit (Bk)" on page 678**

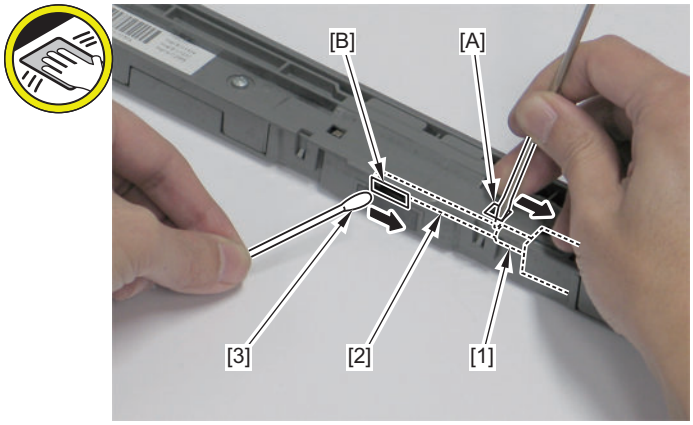
■ Procedure

1. **Clean the Drum Patch Sensor Cover (Bk) [1] with wet and tightly-wrung lint-free paper [2].**

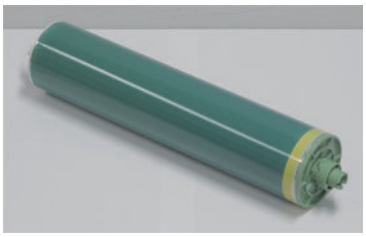


2. **Insert the flat-blade screwdriver into the hole [A] of the Drum Patch Sensor Unit (Bk), push the Solenoid Pin [1], and then open the shutter [2].**
3. **Clean the surface [B] of the Patch Sensor (Bk) in the single direction with wet and tightly-wrung cotton swab [3].After cleaning, check that there is no soiling caused by toner on the surface [B] of the sensor.**

CAUTION:
- Do not use alcohol because it causes melting and clouding of the sensor window.
- Do not dry wipe the sensor window because it is charged to attract toner.



Removing the Drum (Bk)



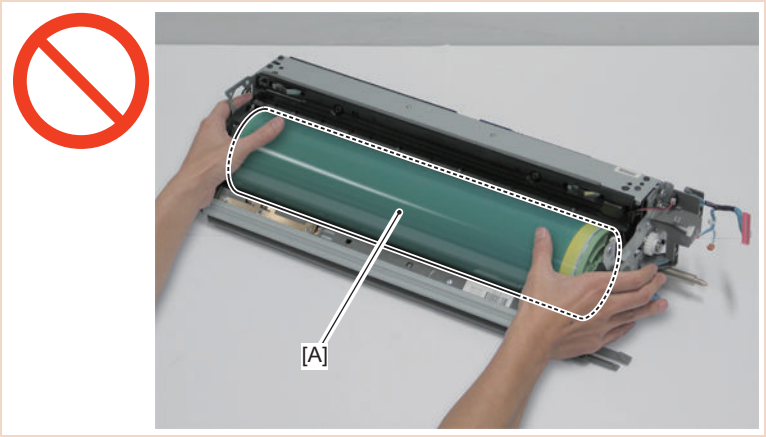
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover** **“Removing the Toner Replacement Cover” on page 941**
3. **Opening the Process Unit Inner Cover** **“Opening the Process Unit Inner Cover” on page 542**

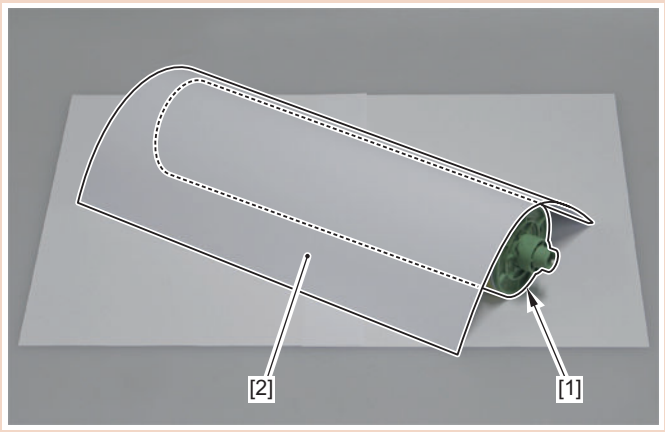
4. **Removing the Primary Charging Assembly** **“Removing the Primary Charging Assembly” on page 627**
5. **Removing the Pre-transfer Charging Assembly** **“Removing the Pre-transfer Charging Assembly” on page 649**
6. **Removing the Drum Unit (Bk)** **“Removing the Drum Unit (Bk)” on page 662**
7. **Removing the Drum Cleaning Unit** **“Removing the Drum Cleaning Unit” on page 670**
8. **Removing the Drum Patch Sensor Unit (Bk)** **“Removing the Drum Patch Sensor Unit (Bk)” on page 678**

■ Procedure

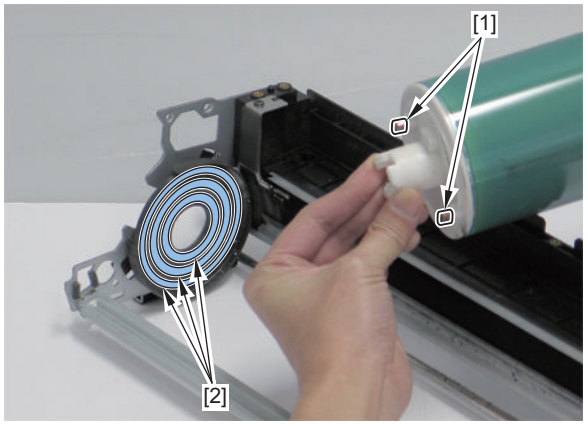
CAUTION:
- When replacing this part, execute “When Replacing the Drum (Bk)” on page 686.
- Do not touch the surface [A] of the Photosensitive Drum when installing/removing.



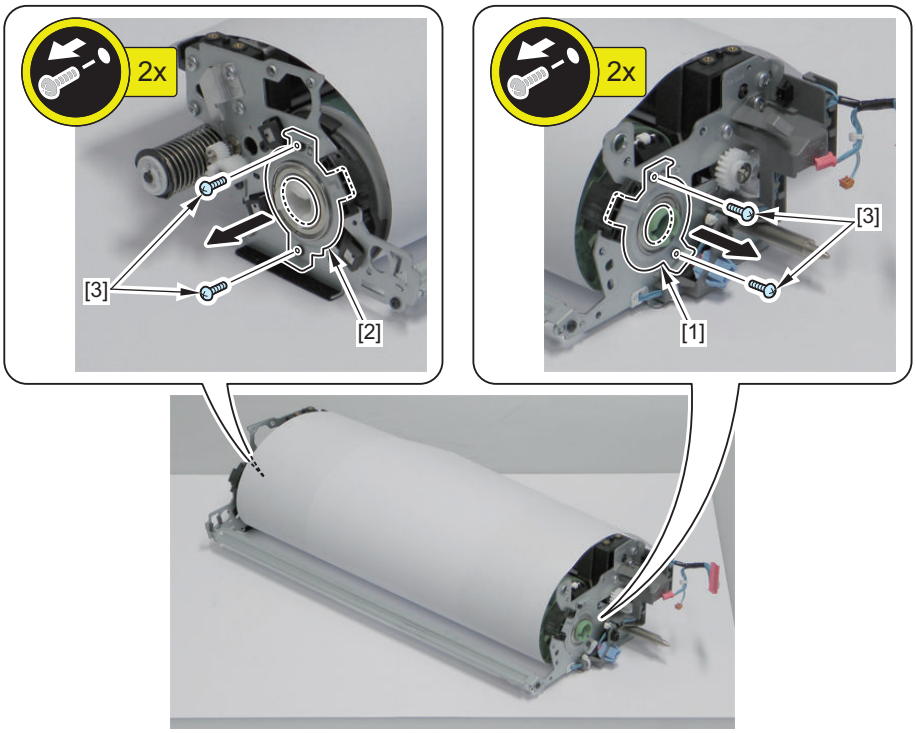
CAUTION:
- Cover the drum [1] with 5 or more sheets of paper or the Lightproof Sheet [2].



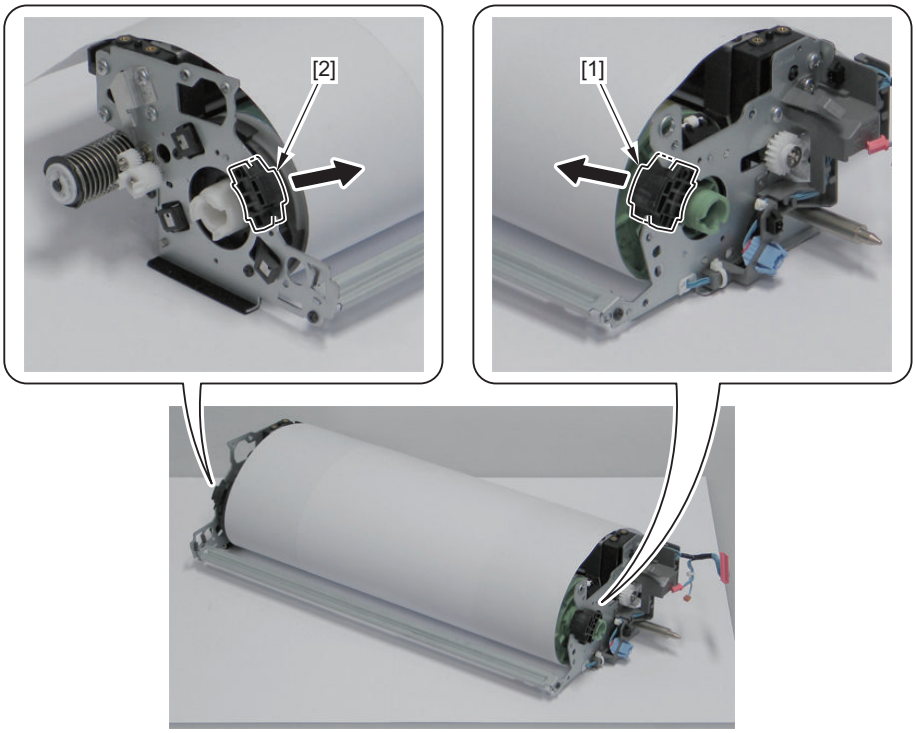
NOTE:
If there is abnormal noise from the drum (Bk), apply Barrierta to the circumference of the 2 Sliding Assemblies [1] of the drum and the 3 Slip Rings [2].



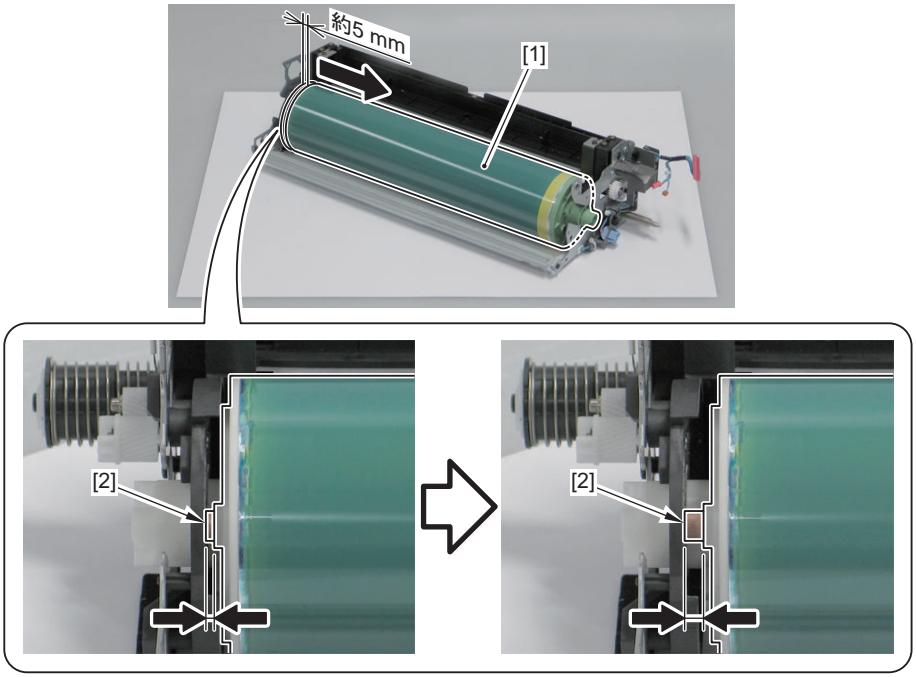
1. **Remove the Drum Shaft Bearing (Front) [1] and Drum Shaft Bearing (Rear) [2].**
   - 2 Screws [3] each



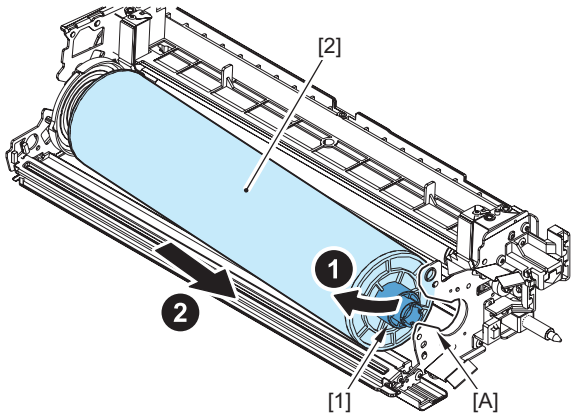
2. **Remove the SD Spacer (Front) [1] and SD Spacer (Rear) [2].**



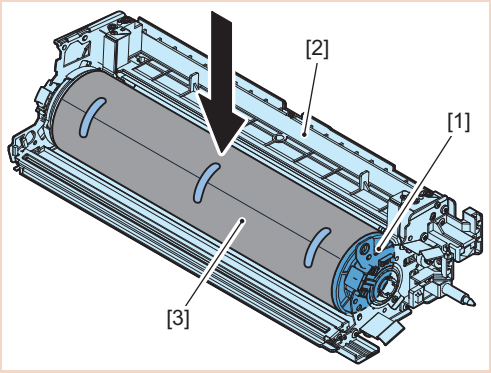
3. **Move the Drum (Bk) [1] in the direction of the arrow by approx. 5.0 mm, and remove the 2 Drum Sliding Assemblies [2].**



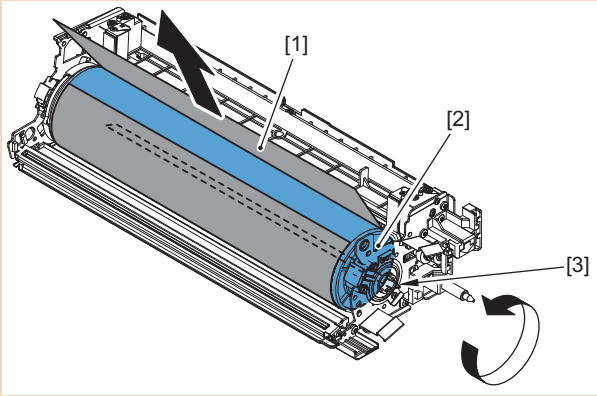
4. **Pull out the Drum Shaft [1] on the front side from the groove [A] of the Drum Unit Frame, and then remove the Drum (Bk) [2] in the direction of the arrow.**



CAUTION:
When installing a new drum (Bk), be sure to remove the Lightproof Sheet [3] after installing the drum [1] to the Drum Unit Frame [2].



CAUTION:
Be sure to rotate the drum [2] counterclockwise when removing the Lightproof Sheet [1]. (If the drum is rotated clockwise, the Scoop-up Sheet [3] may flip.)



When Replacing the Drum (Bk)

■ Procedure

1. **Perform the works to be done before replacing the drum.**
    1. Turn OFF the warm-up rotation control.
    COPIER > FUNCTION > INSTALL > AINR-OFF = 1

2. Turn OFF the main power (replace the Drum Unit).

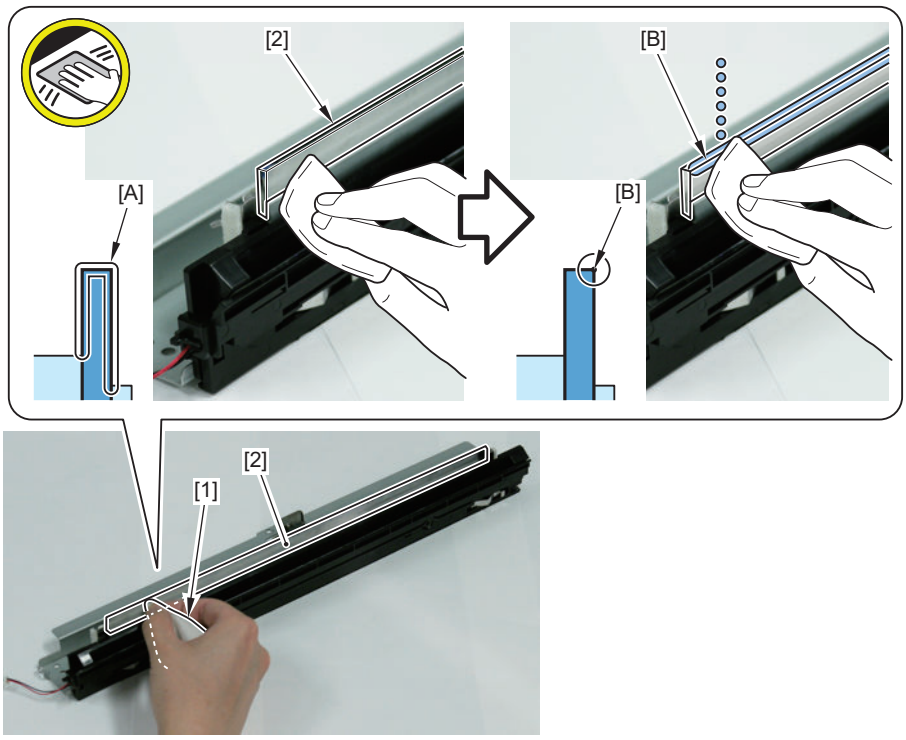
2. Perform the works to be done when replacing the drum (Bk).

It is recommended to replace the Drum Cleaning Blade with a new one at the same time as replacing the Drum.“Removing the Drum Cleaning Blade (Bk) and the Side Seal (Front)/(Rear)” on page 673

When reusing the Drum Cleaning Blade, follow the steps 1 to 3 shown below to clean the edge of the Drum Cleaning Blade and apply lubricant (Tospearl) to the edge.

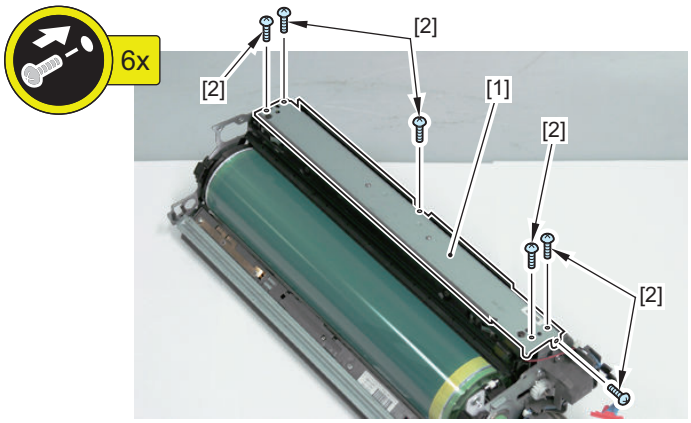
CAUTION:
Installing the Drum Cleaning Blade without cleaning its edge or applying lubricant (Tospearl) will cause a cleaning error.

1. Clean the surface [A] of the Drum Cleaning Blade [2] installed to the Drum Cleaning Unit with lint-free paper [1], and apply lubricant (Tospearl) to the edge [B] contacting the Drum after cleaning.

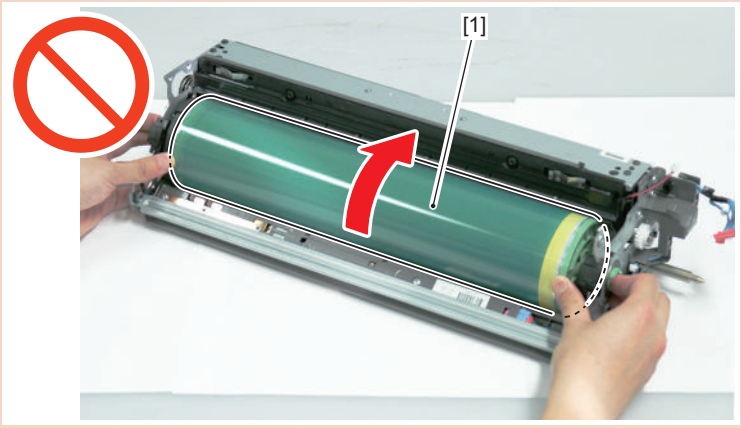


CAUTION:
Be careful not to scatter lubricant (Tospearl) when cleaning the edge of the Drum Cleaning Blade and when applying lubricant. If lubricant (Tospearl) falls onto the Pre-exposure Unit, it will cause image failure. If lubricant (Tospearl) scatters onto the Pre-exposure Unit, clean it with a blower, etc.

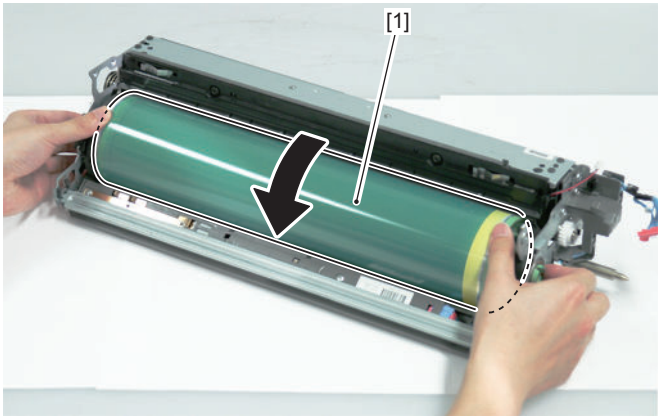
2. In order to rotate the Drum, temporarily secure the Drum Cleaning Unit [1] to the Drum Unit (Bk).
   - 6 Screws [2]



CAUTION:
Do not rotate the Drum [1] in the reverse direction (clockwise as viewed from the front side).
This may cause the Drum Cleaning Blade to be everted, resulting in image failure.



3. Hold both ends, and rotate the Drum [1] approx. one turn in the direction of the arrow.



CAUTION:
If you feel heavy load when you rotate the Drum, the Drum Cleaning Blade may be everted. Remove the Drum Cleaning Unit again, clean the edge of the Drum Cleaning Blade, and apply lubricant (Tospearl) to the edge.

4. Assemble the Drum Cleaning Unit in the reverse order of removal.
5. Assemble the Drum (Bk) in the reverse order of removal, and install it to the host machine.

3. Perform the works to be done after replacing the drum.

1. Turn ON the main power.

2. Execute the ITB neutral position adjustment.
   COPIER > FUNCTION > INSTALL > INIT-ITB
3. Execute the drum reset mode.
   Select COPIER > FUNCTION > INSTALL > CLR-SET, and set the target color to "1".
   COPIER > FUNCTION > INSTALL > DRMRESET
4. Turn ON the warm-up rotation control.
   COPIER > FUNCTION > INSTALL > AINR-OFF = 0
5. Auto gradation adjustment
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
6. Color displacement correction
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
7. Execute uneven density correction.
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

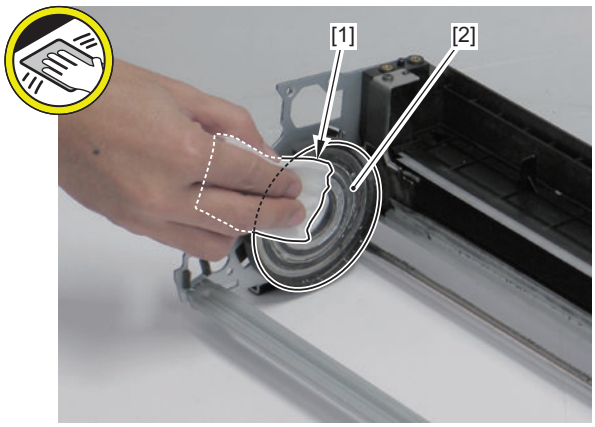
Cleaning/Lubrication of the Drum Sliding Shaft Support

■ Preparation

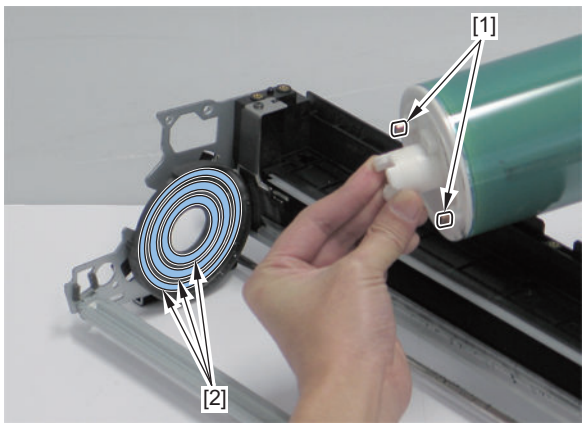
1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
6. **Removing the Drum Unit (Bk)****"Removing the Drum Unit (Bk)" on page 662**
7. **Removing the Drum Cleaning Unit****"Removing the Drum Cleaning Unit" on page 670**
8. **Removing the Drum Patch Sensor Unit (Bk)****"Removing the Drum Patch Sensor Unit (Bk)" on page 678**
9. **Removing the Drum (Bk)****"Removing the Drum (Bk)" on page 682**

■ Procedure

1. **Clean the Drum Sliding Shaft Support [2] with lint-free paper [1] moistened with alcohol.**



2. **Apply grease to the whole circumference of the 3 Slip Rings [2] of the Sliding Assembly [1] of the drum.**



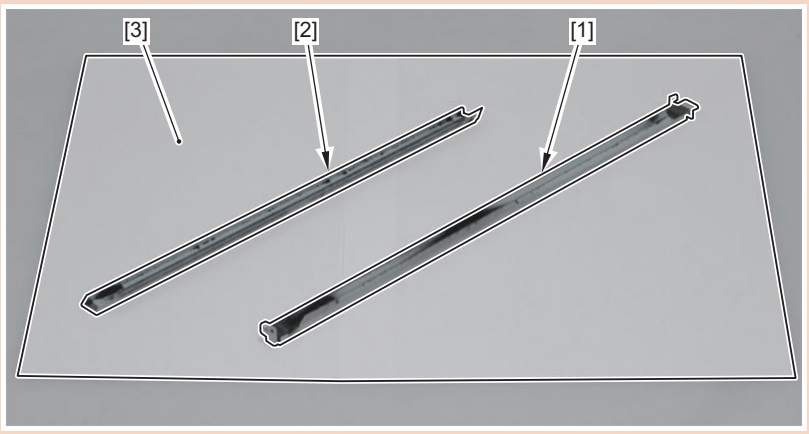
Removing the Drum Cleaning Scoop-up Sheet (Bk)

■ Preparation

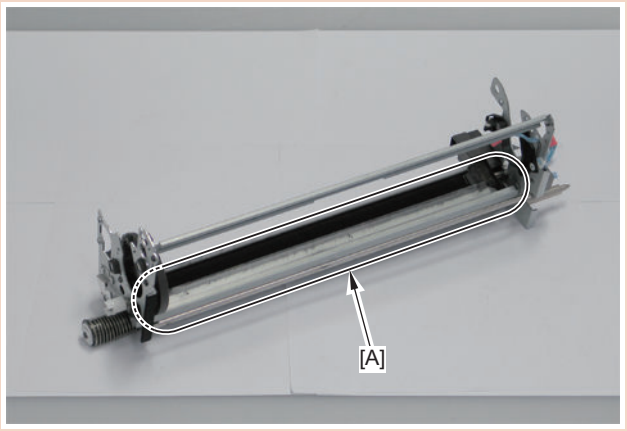
1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
6. **Removing the Drum Unit (Bk)****"Removing the Drum Unit (Bk)" on page 662**
7. **Removing the Drum Cleaning Unit****"Removing the Drum Cleaning Unit" on page 670**
8. **Removing the Drum Patch Sensor Unit (Bk)****"Removing the Drum Patch Sensor Unit (Bk)" on page 678**
9. **Removing the Drum (Bk)****"Removing the Drum (Bk)" on page 682**

■ Procedure

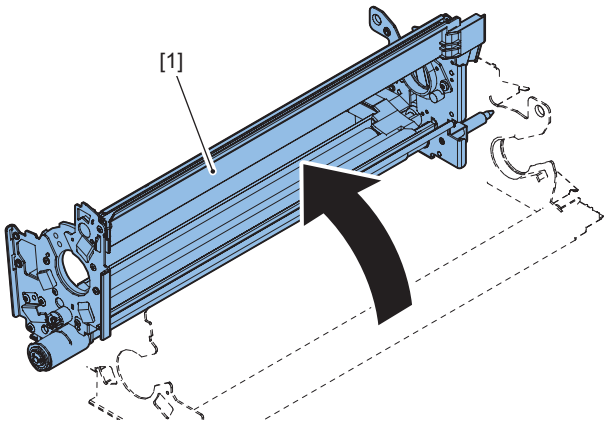
CAUTION:
Be sure to place the Drum Cleaning Scoop-up Plate [1] and Drum Cleaning Scoop-up Sheet (Bk) [2] on a sheet of paper [3] because toner is attached on them.



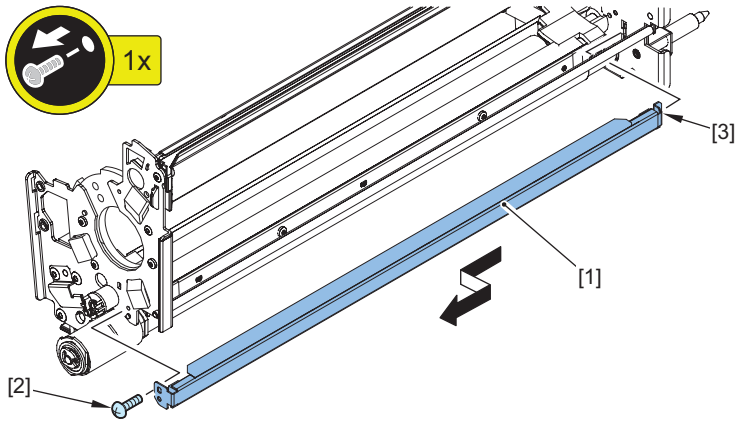
CAUTION:
Since there is toner accumulated on the [A] part, be sure to perform the work while paying attention not to scatter the toner.



1. **Move the Drum Unit (Bk) [1] in the direction of the arrow.**

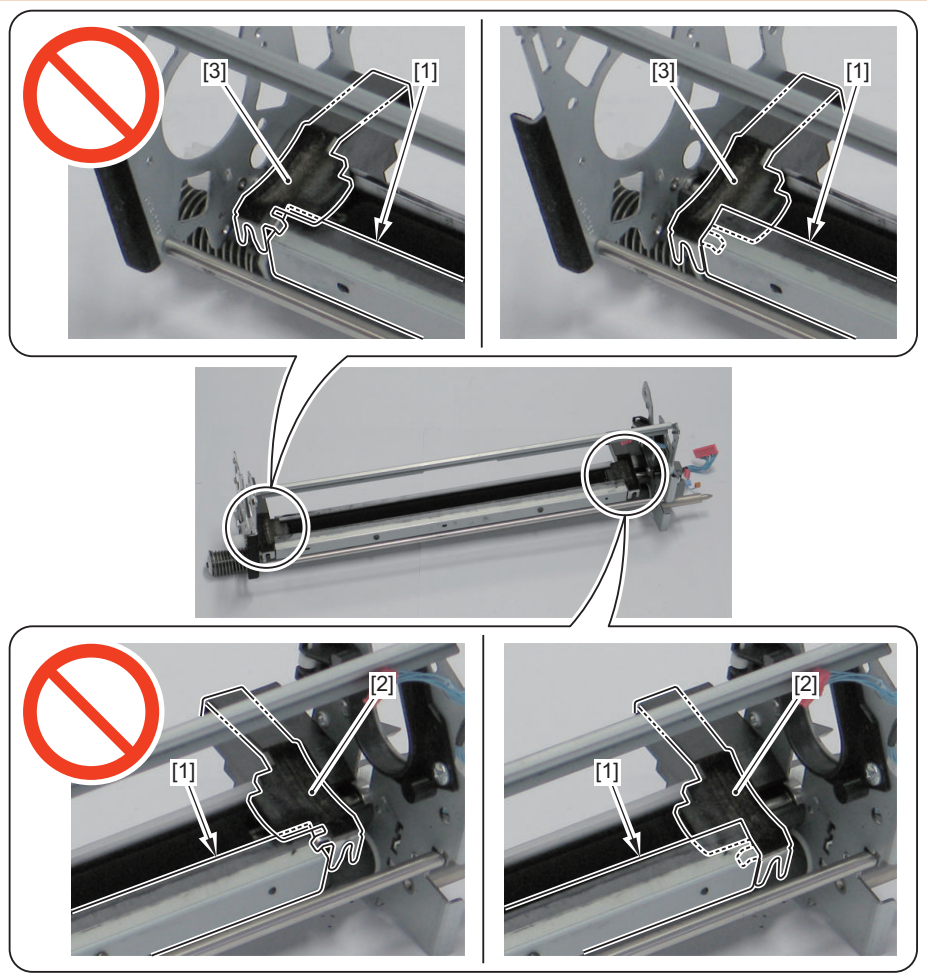


2. **Remove the Drum Cleaning Scoop-up Plate [1].**
   - 1 Screw [2]
   - 1 Protrusion [3]

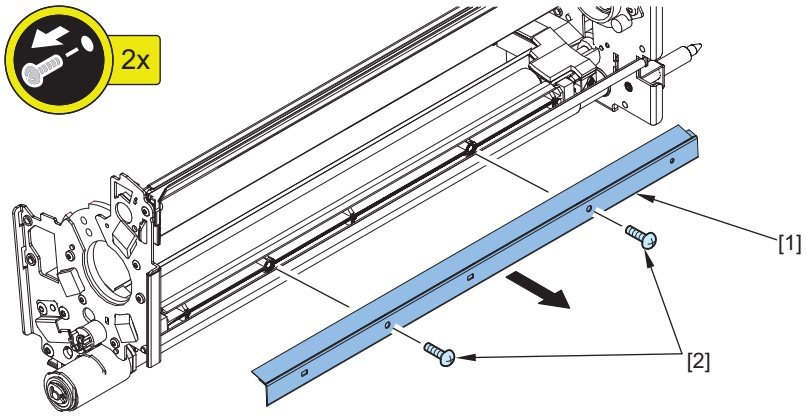


CAUTION:
When disassembling/assembling the Drum Cleaning Scoop-up Sheet (Bk), be sure to follow the order below because the Drum Cleaning Scoop-up Sheet (Bk) [1], Front Edge Scraper (Bk) [2] and Rear Edge Scraper (Bk) [3] are layered in specific order.
- At disassembly: Remove the Drum Cleaning Scoop-up Sheet (Bk) [1] first, before removing the Front Edge Scraper (Bk) [2] and the Rear Edge Scraper (Bk) [3].
- At assembly: Install the Front Edge Scraper (Bk) [2] and the Rear Edge Scraper (Bk) [3] before installing the Drum Cleaning Scoop-up Sheet (Bk) [1].

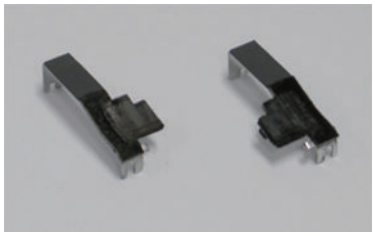
CAUTION:



3. **Remove the Drum Cleaning Scoop-up Sheet (Bk) [1].**
   - 2 Screws [2]



Removing the Front Edge Scraper (Bk) and the Rear Edge Scraper (Bk)

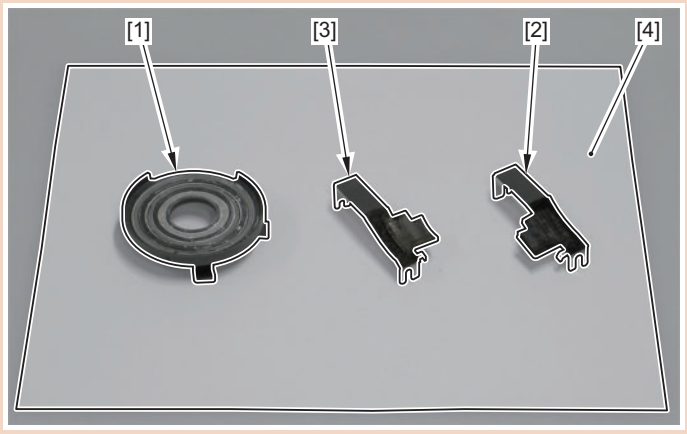


■ Preparation

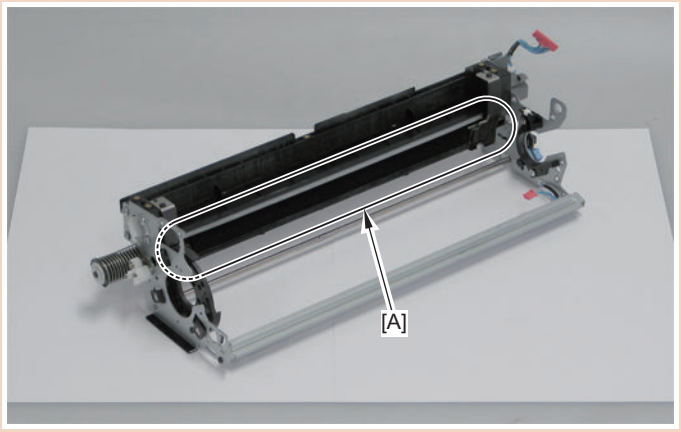
1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
6. **Removing the Drum Unit (Bk)****"Removing the Drum Unit (Bk)" on page 662**
7. **Removing the Drum Cleaning Unit****"Removing the Drum Cleaning Unit" on page 670**
8. **Removing the Drum Patch Sensor Unit (Bk)****"Removing the Drum Patch Sensor Unit (Bk)" on page 678**
9. **Removing the Drum (Bk)****"Removing the Drum (Bk)" on page 682**
10. **Removing the Drum Cleaning Scoop-up Sheet (Bk)****"Removing the Drum Cleaning Scoop-up Sheet (Bk)" on page 690**

■ Procedure

CAUTION:
Be sure to place the Drum Sliding Shaft Support [1], Front Edge Scraper (Bk) [2], and Rear Edge Scraper (Bk) [3] on a sheet of paper [4] because toner is attached on them.



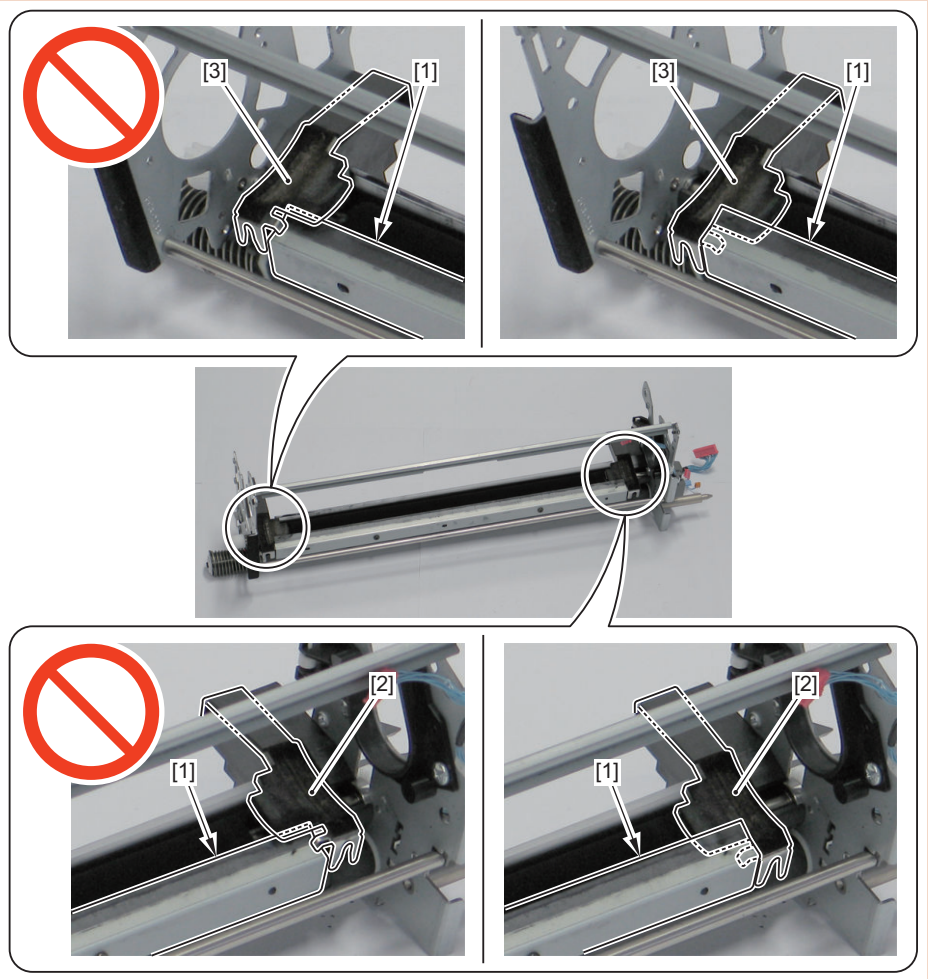
CAUTION:
Since there is toner accumulated on the [A] part, be sure to perform the work while paying attention not to scatter the toner.



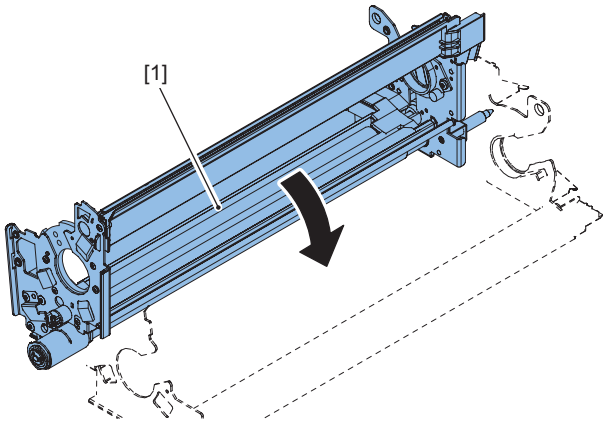
CAUTION:
When disassembling/assembling the Drum Cleaning Scoop-up Sheet (Bk), be sure to follow the order below because the Drum Cleaning Scoop-up Sheet (Bk) [1], Front Edge Scraper (Bk) [2] and Rear Edge Scraper (Bk) [3] are layered in specific order.

- At disassembly: Remove the Drum Cleaning Scoop-up Sheet (Bk) [1] first, before removing the Front Edge Scraper (Bk) [2] and the Rear Edge Scraper (Bk) [3].
- At assembly: Install the Front Edge Scraper (Bk) [2] and the Rear Edge Scraper (Bk) [3] before installing the Drum Cleaning Scoop-up Sheet (Bk) [1].

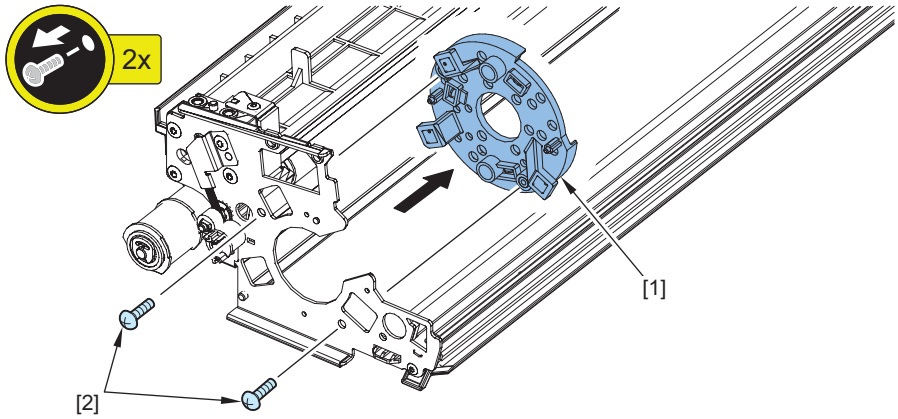
CAUTION:



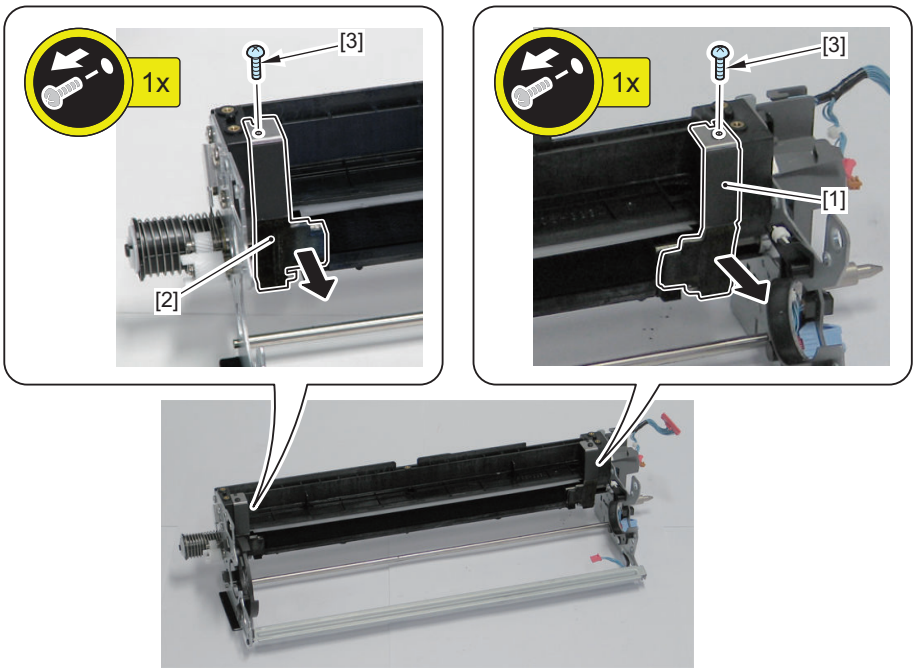
1. **Move the Drum Unit (Bk) [1] in the direction of the arrow.**



2. **Remove the Drum Sliding Shaft Support [1] at the rear side.**
   - 2 Screws [2]



3. **Remove the Front Edge Scraper (Bk) [1] and the Rear Edge Scraper (Bk) [2].**
   - 2 Screws [3]



Removing the Drum Fur Brush

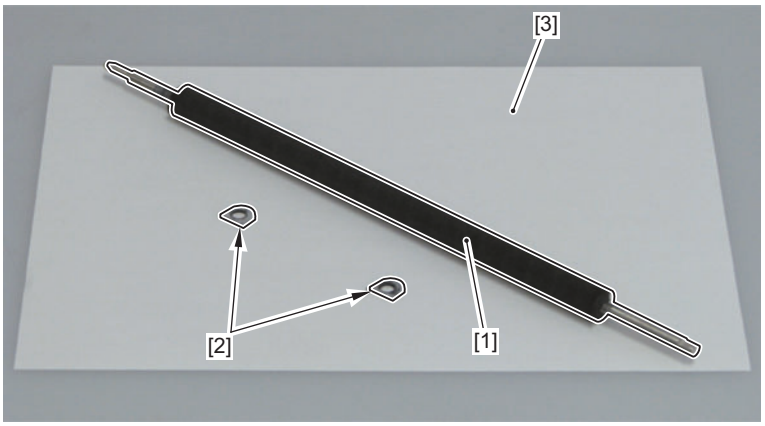
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**

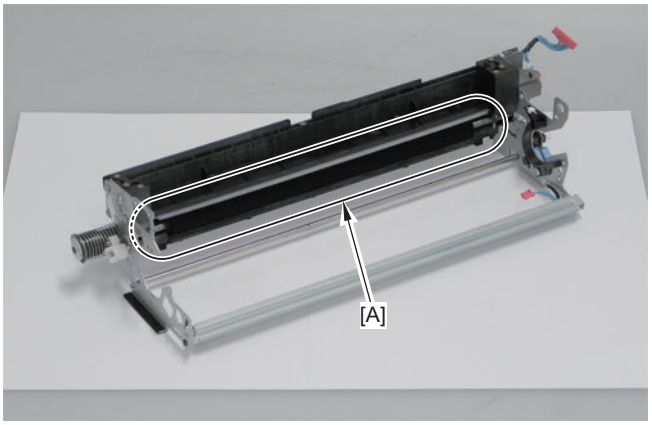
5. Removing the Pre-transfer Charging Assembly"Removing the Pre-transfer Charging Assembly" on page 649
6. Removing the Drum Unit (Bk)"Removing the Drum Unit (Bk)" on page 662
7. Removing the Drum Cleaning Unit"Removing the Drum Cleaning Unit" on page 670
8. Removing the Drum Patch Sensor Unit (Bk)"Removing the Drum Patch Sensor Unit (Bk)" on page 678
9. Removing the Drum (Bk)"Removing the Drum (Bk)" on page 682
10. Removing the Drum Cleaning Scoop-up Sheet (Bk)"Removing the Drum Cleaning Scoop-up Sheet (Bk)" on page 690
11. Removing the Edge Scraper 1 (Bk) and the Edge Scraper 2 (Bk)"Removing the Front Edge Scraper (Bk) and the Rear Edge Scraper (Bk)" on page 694

■ Procedure

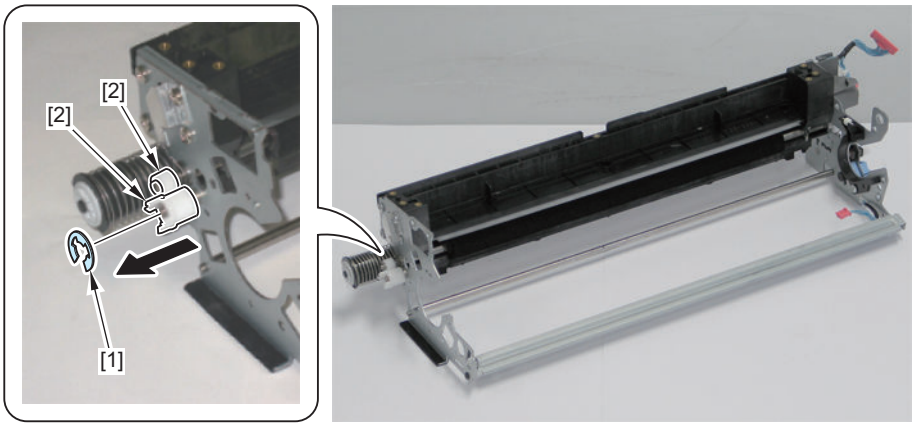
CAUTION:
Because there is toner on the Drum Fur Brush [1] and the Felt Seal [2], place them on a sheet of paper [3], etc.



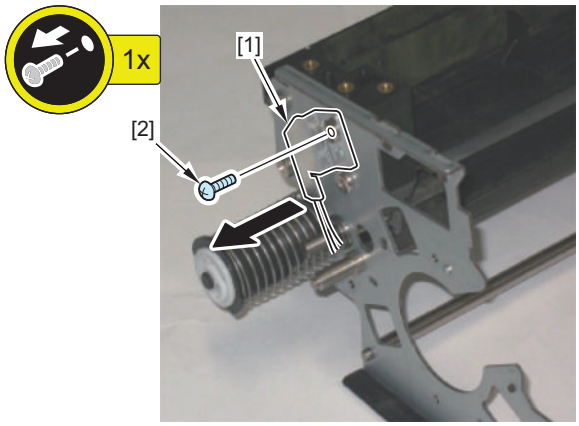
CAUTION:
Since there is toner accumulated on the [A] part, be sure to perform the work while paying attention not to scatter the toner.



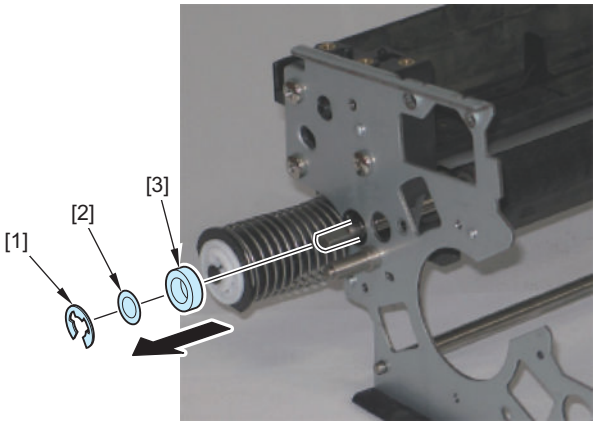
1. **Remove the E-ring [1] and the 2 gears [2].**



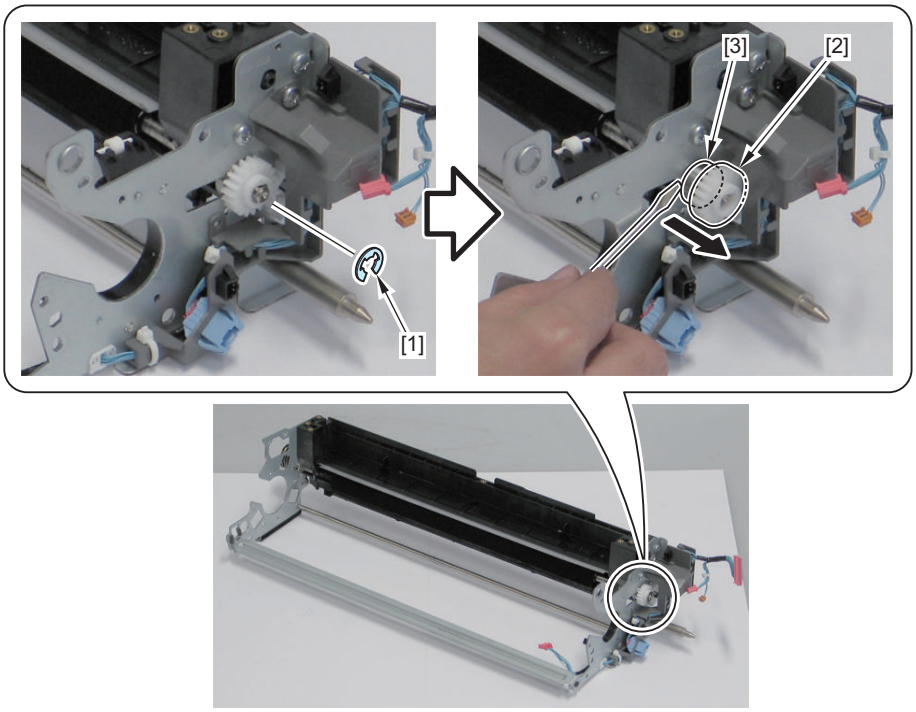
2. **Remove the Brush Plate [1].**
   1 Screw [2]



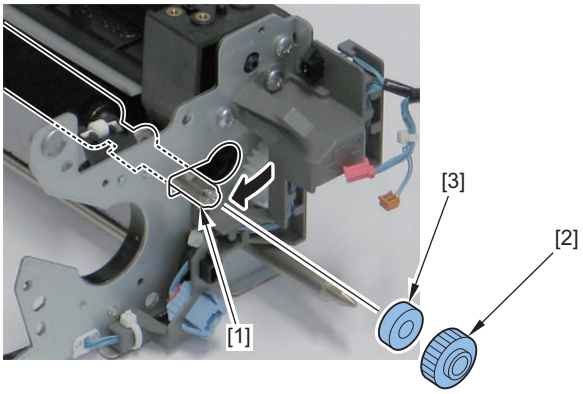
3. **Remove the E-ring [1], washer [2], and Ball Bearing [3].**



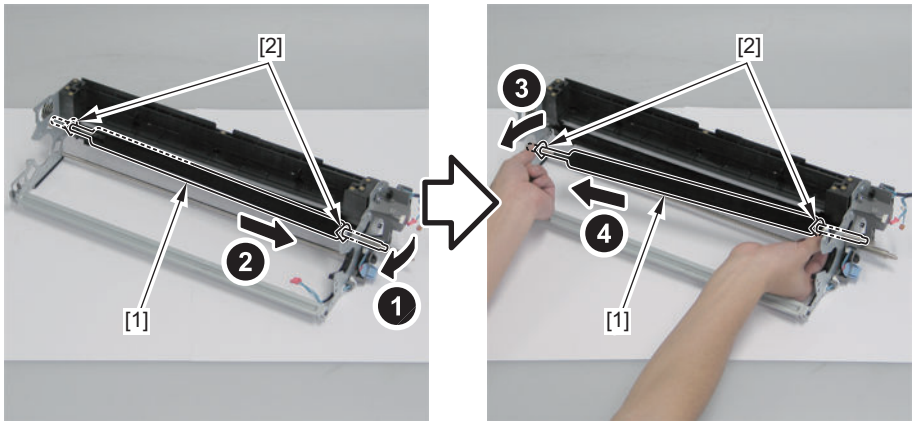
4. **Remove the E-ring [1] and move the gear [2] and the bearing [3].**



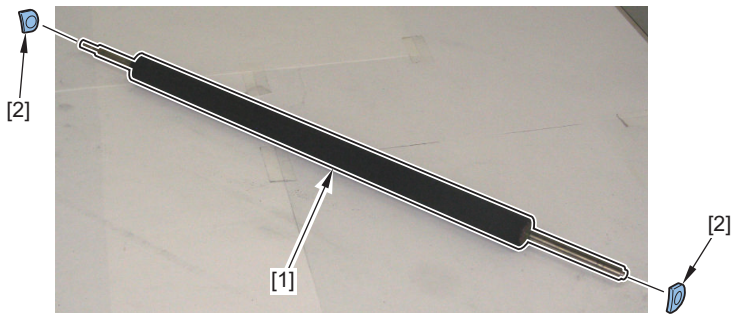
5. **Move the Drum Fur Brush [1] and remove the gear [2] and the bearing [3].**



6. **Remove the Drum Fur Brush [1] and the 2 Felt Seals [2].**

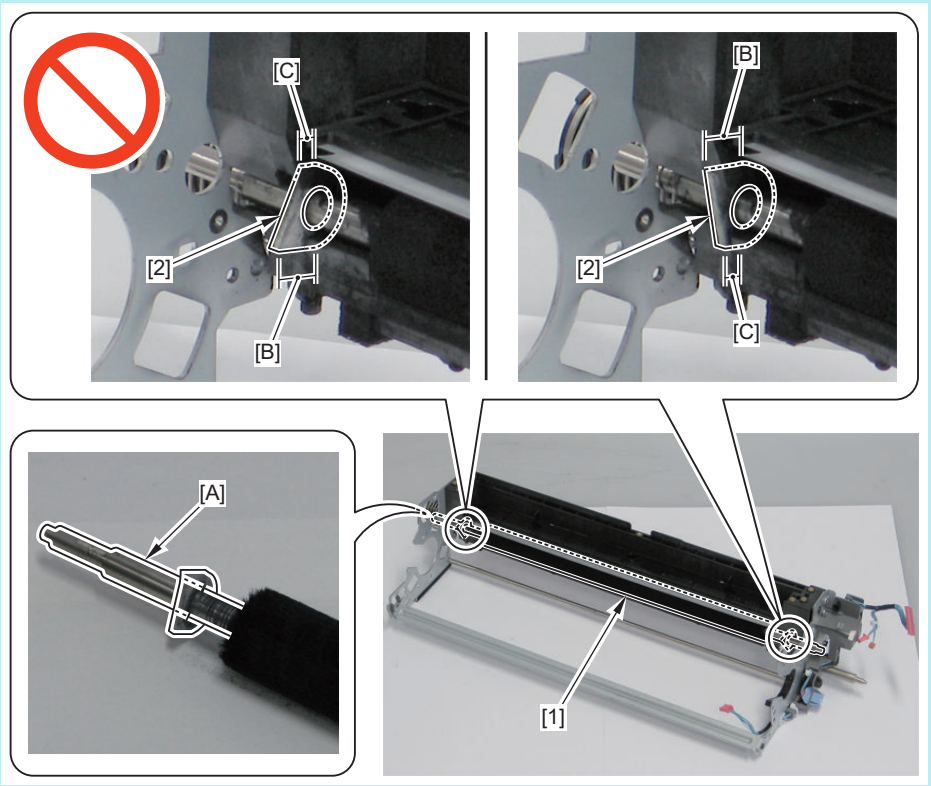


7. **Remove the 2 Felt Seals [2] from the Drum Fur Brush [1].**



NOTE:

- When installing the Drum Fur Brush [1], install it with the shaft [A] on the rear side.
- When installing the 2 Felt Seals [2], be sure to install them with the long sides [B] up and the short sides [C] down.



Removing the Developing Assembly (Bk)

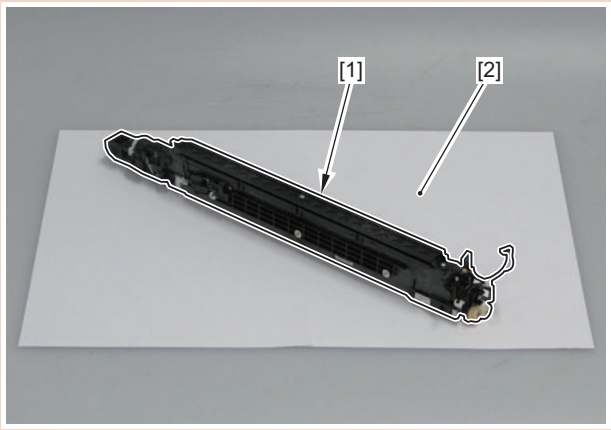
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**

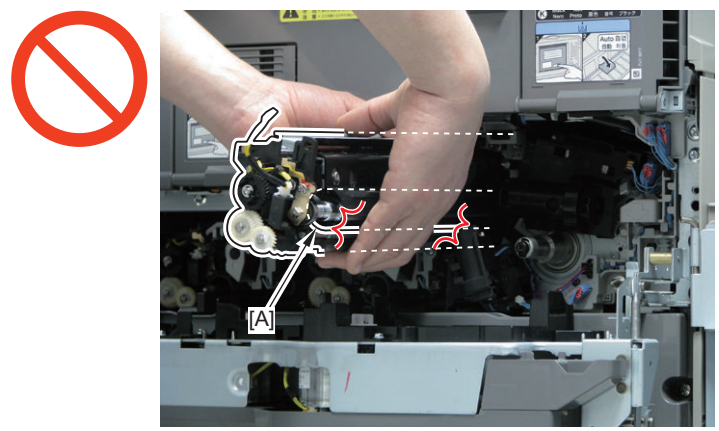
■ Procedure

CAUTION:
When replacing this part, execute “When Replacement the Developing Assembly” on page 709.

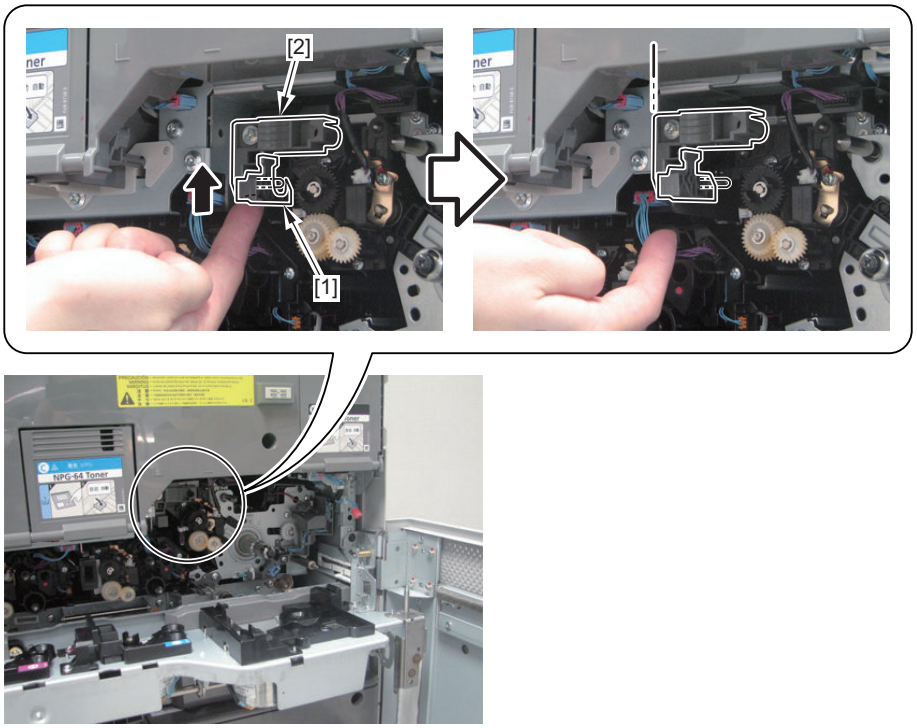
CAUTION:
Be sure to place the Developing Assembly (Bk) [1] on a sheet of paper [2], etc.



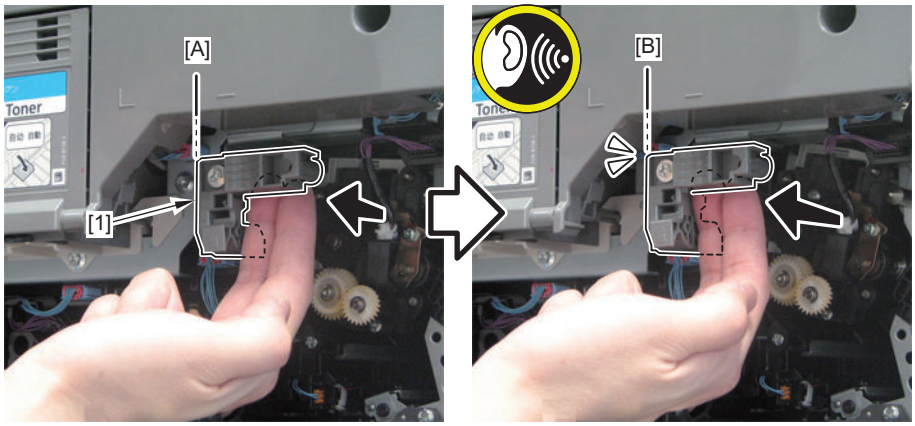
CAUTION:
Do not touch the surface [A] of the Developing Sleeve.



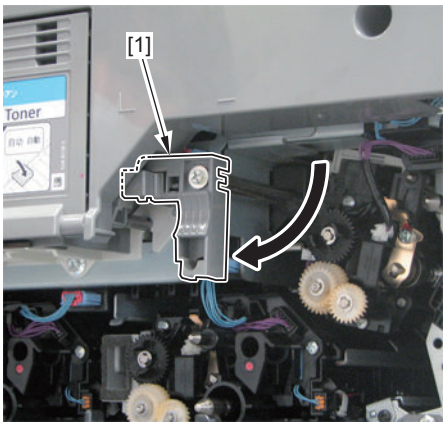
1. **Raise the Lock Release Lever [1] to release the Black Developing Assembly Pressure Lever [2].**



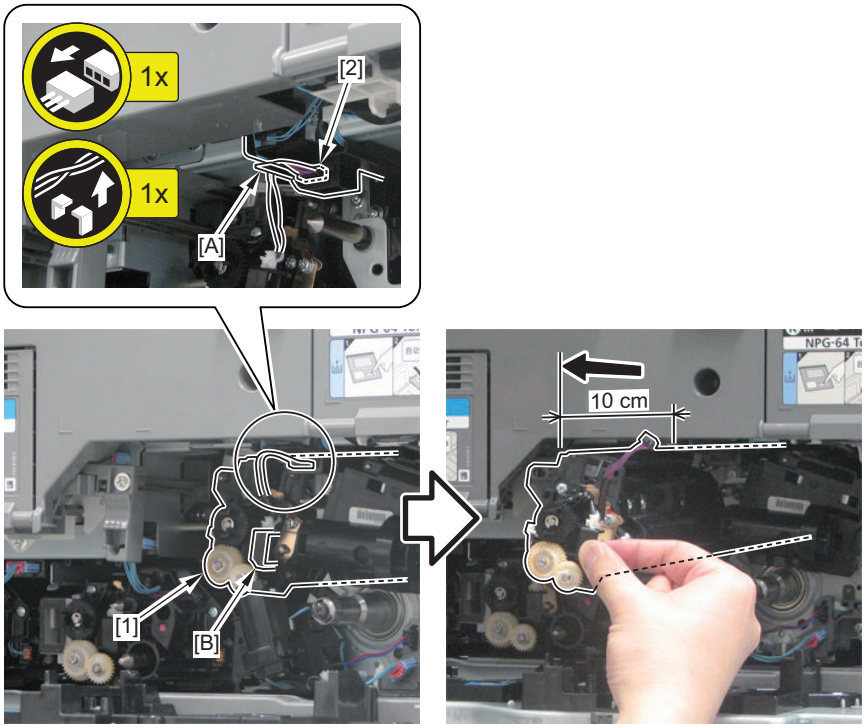
2. **Pull out the Black Developing Assembly Pressure Lever [1] until it stops [A] to release pressure applied on the Developing Assembly (Bk), and then further pull out the lever to the position [B].**



3. **Turn the Black Developing Assembly Pressure Lever [1] in the direction of the arrow.**

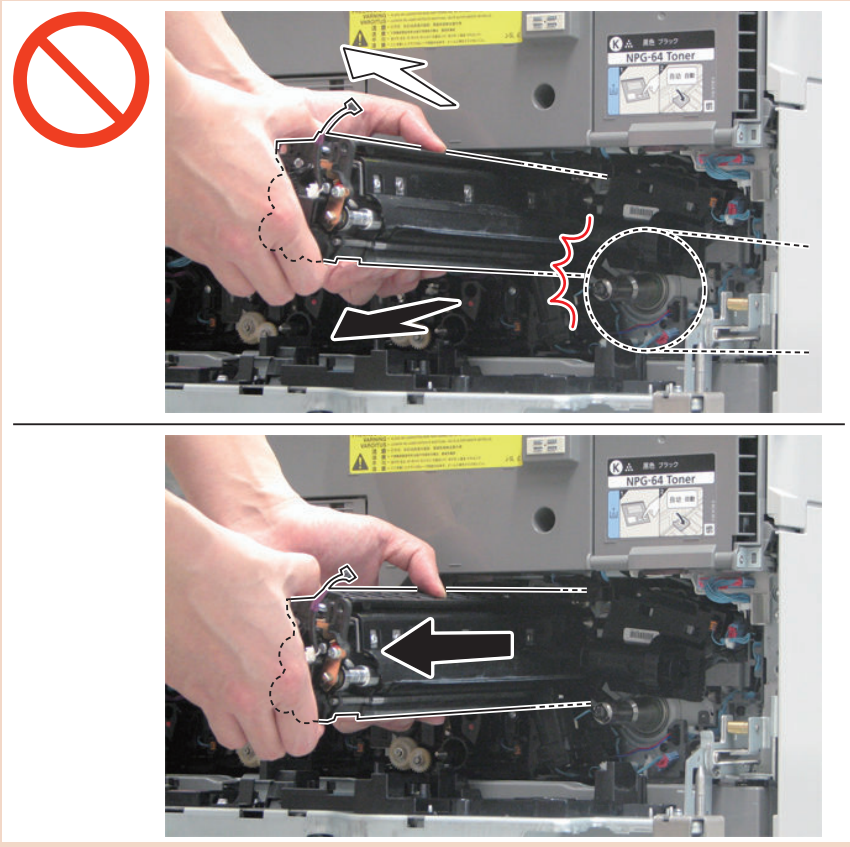


4. **Free the harness from the guide [A], and hold the handle [B] to pull out the Developing Assembly (Bk) [1] for approx. 10 cm.**
   - 1 Connector [2]



5. **Hold the front upper part and the left side of the Developing Assembly (Bk) and remove it horizontally.**

CAUTION:
If the Developing Assembly is tilted inside the host machine, the Developing Assembly and the drum may come into contact causing damage to the drum. Therefore, be sure to install or remove it horizontally.



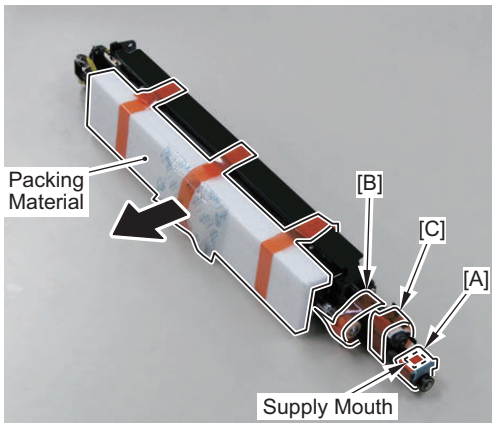
Installing the Developing Assembly (Bk)

■ Unpacking a new Developing Assembly (Bk)

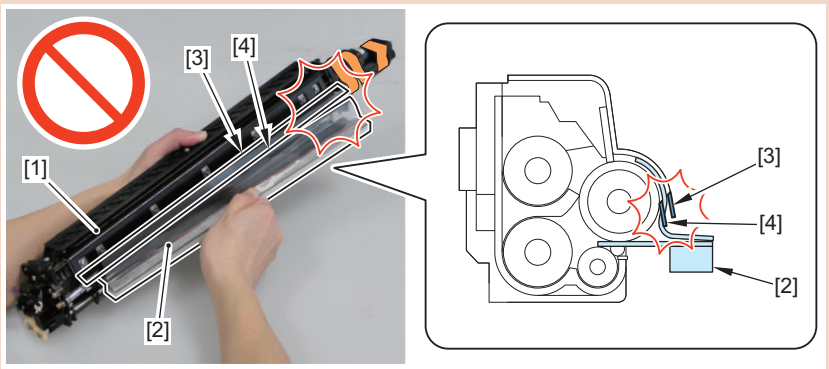
CAUTION:
- Do not tilt or strongly shake the Developing Assembly, but be sure to hold it in a horizontal state (otherwise, toner scattering or image failure may occur).
- When touching the Developing Assembly, check that no foreign particle (especially metal chip) is attached on your hands before starting the work. (If foreign particle is attached on the sleeve, it can cause image failure).

1. **Take out the Developing Assembly from the attached packing box.**
2. **Unpack the Developing Assembly and remove the packing material.**

CAUTION:
- Be sure not to remove the tape [A] on the Supply Mouth until right before installing to the host machine.
- Do not remove tapes [B] and [C] before removing the SB Sleeve Seal.
- Because the tapes [B] and [C] secure the sleeve in place to prevent it from moving when the SB Sleeve Seal is removed, be sure to remove tapes [B] and [C] after the SB Sleeve Seal.

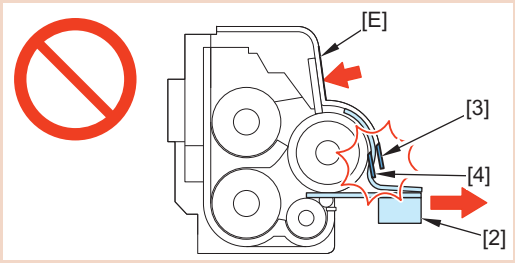


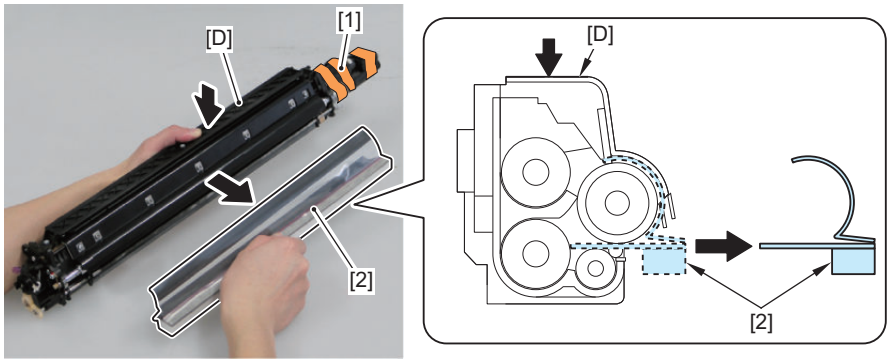
CAUTION:
When removing the SB Sleeve Seal [2] from the Developing Assembly [1], do not damage the Toner Blocking Sheet (Outer) [3] and the Toner Blocking Sheet (Inner) [4].



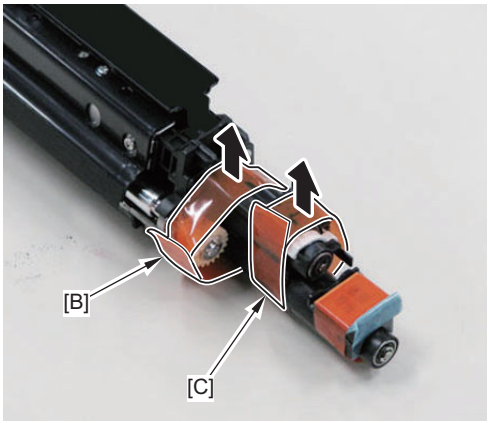
3. **While holding the [D] part (top surface) of the Developing Assembly [1], carefully pull out the SB Sleeve Seal [2] parallel to the Developing Assembly [1] to remove it.**

CAUTION:
Do not hold the [E] part of the Developing Assembly when removing the SB Sleeve Seal [2] (pulling the SB Sleeve Seal [2] while holding the [E] part increases the resistance, at which time the reaction force may cause damage to the Toner Blocking Sheet (Outer) [3] and the Toner Blocking Sheet (Inner) [4]).





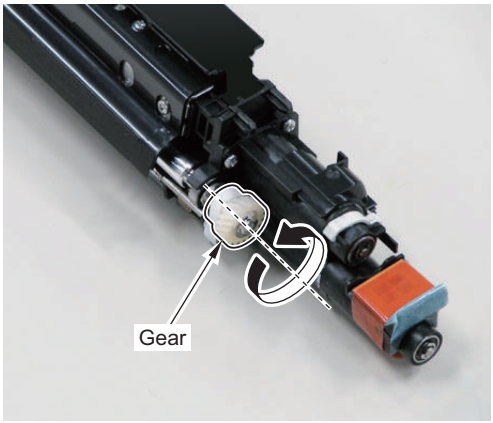
4. **Remove tape [B] and tape [C] securing the Sleeve.**



5. **Make the gear of the Sleeve rotate a full turn or 1.5 turns in the direction of the arrow (clockwise).**

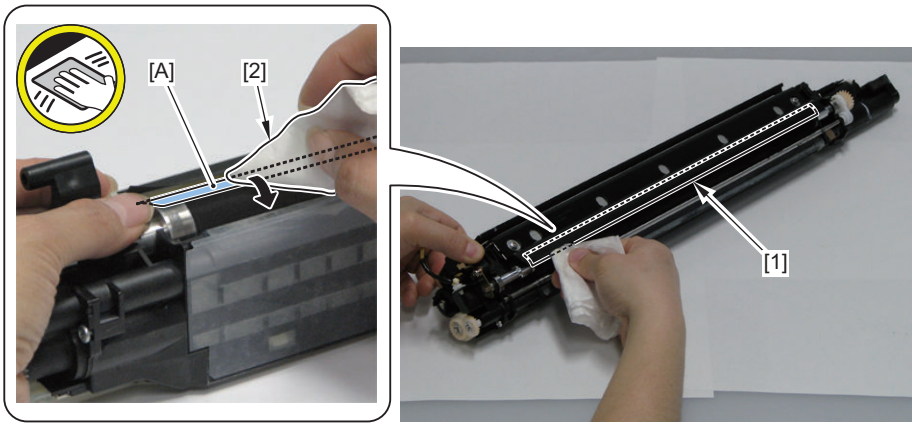
CAUTION:
Do not turn the Developing Sleeve in the reverse direction.
If you rotate it in the reverse direction, toner clots on the Sleeve may damage the Toner Blocking Sheet on the Sleeve.

NOTE:
Toner clots are removed by rotating the Sleeve in the direction of the arrow (clockwise).



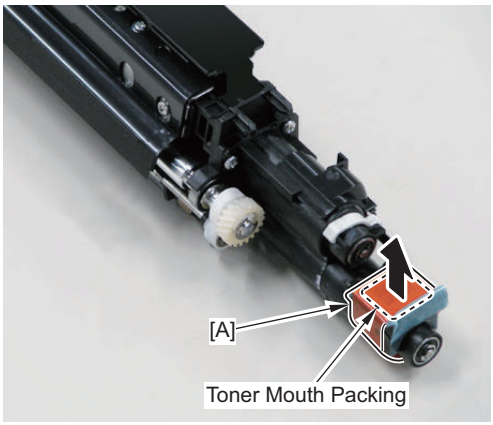
6. **Check that developer is not scattered on the Toner Blocking Sheet (Inner) [1]. If it is scattered, clean it [A] with dry lint-free Paper [2].**

CAUTION:
Do not use alcohol when cleaning the Toner Blocking Sheet (Inner).
Be careful not to allow alcohol to attach on the Developing Sleeve.



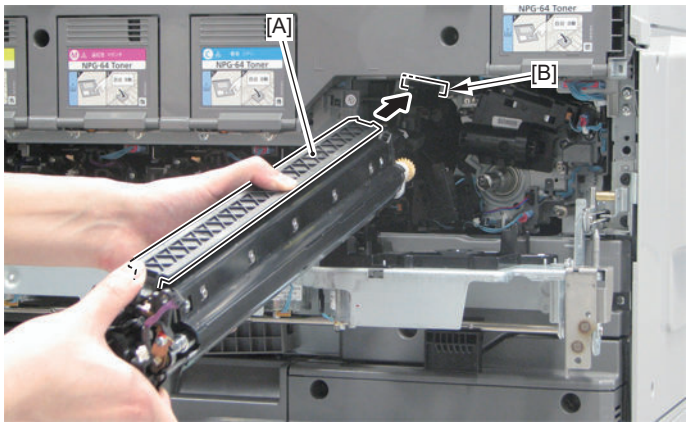
7. **Remove the tape [A] and the packaging material of the Supply Mouth.**

CAUTION:
Be sure to remove the packaging material of the Supply Mouth.

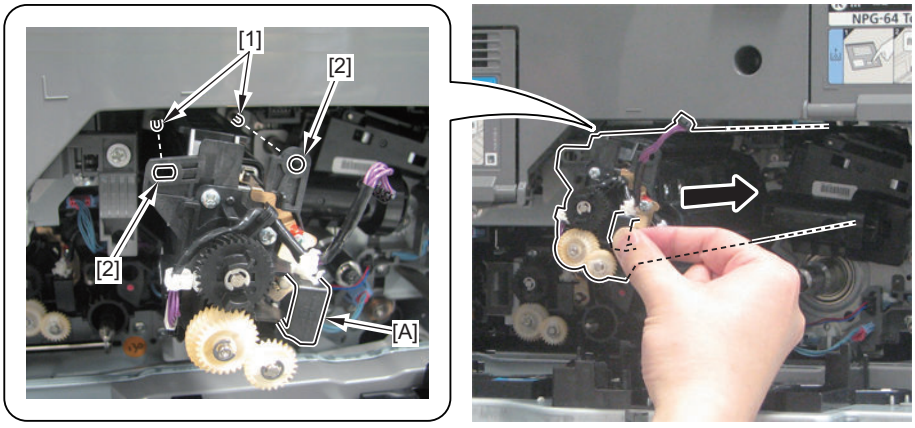


■ Procedure

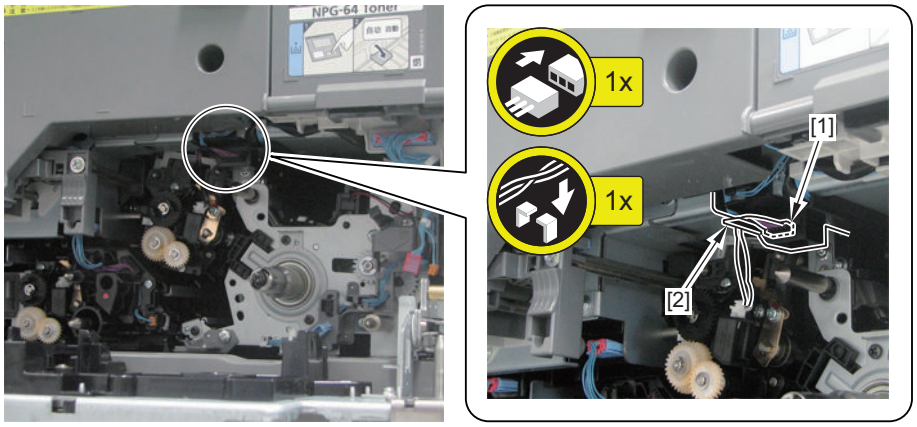
1. **Align the rail [A] of the Developing Assembly (Bk) with the groove [B] of the host machine, and insert the assembly approx. 2/3 of the way while keeping it in a horizontal position.**



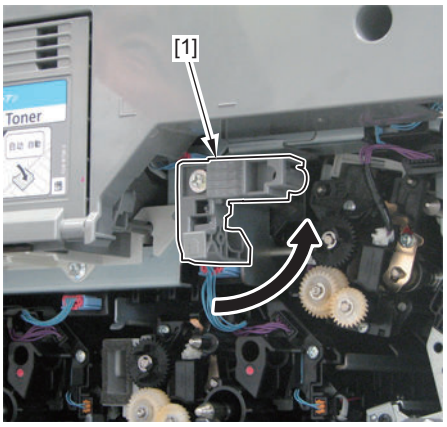
2. **Press the handle [A] of the Developing Assembly (Bk), align the 2 Positioning Pins [1] with the 2 boss holes [2], and then push the assembly until it stops.**



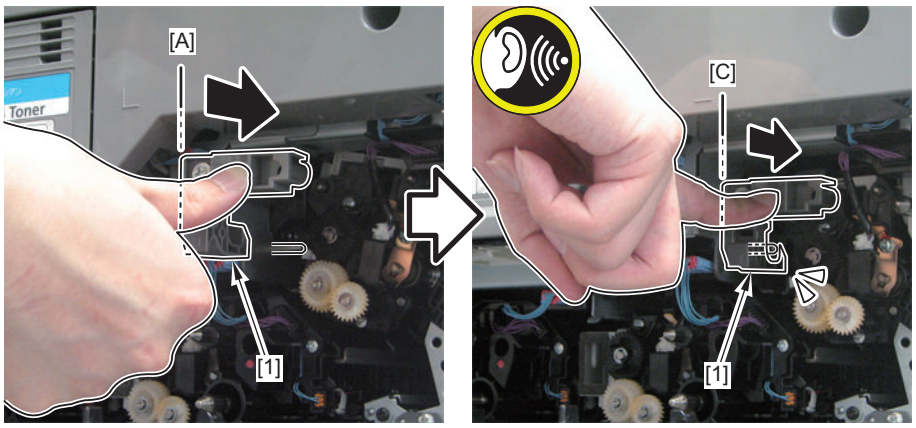
3. **Connect the connector [1], and secure the harness with the Harness Guide [2].**



4. **Turn the Black Developing Assembly Pressure Lever [1] counterclockwise.**



5. **Apply pressure to the Developing Assembly, and lock the lever.**



When Replacement the Developing Assembly

■ Procedure

1. **Perform the works to be done before replacing the Developing Assembly.**
   1. Turn OFF the warm-up rotation control.
      COPIER > FUNCTION > INSTALL > AINR-OFF = 1
   2. Turn OFF the main power (replace the Developing Assembly).
2. **Perform the works to be done after replacing the Developing Assembly.**
   1. Turn ON the main power.

2. Execute the initial installation mode of the Developing Assembly.
   Select COPIER > FUNCTION > INSTALL > CLR-SET, and set the target color to "1".
   COPIER > FUNCTION > INSTALL > INISET
3. Execute the ITB neutral position adjustment.
   COPIER > FUNCTION > INSTALL > INIT-ITB
4. Auto gradation adjustment
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. Color displacement correction
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. Execute uneven density correction.
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

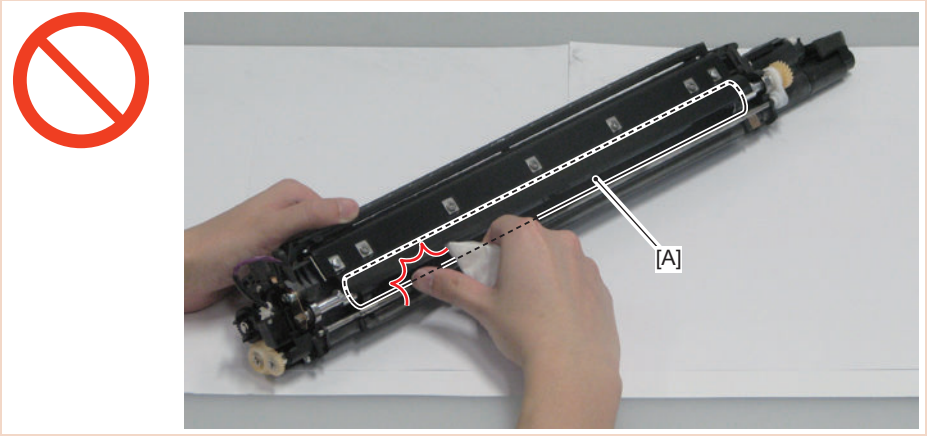
Cleaning the Developing Assembly Sleeve Cover (Bk) / Toner Blocking Sheet (Bk)

■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Developing Assembly (Bk)****"Removing the Developing Assembly (Bk)" on page 701**

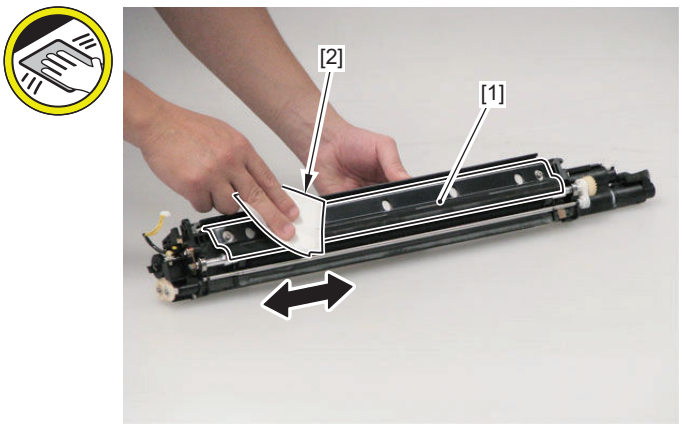
■ Procedure

CAUTION:
When cleaning, do not touch the surface [A] of the Developing Sleeve.

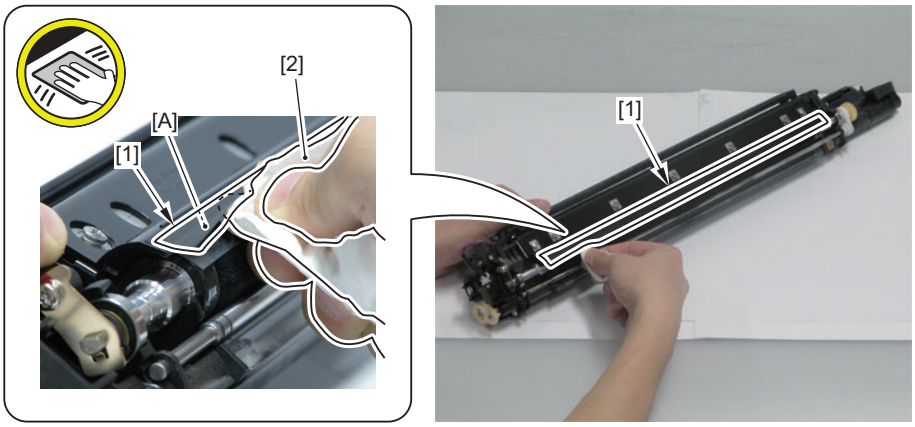


CAUTION:
Do not use alcohol when cleaning the Toner Blocking Sheet (Inner) and the Toner Blocking Sheet (Outer).
Be careful not to allow alcohol to attach on the Developing Sleeve.

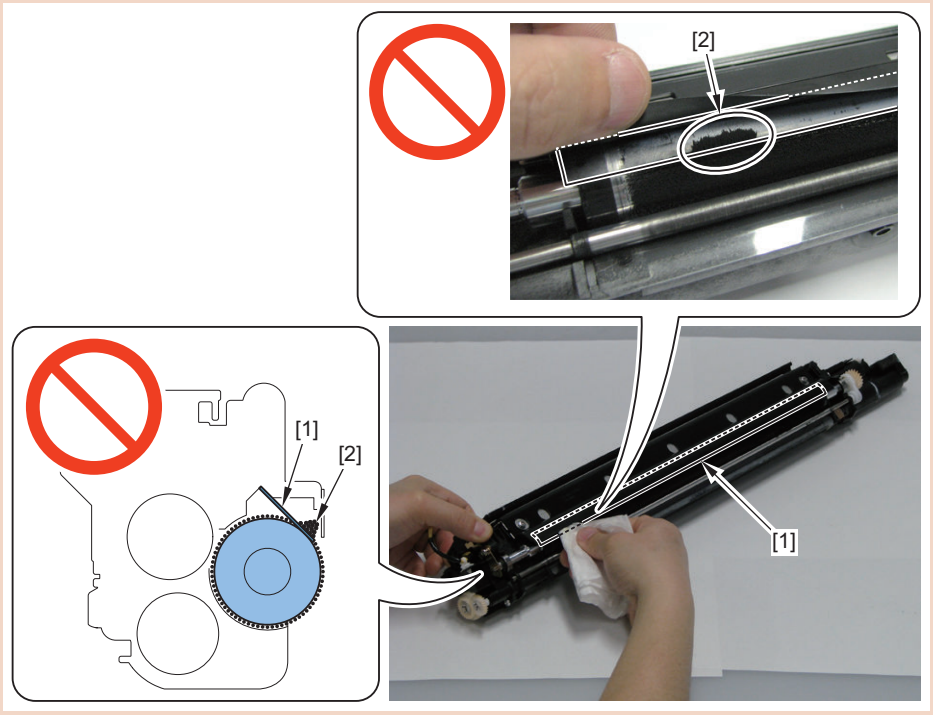
1. **Clean the Sleeve Cover (Bk) [1] of the Developing Assembly with lint-free paper [2] moistened with alcohol.**



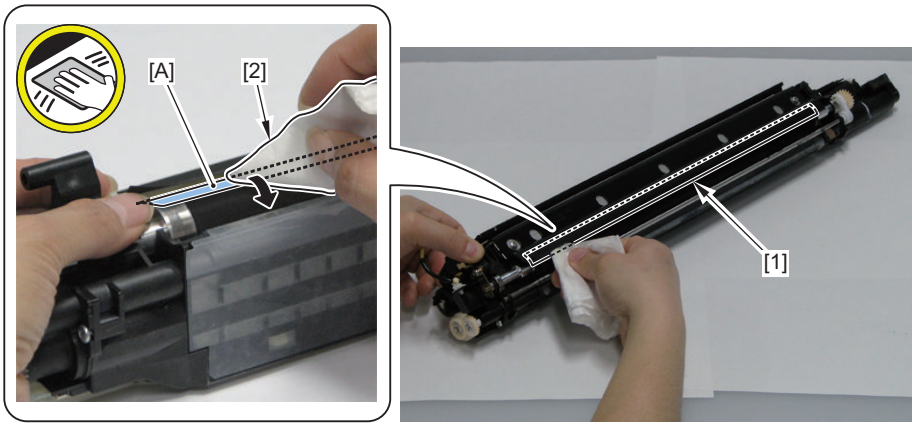
2. **Clean the inner surface [A] of the Toner Blocking Sheet (Outer) [1] of the Developing Assembly with dry lint-free paper [2].**



CAUTION:
Check that the developer [2] is not placed on the Toner Blocking Sheet [1] before returning it to the host machine.



3. **Clean the surface [A] of the Toner Blocking Sheet (Inner) [1] of the Developing Assembly with dry lint-free paper [2].**



Removing the Process Unit (Y)/(M)/(C)

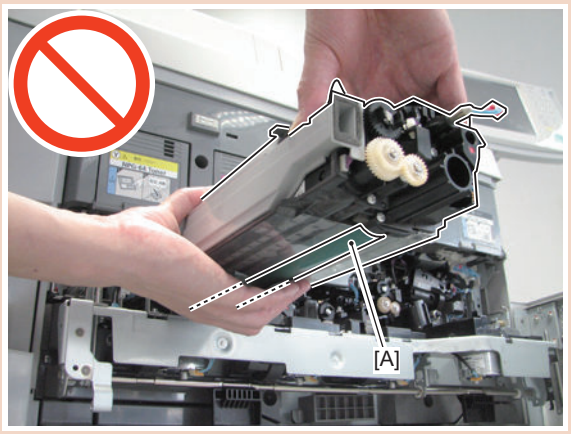
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**

■ Procedure

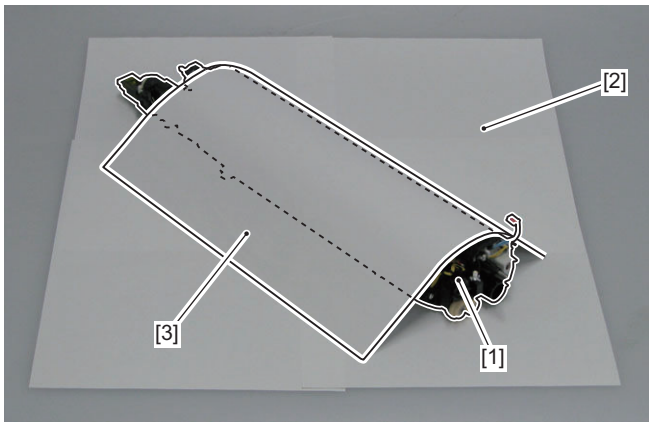
CAUTION:
When handling the Process Unit (Y)/(M)/(C), be sure to follow the following caution.

- Do not touch the surface [A] of the Photosensitive Drum.



CAUTION:

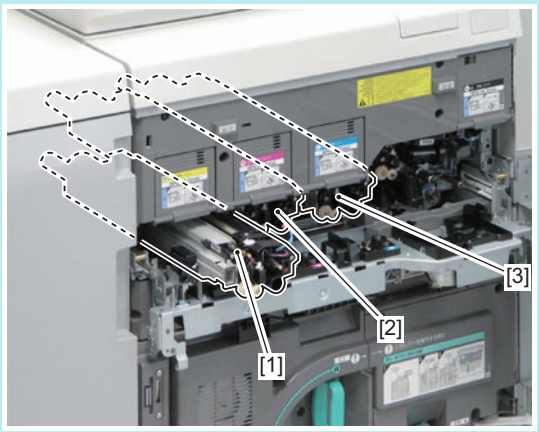
- When handling the Process Unit (Y)/(M)/(C) [1], place it on a sheet of paper [2] and cover it with the Drum Protection Sheet, or wrap 5 or more papers [3] around it to block light.



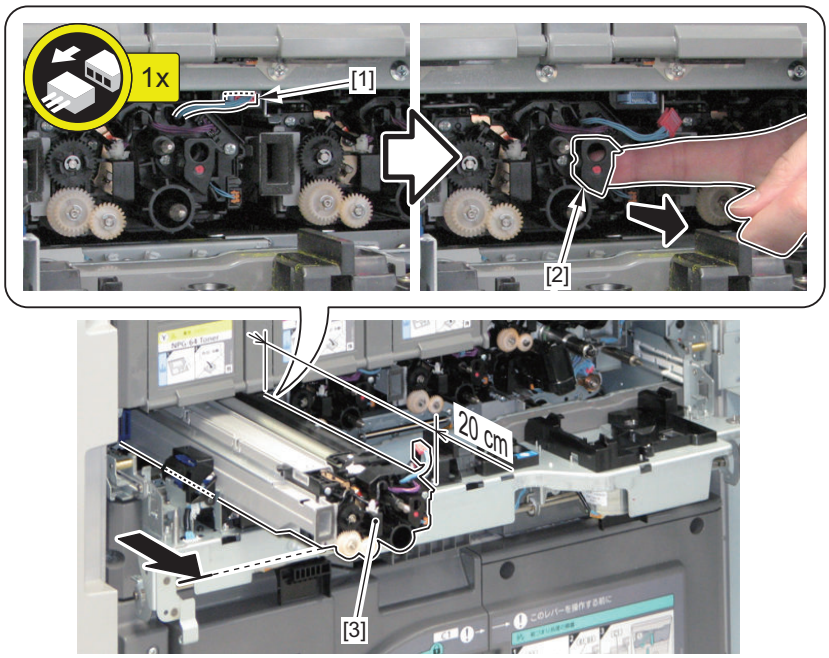
- Do not place the Drum in a location where is exposed to direct rays of the sun (e.g. near the window).
- Do not store in a location with high/low temperature/humidity, or in a location where temperature or humidity is dramatically changed.
- Do not store in a dusty area or in a location full of ammonia gas or organic solvent gas.

NOTE:

This procedure explains the case for the Process Unit (Y) [1]. Be sure to perform the same procedure for the Process Unit (M) [2]/(C) [3].

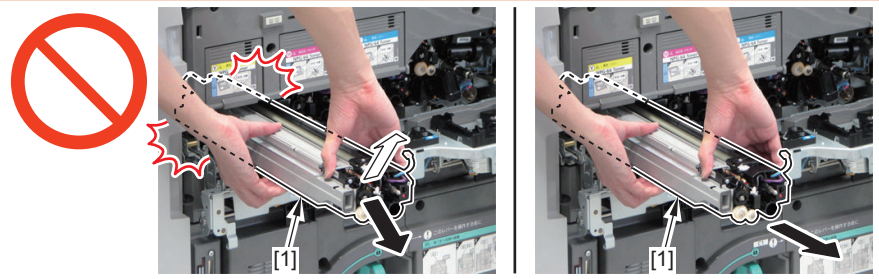


1. **Disconnect the connector [1], hook your finger to the handle [2], and then pull out the Process Unit [3] for approx. 20 cm.**



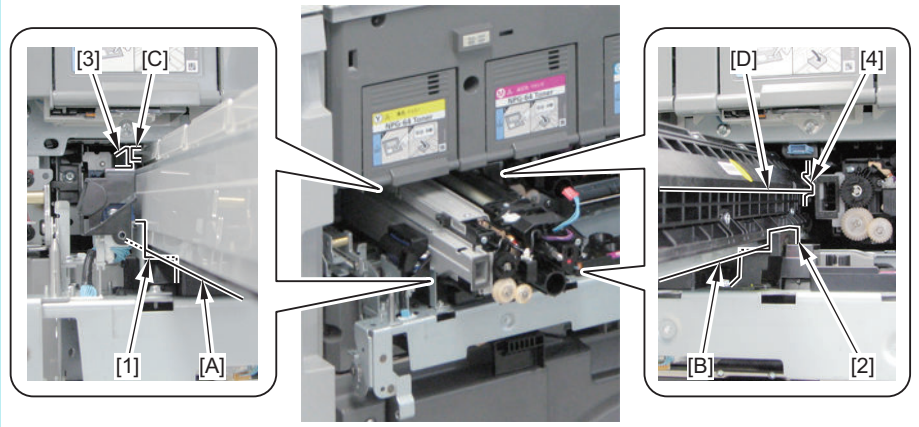
2. Hold the front upper part and the left side of the Process Unit [1] and pull it out horizontally.

CAUTION:
If the Process Unit [1] is tilted inside the machine, it may damage the ITB. Therefore, be sure to keep the unit horizontally when installing/removing it.

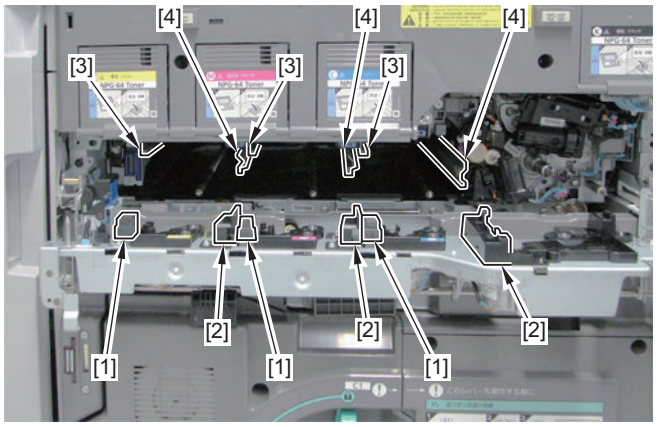


NOTE:
How to install the Process Unit

1. Align the left side [A] with the guide [1] of the Process Unit Inner Cover and the right lower side [B] with the guide [2] of the Process Unit Inner Cover, and then place the Process Unit horizontally.
2. Align the protrusion [C] on the upper left of the Process Unit with the rail [3] and the protrusion [D] on the upper right of the unit with the rail [4], and then install the unit.



NOTE:
The following shows the locations of the guides [1] and [2] for the Process Unit Inner Cover (Y)/(M)/(C).
The following shows the locations of the rails [3] and [4] for the Process Unit Inner Cover (Y)/(M)/(C).



Separating the Developing Assembly (Y)/(M)/(C) from the Drum Unit (Y)/(M)/(C)

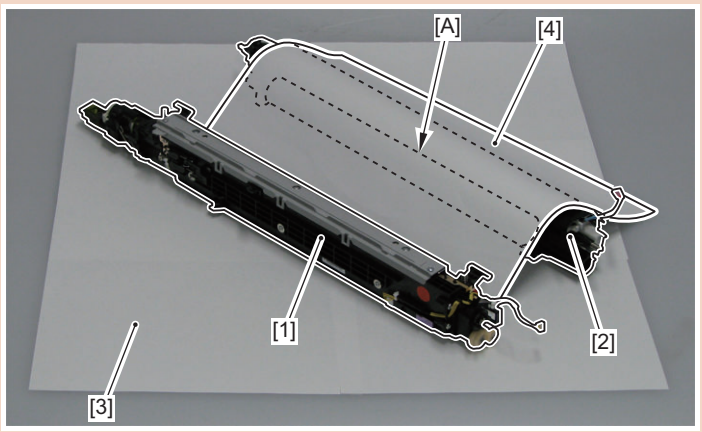
■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Process Unit (Y)/(M)/(C)****"Removing the Process Unit (Y)/(M)/(C)" on page 712**

■ Procedure

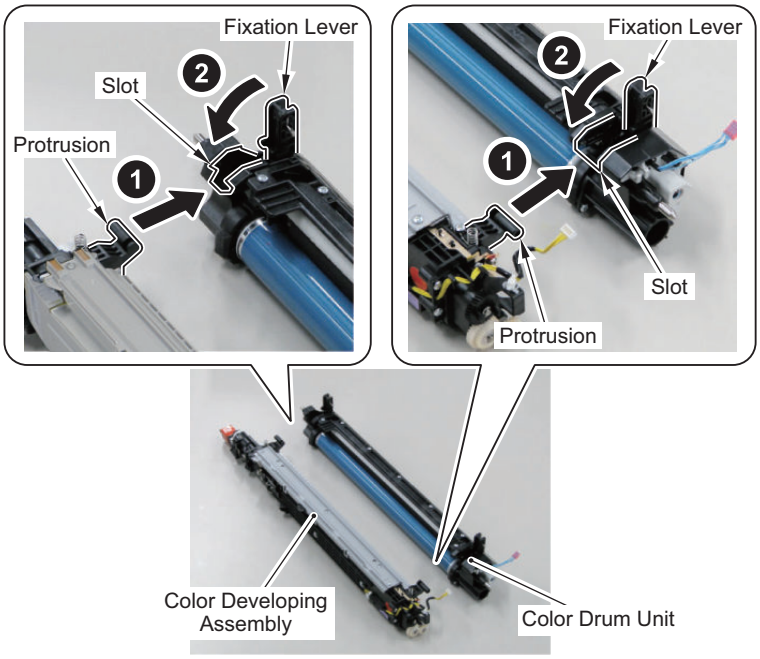
CAUTION:
- When replacing the Developing Assembly (Y)/(M)/(C), perform "When Replacement the Developing Assembly" on page 709.
- When replacing the Drum Unit (Y)/(M)/(C), perform "Cleaning the Sleeve Cover of the Developing Assembly (Y)/(M)/(C), Toner Catch Sheet (Y)/(M)/(C), and Toner Blocking Sheet (Y)/(M)/(C)" on page 724 and "When Replacing the Drum Unit (Y)/(M)/(C)" on page 724.

CAUTION:
Be sure to place the Developing Assembly [1] and the Drum Unit [2] on a sheet of paper [3] because toner is attached on them.
To prevent the sensitivity of the Photosensitive Drum from deteriorating, note the following points.
- Do not touch the surface [A] of the Photosensitive Drum.
- To prevent the Photosensitive Drum from exposure to light for a long time, cover it with 5 or more papers [4] or the Lightproof Sheet [4].

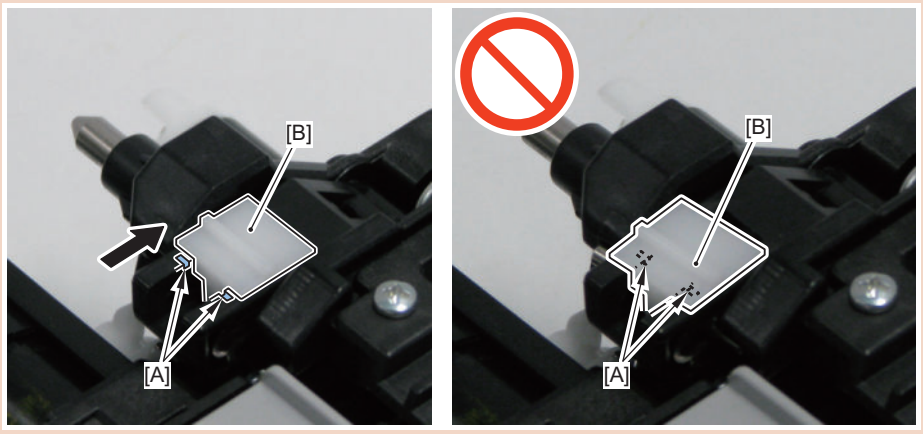


CAUTION:
- Do not place the Process Unit and the Drum in a location where is exposed to direct rays of the sun (e.g. near the window).
- Do not store in a location with high/low temperature/humidity, or in a location where temperature or humidity is dramatically changed.
- Do not store in a dusty area or in a location full of ammonia gas or organic solvent gas.

1. **While pressing the locks [1] of the Connecting Arms, release the 2 Connecting Arms [2] to open them, and separate the Developing Assembly [3] and the Drum Unit [4].**
   - 2 Harness Guides [5]
   - 1 Connector [6]



CAUTION:
When connecting the Developing Assembly and the Drum Unit, move the lock [B] of the Connecting Arm to the position where the lines [A] of the Connecting Arm can be seen, and then lock it.

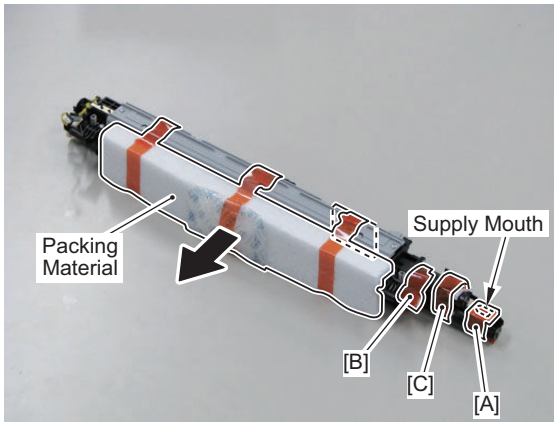


■ Unpacking a new Developing Assembly (Y)/(M)/(C) and Drum Unit (Y)/(M)/(C)

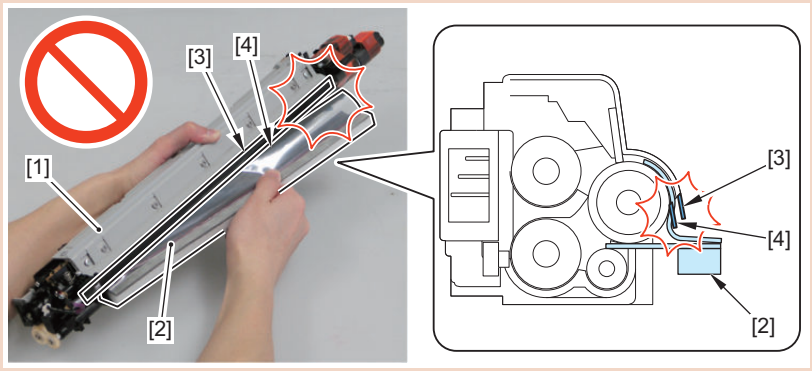
CAUTION:
- The color is specified for the Color Developing Assembly.
- Do not tilt or strongly shake the Developing Assembly, but be sure to hold it in a horizontal state (otherwise, toner scattering or image failure may occur).
- When touching the Developing Assembly, check that no foreign particle (especially metal chip) is attached on your hands before starting the work. (If foreign particle is attached on the sleeve, it can cause image failure).

1. **Take out the Developing Assembly from the attached packing box.**
2. **Unpack the Developing Assembly and remove the packing material.**

CAUTION:
- Be sure not to remove the tape [A] on the Supply Mouth until right before installing to the host machine.
- Do not remove tapes [B] and [C] before removing the SB Sleeve Seal.
- Because the tapes [B] and [C] secure the sleeve in place to prevent it from moving when the SB Sleeve Seal is removed, be sure to remove tapes [B] and [C] after the SB Sleeve Seal.

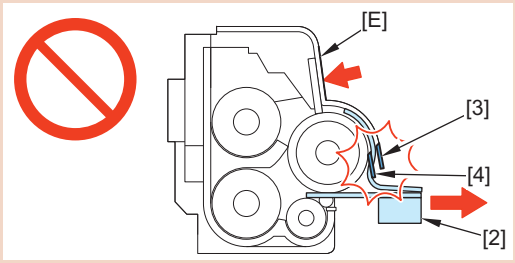


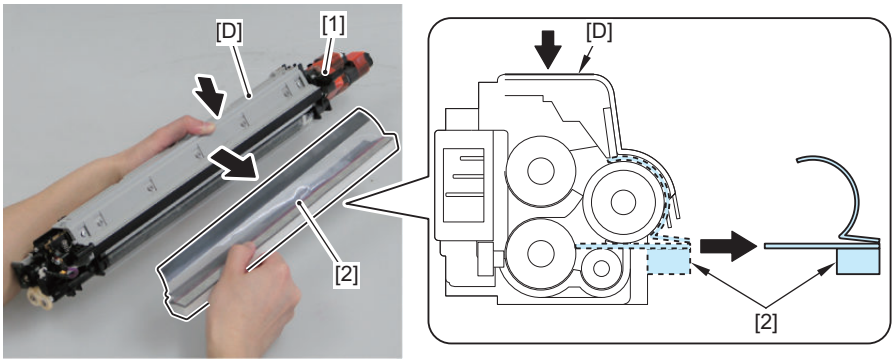
CAUTION:
When removing the SB Sleeve Seal [2] from the Developing Assembly [1], do not damage the Toner Blocking Sheet (Outer) [3] and the Toner Blocking Sheet (Inner) [4].



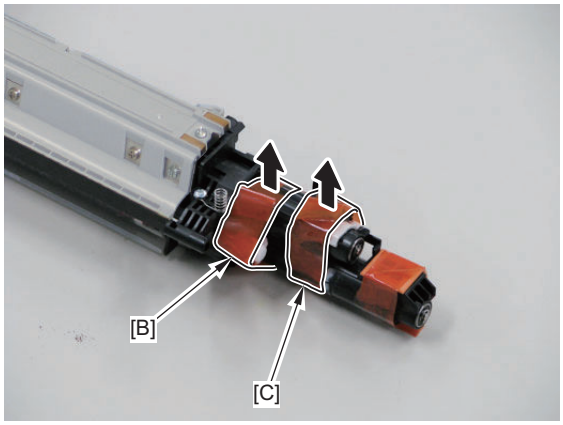
3. **While holding the [D] part (top surface) of the Developing Assembly [1], carefully pull out the SB Sleeve Seal [2] parallel to the Developing Assembly [1] to remove it.**

CAUTION:
Do not hold the [E] part of the Developing Assembly when removing the SB Sleeve Seal [2] (pulling the SB Sleeve Seal [2] while holding the [E] part increases the resistance, at which time the reaction force may cause damage to the Toner Blocking Sheet (Outer) [3] and the Toner Blocking Sheet (Inner) [4]).





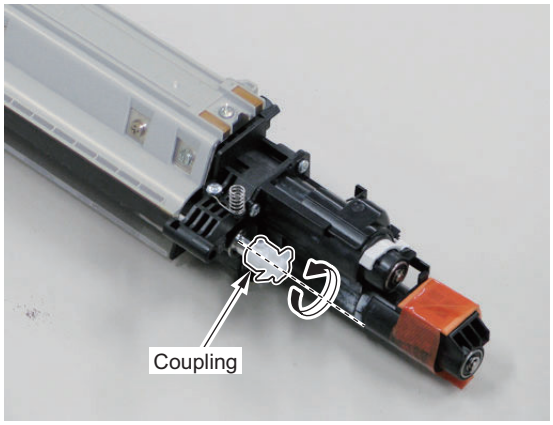
4. **Remove tape [B] and tape [C] securing the Sleeve.**



5. **Make the Coupling of the Sleeve rotate a full turn or 1.5 turns in the direction of the arrow (clockwise).**

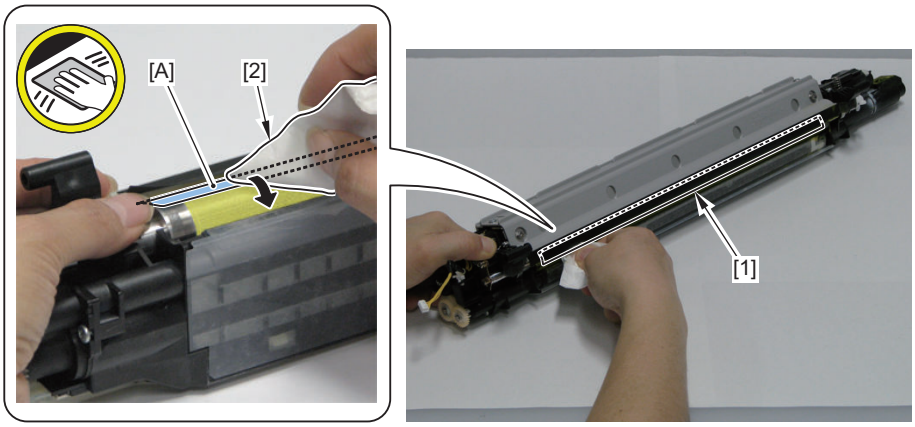
CAUTION:
Do not turn the Developing Sleeve in the reverse direction.
If you rotate it in the reverse direction, toner clots on the Sleeve may damage the Toner Blocking Sheet on the Sleeve.

NOTE:
Toner clots are removed by rotating the Sleeve in the direction of the arrow (clockwise).



6. **Check that developer is not scattered on the Toner Blocking Sheet (Inner) [1]. If it is scattered, clean it [A] with dry lint-free Paper [2].**

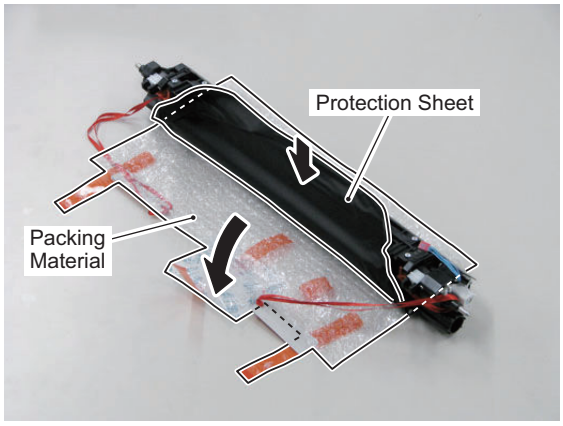
CAUTION:
Do not use alcohol when cleaning the Toner Blocking Sheet (Inner).
Be careful not to allow alcohol to attach on the Developing Sleeve.



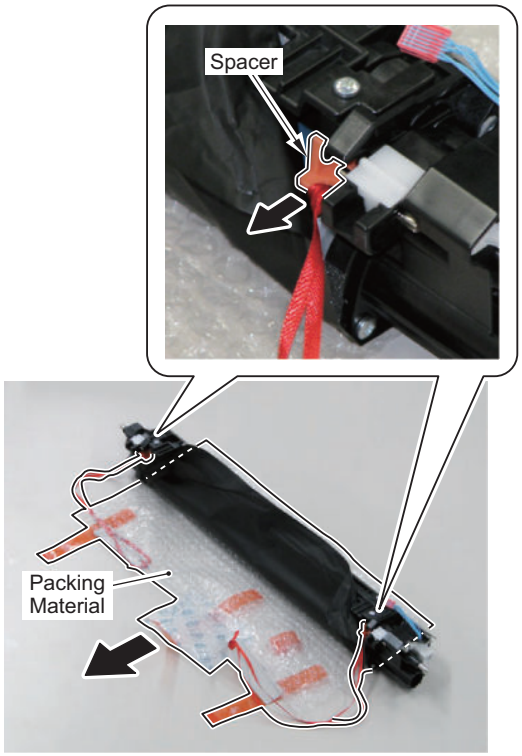
7. **Take out the Drum Unit from the packaging box.**

8. Unpack the Drum Unit, and remove the packaging material.

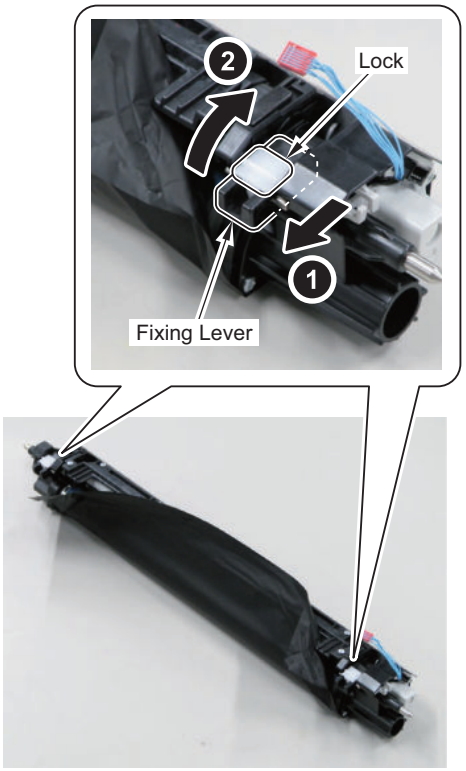
CAUTION:
- Do not touch the Photosensitive Drum.
- During work, cover it with the Protection Sheet.



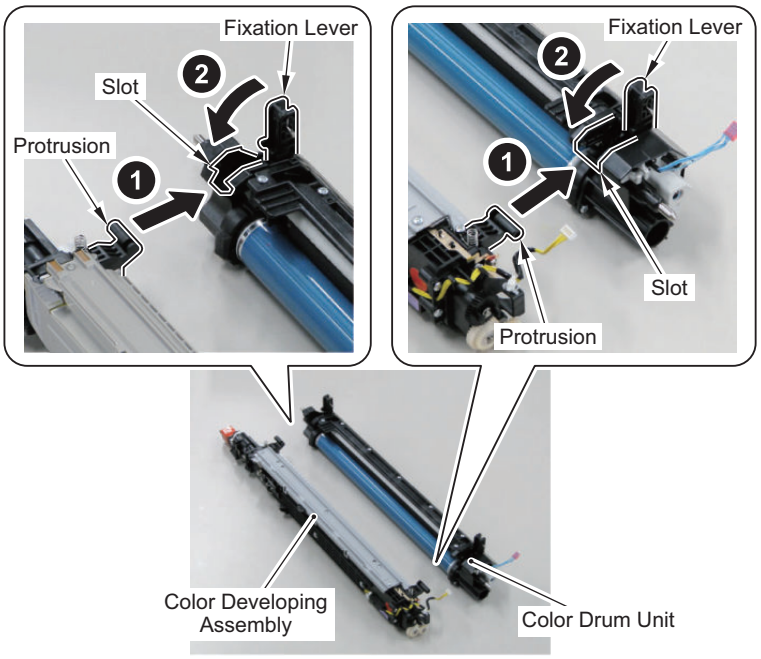
9. Pull the 2 spacers in the direction of the arrow to remove them from the Drum Unit.



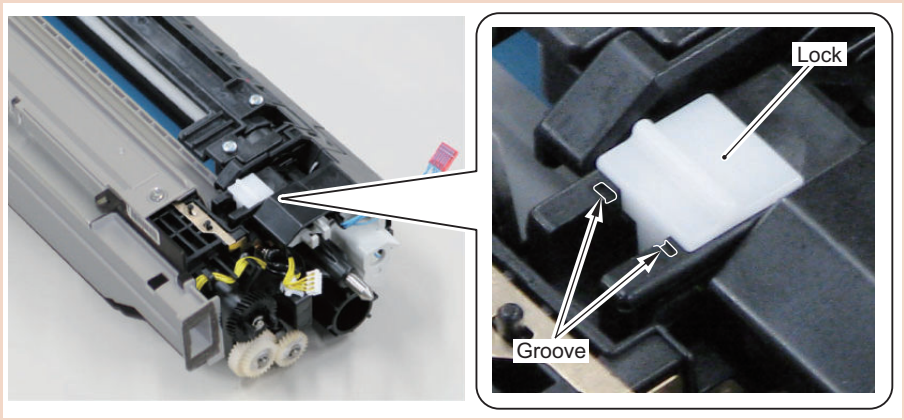
10. Release the lock of the Fixation Lever of the Drum Unit to lift up the Fixation Lever.



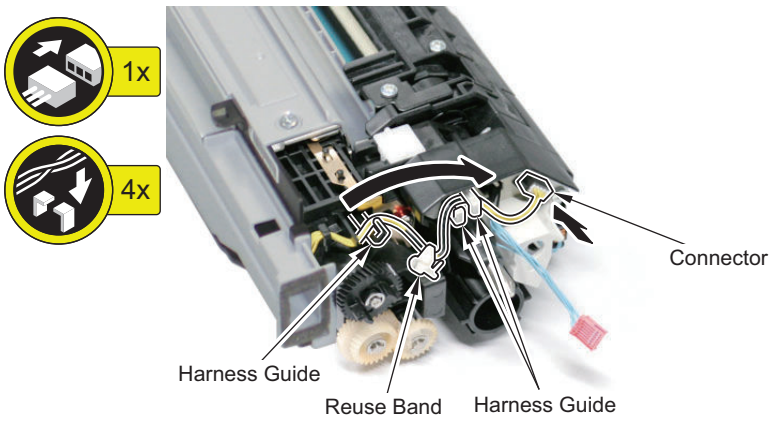
11. Insert the 2 protrusions of the Developing Assembly into the Drum Unit (yellow) to join the Developing Assembly and the Drum Unit, and then turn over the Fixation Lever in the direction of the arrow to assemble the Process Unit.



CAUTION:
Check to see whether the lock is securely in place or the grooves as shown in the figure are visible. (If the lock is not completely secure when the Process Unit is introduced into the host machine, it may not be possible to remove it from the host machine.)

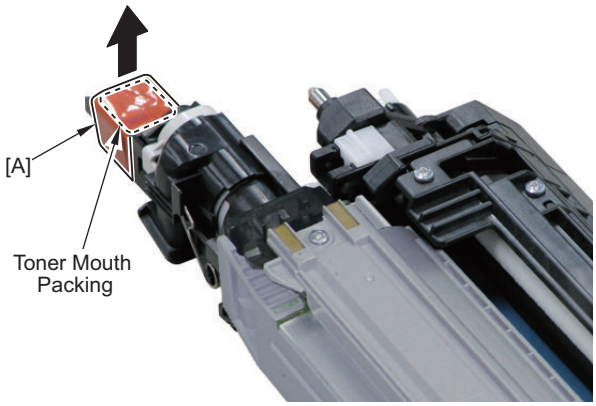


12. Secure the harness using the Harness Guide and the Reuse Band, and connect the connector.



13. **Remove the tape [A] and the packaging material of the Supply Mouth.**

CAUTION:
Be sure to remove the packaging material of the Supply Mouth.



When Replacing the Drum Unit (Y)/(M)/(C)

■ Procedure

1. **Perform the works to be done before replacing the drum.**
   1. Turn OFF the warm-up rotation control.
      COPIER > FUNCTION > INSTALL > AINR-OFF = 1
   2. Turn OFF the main power (replace the Drum Unit).
2. **Perform the works to be done after replacing the drum.**
   1. Turn ON the main power.
   2. Execute the ITB neutral position adjustment.
      COPIER > FUNCTION > INSTALL > INIT-ITB
   3. Execute the drum reset mode.
      Select COPIER > FUNCTION > INSTALL > CLR-SET, and set the target color to "1".
      COPIER > FUNCTION > INSTALL > DRMRESET
   4. Turn ON the warm-up rotation control.
      COPIER > FUNCTION > INSTALL > AINR-OFF = 0
   5. Auto gradation adjustment
      [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
   6. Color displacement correction
      [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
   7. Execute uneven density correction.
      [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

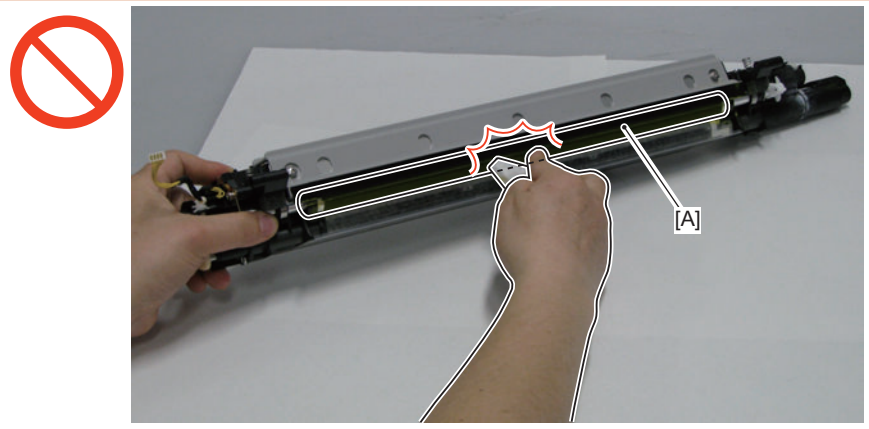
Cleaning the Sleeve Cover of the Developing Assembly (Y)/(M)/(C), Toner Catch Sheet (Y)/(M)/(C), and Toner Blocking Sheet (Y)/(M)/(C)

■ Preparation

1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Process Unit (Y)/(M)/(C)****"Removing the Process Unit (Y)/(M)/(C)" on page 712**
5. **Separating the Developing Assembly (Y)/(M)/(C) from the Drum Unit (Y)/(M)/(C)****"Separating the Developing Assembly (Y)/(M)/(C) from the Drum Unit (Y)/(M)/(C)" on page 716**

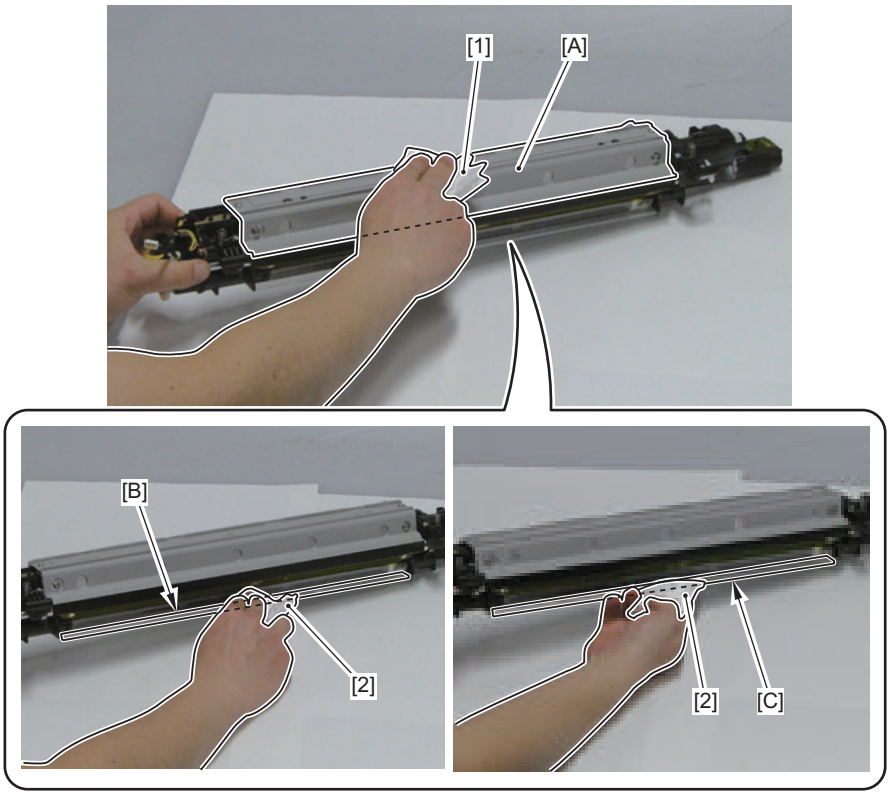
■ Procedure

CAUTION:
When cleaning, do not touch the surface [A] of the Developing Cylinder.



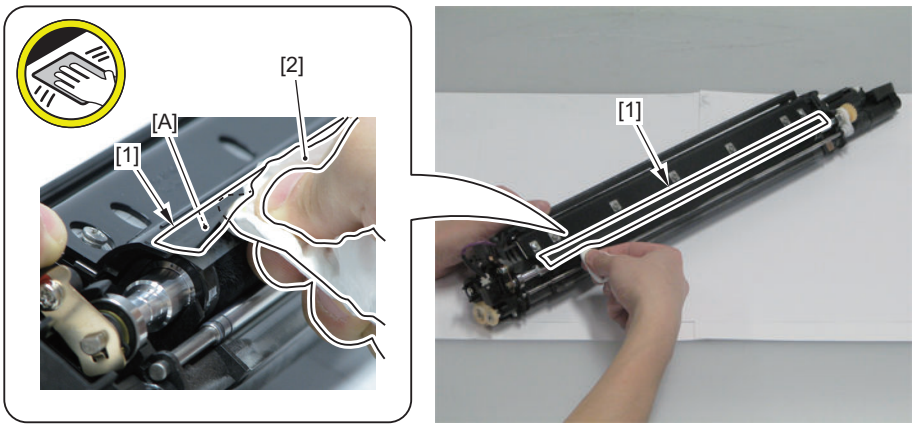
1. **Remove soiling at the surface [A] of the Sleeve Cover of the Developing Assembly (Y)/(M)/(C) with lint-free paper [1] moistened with alcohol.**
2. **Remove soiling at the front side [B] and the back side [C] of the Toner Catch Sheet of the Developing Assembly (Y)/(M)/(C) with dry lint-free paper [2].**

CAUTION:
Be careful not to allow alcohol to attach on the Developing Sleeve.

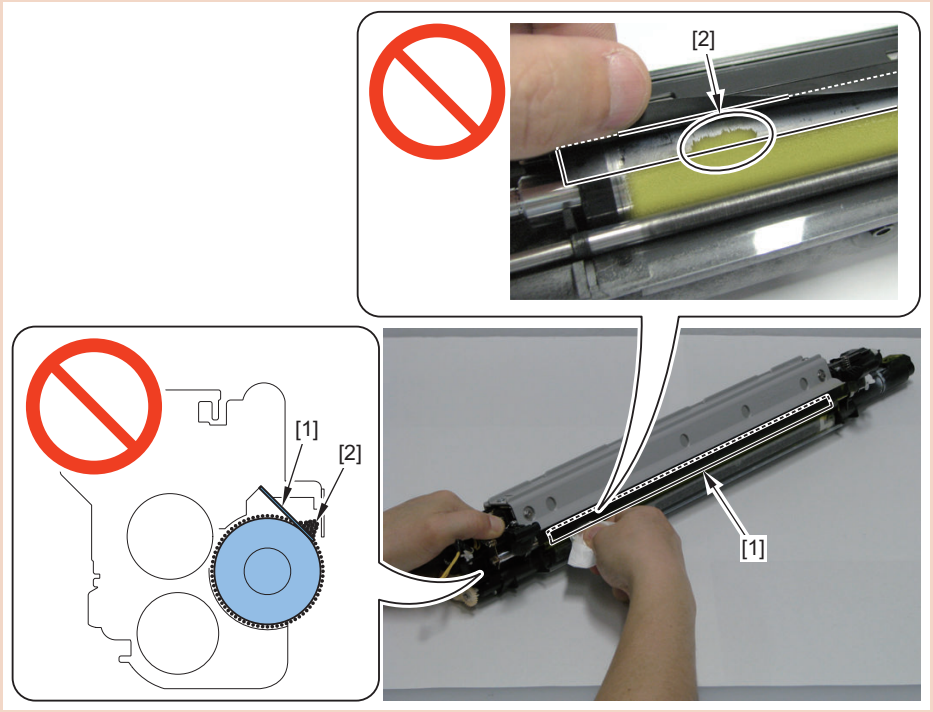


CAUTION:
Do not use alcohol when cleaning the Toner Blocking Sheet (Inner) and the Toner Blocking Sheet (Outer).
Be careful not to allow alcohol to attach on the Developing Sleeve.

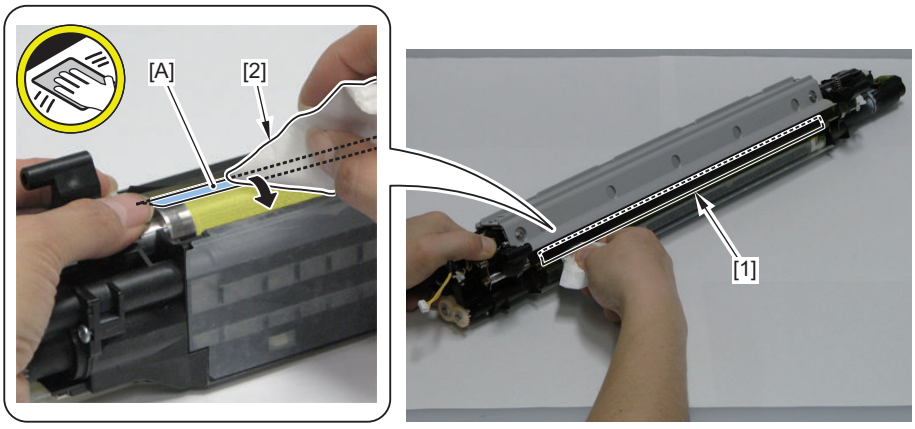
3. **Clean the inner surface [A] of the Toner Blocking Sheet (Outer) [1] of the Developing Assembly with dry lint-free paper [2].**



CAUTION:
Check that the developer [2] is not placed on the Toner Blocking Sheet [1] before returning it to the host machine.



4. **Clean the surface [A] of the Toner Blocking Sheet (Inner) [1] of the Developing Assembly with dry lint-free paper [2].**



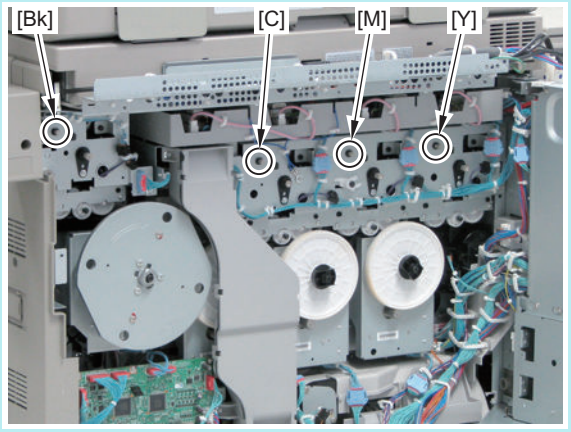
Removing the Toner Container Manually

■ Preparation

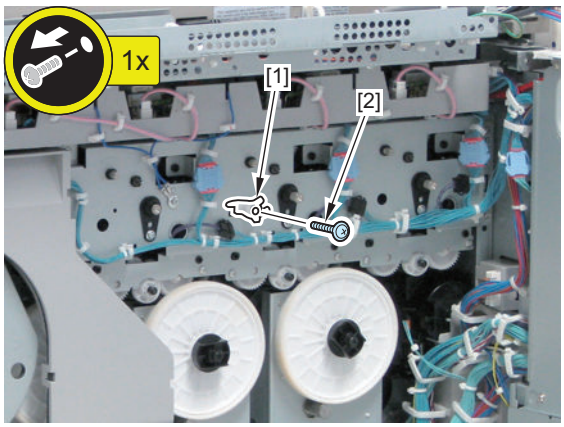
1. **Removing the Box Left Cover****"Removing the Box Left Cover" on page 947**
2. **Removing the Box Upper Cover****"Removing the Box Upper Cover" on page 948**
3. **Opening the Controller Box****"Open the Controller Box" on page 507**
4. **Open the Toner Replacement Cover.**

■ Procedure

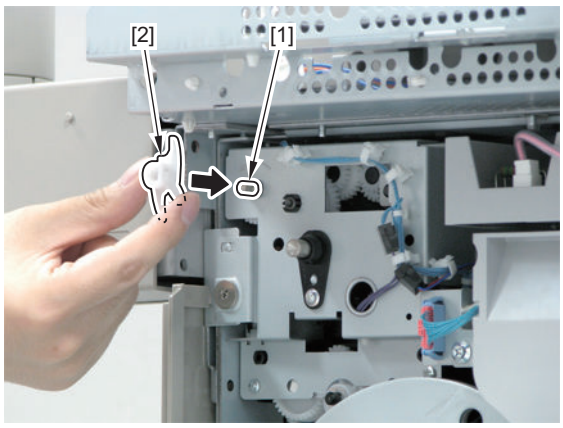
NOTE:
This procedure explains how to remove the Toner Container (Bk).
Be sure to perform the same procedure for the Toner Container (Y)/(M)/(C).



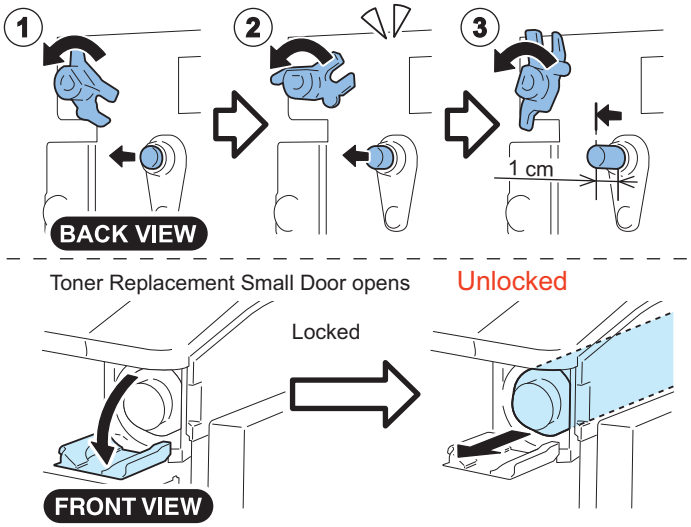
1. **Remove the Toner Container Removing Tool [1].**
   - 1 Screw [2]

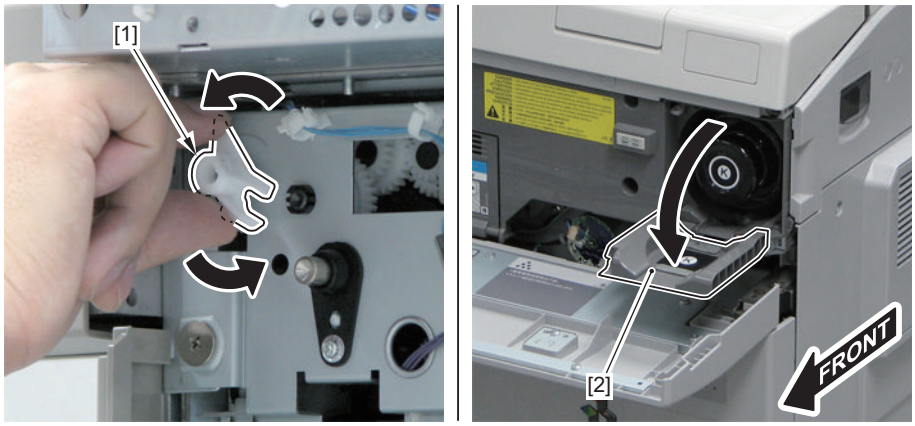


2. **Insert the Toner Container Removing Tool [2] into the Toner Container Lock Shaft [1].**



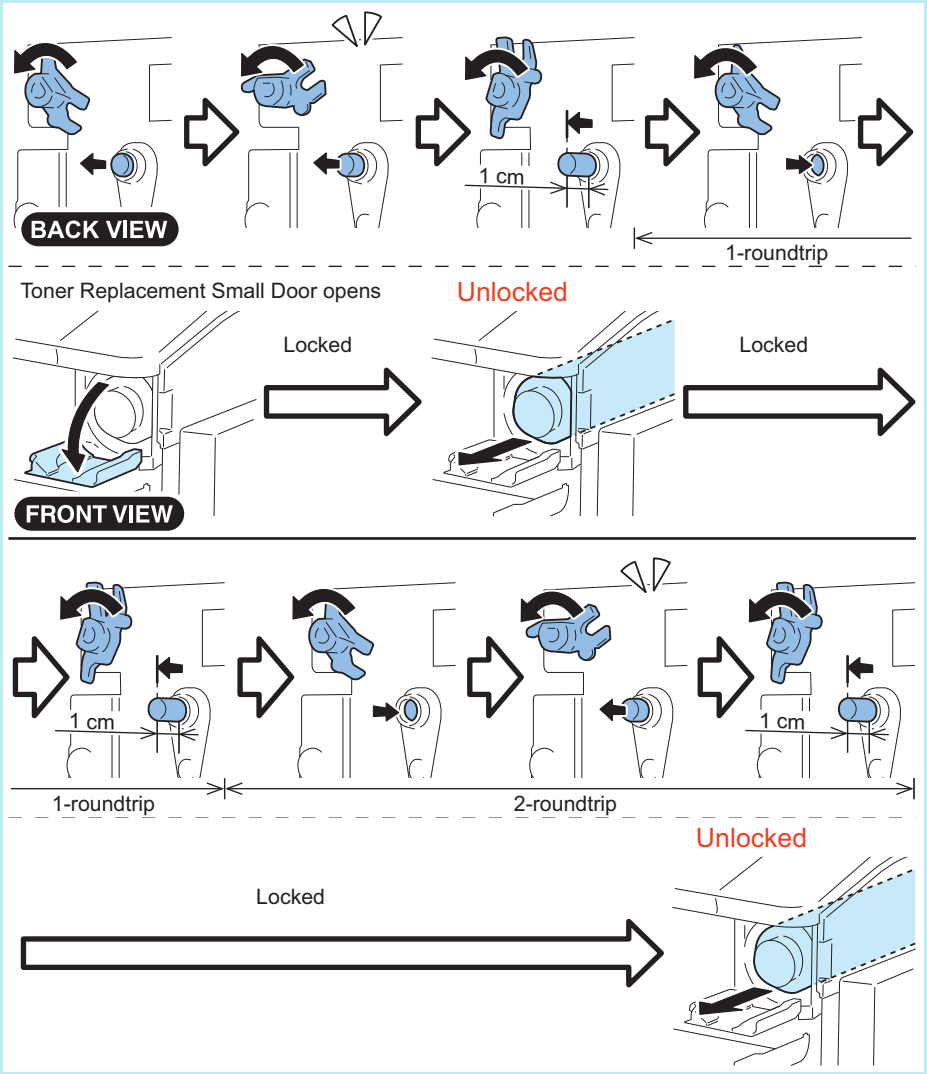
3. **Rotate the Toner Container Removing Tool [1] counterclockwise to set the Toner Container to "unlocked state".**
   Unlocked state refers to the following condition:
   (1) The Toner Replacement Small Door [2] at the front side opens.
   (2) A click sound is heard.
   (3) After that, the pin pops out to its maximum (approx. 1 cm).





NOTE:
Unlocked state of the Toner Container
Normally, the Toner Container is "locked" so that it cannot be taken out.
To manually take out the Toner Container, you need to rotate the Lock Shaft counterclockwise to set it to the "unlocked state".
The Toner Container is in the "unlocked state" when the pin pops out to its maximum at this moment.
Because the Lock Shaft cannot be rotated reversely, if you miss the "unlocked state" once, wait for the next turn when the pin pops out to its maximum, which indicates the next "unlocked state".

NOTE:



4. Take out the Toner Container [1].

CAUTION:
Even when the Toner Container is "locked", you can install it and close the Toner Replacement Small Door.
In this case, toner is not supplied from the Toner Container and "Remaining Toner Error Message" appears.
When this happens, remove and then install the Toner Container again.

Removing the Hopper Tray (Bk)

■ Preparation

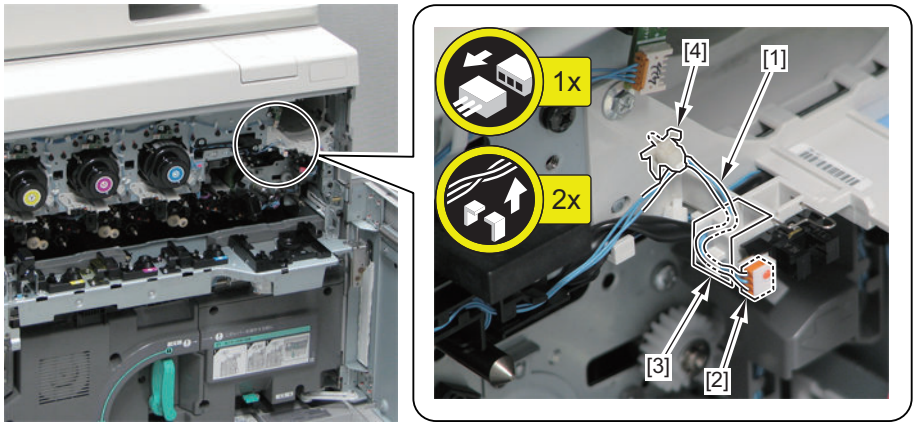
1. **Remove the Toner Container (Bk).**

NOTE:
Before turning OFF the power of the host machine, use the Control Panel to remove the Toner Container of the corresponding color.
If the power of the host machine is already turned OFF, see the procedure on manually removing the Toner Container "Removing the Toner Container Manually" on page 727 to remove the Toner Container of the corresponding color.

2. **Open the Front Cover.**
3. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
4. **Removing the Toner Container Replacement Cover****"Removing the Toner Container Replacement Cover" on page 941**
5. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
6. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**

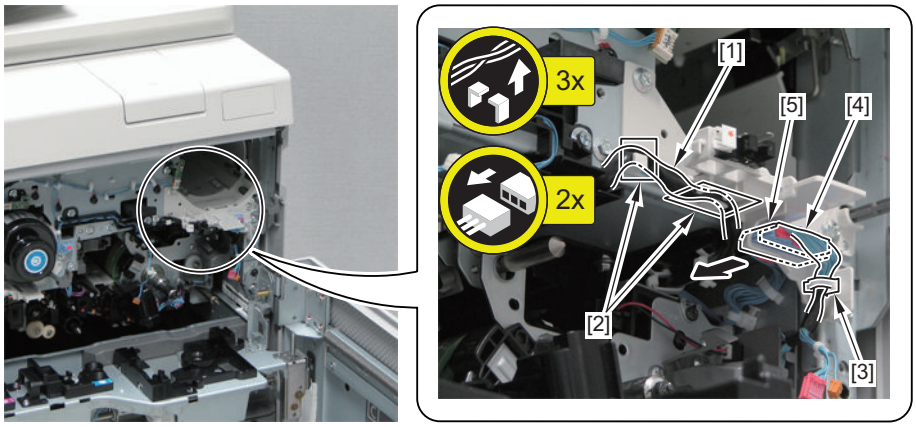
■ Procedure

1. **Free the harness [1].**
   - 1 Connector [2]
   - 1 Harness Guide [3]
   - 1 Reuse Band [4]

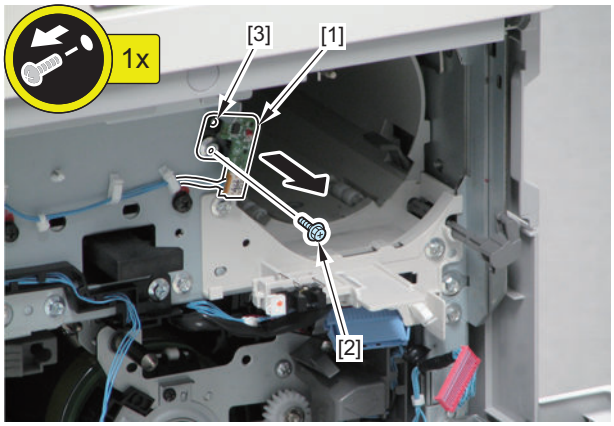


2. **Free the 2 harnesses [1] from the 2 guides [2].**

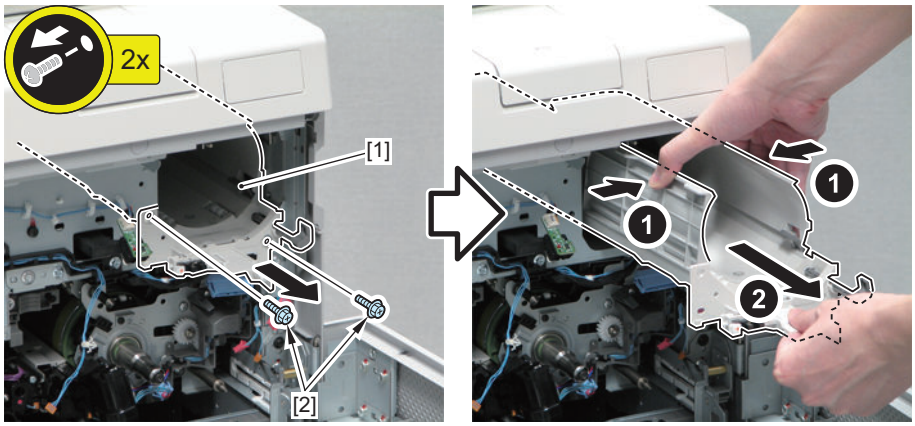
3. **Open the Wire Saddle [3], and disconnect the connector [4] and the Relay Connector [5].**



4. **Remove the Toner Container ID Read Sensor (Bk) [1].**
   - 1 Screw [2]
   - 1 Boss [3]



5. **Remove the Hopper Tray (Bk) [1] while bending it.**
   - 2 Screws [2]



Removing the Hopper Tray (Y)/(M)/(C)

■ Preparation

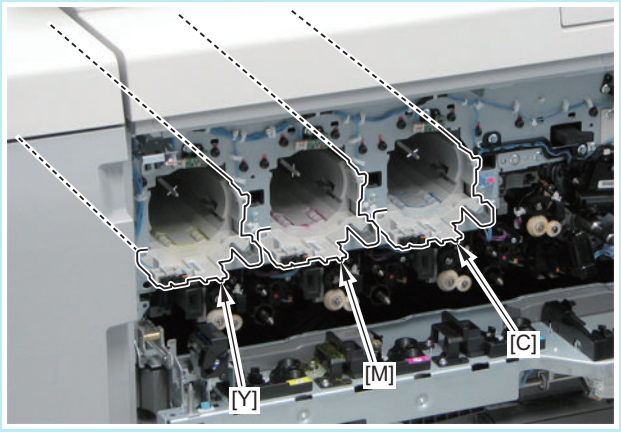
1. **Remove the Toner Container (Y)/(M)/(C).**

NOTE:
Before turning OFF the power of the host machine, use the Control Panel to remove the Toner Container of the corresponding color.
If the power of the host machine is already turned OFF, see the procedure on manually removing the Toner Container "Removing the Toner Container Manually" on page 727 to remove the Toner Container of the corresponding color.

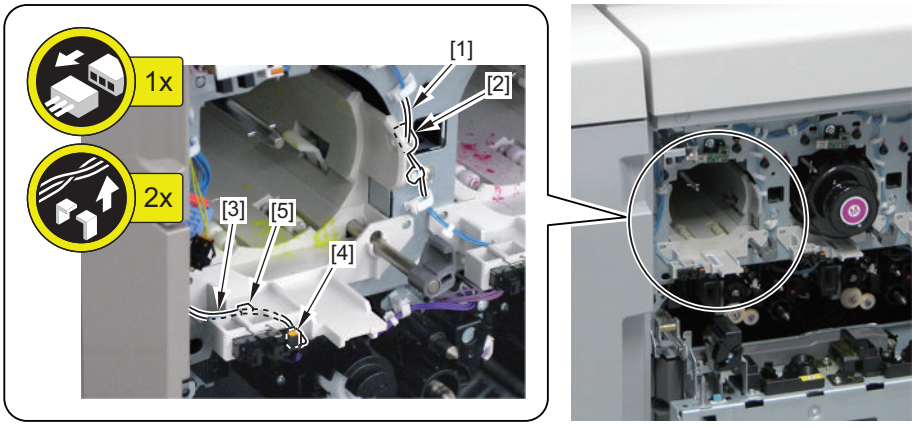
2. **Open the Front Cover.**
3. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
4. **Removing the Toner Container Replacement Cover****"Removing the Toner Container Replacement Cover" on page 941**
5. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**

■ Procedure

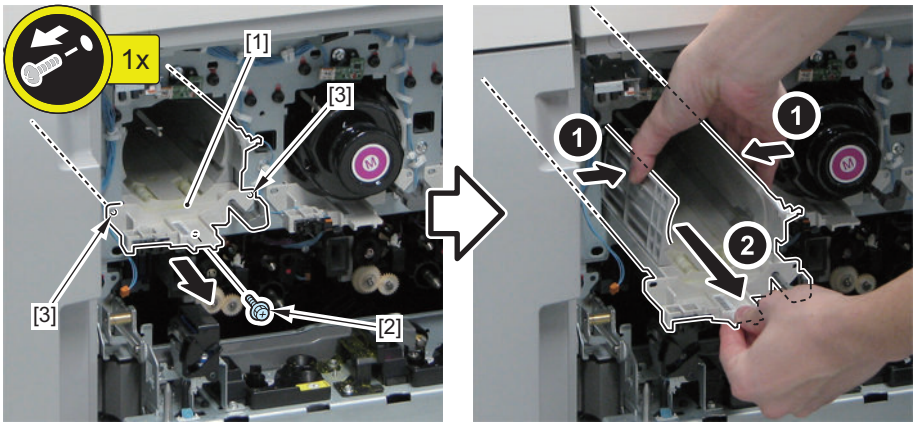
NOTE:
This procedure explains how to remove the Hopper Tray (Y).
Be sure to perform the same procedure for the Hopper Tray (M)/(C).



1. **Free the harness [1].**
   - 1 Wire Saddle [2]
2. **Free the harness [3].**
   - 1 Connector [4]
   - 1 Harness Guide [5]



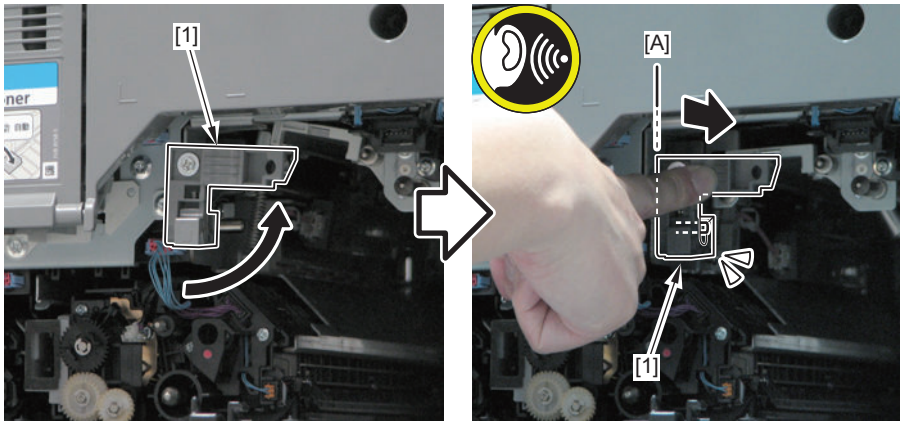
3. **Remove the Hopper Tray (Y) [1] while bending it.**
   - 1 Screw [2]
   - 2 Bosses [3]



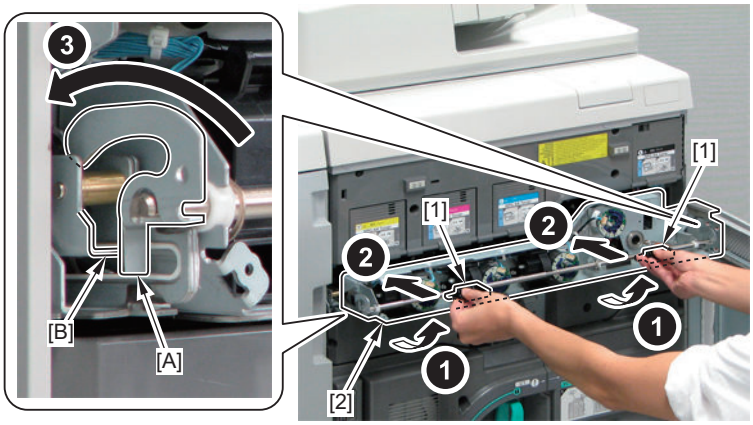
Removing the Drum Drive Unit (Bk)

■ Preparation

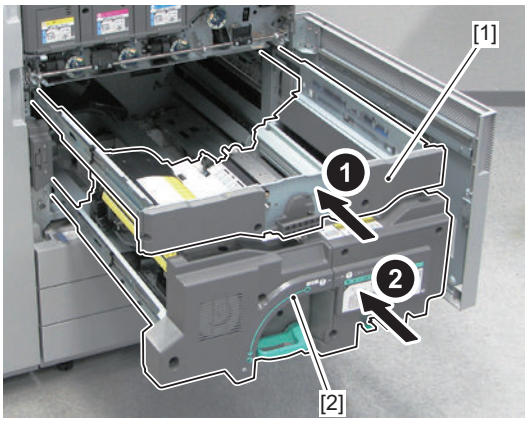
1. **Open the Front Cover.**
2. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
3. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
4. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
5. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
6. **Removing the Developing Assembly (Bk)****"Removing the Developing Assembly (Bk)" on page 701**
7. **Removing the Drum Unit (Bk)****"Removing the Drum Unit (Bk)" on page 662**
8. **Turn the Black Developing Assembly Pressure Lever [1] counterclockwise, and push it to the position [A] to lock the lever.**



9. **Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the handles at a 90-degree angle further and close the Process Unit Inner Cover [2].**



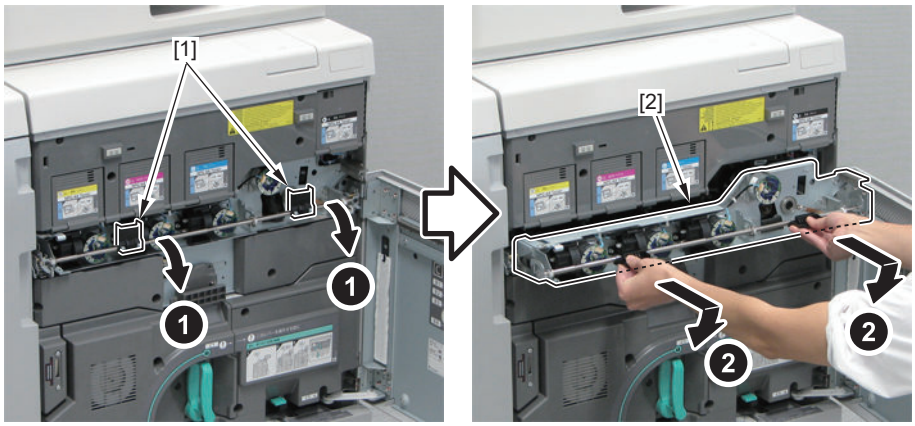
10. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
11. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
12. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
13. **Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.**



14. **Removing the Box Left Cover****"Removing the Box Left Cover" on page 947**
15. **Removing the Box Upper Cover****"Removing the Box Upper Cover" on page 948**
16. **Opening the Controller Box****"Open the Controller Box" on page 507**

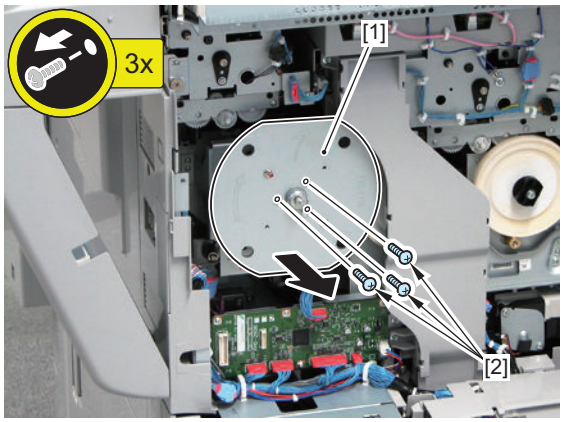
■ Disassembling Procedure

1. **Turn the 2 handles [1], and open the Process Unit Inner Cover [2] by pulling it out until it stops.**

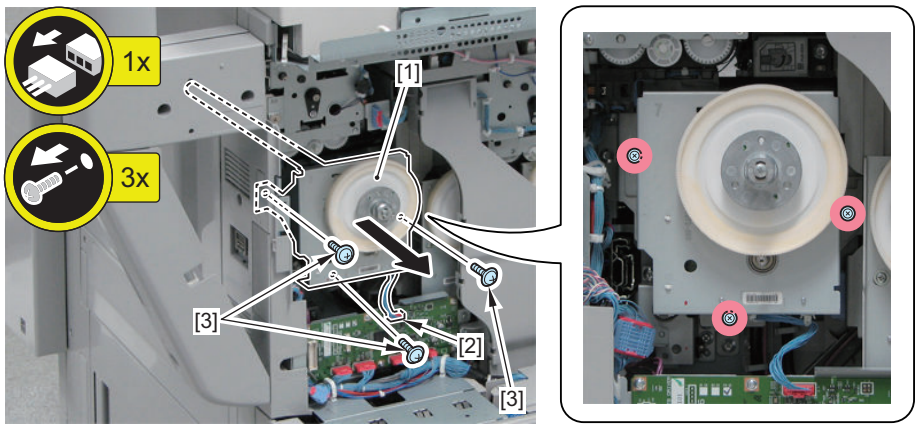


CAUTION:
Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) inside the machine if the Process Unit Inner Cover is kept open for 5 minutes or more. Be sure to either install the Lightproof Sheet, or close the Process Unit Inner Cover within 5 minutes.

2. **Remove the Flywheel [1].**
   - 3 Screws [2]



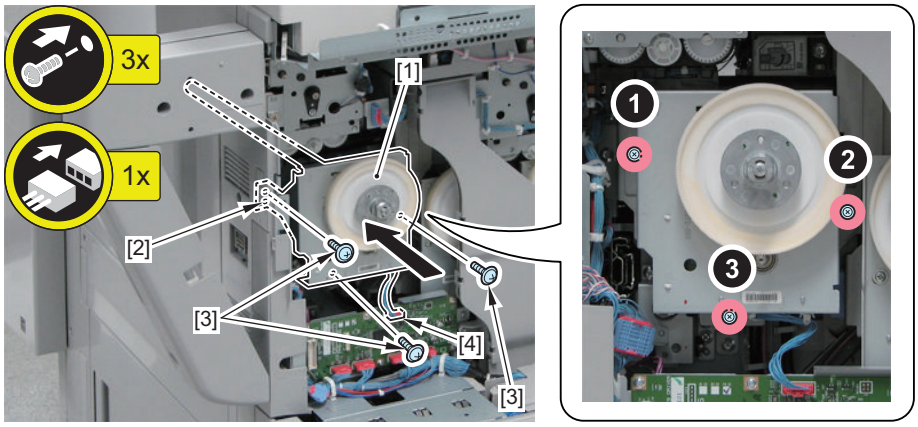
3. **Remove the Drum Drive Unit (Bk) [1].**
   - 1 Connector [2]
   - 3 Screws [3]



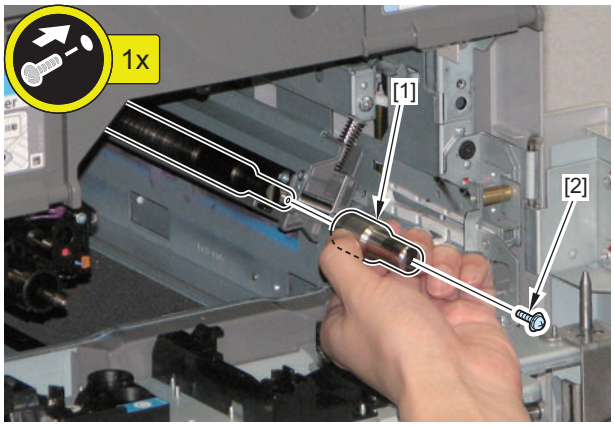
■ Assembling Procedure

NOTE:
Because the positioning of the Drum Drive Unit (Bk) is necessary for installation, be sure to install it in the following order.

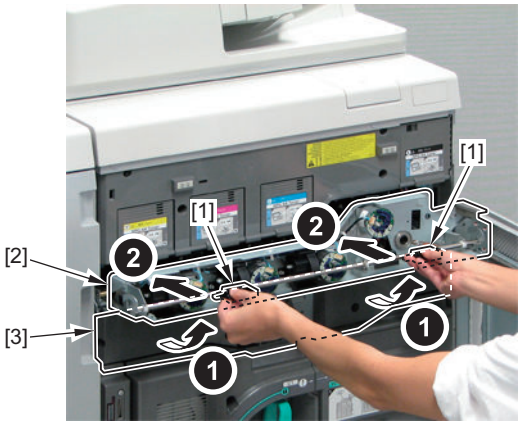
1. **Install the Drum Drive Unit (Bk) [1] by aligning it with the boss [2], and tighten the 3 screws [3] temporarily in the following order.**
   - 1 Connector [4]



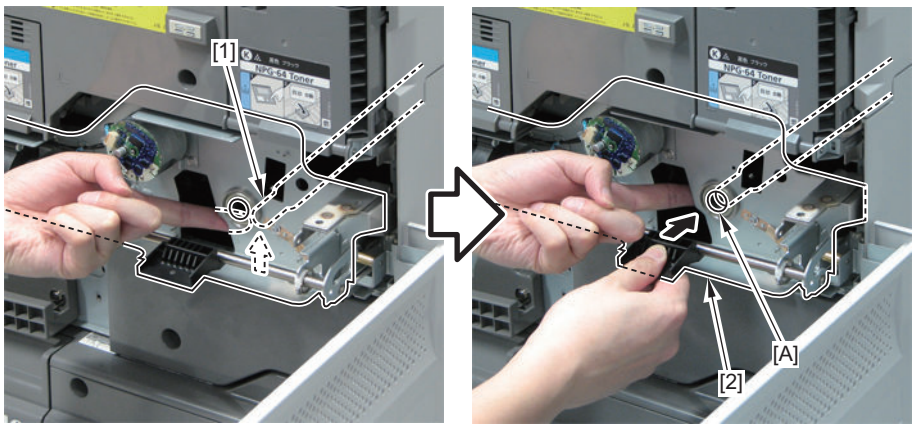
2. **Install the Drum Cap [1].**
   - 1 Screw [2]



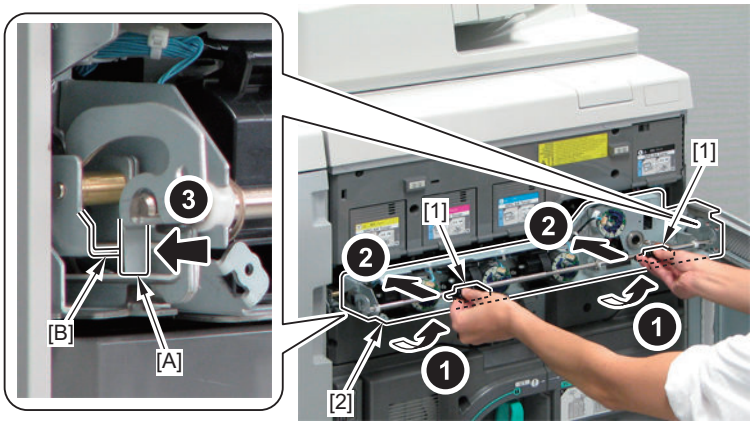
3. **Hold the 2 handles [1] and Close the Process Unit Inner Cover [2], and place it temporarily on the ITB Frame [3].**



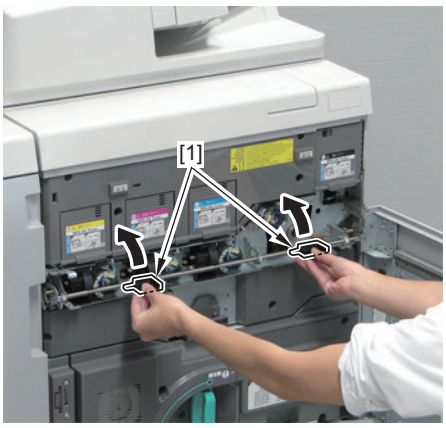
4. **Put the Drum Drive Shaft [1] in the hole [A] of the Process Unit Inner Cover [2].**



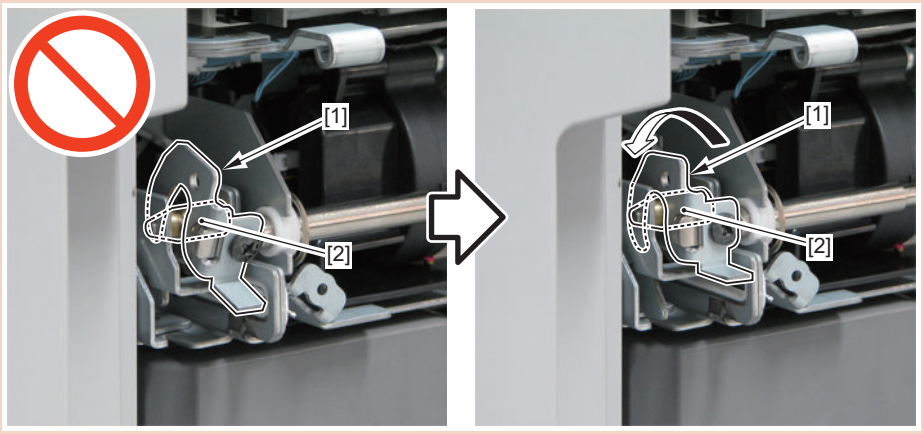
5. **Push the Process Unit Inner Cover [2], and push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder.**



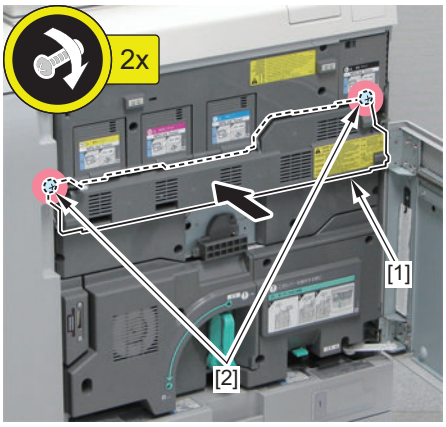
6. **Raise the 2 handles [1] at a 90-degree angle further and close the Process Unit Inner Cover.**



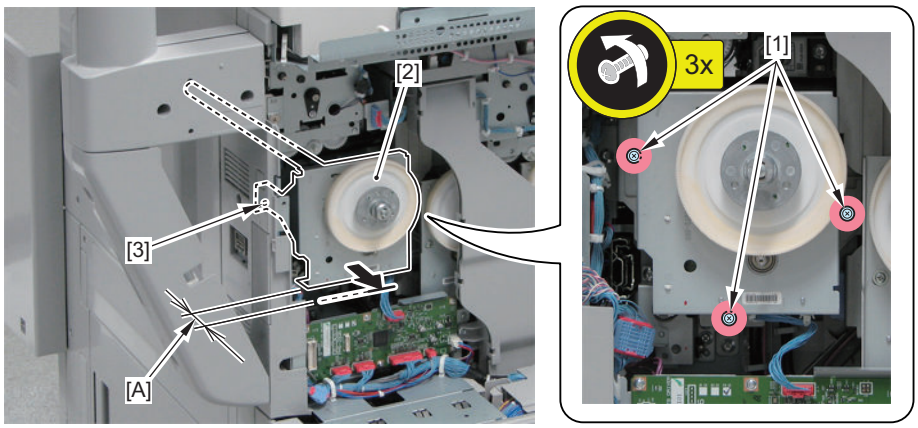
CAUTION:
Be sure that the 2 hooks [1] of the Process Unit Inner Cover are hooked to the 2 Hinges Shafts [2] of the machine so that the cover is locked.



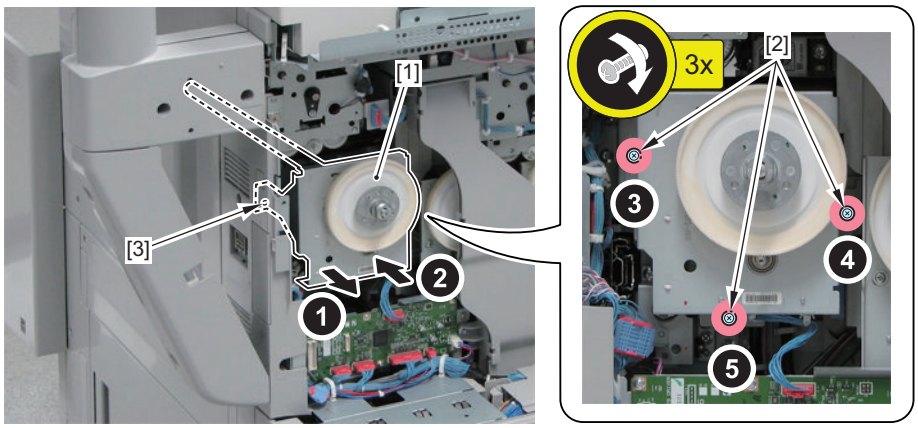
7. **Install the Process Unit Front Cover [1].**
   - 2 Screws [2] (to tighten)



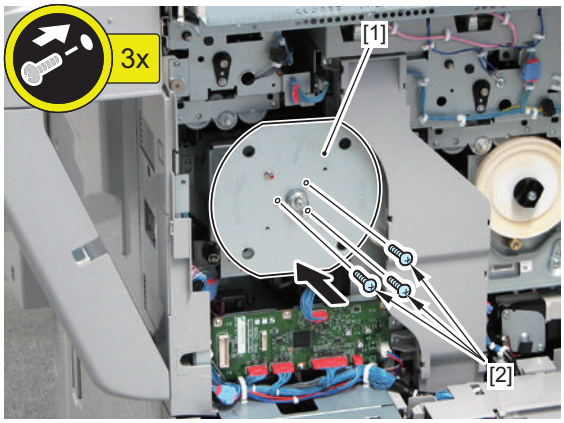
8. **Turn the screwdriver one full turn to loosen the 3 screws [1], and make space of approx. 0.5 mm [A] between the Drum Drive Unit (Bk) [2] and the Rear Plate (the boss [3] will not come off even if the Drum Drive Unit (Bk) [2] is moved right and left).**



9. **Remove and then insert the Drum Drive Unit (Bk) [1] straight to push it against the Rear Plate, and fully tighten the 3 screws [2] in the following order.**
   - 1 Boss [3]



10. **Install the Flywheel [1].**
    - 3 Screws [2]

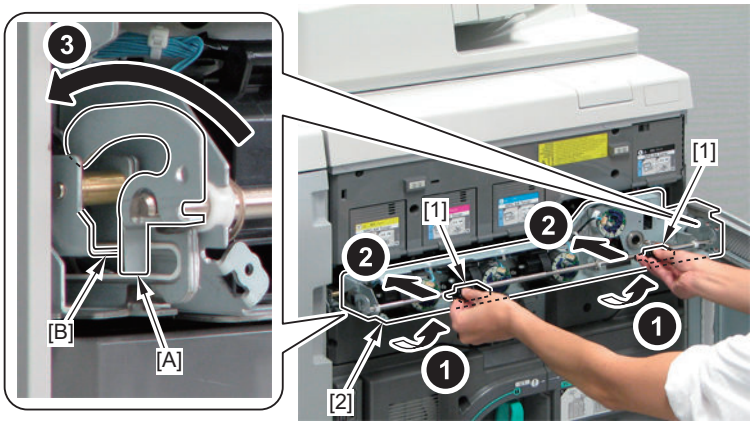


11. **Open the Process Unit Inner Cover, and remove the Drum Cap installed in step 2.**

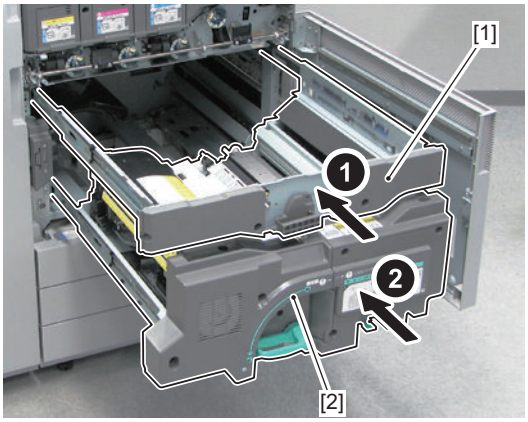
Removing the Process Drive Unit (Y)/(M)/(C)

■ Preparation

1. Open the Front Cover.
2. Removing the Toner Replacement Cover"Removing the Toner Replacement Cover" on page 941
3. Open the Process Unit Inner Cover."Opening the Process Unit Inner Cover" on page 542
4. Removing the Process Unit (Y)/(M)/(C)"Removing the Process Unit (Y)/(M)/(C)" on page 712
5. Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the handles at a 90-degree angle further and close the Process Unit Inner Cover [2].



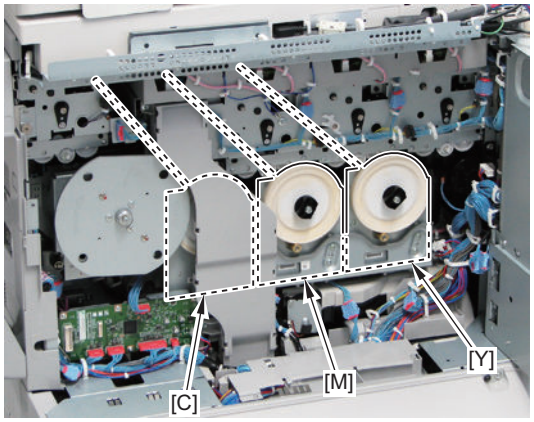
6. Pull out the Fixing Feed Unit."Pulling out the Fixing Feed Unit" on page 859
7. Pulling out the ITB Unit"Pulling out the ITB Unit" on page 550
8. Removing the ITB Unit"Removing the ITB Unit" on page 553
9. Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.



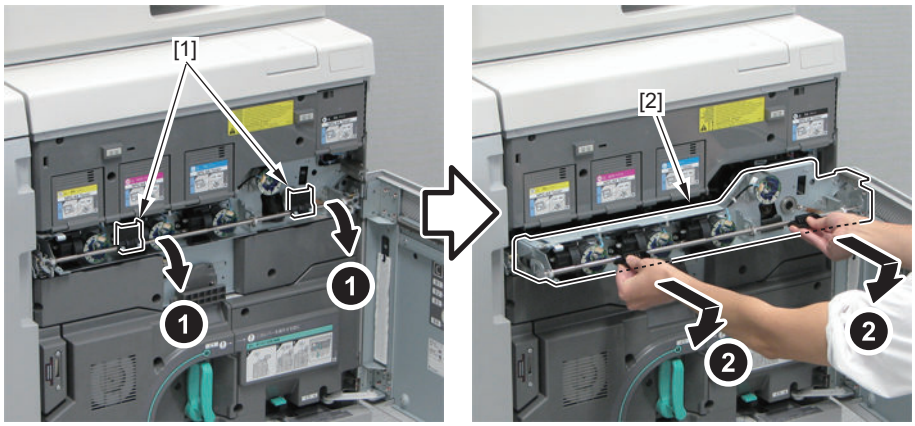
10. Removing the Box Left Cover"Removing the Box Left Cover" on page 947
11. Removing the Box Upper Cover"Removing the Box Upper Cover" on page 948
12. Opening the Controller Box"Open the Controller Box" on page 507

■ Disassembling Procedure

NOTE:
This procedure explains how to remove the Process Drive Unit (C).
Be sure to perform the same procedure for the Process Drive Unit (M)/(Y).



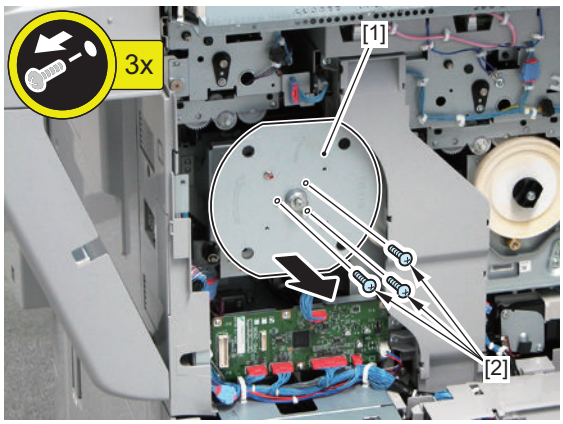
1. **Turn the 2 handles [1], and open the Process Unit Inner Cover [2] by pulling it out until it stops.**



CAUTION:
Deterioration in sensitivity of the Photosensitive Drum may occur on the Drum Unit (Bk) inside the machine if the Process Unit Inner Cover is kept open for 5 minutes or more.
Be sure to either install the Lightproof Sheet, or close the Process Unit Inner Cover within 5 minutes.

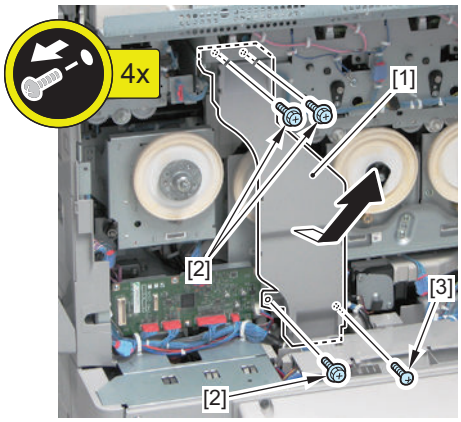
2. **Remove the Flywheel [1].**
   - 3 Screws [2]

NOTE:
When removing the Process Drive Unit (M)/(Y), there is no need to remove the Flywheel.



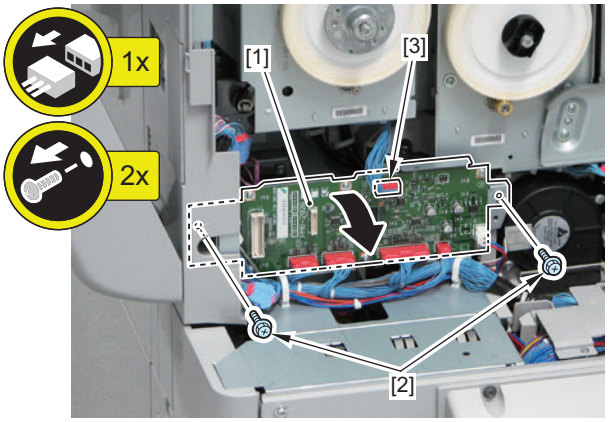
3. **Remove the Duct [1].**
   - 3 Screws (RS) [2]
   - 1 Screw (Tapping) [3]

NOTE:
When removing the Process Drive Unit (Y), there is no need to remove the Duct.

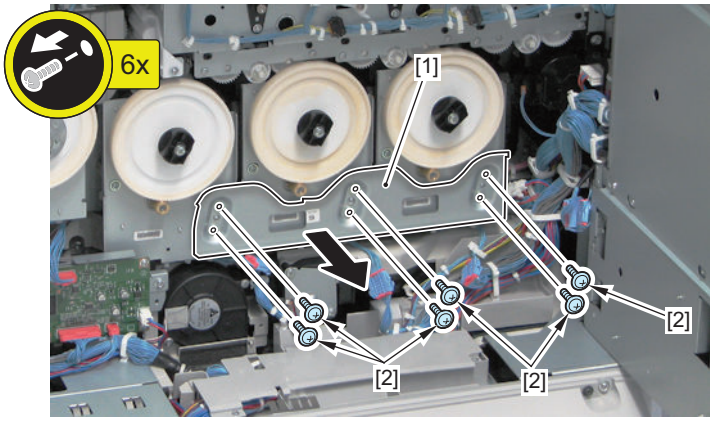


4. **Tilt the PCB Mounting Base [1] forward.**
   - 2 Screws [2]
   - 1 Connector [3]

NOTE:
When removing the Process Drive Unit (M)/(Y), there is no need to tilt the PCB Mounting Base forward.

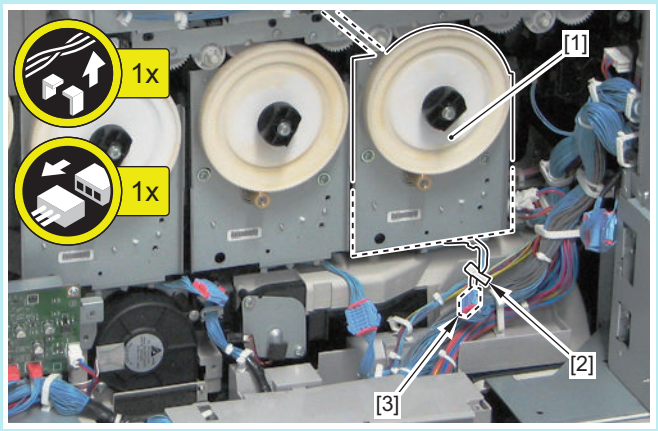


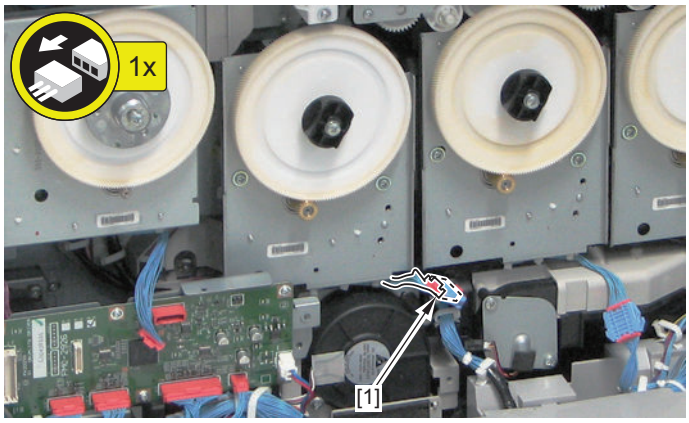
5. **Remove the Process Drive Unit (Y)/(M)/(C) Connecting Plate [1].**
   - 6 Screws [2]



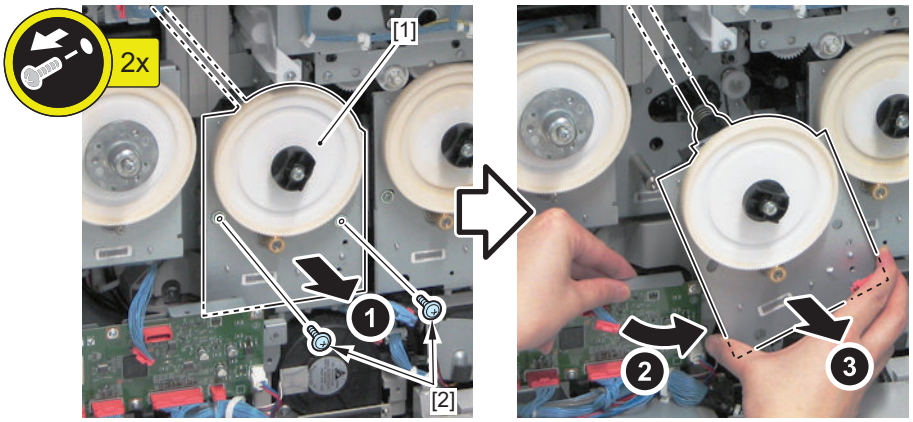
6. **Disconnect the connector [1].**

NOTE:
When removing the Process Drive Unit (Y) [1], open the Wire Saddle [2], and remove the Connector [3]





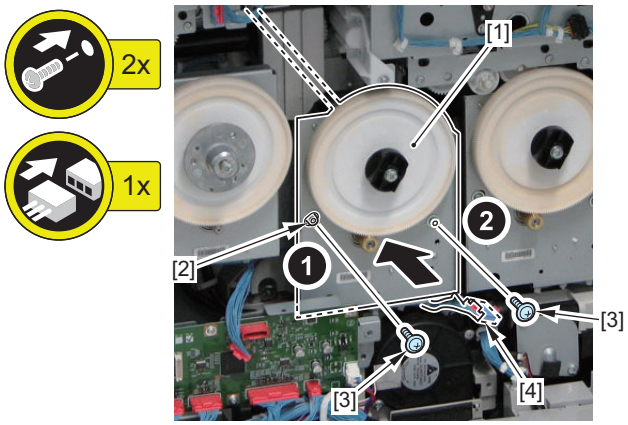
7. **Remove the Process Drive Unit (C) [1].**
   - 2 Screws [2]



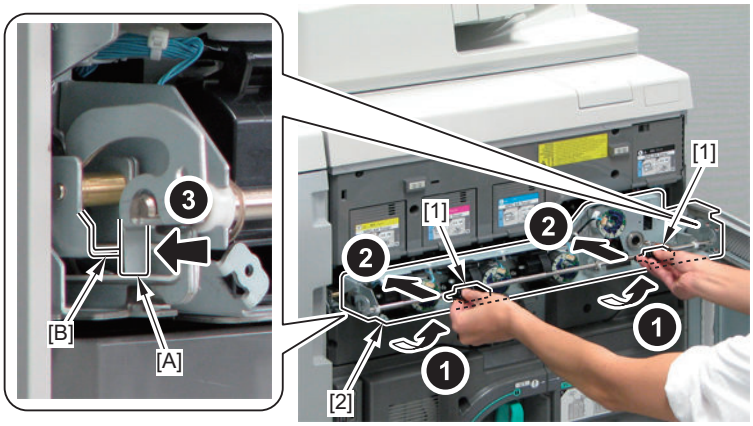
■ Assembling Procedure

NOTE:
Because the positioning of the Process Drive Unit (Y)/(M)/(C) is necessary for installation, be sure to install it in the following order.

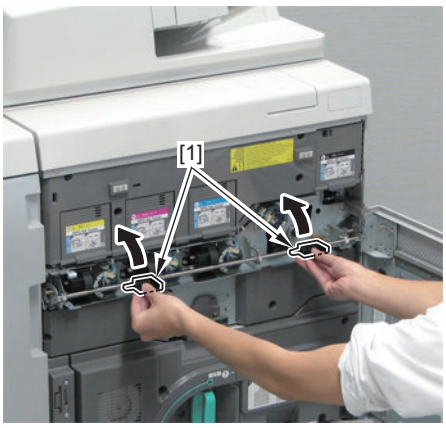
1. **Install the Process Drive Unit (C) [1] by aligning it with the boss [2], and tighten the 2 screws [3] temporarily in the following order.**
   - 1 Connector [4]



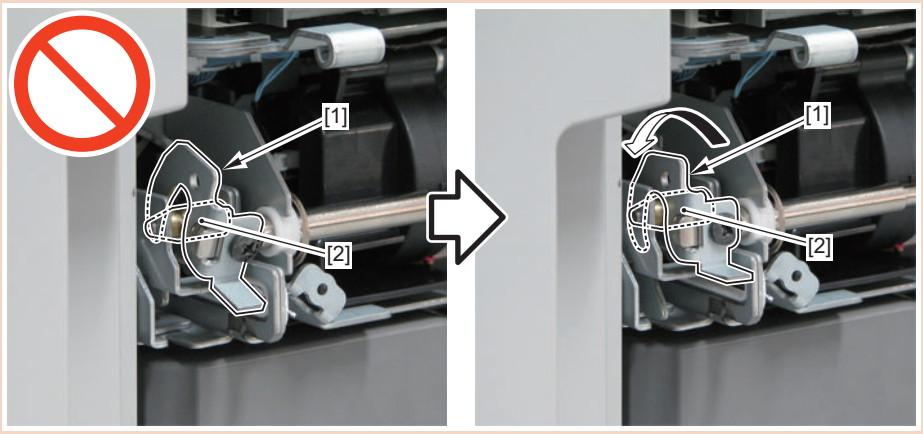
2. **Hold the 2 handles [1] and raise the Process Unit Inner Cover [2].**
3. **Push the Process Unit Inner Cover [2], and push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder.**



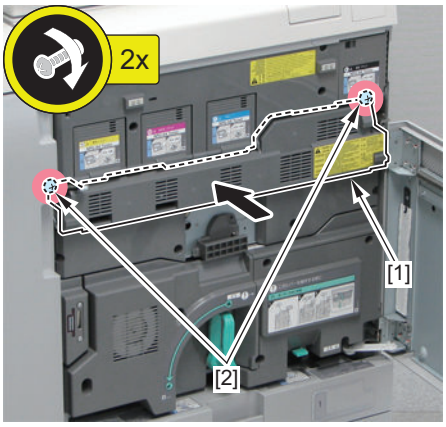
4. **Raise the 2 handles [1] at a 90-degree angle further and close the Process Unit Inner Cover.**



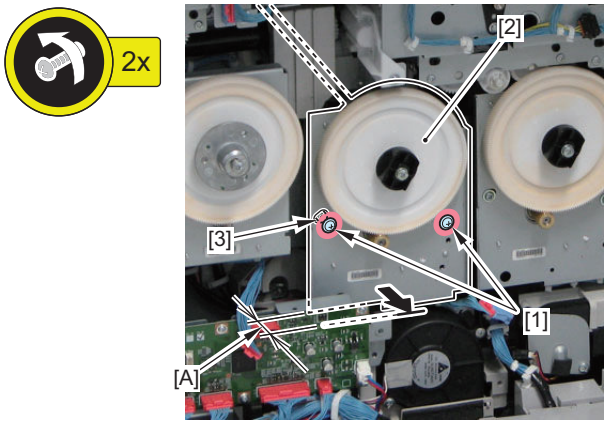
CAUTION:
Be sure that the 2 hooks [1] of the Process Unit Inner Cover are hooked to the 2 Hinges Shafts [2] of the machine so that the cover is locked.



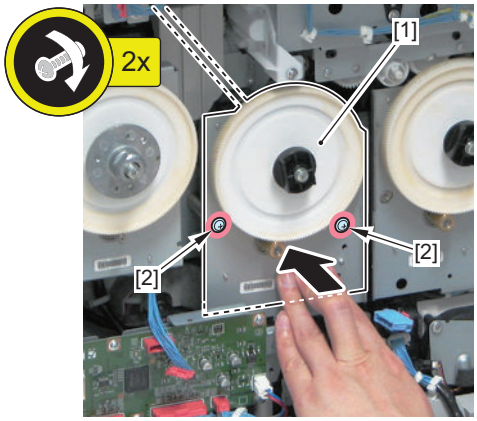
5. **Install the Process Unit Front Cover [1].**
   - 2 Screws [2] (to tighten)



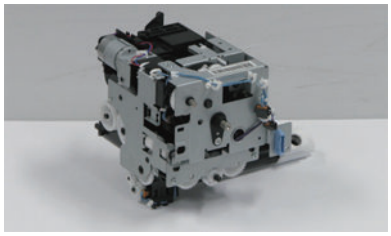
6. **Turn the screwdriver one full turn to loosen 2 screws [1], and make space of approx. 0.5 mm [A] between the Process Drive Unit (C) [2] and the Rear Plate (the boss [3] will not come off even if the Process Drive Unit (C) [2] is moved right and left).**



7. **Remove and then insert the Process Drive Unit (C) [1] straight to push it against the Rear Plate, and fully tighten the 2 screws [2] in the following order.**
   - 1 Boss [3]



Removing the Hopper Unit (Bk)



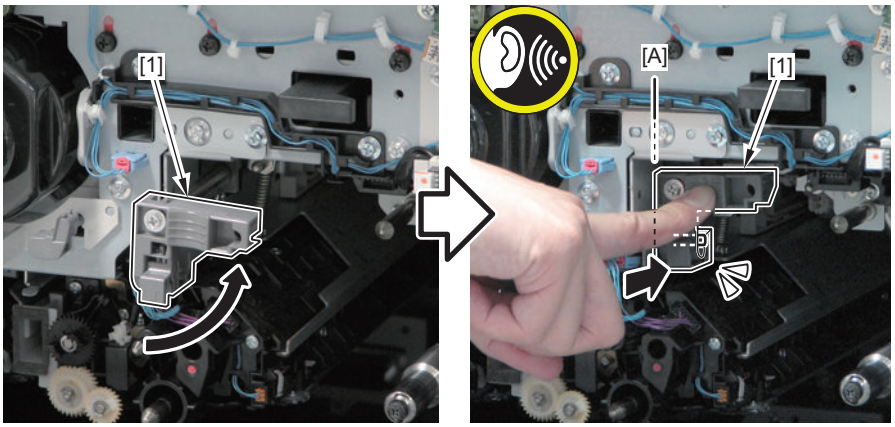
■ Preparation

1. **Remove the Toner Container (Bk).**

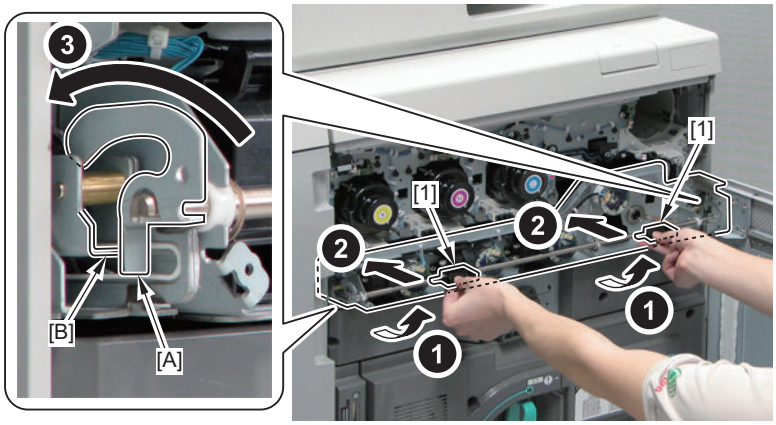
NOTE:
Before turning OFF the power of the host machine, use the Control Panel to remove the Toner Container of the corresponding color.
If the power of the host machine is already turned OFF, see the procedure on manually removing the Toner Container “Removing the Toner Container Manually” on page 727 to remove the Toner Container of the corresponding color.

2. **Open the Front Cover.**
3. **Removing the Toner Replacement Cover “Removing the Toner Replacement Cover” on page 941**

4. Removing the Toner Container Replacement Cover “Removing the Toner Container Replacement Cover” on page 941
5. Opening the Process Unit Inner Cover “Opening the Process Unit Inner Cover” on page 542
6. Removing the Primary Charging Assembly “Removing the Primary Charging Assembly” on page 627
7. Removing the Pre-transfer Charging Assembly “Removing the Pre-transfer Charging Assembly” on page 649
8. Removing the Developing Assembly (Bk) “Removing the Developing Assembly (Bk)” on page 701
9. Removing the Drum Unit (Bk) “Removing the Drum Unit (Bk)” on page 662
10. Turn the Black Developing Assembly Pressure Lever [1] counterclockwise, and push it to the position [A] to lock the lever.

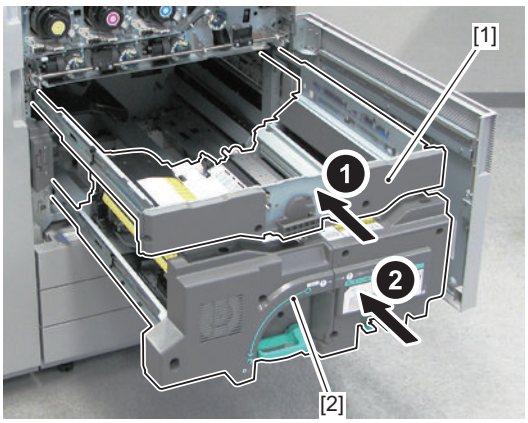


11. Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the levers at a 90-degree angle further and close the Process Unit Inner Cover [2].



12. Pulling out the Fixing Feed Unit “Pulling out the Fixing Feed Unit” on page 859
13. Pulling out the ITB Unit “Pulling out the ITB Unit” on page 550
14. Removing the ITB Unit “Removing the ITB Unit” on page 553

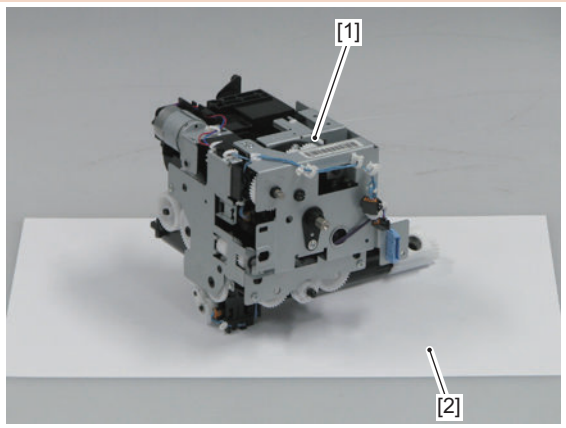
15. **Store the ITB Frame [1] and the Fixing Feed Unit [2].**



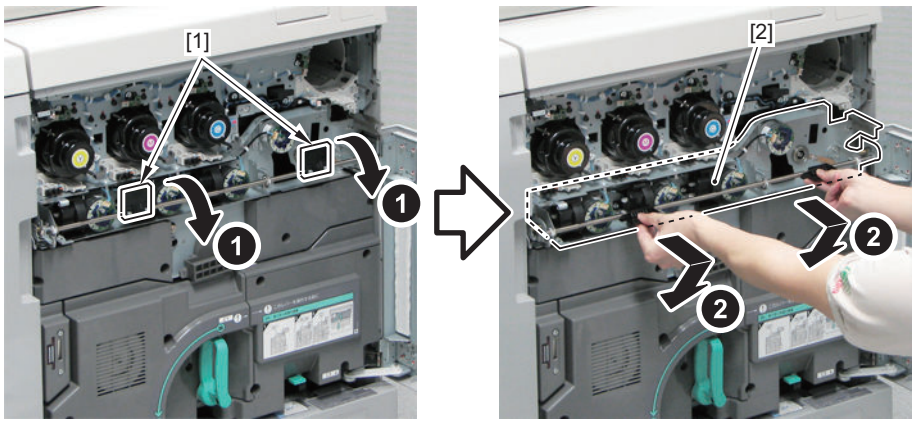
16. **Removing the Box Left Cover** **“Removing the Box Left Cover” on page 947**
17. **Removing the Box Upper Cover** **“Removing the Box Upper Cover” on page 948**
18. **Open the Controller Box** **“Open the Controller Box” on page 507**
19. **Removing the Drum Drive Unit (Bk)** **“Removing the Drum Drive Unit (Bk)” on page 734**

■ Disassembling Procedure

CAUTION:
Place the Hopper Unit (Bk) [1] on a sheet of paper [2], etc. when disassembling/assembling.

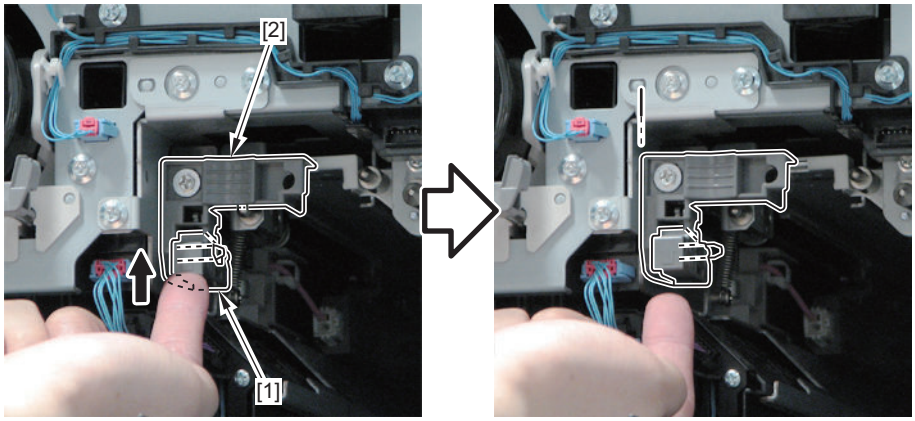


1. **Turn the 2 handles [1], and open the Process Unit Inner Cover [2] by pulling it out until it stops.**

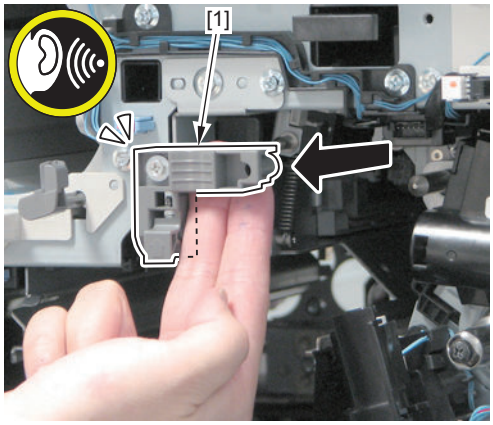


CAUTION:
Deterioration in sensitivity of the Photosensitive Drum may occur on the Process Unit (Y)/(M)/(C) inside the machine if the Process Unit Inner Cover is kept open for 5 minutes or more. Be sure to either install the Lightproof Sheet, or close the Process Unit Inner Cover within 5 minutes.

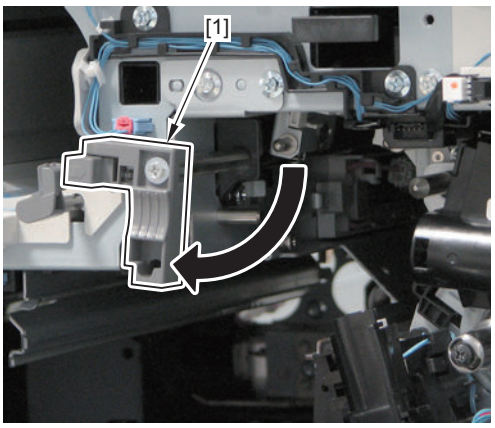
2. **Lift the Lock Release Lever [1], and release the lock of the Black Developing Assembly Pressure Lever [2].**



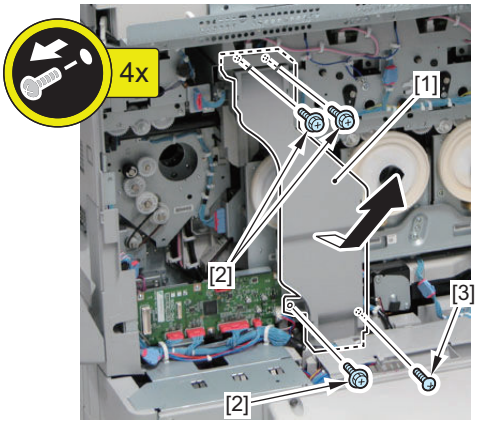
3. **Pull out the Black Developing Assembly Pressure Lever [1] until it stops.**



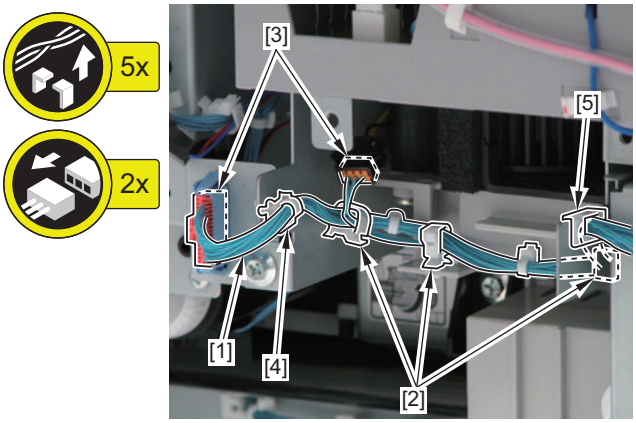
4. **Turn the Black Developing Assembly Pressure Lever [1].**



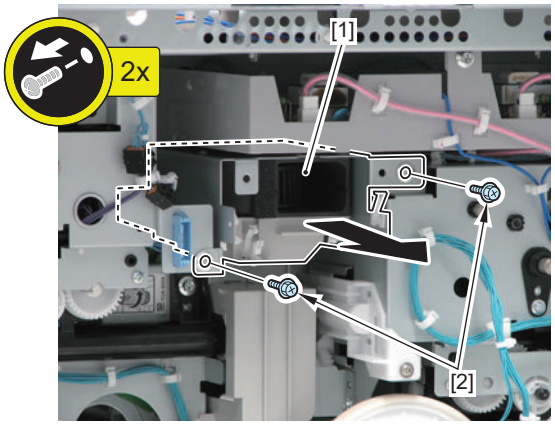
5. **Remove the Duct [1].**
   - 3 Screws (RS) [2]
   - 1 Screw (Tapping) [3]



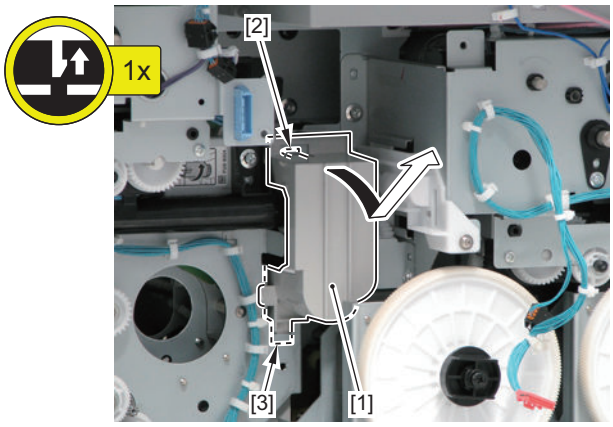
6. **Free the harness [1].**
   - 3 Wire Saddles [2]
   - 2 Connectors [3]
   - 1 Reuse Band [4]
   - 1 Edge Saddle [5]



7. **Remove the Fan Unit [1].**
   - 2 Screws [2]

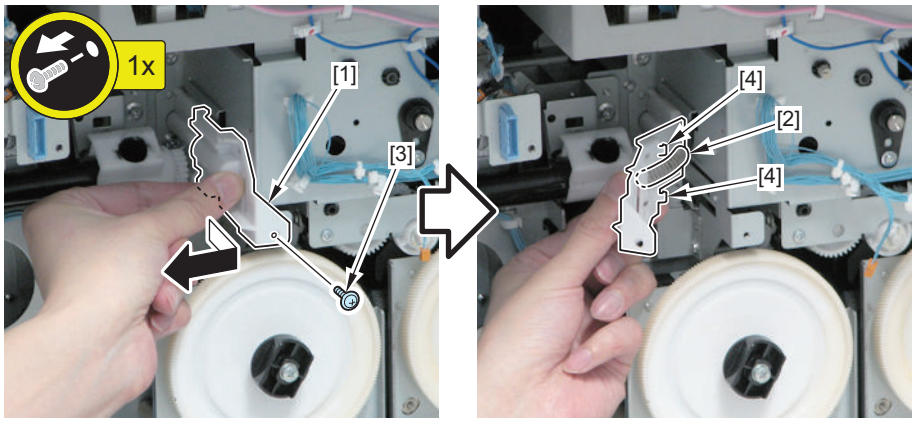


8. **While opening the upper part of the Hopper Shield [1], pull it forward to remove it.**
   - 1 Claw [2]
   - 1 Hook [3]



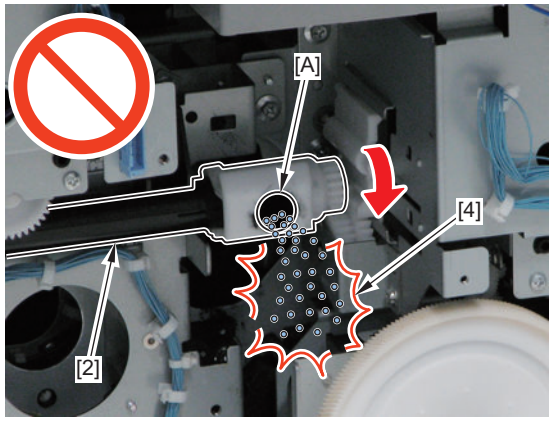
9. **Remove the Rail Cover (Front) [1] and the spring [2].**
   - 1 Screw [3]
   - 2 Hooks [4]

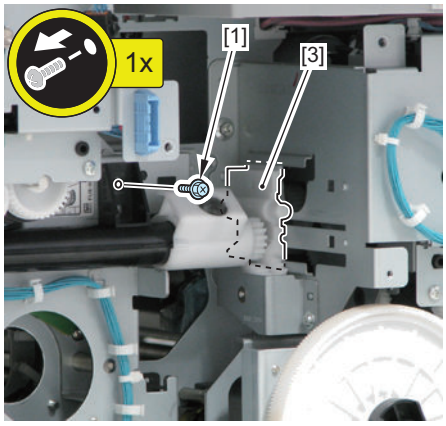
CAUTION:
Be sure to hold the Rail Cover (Front) [1] so as not to drop the spring [2] when removing it.

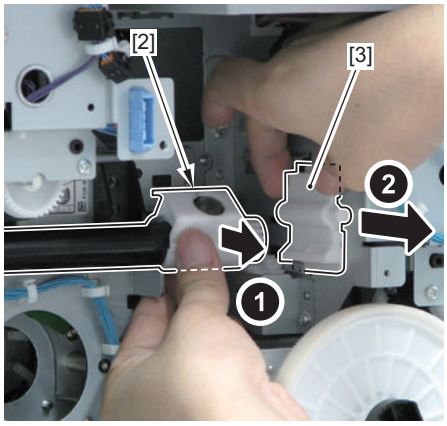


10. Remove the screw [1], and remove the Rail Cover (Rear) [3] while pulling the Toner Feed Pipe [2] toward the front.

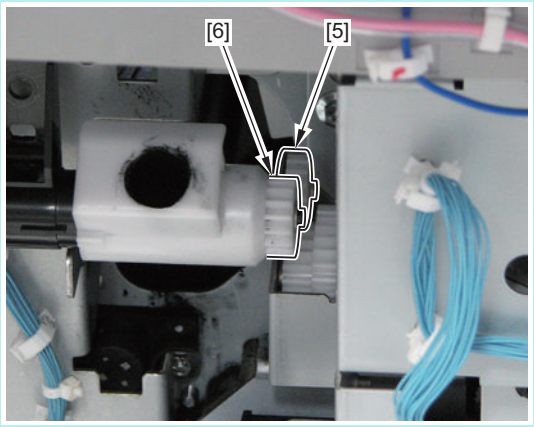
CAUTION:
Do not tilt the Supply Mouth [A] of the Toner Feed Pipe [2]; otherwise toner [4] may scatter.







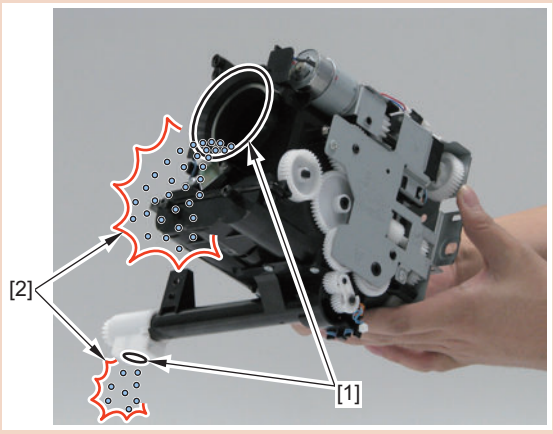
NOTE:
The Toner Feed Pipe [2] is pulled toward the front in order to disengage between the gear [5] of the Hopper Unit (Y)/(M)/(C) and the gear [6] of the Toner Feed Pipe.

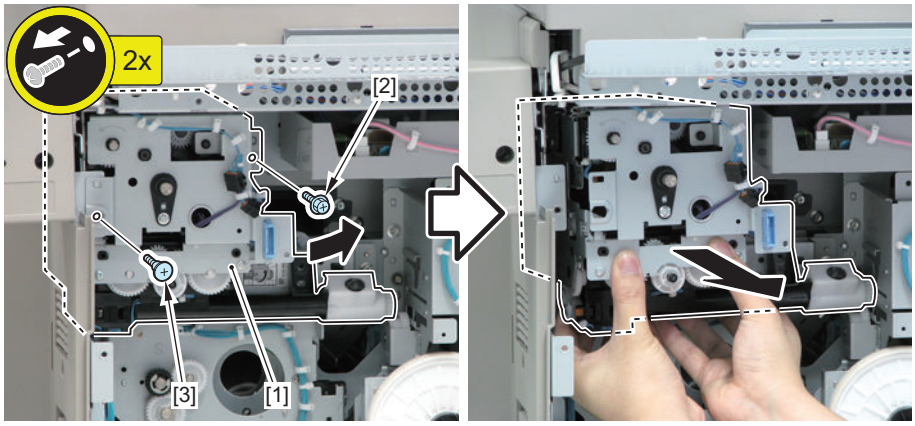


11. Remove the Hopper Unit (Bk) [1].

- 1 Screw [2]
- 1 Stepped Screw [3]

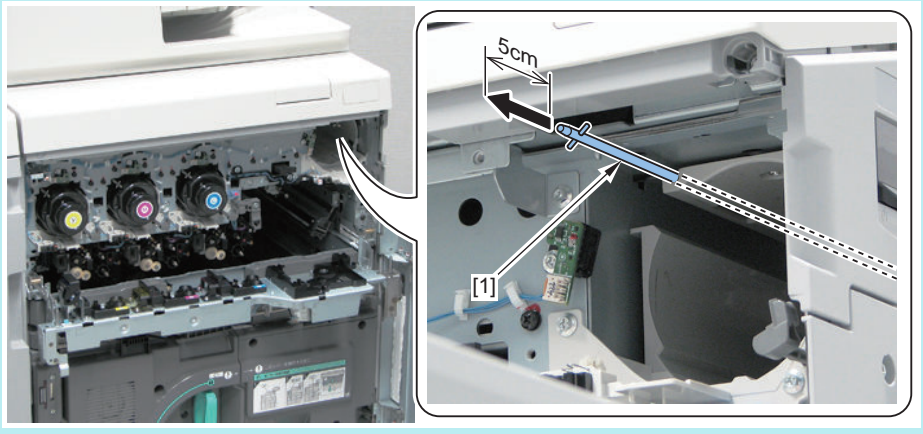
CAUTION:
When removing the Hopper Unit (Bk), be sure not to spill toner [2] from the Toner Supply Mouth [1].





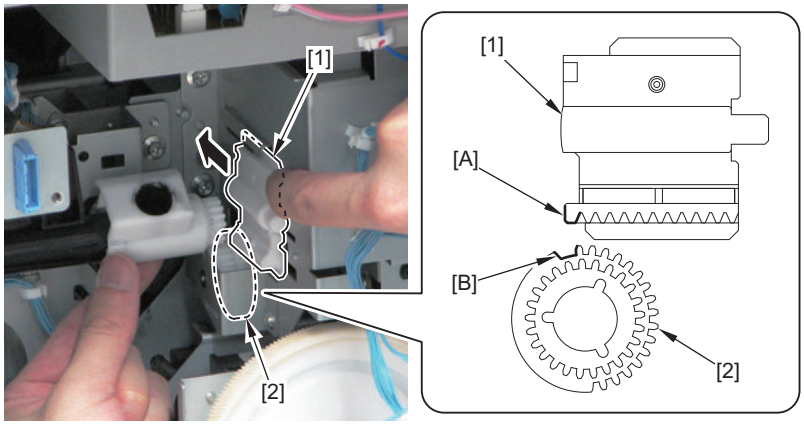
■ Assembling Procedure

NOTE:
When assembling the Hopper Unit (Bk), pull out the Small Door Open/Close Shaft [1] at the front side of the host machine by approx. 50 mm, and then install the Hopper Unit (Bk).

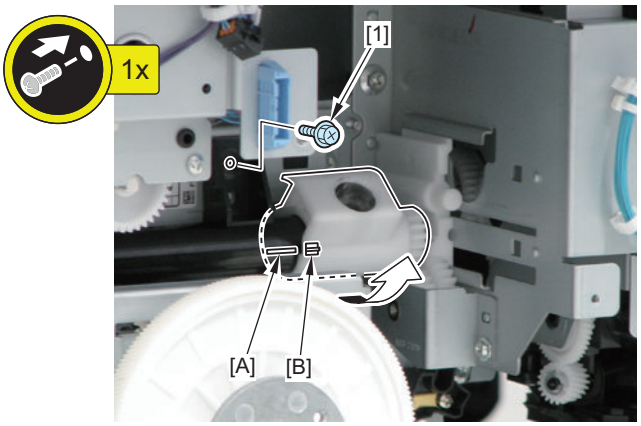


NOTE:
When assembling the Hopper Unit (Bk), use the following procedure to match the phase of the gear.

1. **Match the phase of the tooth [A] of the Rail Cover (Rear) [1] with the tooth [B] of the gear [2], and then push in the Rail Cover (Rear) [1] until it stops.**

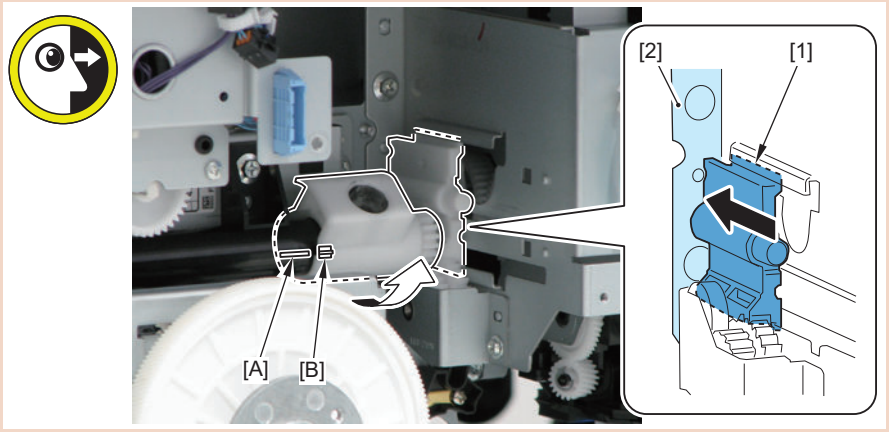


2. **Align the line [A] on the pipe of the Hopper Unit (Bk) with the line [B] on the Toner Supply Mouth, and then use the screw [1] to secure it.**

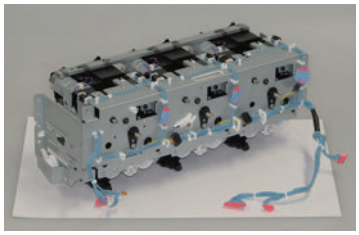


CAUTION:

- Be sure that the Rail Cover (Rear) [1] touches the plate [2] on the rear side.
- Be sure to rotate the Toner Supply Mouth in the direction of the arrow until it stops so that the line [A] on the pipe of the Hopper Unit (Bk) is aligned with the line [B] on the Toner Supply Mouth.



Removing the Hopper Unit (Y)/(M)/(C)

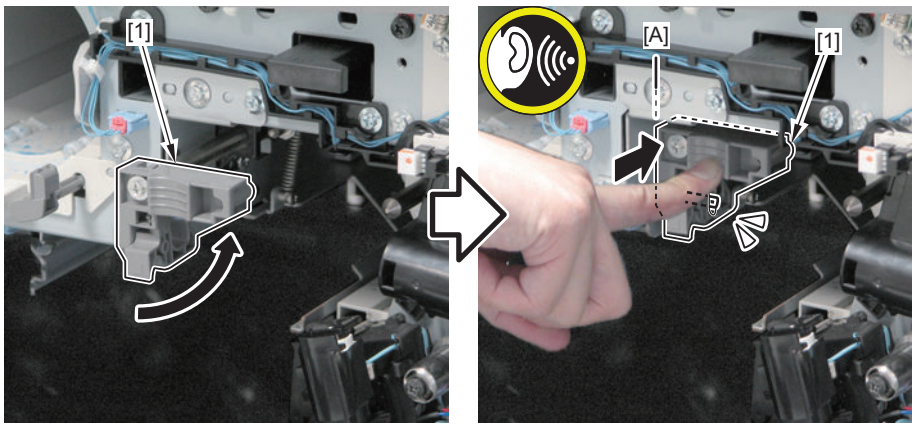


■ Preparation

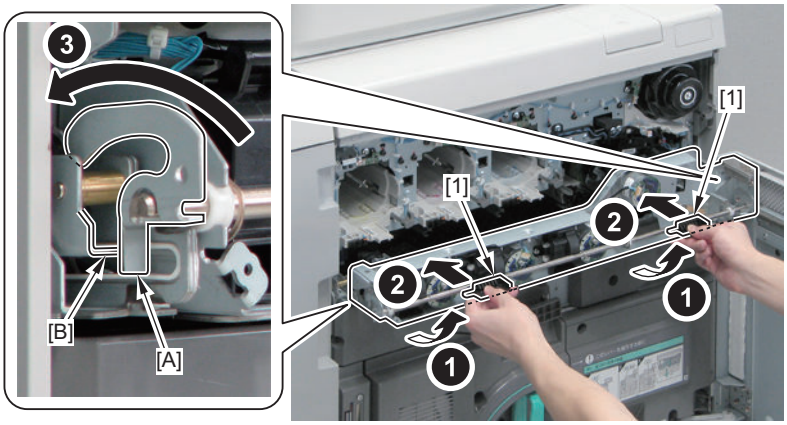
1. **Remove the Toner Container (Y)/(M)/(C).**

NOTE:
Before turning OFF the power of the host machine, use the Control Panel to remove the Toner Container (Y)/(M)/(C).
If the power of the host machine is already turned OFF, see the procedure on manually removing the Toner Container "Removing the Toner Container Manually" on page 727 to remove the Toner Container (Y)/(M)/(C).

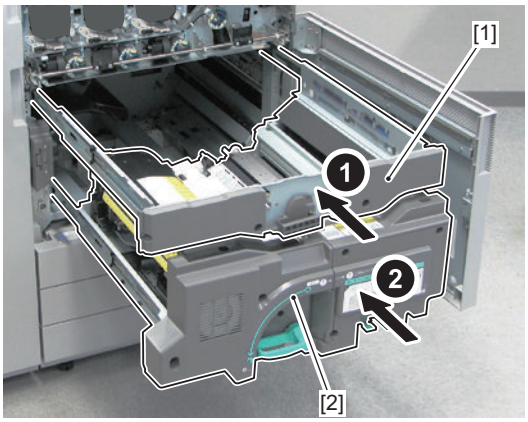
2. **Open the Front Cover.**
3. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
4. **Removing the Toner Container Replacement Cover****"Removing the Toner Container Replacement Cover" on page 941**
5. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
6. **Removing the Process Unit (Y)/(M)/(C)****"Removing the Process Unit (Y)/(M)/(C)" on page 712**
7. **Removing the Developing Assembly (Bk)****"Removing the Developing Assembly (Bk)" on page 701**
8. **Turn the Black Developing Assembly Pressure Lever [1] counterclockwise, and push it to the position [A] to lock the lever.**



9. **Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the handles at a 90-degree angle further and close the Process Unit Inner Cover [2].**



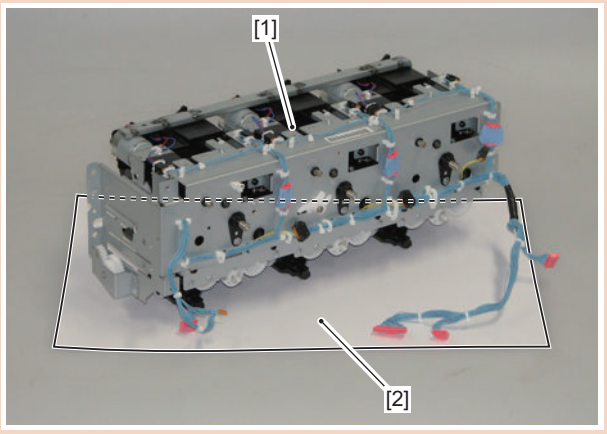
10. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
11. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
12. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
13. **Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.**



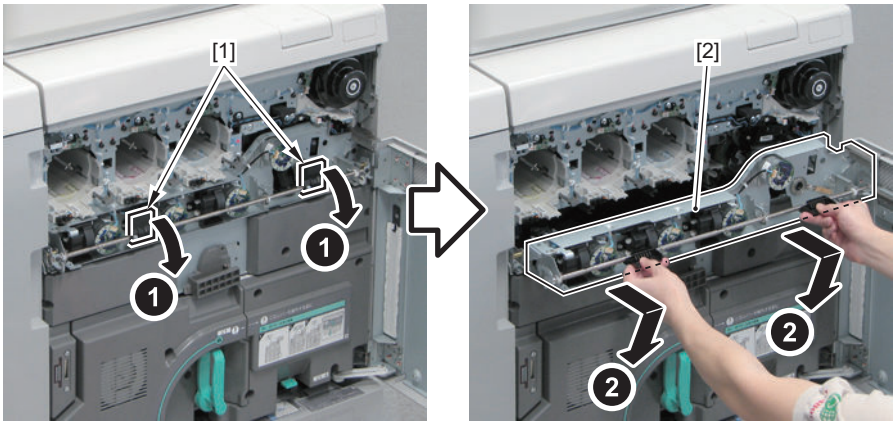
14. **Removing the Box Left Cover****"Removing the Box Left Cover" on page 947**
15. **Removing the Box Upper Cover****"Removing the Box Upper Cover" on page 948**
16. **Opening the Controller Box****"Open the Controller Box" on page 507**
17. **Removing the Process Drive Unit (Y)/(M)/(C)****"Removing the Process Drive Unit (Y)/(M)/(C)" on page 741**
18. **Removing the Developing Drive Unit (Y)/(M)/(C)****"Removing the Developing Drive Unit (Y)/(M)/(C)" on page 772**

■ Disassembling Procedure

CAUTION:
Place the Hopper Unit (Y)/(M)/(C) [1] on a sheet of paper [2], etc. when disassembling/assembling.

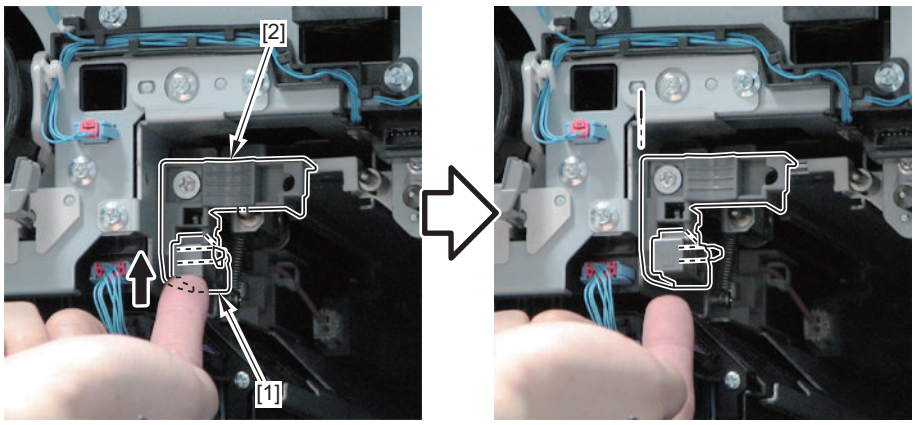


1. **Turn the 2 handles [1], and open the Process Unit Inner Cover [2] by pulling it out until it stops.**

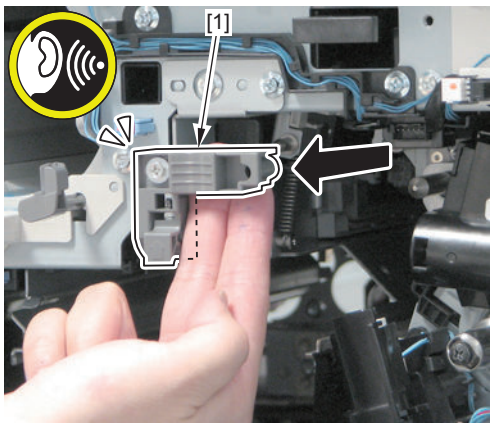


CAUTION:
Deterioration in sensitivity of the Photosensitive Drum may occur on the Drum Unit (Bk) inside the machine if the Process Unit Inner Cover is kept open for 5 minutes or more.
Be sure to either install the Lightproof Sheet, or close the Process Unit Inner Cover within 5 minutes.

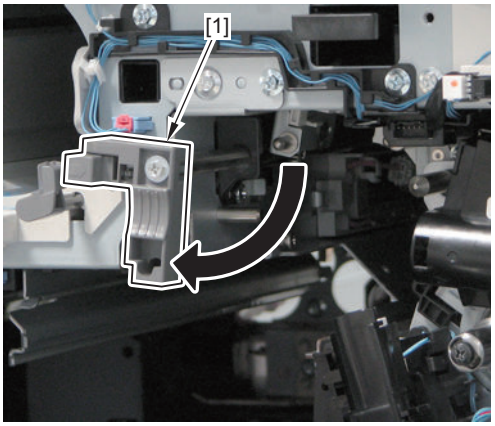
2. **Lift the Lock Release Lever [1], and release the lock of the Black Developing Assembly Pressure Lever [2].**



3. **Pull out the Black Developing Assembly Pressure Lever [1] until it stops.**

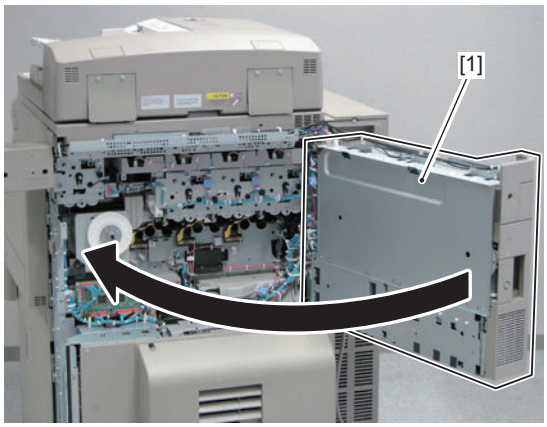


4. **Turn the Black Developing Assembly Pressure Lever [1].**

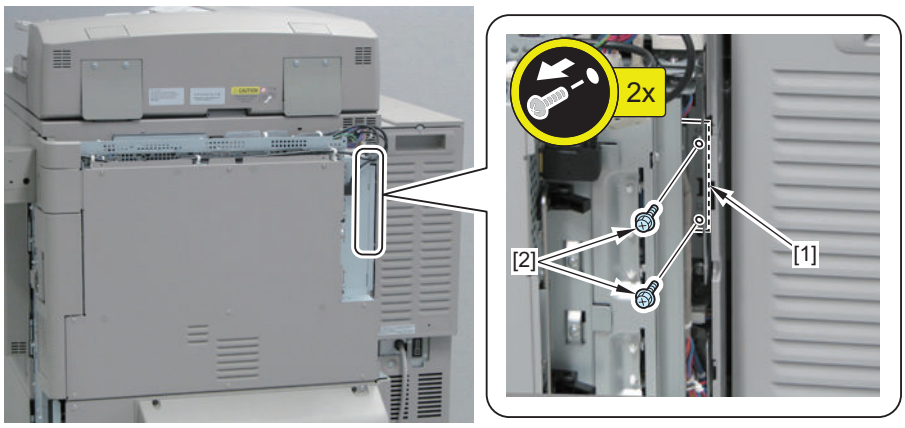


5. **Close the Controller Box [1].**

CAUTION:
When closing the Controller Box, be careful not to trap the harness.

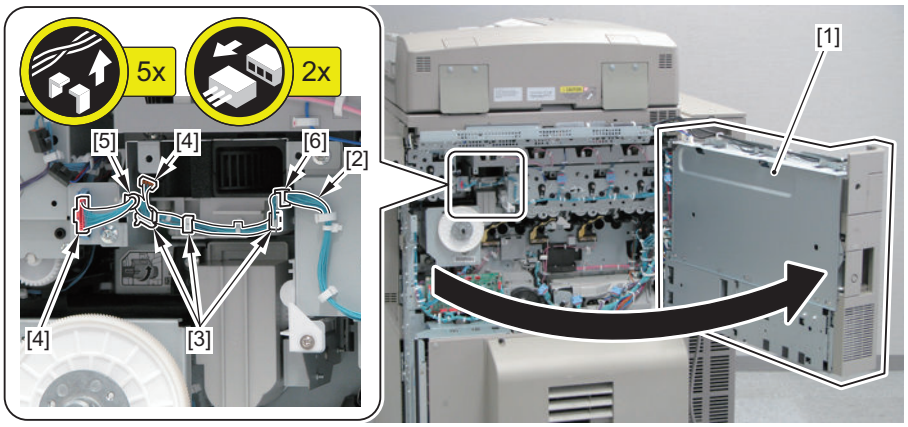


6. **Remove the 2 screws [2] of the Hopper Unit (Y)/(M)/(C) [1].**

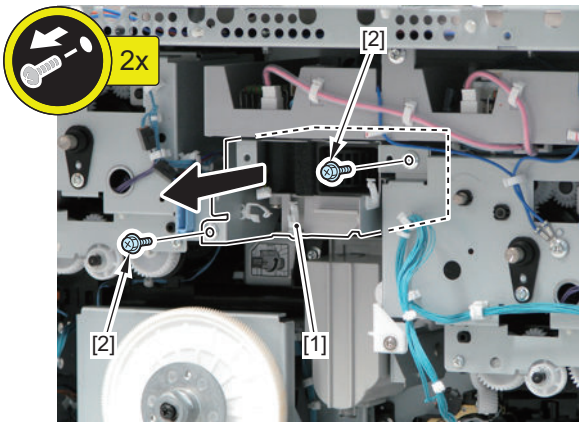


7. **Open the Controller Box [1].**

8. **Free the harness [2].**
   - 3 Wire Saddles [3]
   - 2 Connectors [4]
   - 1 Reuse Band [5]
   - 1 Edge Saddle [6]

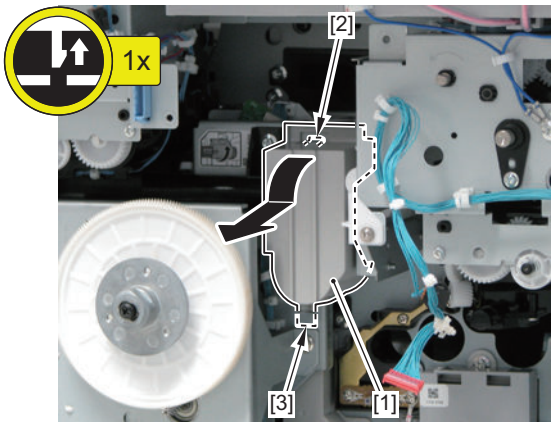


9. **Remove the Fan Unit [1].**
   - 2 Screws [2]



10. While opening the upper part of the Hopper Shield [1], pull it forward to remove it.

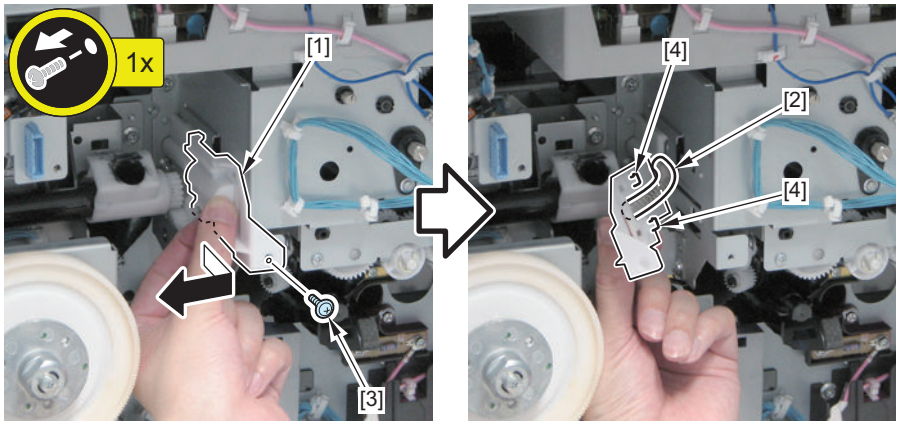
- 1 Claw [2]
- 1 Hook [3]



11. Remove the Rail Cover (Front) [1] and the spring [2].

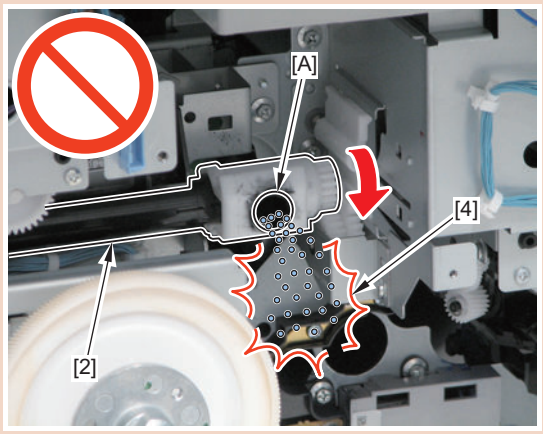
- 1 Screw [3]
- 2 Hooks [4]

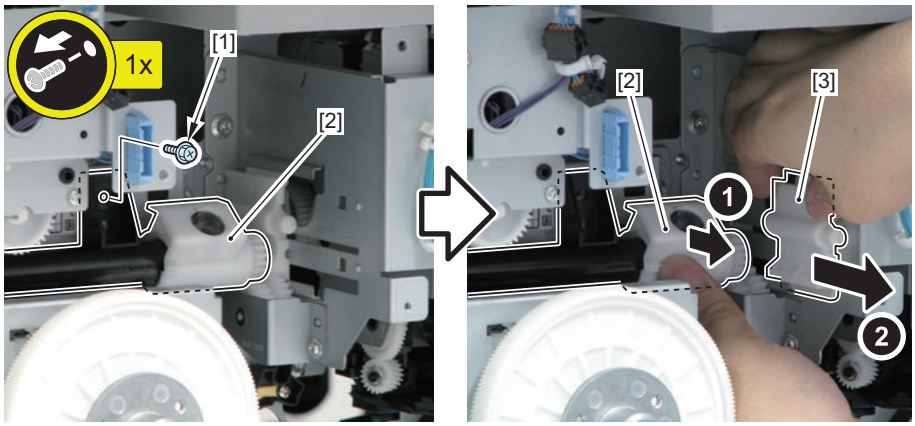
CAUTION:
Be sure to hold the Rail Cover (Front) [1] so as not to drop the spring [2] when removing it.



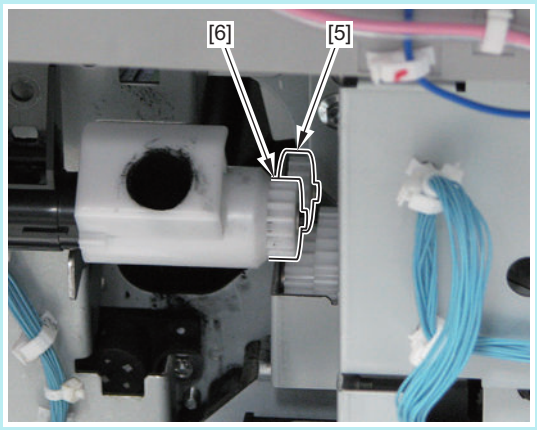
12. Remove the screw [1], and remove the Rail Cover (Rear) [3] while pulling the Toner Feed Pipe [2] toward the front.

CAUTION:
Do not tilt the Supply Mouth [A] of the Toner Feed Pipe [2]; otherwise toner [4] may scatter.



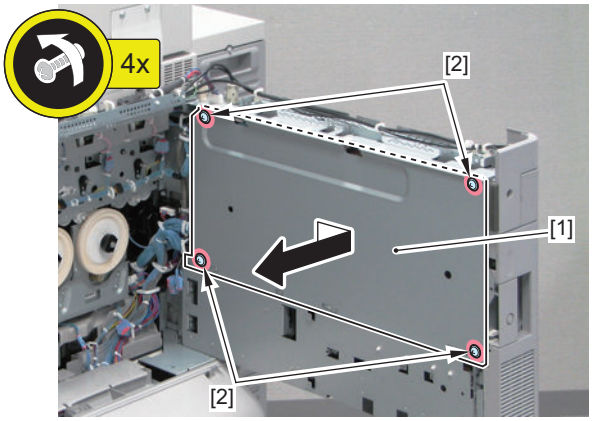


NOTE:
The Toner Feed Pipe [2] is pulled toward the front in order to disengage between the gear [5] of the Hopper Unit (Y)/(M)/(C) and the gear [6] of the Toner Feed Pipe.

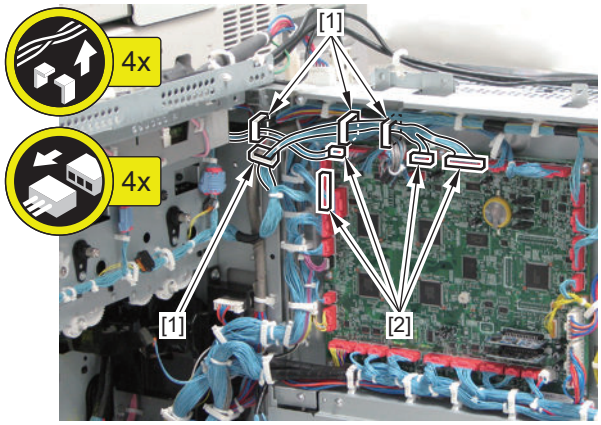


13. Remove the DC Controller Cover [1].

- 4 Screws [2] (to loosen)



14. Open the 4 Wire Saddles [1], and disconnect the 4 connectors [2].

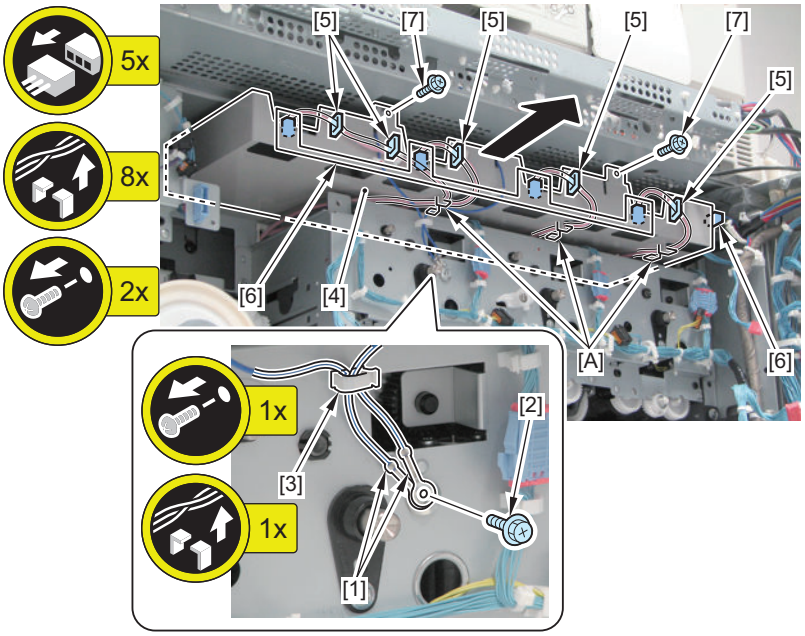


15. Remove the 2 Grounding Wires [1].

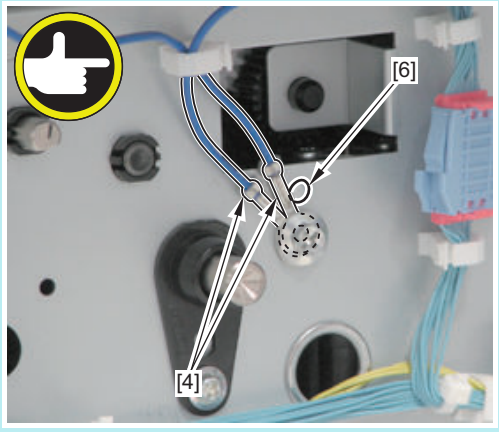
- 1 Screw [2]
- 1 Wire Saddle [3]

16. Remove the Developing High Voltage PCB [4].

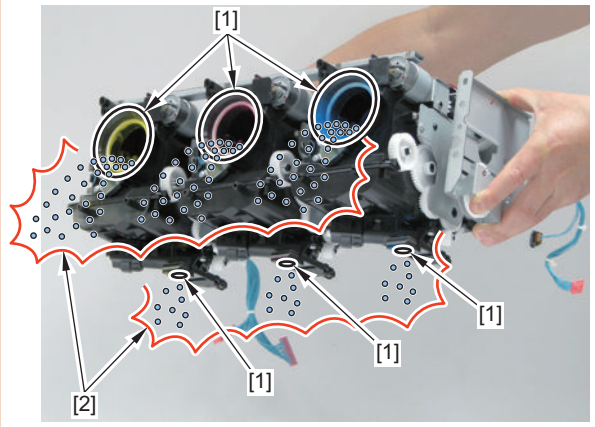
- 5 Wire Saddles [5]
- 5 Connectors [6]
- 3 Guides [A]
- 2 Screws [7]



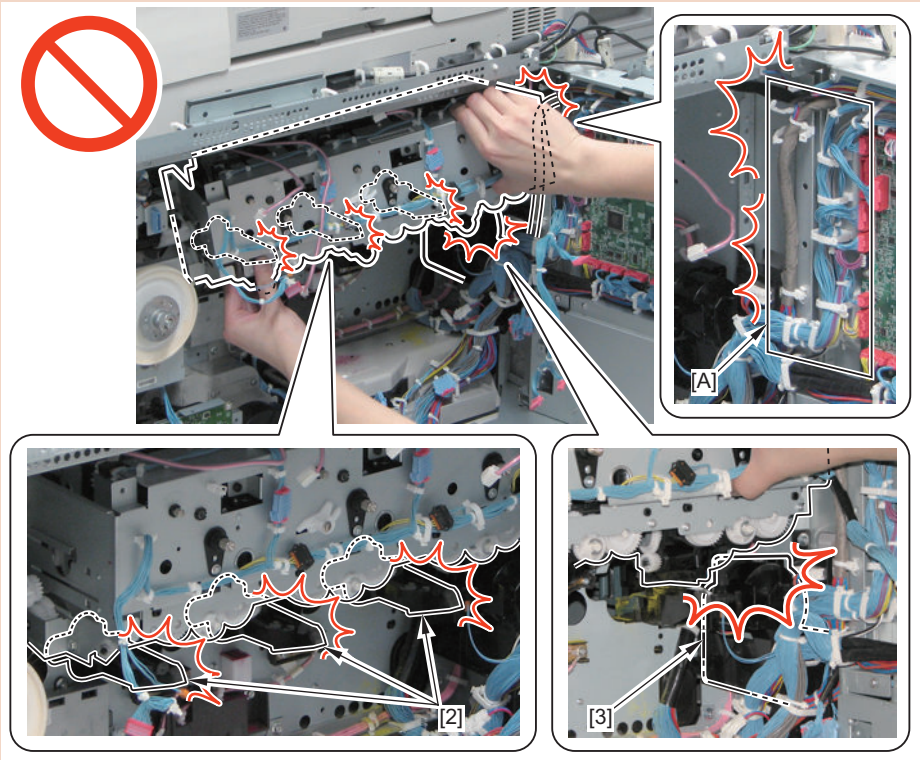
NOTE:
When installing the Grounding Terminal [4], be sure that it is not placed on the boss [6].



CAUTION:
When disassembling/assembling the Hopper Unit (Y)/(M)/(C), pay attention to the following points.
- Do not spill toner [2] from the Toner Supply Mouth [1].

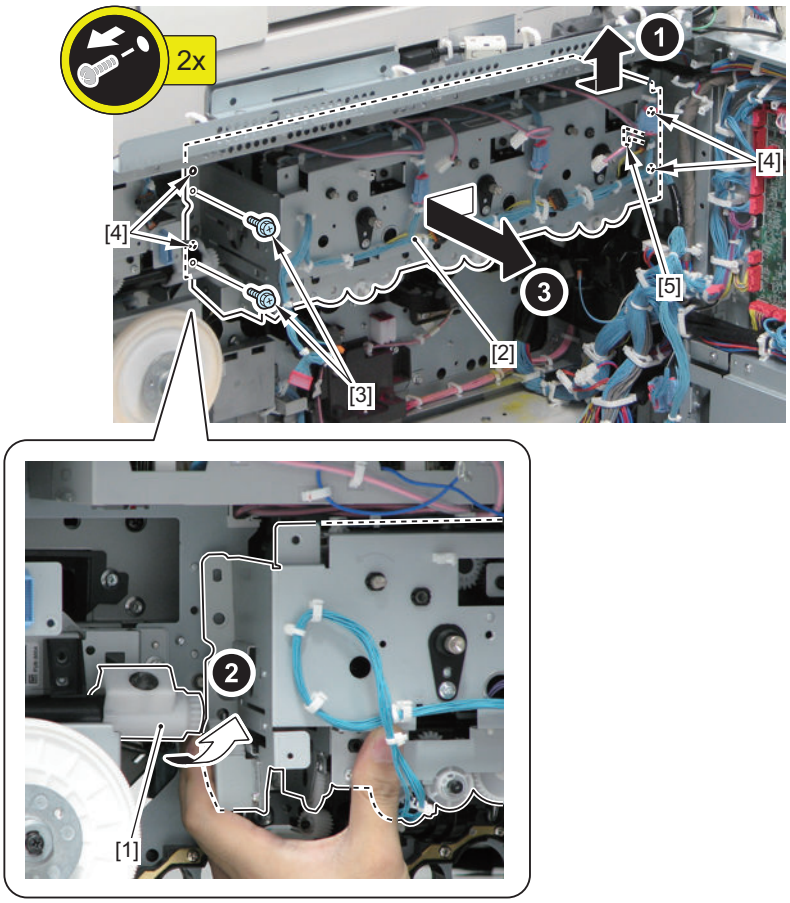


CAUTION:
- When installing/removing the Hopper Unit (Y)/(M)/(C), do not hit it with the 3 ducts [2], the harness [A], and the Hopper Cooling Suction Fan [3].



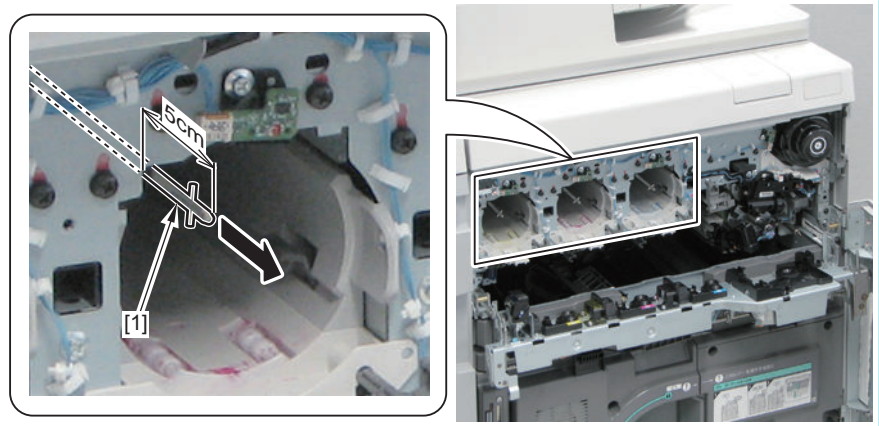
17. Remove the Hopper Unit (Y)/(M)/(C) [2] while avoiding the gear [1] of the Hopper Unit (Bk).

- 2 Screws [3]
- 4 Bosses [4]
- 1 Hook [5]



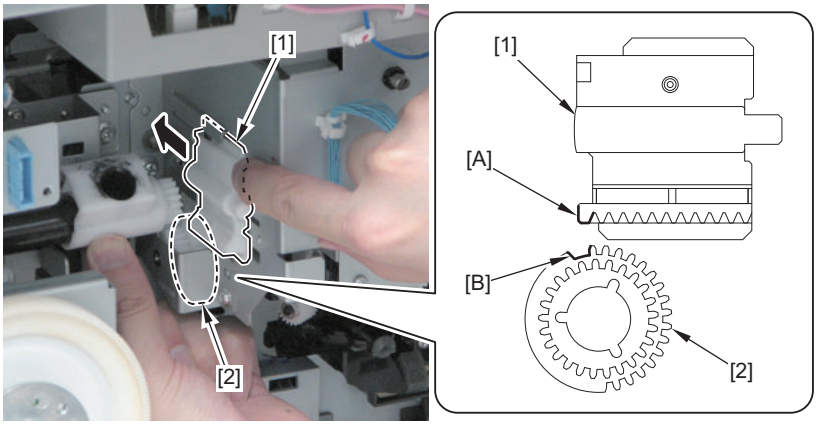
■ Assembling Procedure

NOTE:
When assembling the Hopper Unit (Y)/(M)/(C), pull out the 3 Small Door Open/Close Shafts [1] at the front side of the host machine by approx. 50 mm, and then install the Hopper Unit (Y)/(M)/(C).

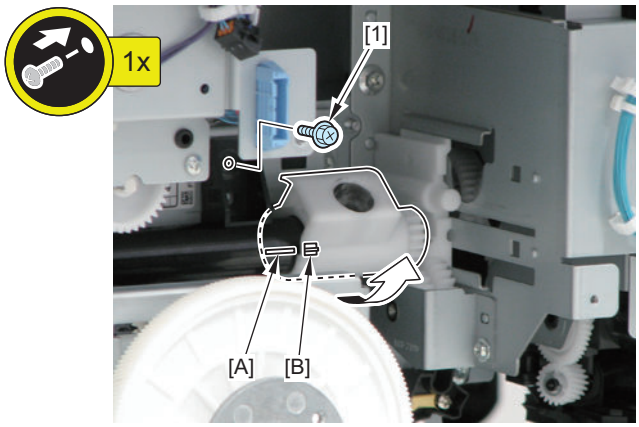


NOTE:
When assembling the Hopper Unit (Y)/(M)/(C), use the following procedure to match the phase of the gear.

1. **Match the phase of the tooth [A] of the Rail Cover (Rear) [1] with the tooth [B] of the gear [2], and then push in the Rail Cover (Rear) [1] until it stops.**

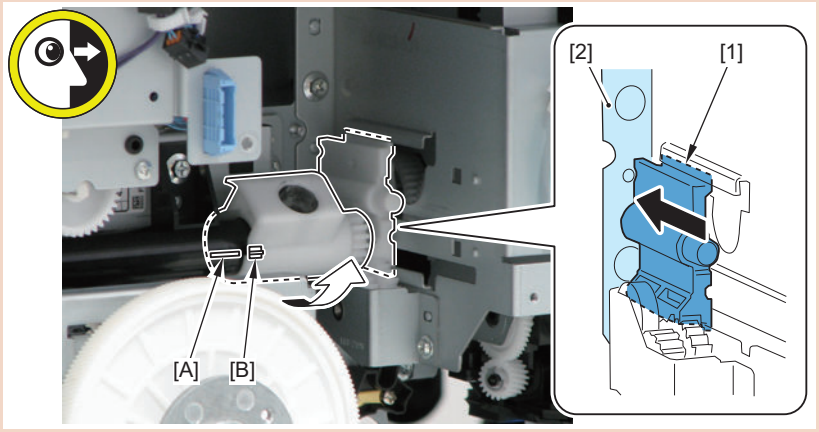


2. **Align the line [A] on the pipe of the Hopper Unit (Bk) with the line [B] on the Toner Supply Mouth, and then use the screw [1] to secure it.**

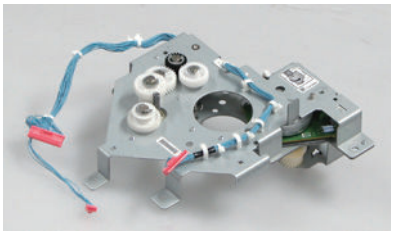


CAUTION:

- Be sure that the Rail Cover (Rear) [1] touches the plate [2] on the rear side.
- Be sure to rotate the Toner Supply Mouth in the direction of the arrow until it stops so that the line [A] on the pipe of the Hopper Unit (Bk) is aligned with the line [B] on the Toner Supply Mouth.



Removing the Developing Drive Unit (Bk)

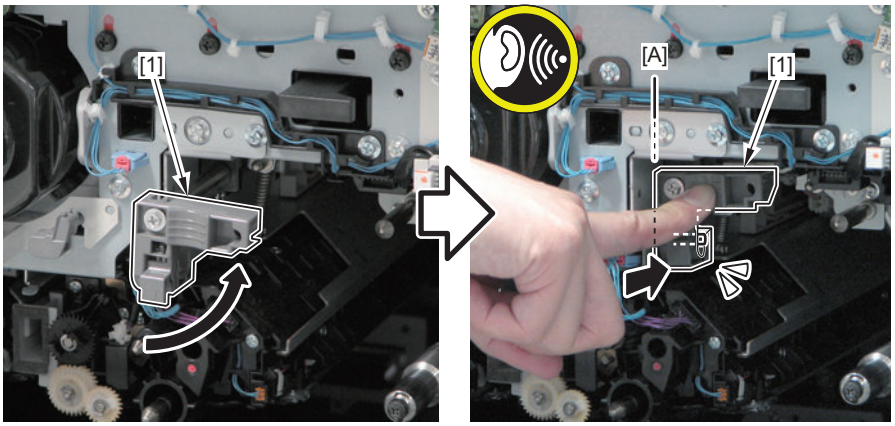


■ Preparation

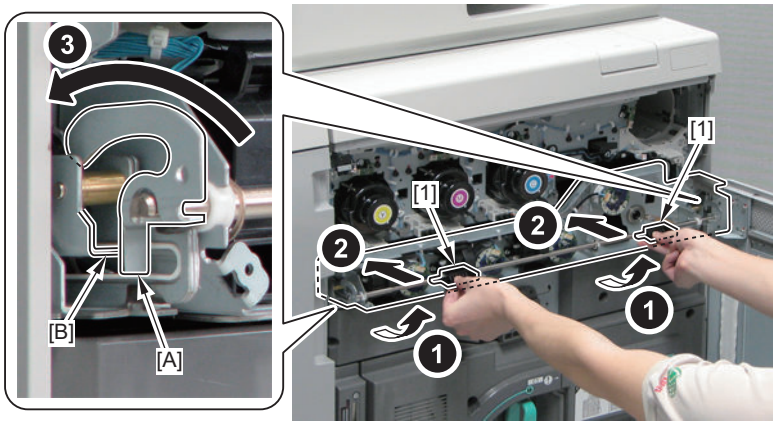
1. **Remove the Toner Container (Bk).**

NOTE:
Before turning OFF the power of the host machine, use the Control Panel to remove the Toner Container of the corresponding color.
If the power of the host machine is already turned OFF, see the procedure on manually removing the Toner Container "Removing the Toner Container Manually" on page 727 to remove the Toner Container of the corresponding color.

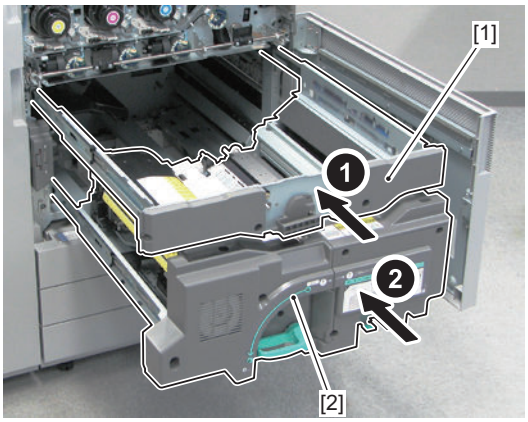
2. **Open the Front Cover.**
3. **Removing the Toner Replacement Cover****"Removing the Toner Replacement Cover" on page 941**
4. **Removing the Toner Container Replacement Cover****"Removing the Toner Container Replacement Cover" on page 941**
5. **Open the Process Unit Inner Cover.****"Opening the Process Unit Inner Cover" on page 542**
6. **Removing the Primary Charging Assembly****"Removing the Primary Charging Assembly" on page 627**
7. **Removing the Pre-transfer Charging Assembly****"Removing the Pre-transfer Charging Assembly" on page 649**
8. **Removing the Developing Assembly (Bk)****"Removing the Developing Assembly (Bk)" on page 701**
9. **Removing the Drum Unit (Bk)****"Removing the Drum Unit (Bk)" on page 662**
10. **Turn the Black Developing Assembly Pressure Lever [1] counterclockwise, and push it to the position [A] to lock the lever.**



11. **Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the handles at a 90-degree angle further and close the Process Unit Inner Cover [2].**



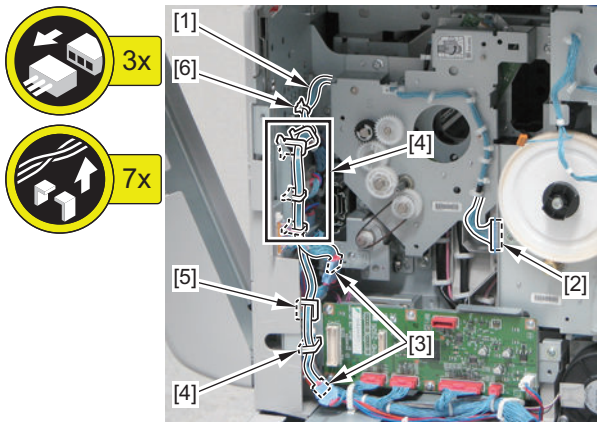
12. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
13. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
14. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
15. **Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.**



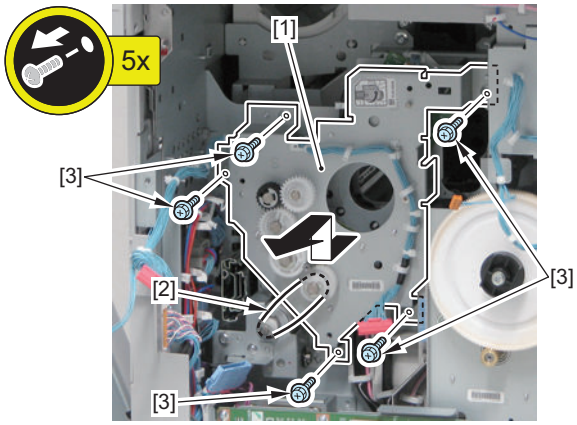
16. **Removing the Box Left Cover****"Removing the Box Left Cover" on page 947**
17. **Removing the Box Upper Cover****"Removing the Box Upper Cover" on page 948**
18. **Opening the Controller Box****"Open the Controller Box" on page 507**
19. **Removing the Drum Drive Unit (Bk)****"Removing the Drum Drive Unit (Bk)" on page 734**
20. **Removing the Hopper Unit (Bk)****"Removing the Hopper Unit (Bk)" on page 748**

■ Procedure

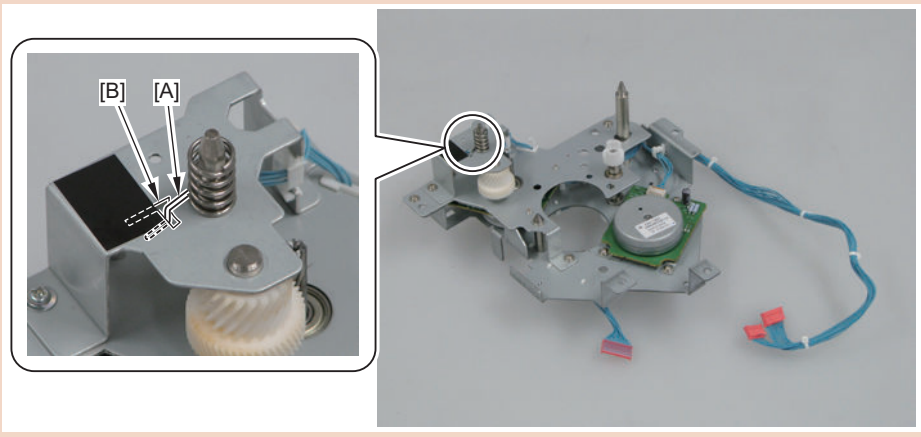
1. **Free the harness [1].**
   - 1 Connector [2]
   - 2 Relay Connectors [3]
   - 5 Wire Saddles [4]
   - 1 Edge Saddle [5]
   - 1 Reuse Band [6]



2. **Remove the Developing Drive Unit (Bk) [1].**
   - Timing Belt [2]
   - 5 Screws [3]



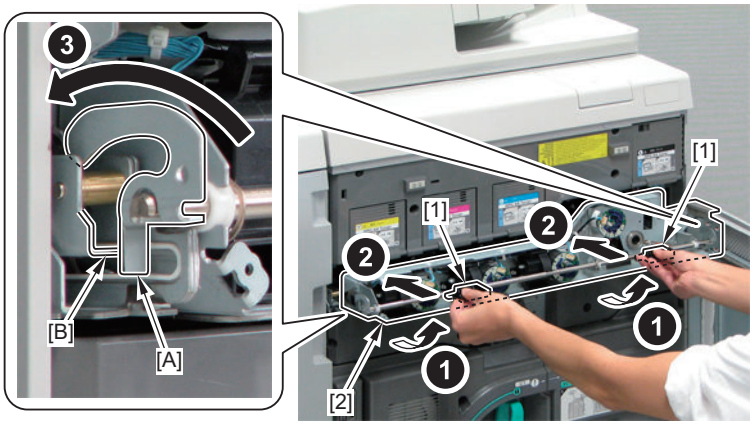
CAUTION:
When assembling the Developing Drive Unit (Bk), be sure that the leading edge [A] of the spring is hooked to the groove [B] of the Developing Drive Unit (Bk).



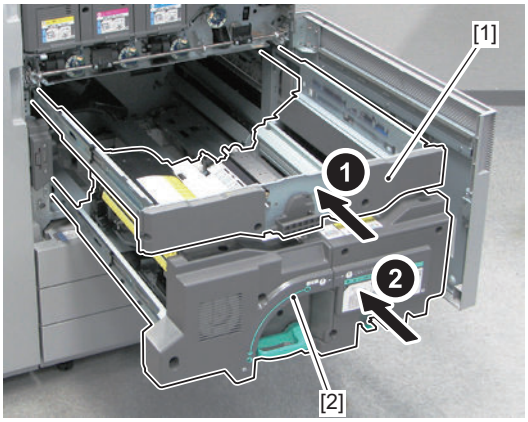
Removing the Developing Drive Unit (Y)/(M)/(C)

■ Preparation

1. Open the Front Cover.
2. Removing the Toner Replacement Cover"Removing the Toner Replacement Cover" on page 941
3. Open the Process Unit Inner Cover."Opening the Process Unit Inner Cover" on page 542
4. Removing the Process Unit (Y)/(M)/(C)"Removing the Process Unit (Y)/(M)/(C)" on page 712
5. Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the handles at a 90-degree angle further and close the Process Unit Inner Cover [2].



6. Pull out the Fixing Feed Unit."Pulling out the Fixing Feed Unit" on page 859
7. Pulling out the ITB Unit"Pulling out the ITB Unit" on page 550
8. Removing the ITB Unit"Removing the ITB Unit" on page 553
9. Put the ITB Frame [1] and the Fixing Feed Unit [2] back in the host machine.

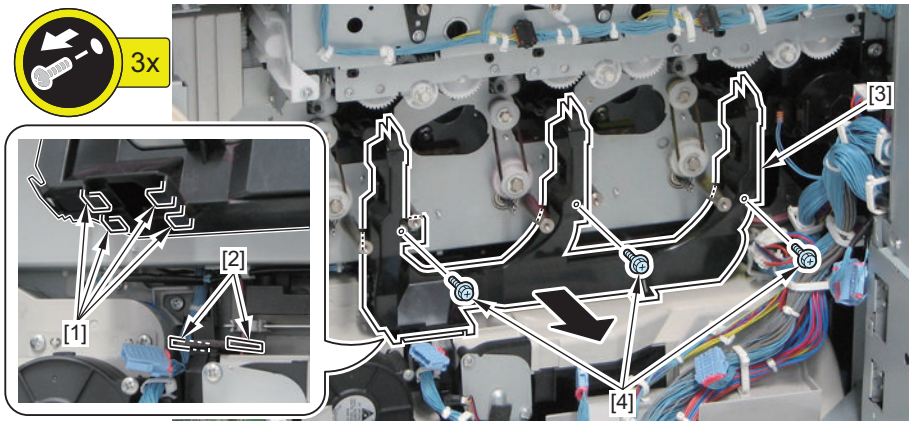


10. Removing the Box Left Cover"Removing the Box Left Cover" on page 947
11. Removing the Box Upper Cover"Removing the Box Upper Cover" on page 948
12. Open the Controller Box."Open the Controller Box" on page 507

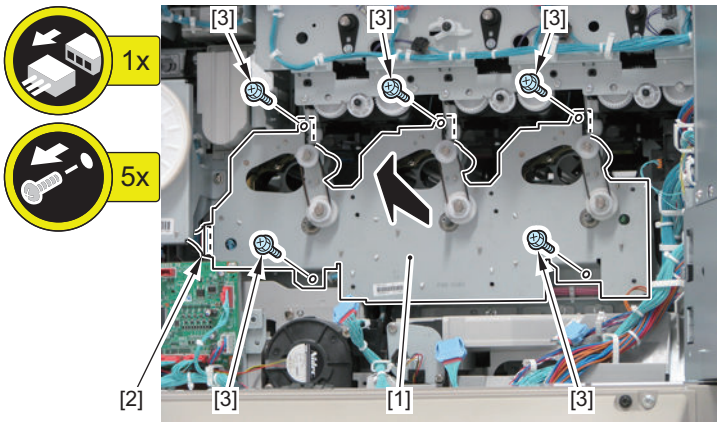
13. **Removing the Process Drive Unit (Y)/(M)/(C)****"Removing the Process Drive Unit (Y)/(M)/(C)" on page 741**

■ Procedure

1. **Pull out the 4 hooks [1] from the rail [2], and remove the duct [3].**
   - 3 Screws [4]



2. **Remove the Developing Drive Unit (Y)/(M)/(C) [1].**
   - 1 Connector [2]
   - 5 Screws [3]

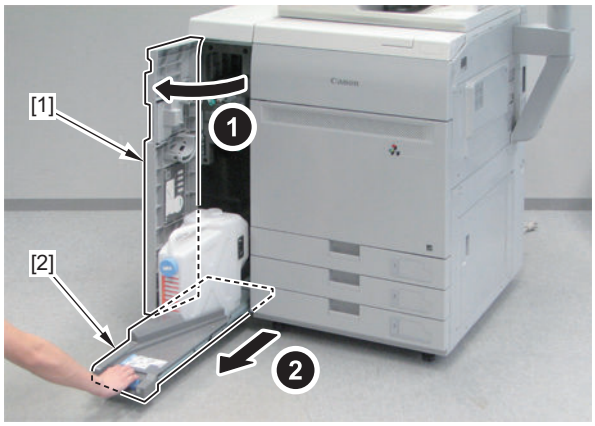


Removing the Waste Toner Container/Collecting Waste Toner

NOTE:
When disposing waste toner only, prepare the waste toner collection tools of the service parts (Waste Toner Joint, Waste Toner Bag, and Waste Toner Band).

■ Procedure

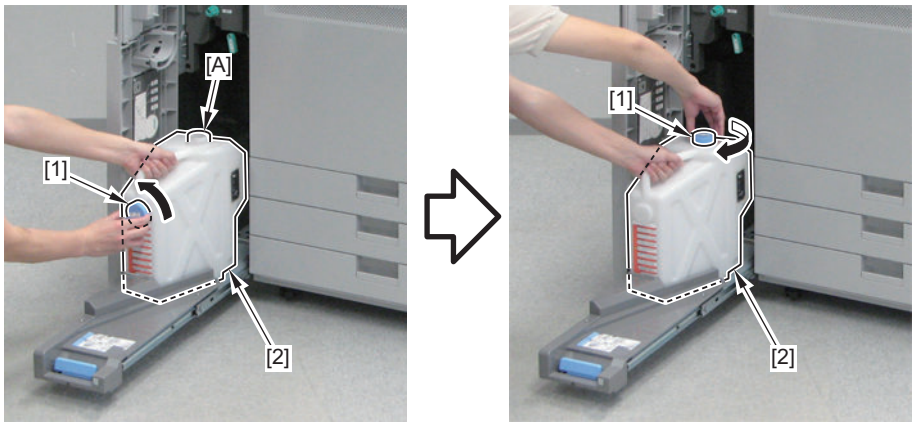
1. **Open the Front Left Cover [1].**
2. **Pull out the Waste Toner Container Storage Tray [2].**



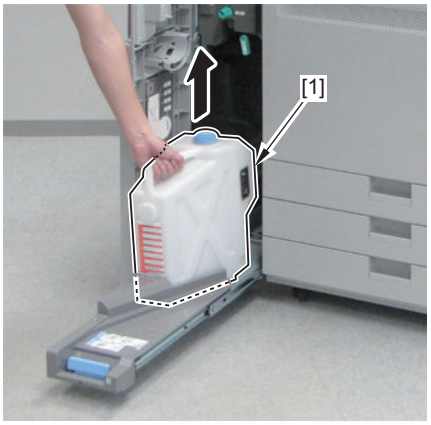
NOTE:
- In the case of collecting waste toner by bringing back the Waste Toner Container, refer to steps 3 to 5.
- In the case of disposing the waste toner only, refer to steps 6 to 17.

In the case of collecting waste toner by bringing back the Waste Toner Container

3. **Remove the Waste Toner Container Cap [1] and attach it to the opening [A] of the Waste Toner Container [2].**



4. **Take out the Waste Toner Container [1].**

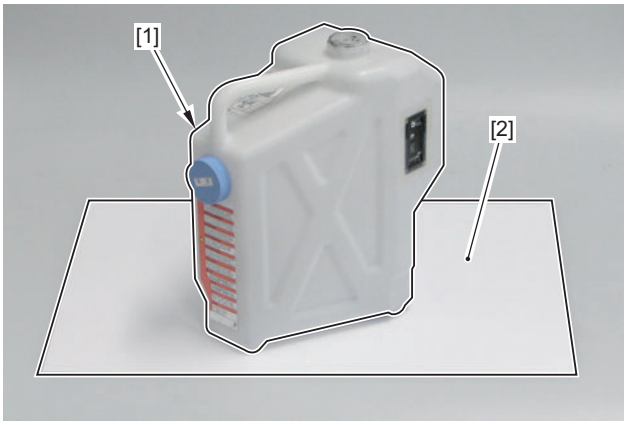


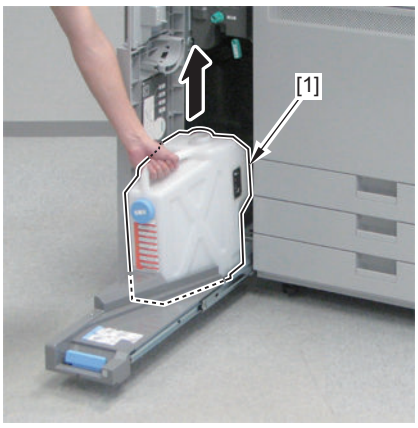
5. **Install the new Waste Toner Container and the Waste Toner Container Cap to the host machine in reverse order.**
   When disposing of waste toner only

CAUTION:
- Do not put waste toner of more than one time in one bag.
- When putting toner in the Waste Toner Bag, be sure to place it on the floor.
- Once the plastic bag is fixed with packing tape, do not remove the tape.

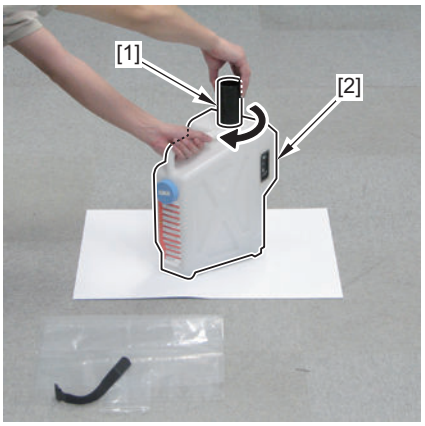
6. **Take out the Waste Toner Container [1].**

CAUTION:
Because the waste toner in the Waste Toner Container [1] may be scattered, be sure to place the Waste Toner Container on a sheet of paper [2].

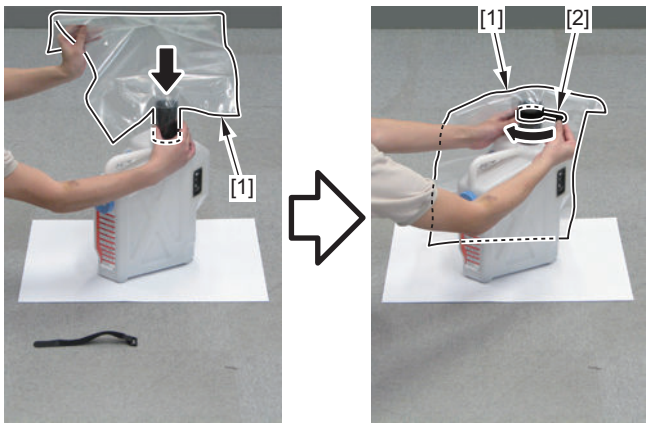




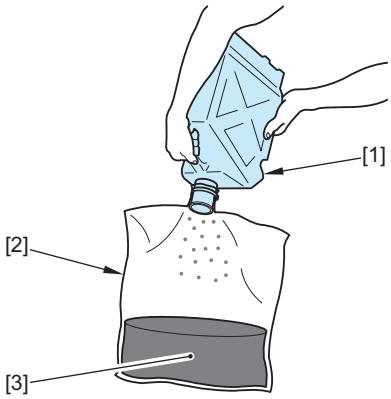
7. **Install the Waste Toner Joint [1] to the Waste Toner Container [2].**



8. **Put the Waste Toner Bag [1] on the Waste Toner Joint and fix it with the Waste Toner Band [2].**

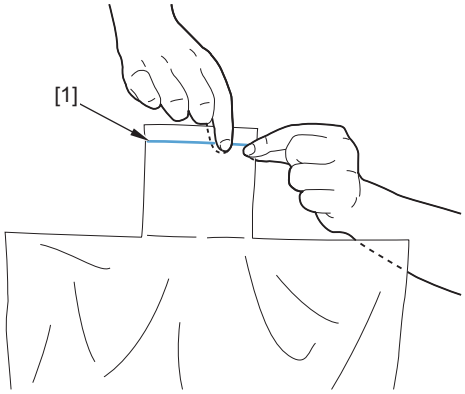


9. **Move the waste toner [3] from the Waste Toner Container [1] to the Waste Toner Bag [2].**

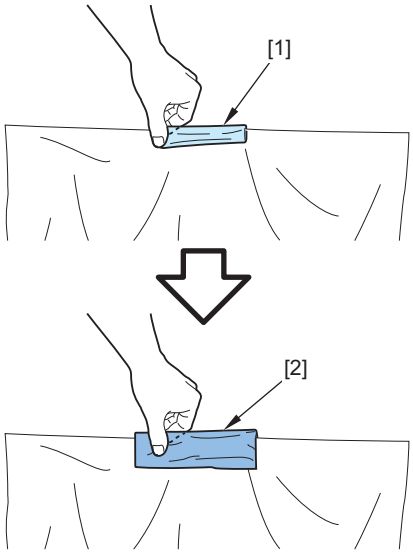


10. **Remove the Waste Toner Band.**

11. **Remove the Waste Toner Bag from the Waste Toner Container and close the opening [1].**

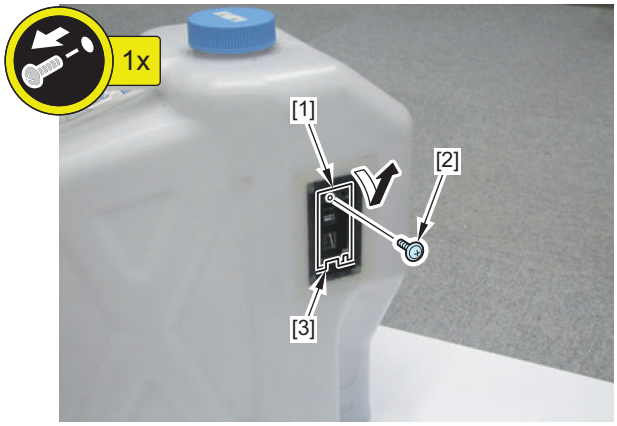


12. **Fold the opening [1] of the Waste Toner Bag and fix it with packing tape [2].**



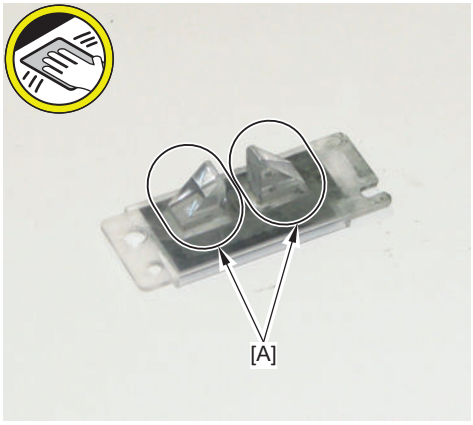
13. **Remove the Waste Toner Joint.**

14. **Remove the Prism [1].**
    - 1 Screw [2]
    - 1 Hook [3]

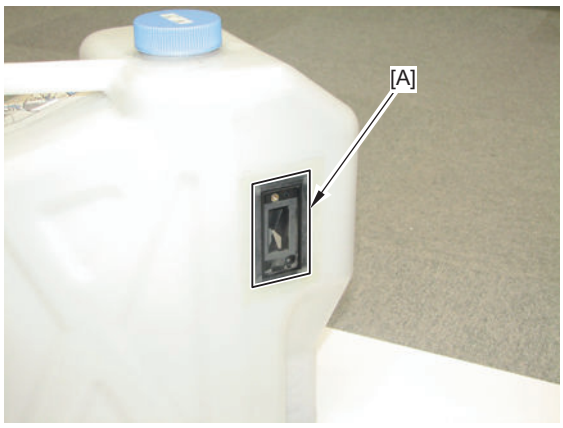


15. **Wipe toner off the 2 prism surfaces [A] with lint-free paper moistened with water.**

CAUTION:
- Do not use ethanol or dry cloth.
- Check that the Prism is dry before installing it to the host machine.



16. **Clean toner from the [A] part of the Waste Toner Container.**



17. **Install the removed parts in reverse order.**
    - Prism
    - Waste Toner Container

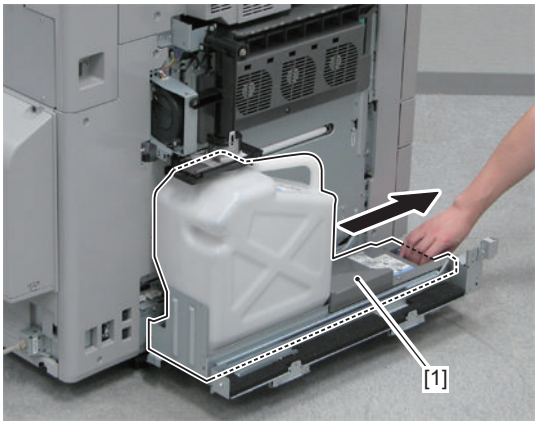
Removing the Waste Toner Vertical Pipe Unit

■ Preparation

1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**
2. **Removing the Decurler Unit****"Removing the Decurler Unit" on page 910**

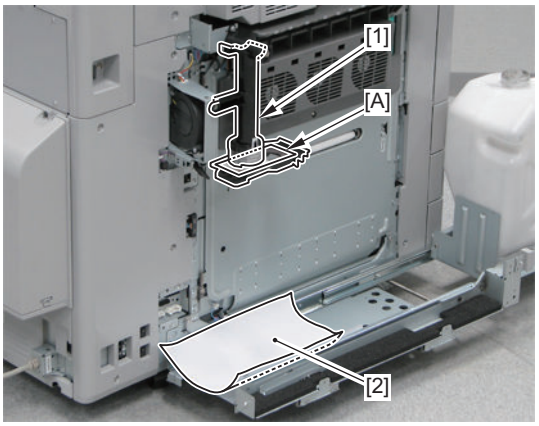
■ Procedure

1. **Pull out the Waste Toner Container Storage Tray [1].**

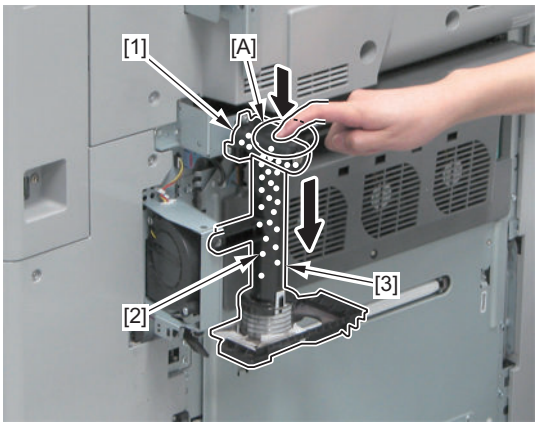


2. **Place paper [2] under the First Shutter [A] of the Waste Toner Primary Feed Unit [1].**

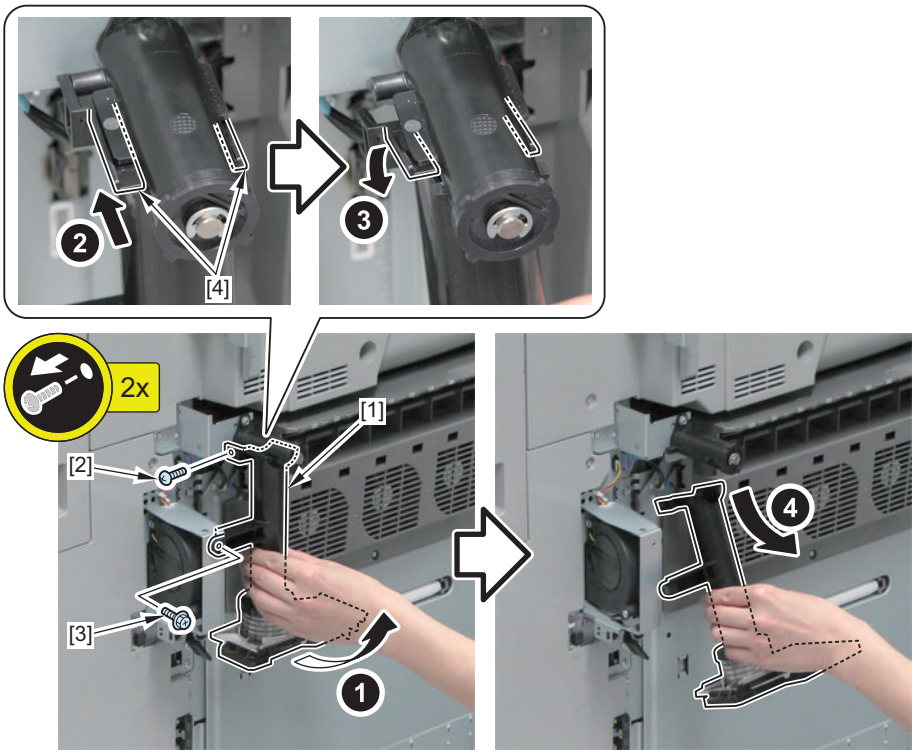
NOTE:
Be sure to place paper [2], otherwise, waste toner may drop.



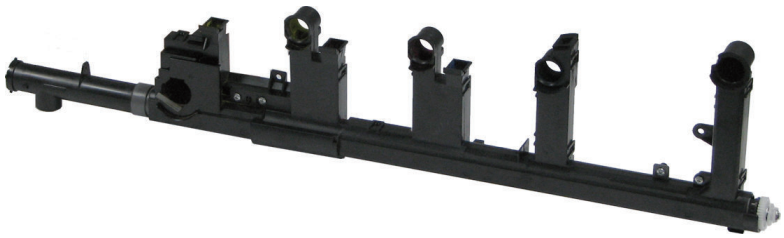
3. **Tap the [A] part of the Waste Toner Primary Feed Unit [1] to drop waste toner [2] inside the unit to the Waste Toner Vertical Pipe Unit [3].**



4. **Remove the Waste Toner Vertical Pipe Unit [1].**
   - 1 Screw [2]
   - 1 Screw (RS) [3]
   - 2 Hooks [4]



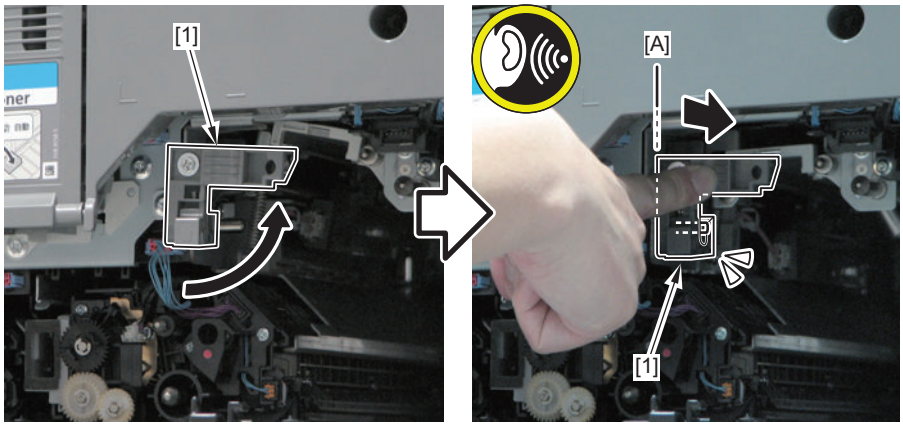
Removing the Waste Toner Primary Feed Unit



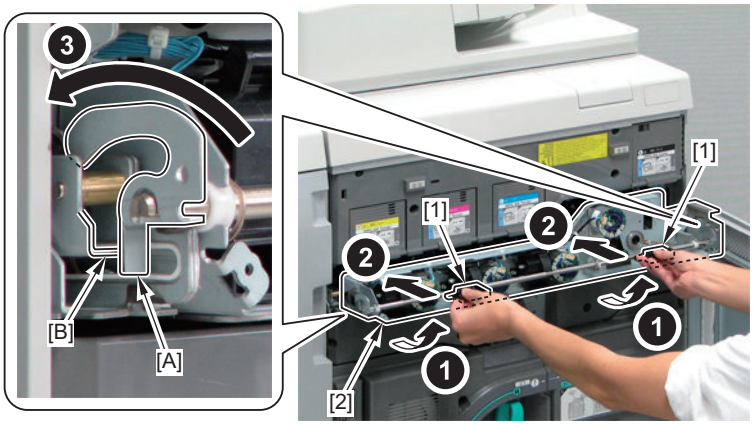
■ Preparation

1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**
2. **Removing the Decurler Unit****"Removing the Decurler Unit" on page 910**
3. **Removing the Delivery Unit****"Removing the Delivery Unit" on page 906**
4. **Removing the Box Left Cover****"Removing the Box Left Cover" on page 947**
5. **Removing the Upper Left Cover****"Removing the Left Upper Cover" on page 950**
6. **Removing the Left Middle Cover****"Removing the Left Middle Cover" on page 951**
7. **Removing the Reverse Unit****"Removing the Reverse Unit" on page 908**
8. **Open the Front Cover.**
9. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
10. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
11. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**
12. **Removing the ITB Frame****"Removing the ITB Frame" on page 557**

13. Put the ITB Slide Rail back in the host machine.
14. Put the Fixing Feed Unit back in the host machine.
15. Removing the Right Middle Front Cover 1"Removing the Right Middle Front Cover 1" on page 944
16. Removing the Toner Replacement Cover"Removing the Toner Replacement Cover" on page 941
17. Open the Process Unit Inner Cover."Opening the Process Unit Inner Cover" on page 542
18. Removing the Process Unit (Y)/(M)/(C)"Removing the Process Unit (Y)/(M)/(C)" on page 712
19. Removing the Primary Charging Assembly"Removing the Primary Charging Assembly" on page 627
20. Removing the Pre-transfer Charging Assembly"Removing the Pre-transfer Charging Assembly" on page 649
21. Removing the Drum Unit (Bk)"Removing the Drum Unit (Bk)" on page 662
22. Removing the Registration Patch Sensor Unit"Removing the Registration Patch Sensor Unit" on page 597
23. Turn the Black Developing Assembly Pressure Lever [1] counterclockwise, and push it to the position [A] to lock the lever.



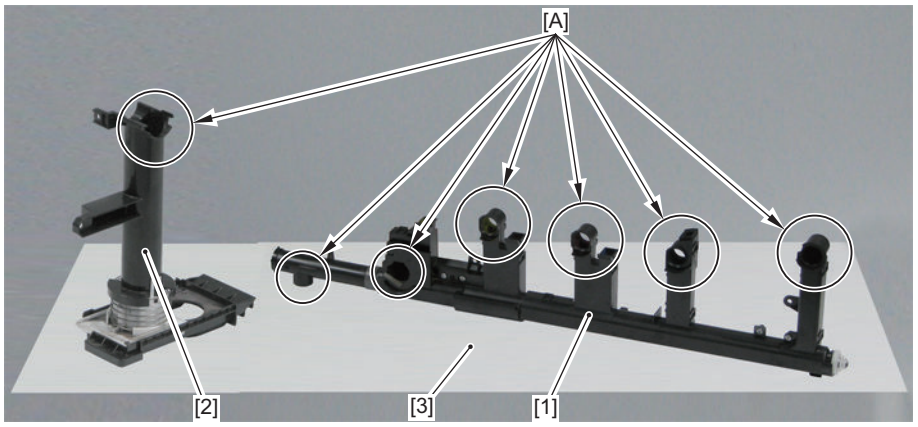
24. Hold the 2 handles [1] and raise the Process Unit Inner Cover [2]. Then, push the 2 plates [A] of the hooks against the 2 end faces [B] of the Hinge Shaft Holder. Raise the handles at a 90-degree angle further and close the Process Unit Inner Cover [2].



25. Pull out the Fixing Feed Unit."Pulling out the Fixing Feed Unit" on page 859

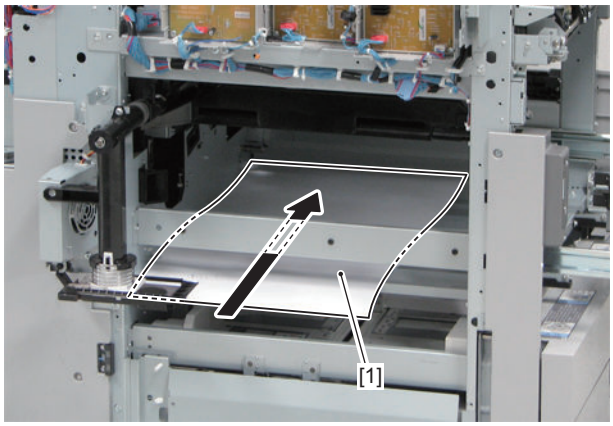
■ Procedure

CAUTION:
- When disassembling/assembling the Waste Toner Primary Feed Unit [1] and the Waste Toner Vertical Pipe Unit [2], prepare a vacuum cleaner specially designed to suction toner dust because waste toner may scatter around.
- Because the waste toner may be spilled out from the 7 waste toner collection mouths [A], be sure to place them on paper [3] when disassembling/assembling.

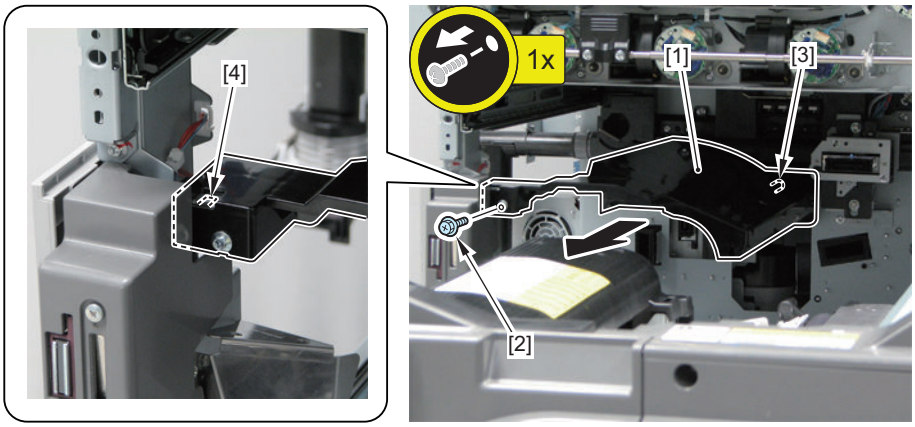


1. **Place paper [1] inside the host machine.**

CAUTION:
Be sure to place paper [1] inside the host machine during work.
- This is to prevent the screws from being dropped and lost.
- This is because toner may be spilled out when the Waste Toner Primary Feed Unit is removed.

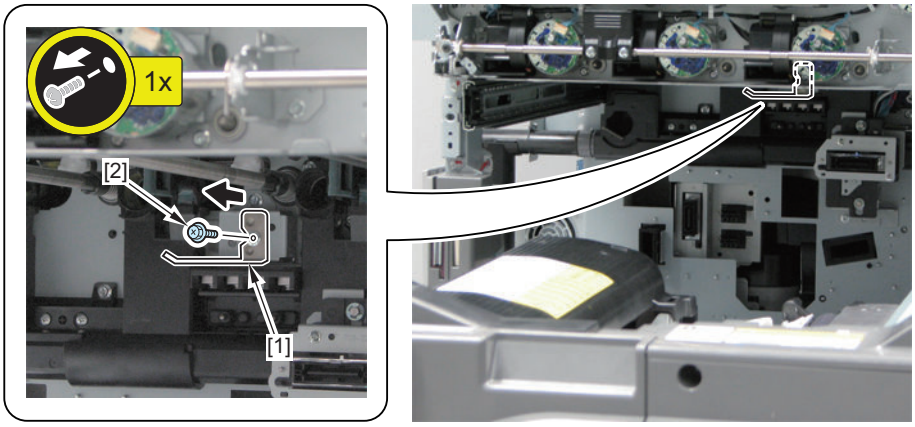


2. **Remove the Fixing Upper Duct [1].**
   - 1 Screw [2]
   - 1 Boss [3]
   - 1 Protrusion [4]

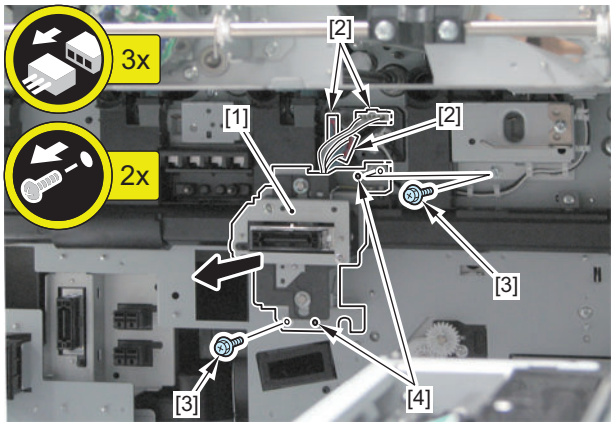


CAUTION:
When assembling, align the positioning boss of the Fixing Upper Duct with the hole on the host machine to install.

3. **Remove the ITB Pressure Plate (Rear Left) [1].**
   - 1 Screw [2]

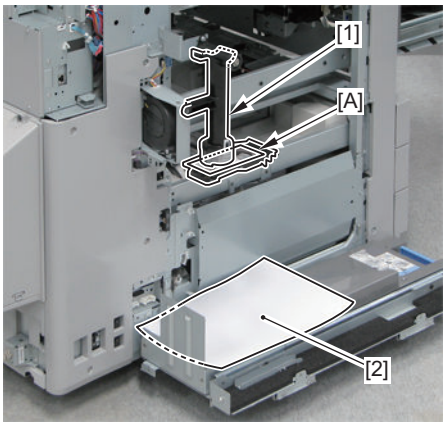


4. **Remove the ITB Drawer Base [1].**
   - 3 Connectors [2]
   - 2 Screws [3]
   - 2 Bosses [4]

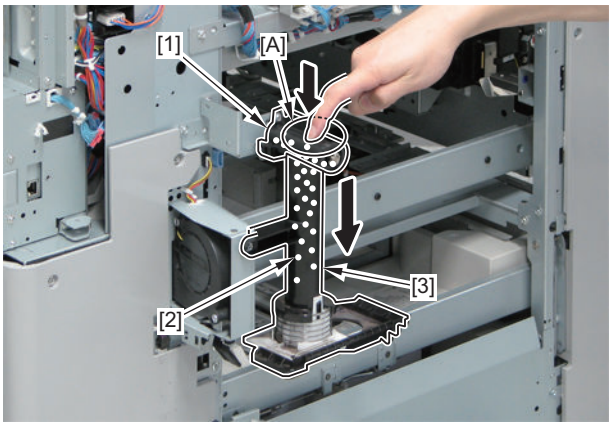


5. **Place paper [2] under the First Shutter [A] of the Waste Toner Primary Feed Unit [1].**

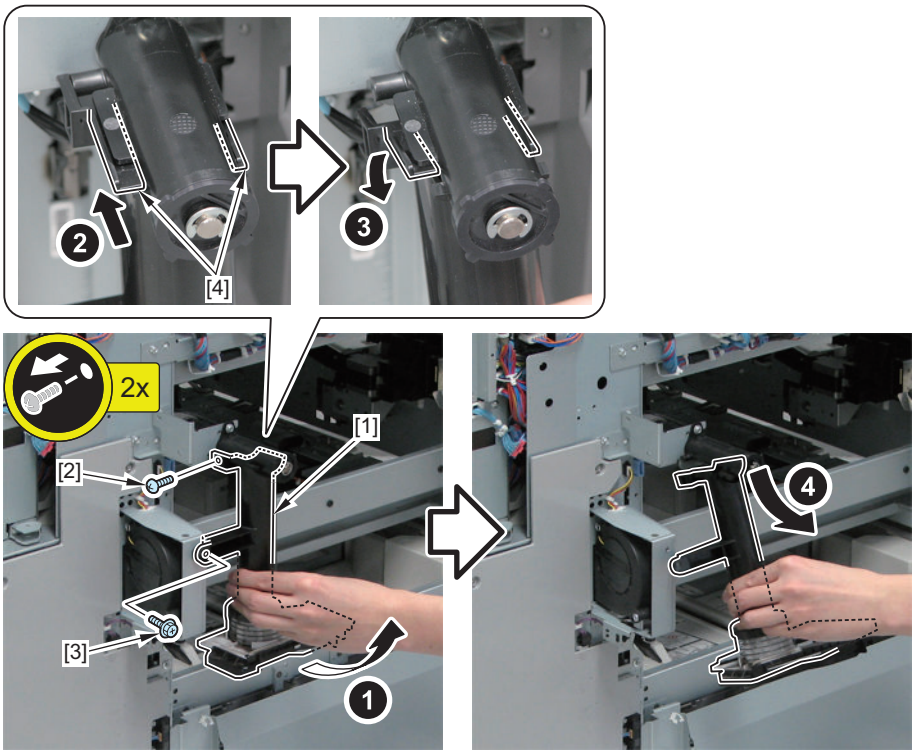
NOTE:
Be sure to place paper [2]; otherwise, waste toner may drop.



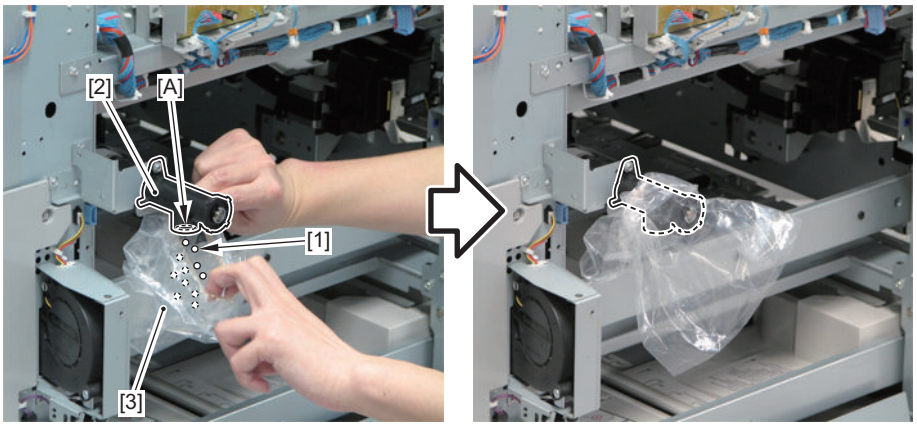
6. **Tap the [A] part of the Waste Toner Primary Feed Unit [1] to drop waste toner [2] inside the unit to the Waste Toner Vertical Pipe Unit [3].**



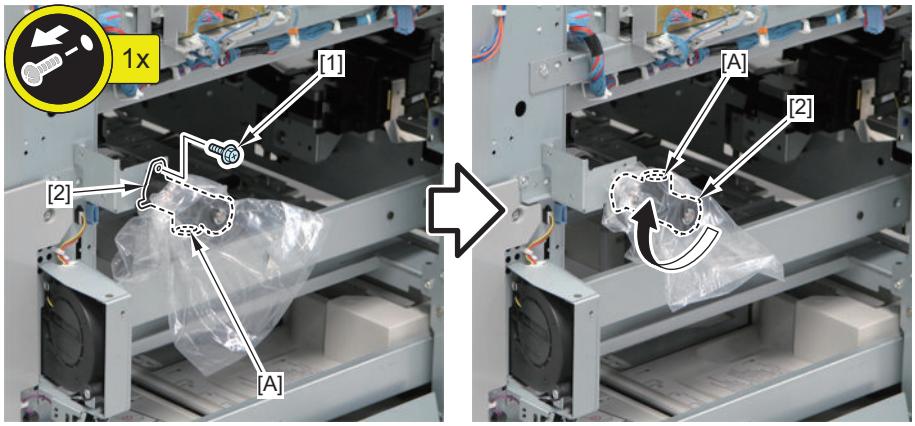
7. **Remove the Waste Toner Vertical Pipe Unit [1].**
   - 1 Screw [2]
   - 1 Screw (RS) [3]
   - 2 Hooks [4]



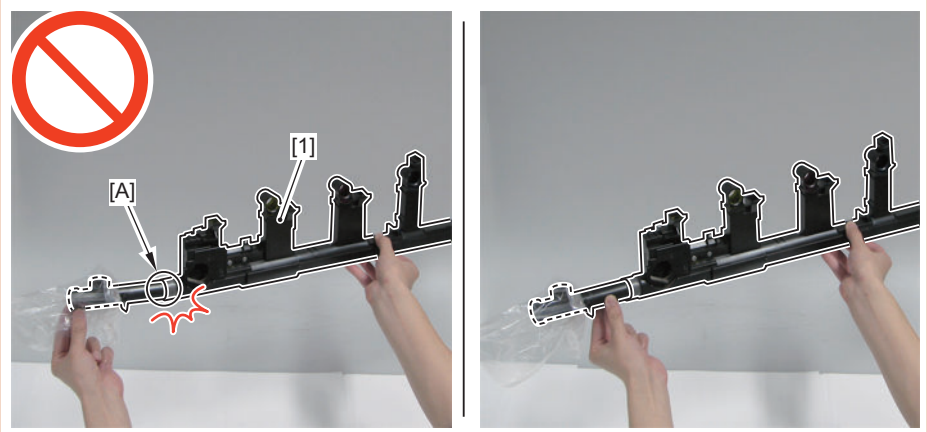
8. **To prevent scattering of waste toner [1], be sure to cover the the collection mouth [A] of the Waste Toner Primary Feed Unit [2] with a plastic bag [3].**



9. Remove the screw [1], and rotate the Waste Toner Primary Feed Unit [2] with the collection mouth [A] side up.



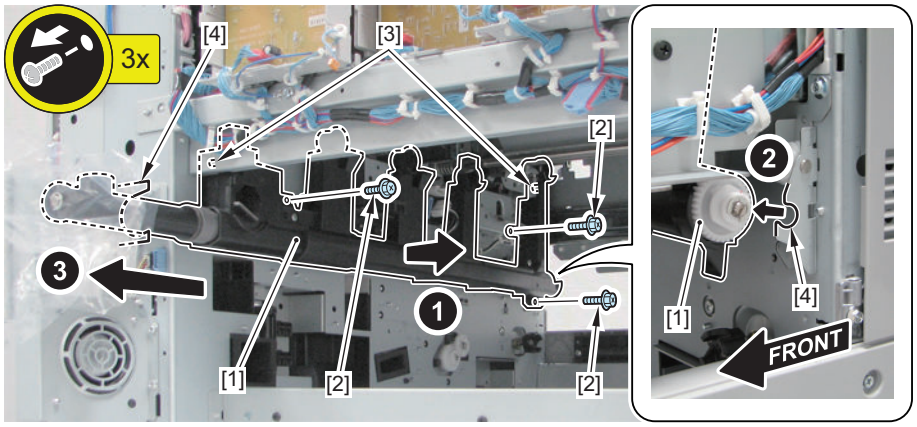
CAUTION:
When holding the Waste Toner Primary Feed Unit [1], be careful not to apply load on the pipe connection [A] on the left side of the unit.



10. Remove the Waste Toner Primary Feed Unit [1].

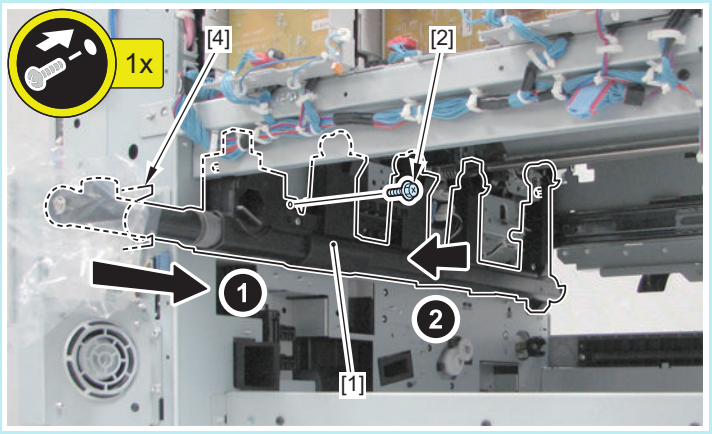
- 3 Screws [2]
- 2 Bosses [3]
- 2 Grooves [4]

CAUTION:
When installing/removing the Waste Toner Primary Feed Unit [1], be careful not to spill toner.

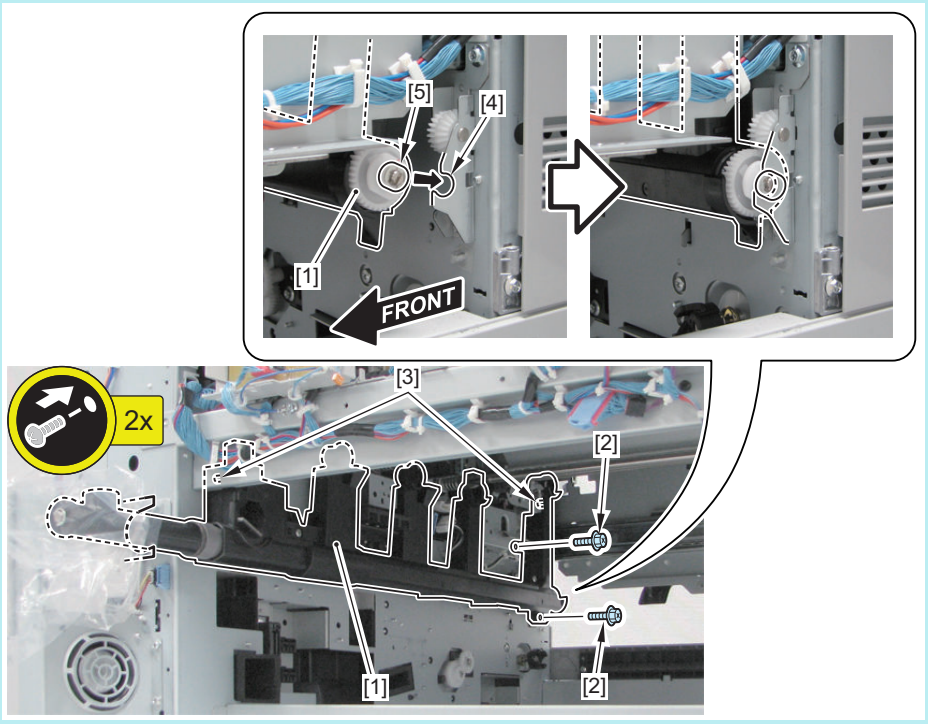


NOTE:
How to install the Waste Toner Primary Feed Unit

1. Temporarily secure the Waste Toner Primary Feed Unit [1].
   - 1 Groove [4]
   - 1 Screw [2]



2. While paying attention to the direction of the Shaft Support [5] on the right side, insert it into the groove [4] of the U-shaped Plate, and fit the 2 Positioning Bosses [3] into the holes on the host machine to install it firmly in place.
   - 2 Screws [2]



Fixing System

Service Note

■ Points to Notes at Replacing/Disposing the Fixing Unit

The heat pipe is used at the upper belt of the fixing unit to even the heat at the rear front direction. The heat pipe is a part that the small amount of liquid is vacuum-encapsulated in the airtight container. Thus, do not throw the heat pipe in the fire because it will burst. When disposing the fixing unit, be sure to shred.

■ Points to note when replacing the Fixing Belt Unit/Pressure Belt Unit

When replacing the Fixing/Pressure Belt Unit, be sure to clear the counter in Service Mode (COPIER > COUNTER > FIXING > FX-BLT-U / FX-BLT-L).
In the case of iRC5180 series, the displacement control of the Fixing Belt needed to be executed when replacing the Fixing Unit and the counter of the Fixing Unit has been automatically cleared by executing the displacement control; therefore, there has been no need to clear the counter when replacing the unit. In the case of this machine, however, the counter will not automatically be cleared because there is no need to execute the displacement control when replacing the Belt Unit. Therefore, the counter needs to be cleared in Service Mode when replacing the Fixing/Pressure Belt Unit.

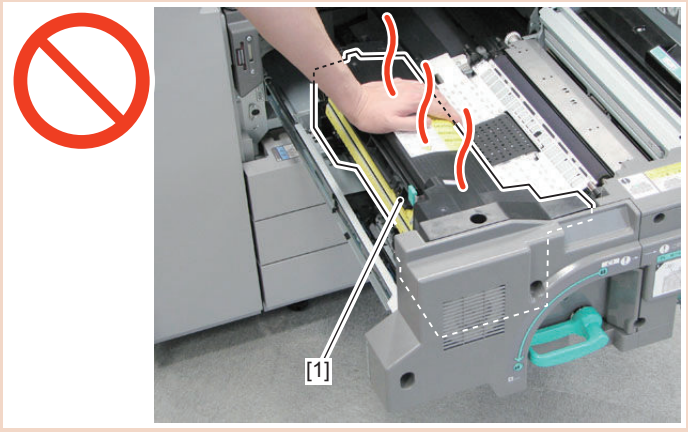
Removing the Fixing Upper Cover

■ Preparation

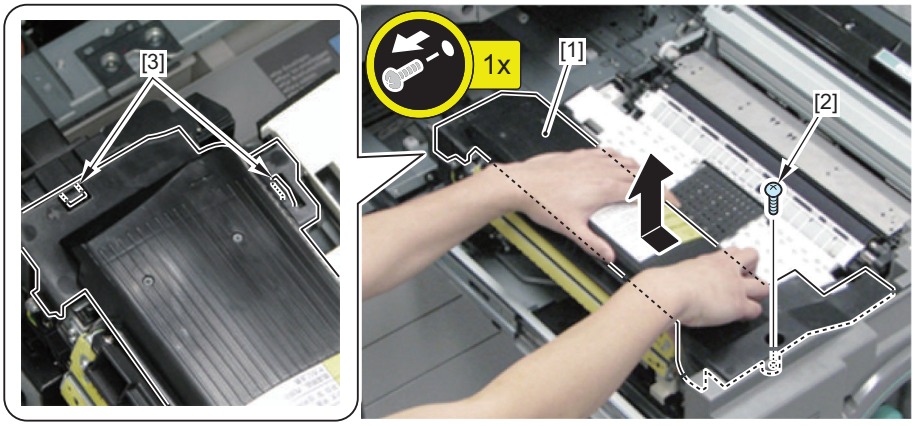
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

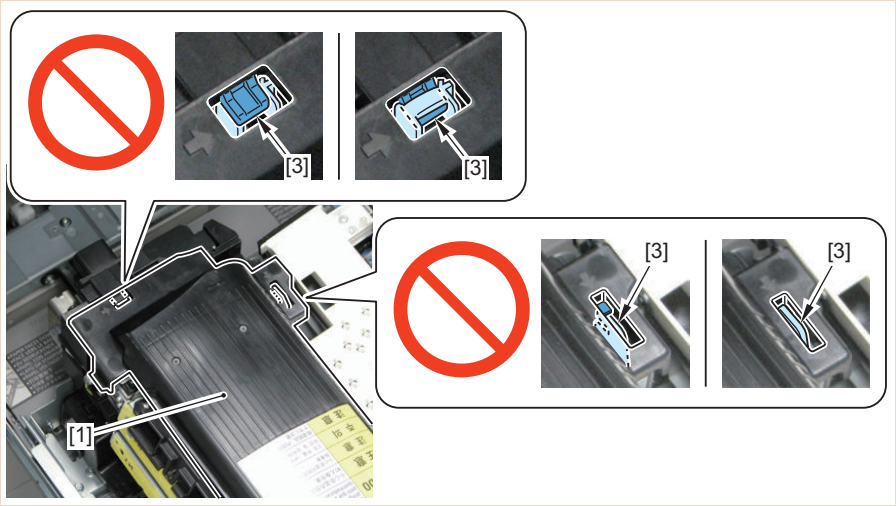
CAUTION:
Because the Fixing Assembly [1] is hot, be sure to perform disassembly/assembly after it is cooled down.



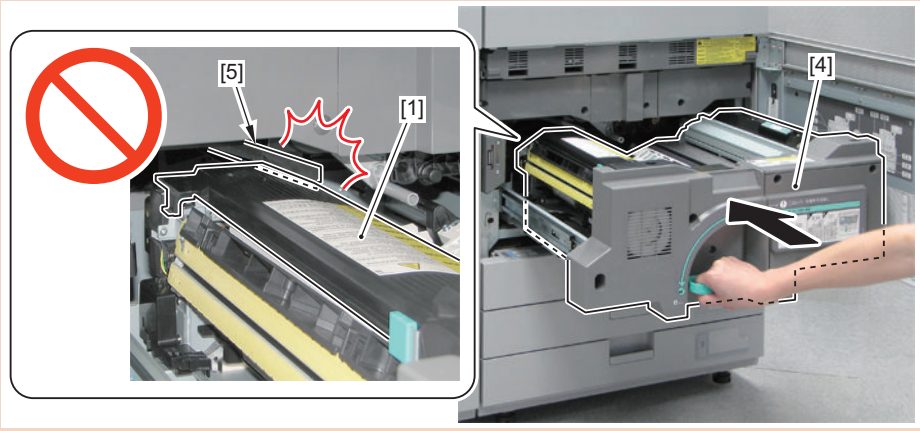
1. **Remove the Fixing Upper Cover [1].**
   - 1 Screw [2]
   - 2 Hooks [3]



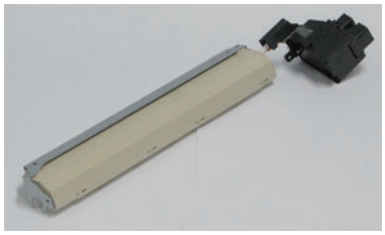
CAUTION:
Be sure to check that the 2 hooks [3] are hooked when installing the Fixing Upper Cover [1].



If the 2 hooks [3] are not hooked, the Fixing Upper Cover [1] may hit the duct [5] when storing the Fixing Feed Unit [4].



Removing the Fixing IH Unit



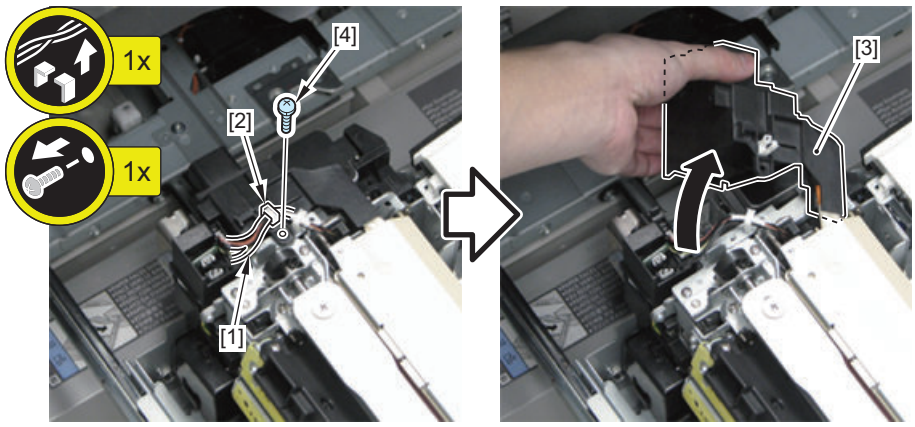
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

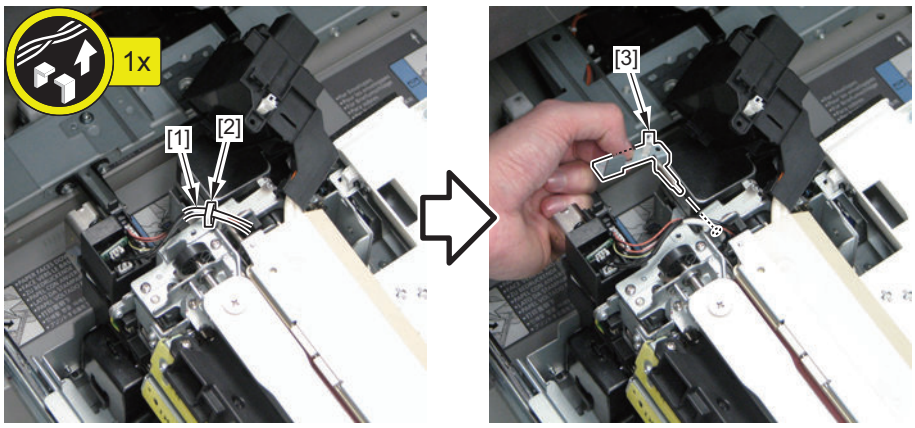
NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

■ Procedure

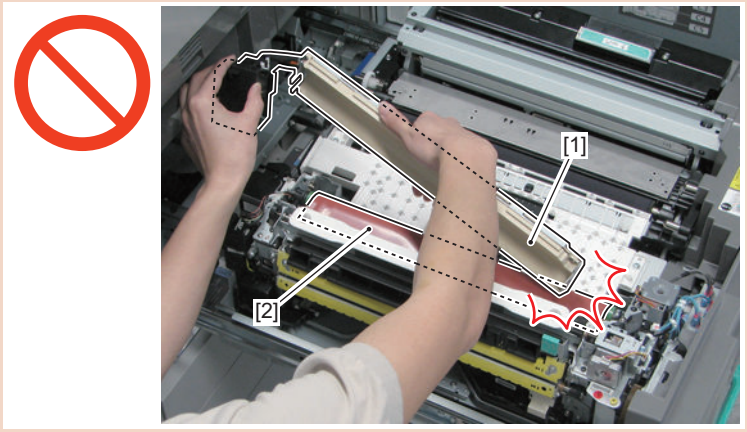
1. **Free the harness [1] from the Wire Saddle [2], and remove the Drawer Connector Cover Unit [3].**
   - 1 Screw (with Washer) [4]



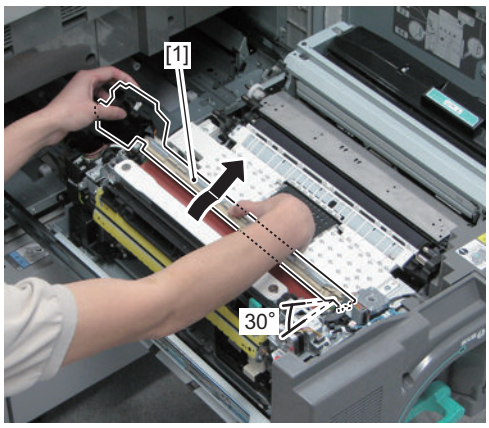
2. **Free the harness [1] from the Wire Saddle [2], and remove the Fixation Pin [3].**



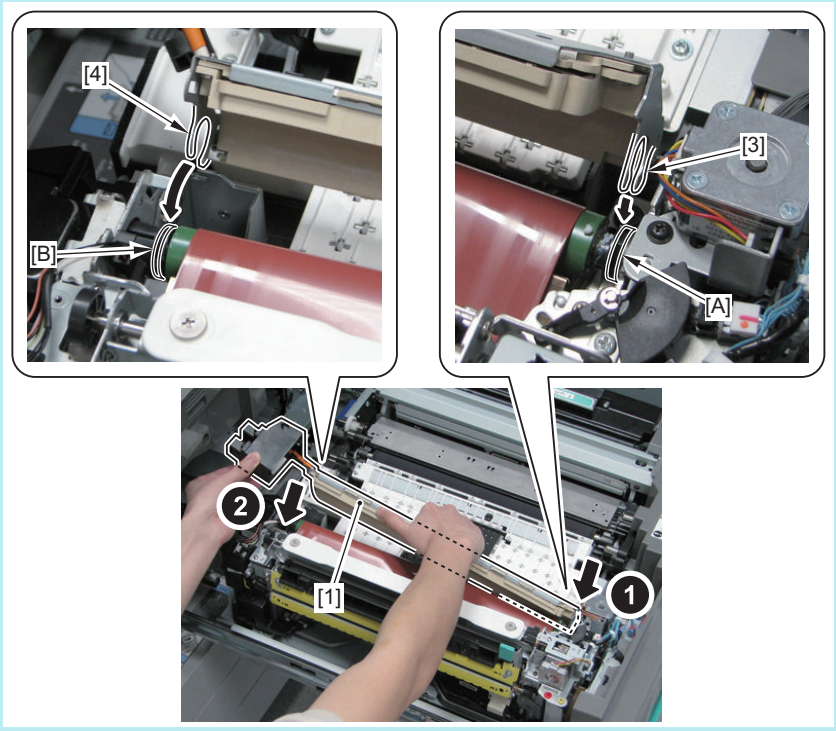
CAUTION:
Do not damage the Fixing Belt [2] when installing/removing the Fixing IH Unit [1].



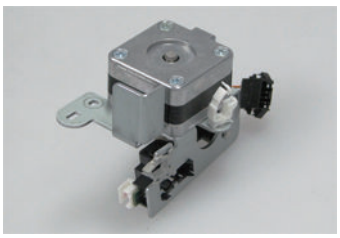
3. **Remove the Fixing IH Unit [1] by opening it for approx. 30 degrees.**



NOTE:
How to install the Fixing IH Unit
Be sure to hook the hook [3] on the front side of the Fixing IH Unit to the groove [A] of the Fixing Belt Unit before hooking the hook [4] on the rear side of the unit to the groove [B].



Removing the Fixing Belt Displacement Control Motor Unit



■ Preparation

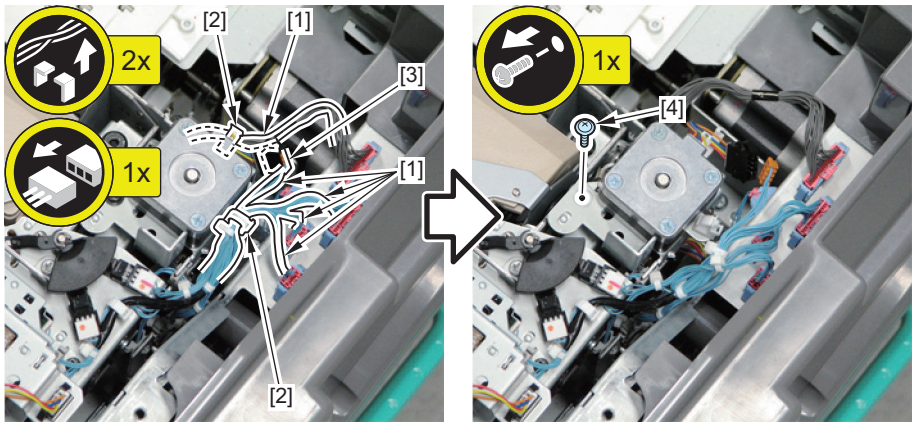
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

3. **Removing the Fixing Upper Cover** **“Removing the Fixing Upper Cover” on page 790**

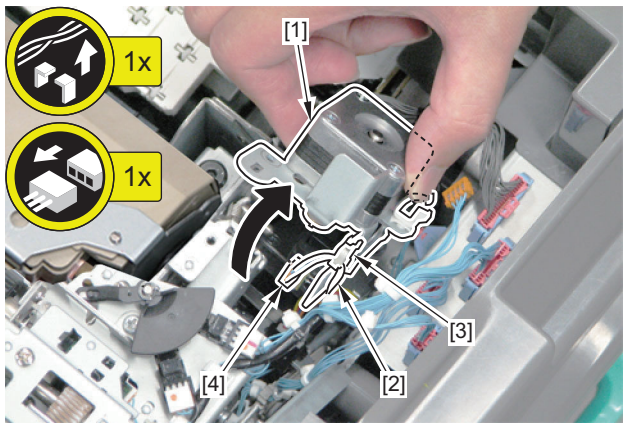
NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow “Removing the Fixing Assembly” on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

■ Procedure

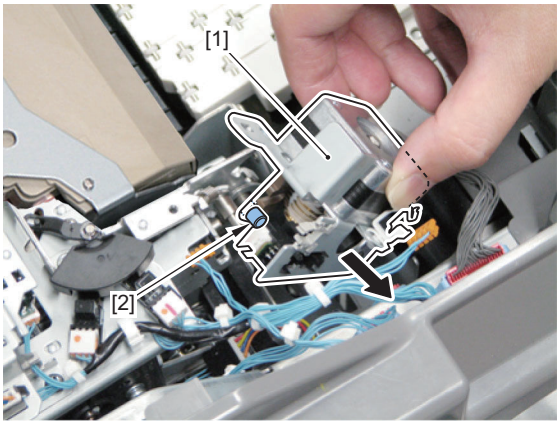
1. **Free the 4 harnesses [1].**
   - 2 Wire Saddles [2]
2. **Disconnect the connector [3].**
3. **Remove the screw [4].**



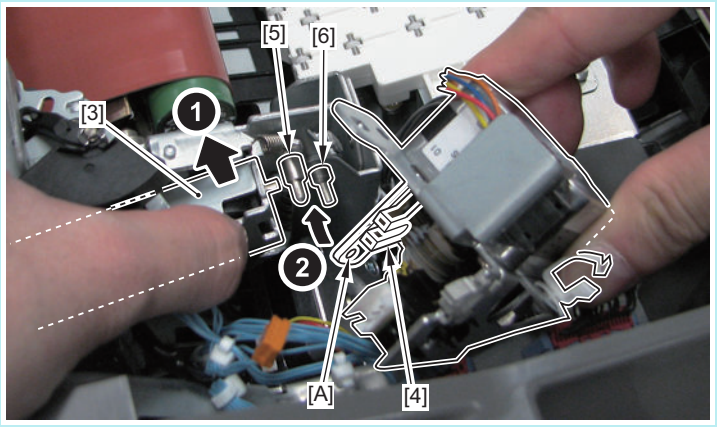
4. **Free the harness [2] from the Edge Saddle [3] by lifting the Fixing Belt Displacement Control Motor Unit [1], and disconnect the connector [4].**



5. **Remove the Fixing Belt Displacement Control Motor Unit [1].**
   - 1 Shaft [2]



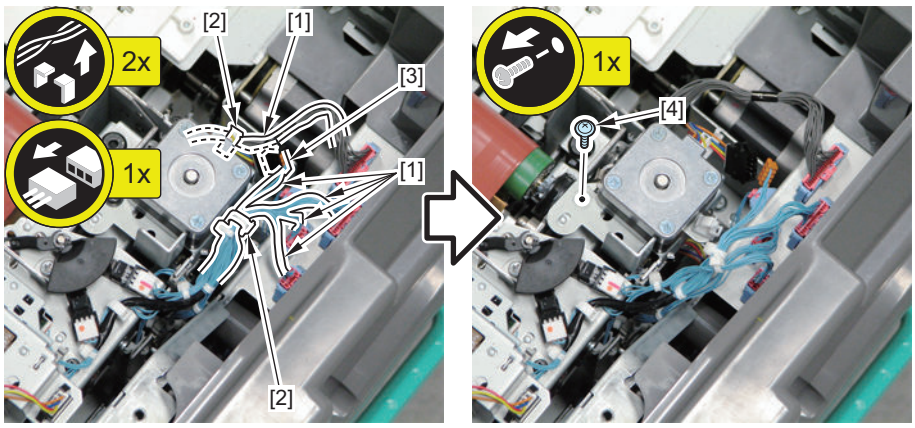
NOTE:
How to install the Fixing Belt Displacement Control Motor Unit
When the Fixing IH Unit is installed, be sure to install the Fixing Belt Displacement Control Motor Unit in the reverse order of removal.
When the Fixing IH Unit is removed, align the hook [4] of the Fixing Belt Displacement Control Motor Unit with the pin [5] while lifting the Tension Arm Unit [3], and align the hole [A] of the Fixing Belt Displacement Control Motor Unit Plate with the shaft [6] to install the unit.



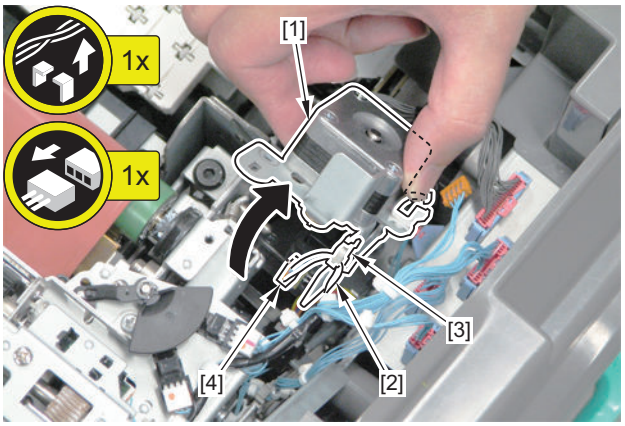
■ Procedure

1. **Free the 4 harnesses [1].**
   - 2 Wire Saddles [2]
   - 2 Connectors [3]
2. **Disconnect the connector [4].**

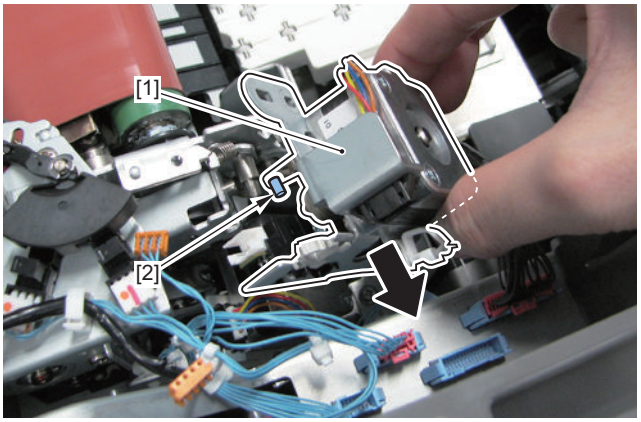
3. **Remove the screw [5].**



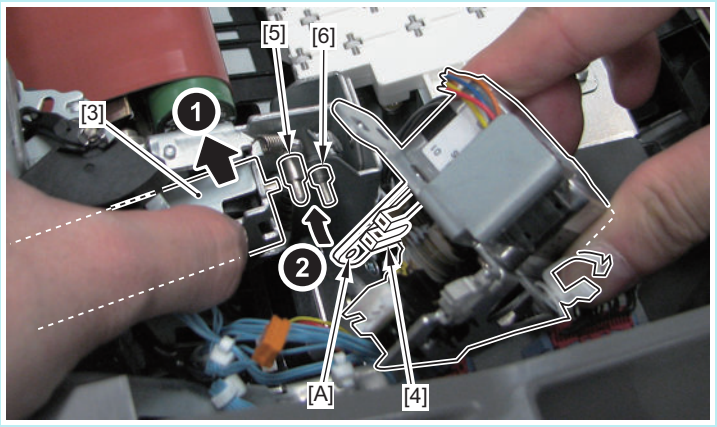
4. **Free the harness [2] from the Edge Saddle [3] by lifting the Fixing Belt Displacement Control Motor Unit [1], and disconnect the connector [4].**



5. **Remove the Fixing Belt Displacement Control Motor Unit [1].**
   - 1 Shaft [2]



NOTE:
How to install the Fixing Belt Displacement Control Motor Unit
While lifting the Tension Arm Unit [3], align the hook [4] of the Fixing Belt Displacement Control Motor Unit with the pin [5] and align the hole [A] of the Fixing Belt Displacement Control Motor Unit Plate with the shaft [6] to install the unit.



Opening the Fixing Belt Unit

■ Preparation

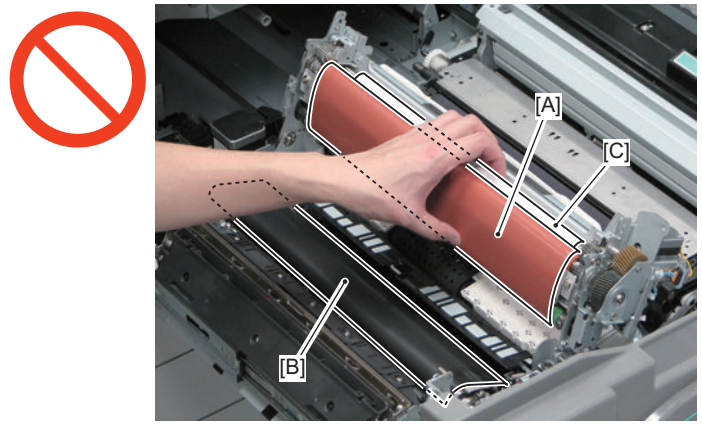
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

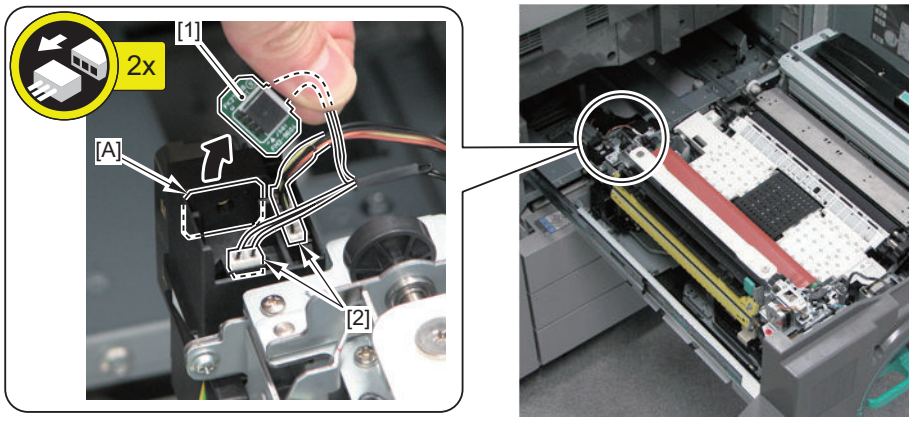
4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**

■ Procedure

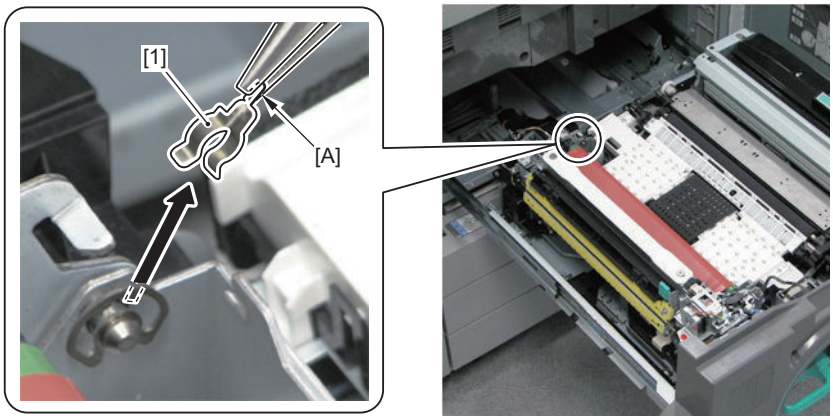
CAUTION:
Do not touch the surface [A] of the Fixing Belt, the surface [B] of the Pressure Belt and the surface [C] of the Fixing Refresh Roller. Otherwise, it may cause fixing failure.



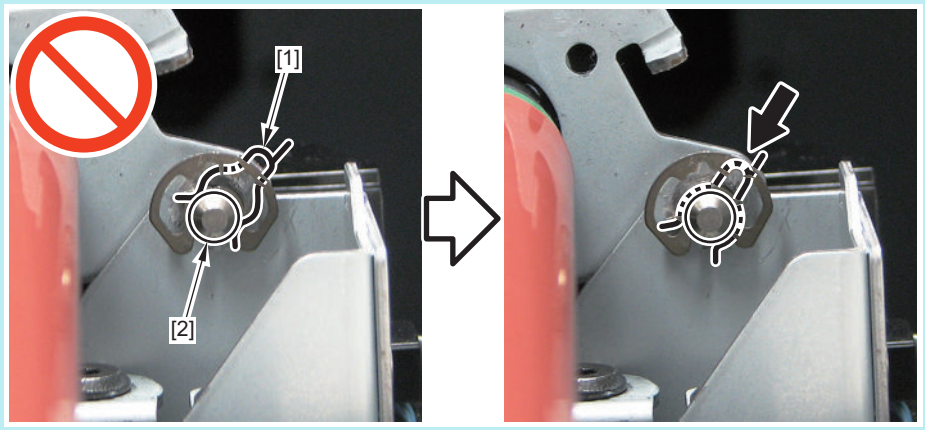
1. **Remove the PCB [1] from the groove [A], and disconnect the 2 connectors [2].**



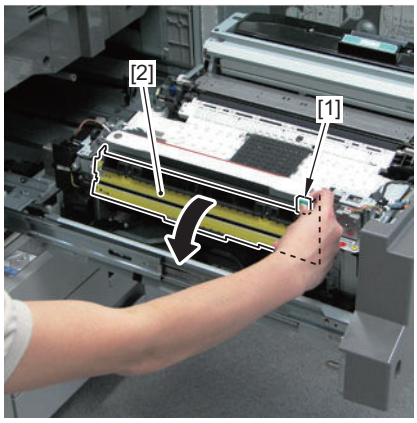
2. **Remove the Spacer Spring [1] by pinching its edge [A] using nippers.**



NOTE:
How to install the Spacer Spring
Fit the Spacer Spring [1] to the shaft [2] to install it.

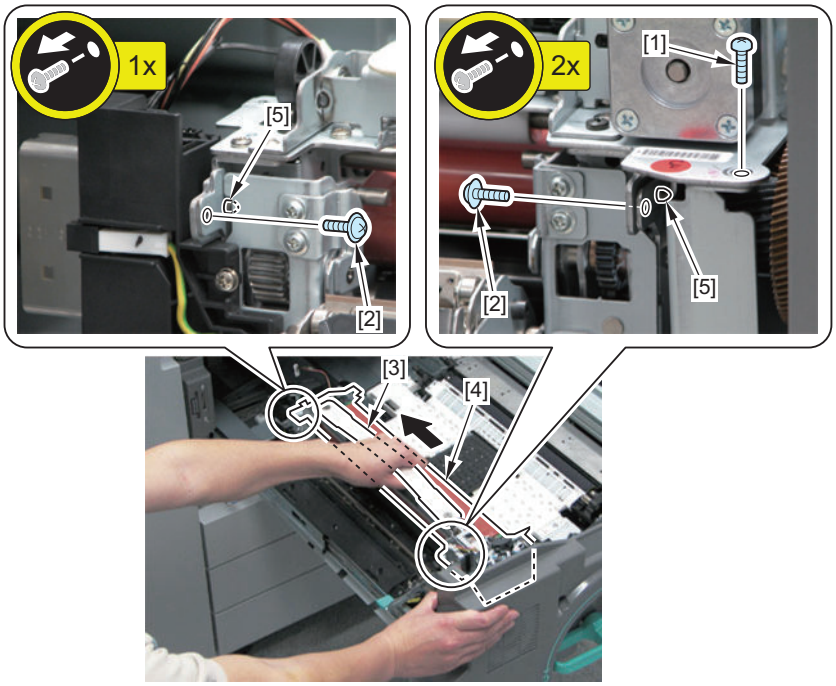


3. **Hold the handle [1], and open the Inner Delivery Unit [2].**



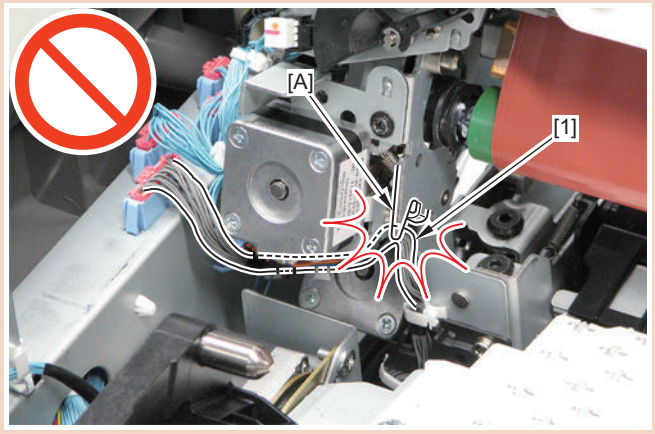
4. **Remove the screw (yellow) [1] and the 2 screws [2].**

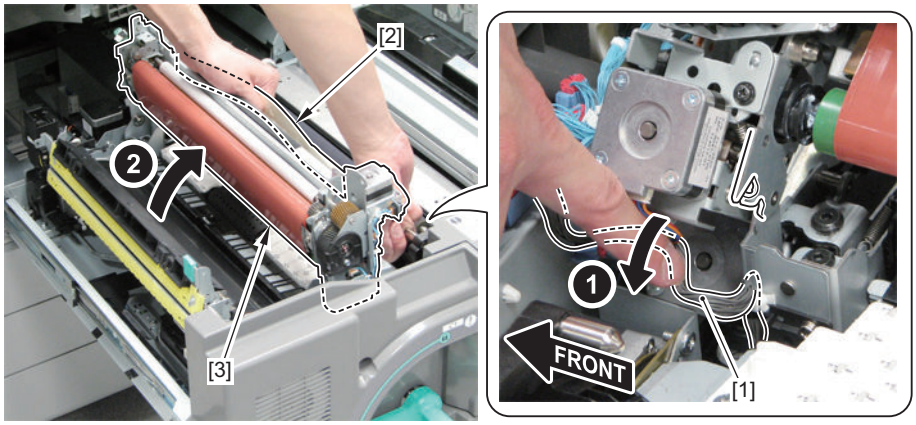
5. **Hold the handle [3], and remove the 2 bosses [5] of the Fixing Belt Unit [4].**



6. **While holding down the harness [1], hold the handle [2], and open the Fixing Belt Unit [3].**

CAUTION:
When opening the Fixing Belt Unit, do not get the harness [1] caught by the plate [A].





Cleaning the Fixing Inlet Guide

■ Preparation

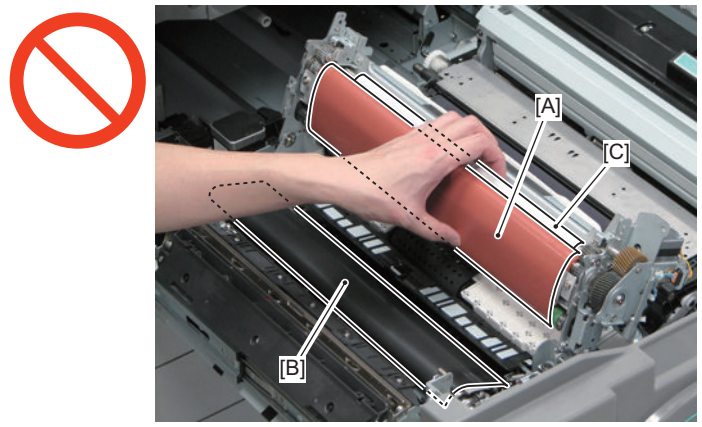
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

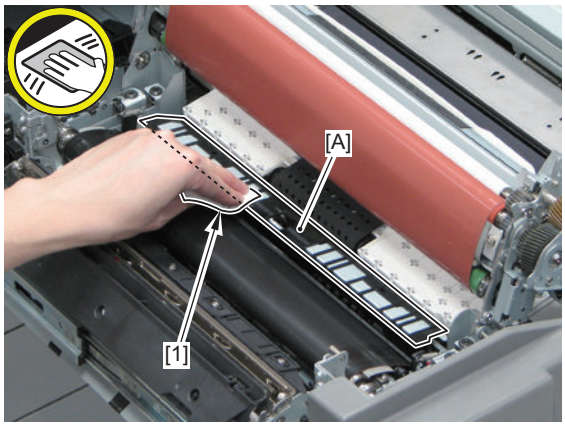
4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**
5. **Open the Fixing Belt Unit.****"Opening the Fixing Belt Unit" on page 798**

■ Procedure

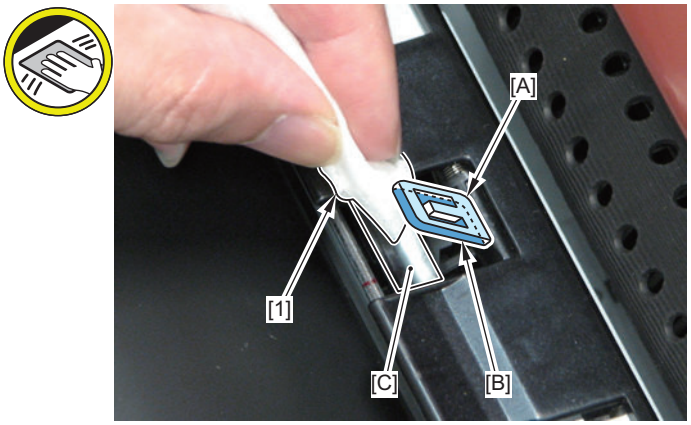
CAUTION:
Do not touch the surface [A] of the Fixing Belt, the surface [B] of the Pressure Belt and the surface [C] of the Fixing Refresh Roller. Otherwise, it may cause fixing failure.



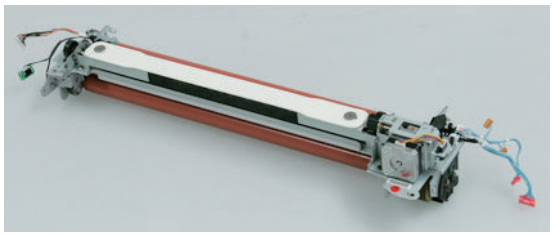
1. **Clean the surface [A] of the Fixing Inlet Guide with lint-free paper [1] moistened with alcohol.**



2. **Clean the Sensor Flag's surface side [A], back side [B], and the [C] part of the Fixing Inlet Guide (which comes in contact with the Sensor Flag) with lint-free paper [1] moistened with alcohol.**



Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit



■ Preparation

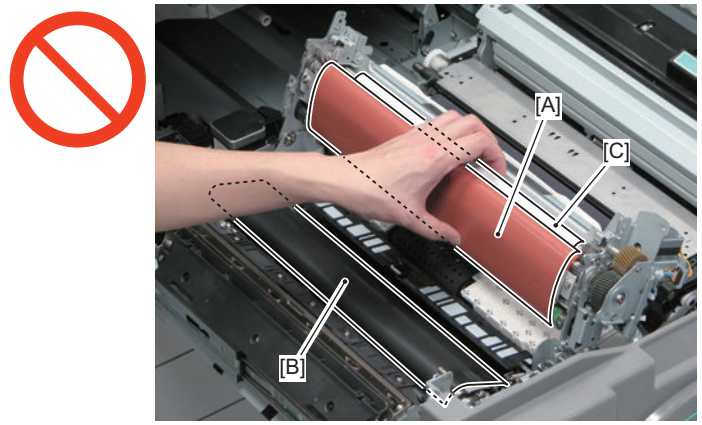
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

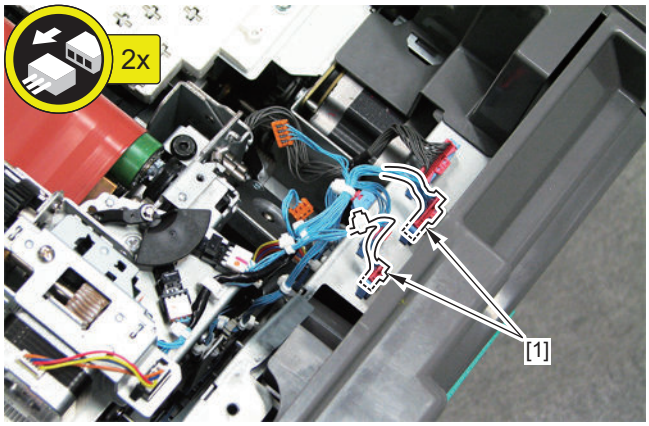
4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****"Removing the Fixing Belt Displacement Control Motor Unit" on page 794**

■ Procedure

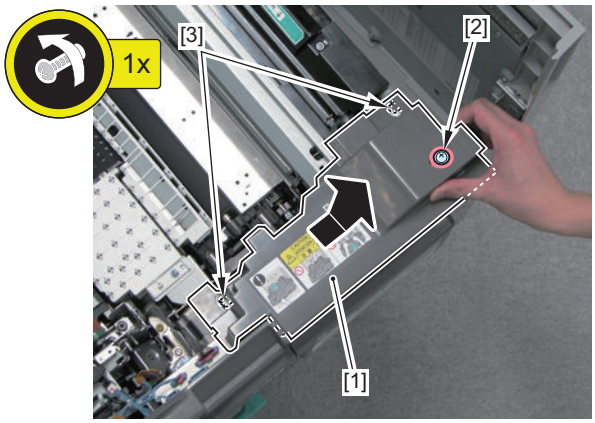
CAUTION:
Do not touch the surface [A] of the Fixing Belt, the surface [B] of the Pressure Belt and the surface [C] of the Fixing Refresh Roller. Otherwise, it may cause fixing failure.



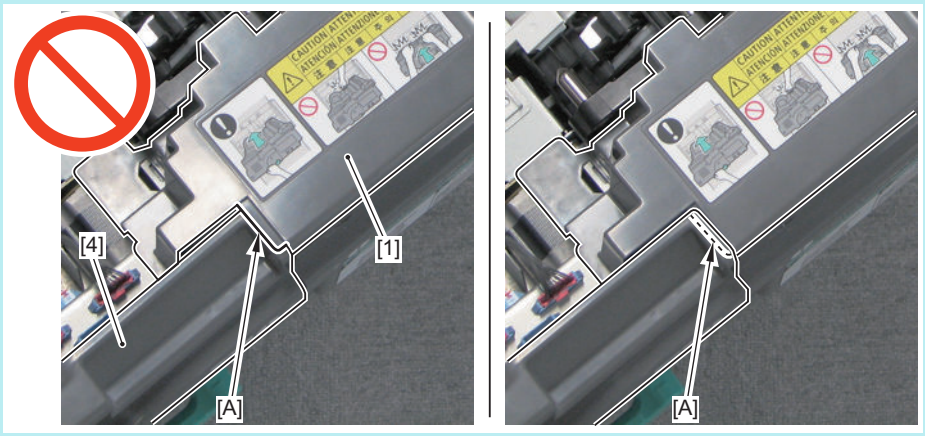
1. **Remove 2 connectors [1]**



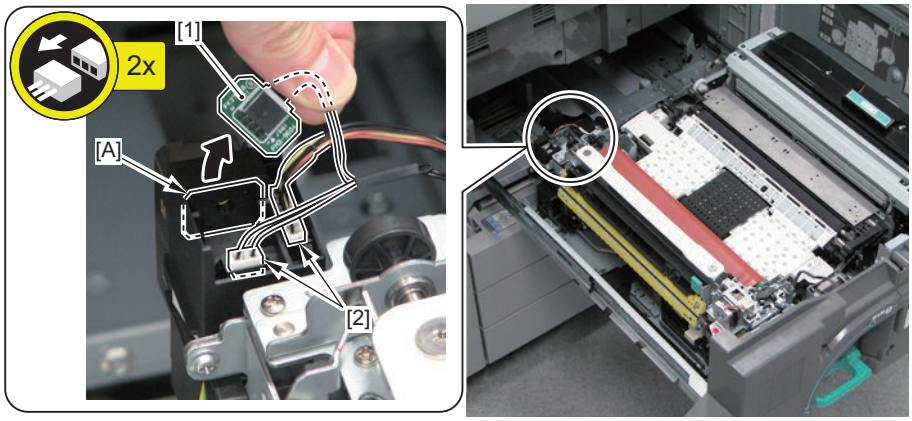
2. **Remove the Fixing Feed Sub Cover [1].**
   - 1 Screw [2] (to loosen)
   - 2 Hooks [3]



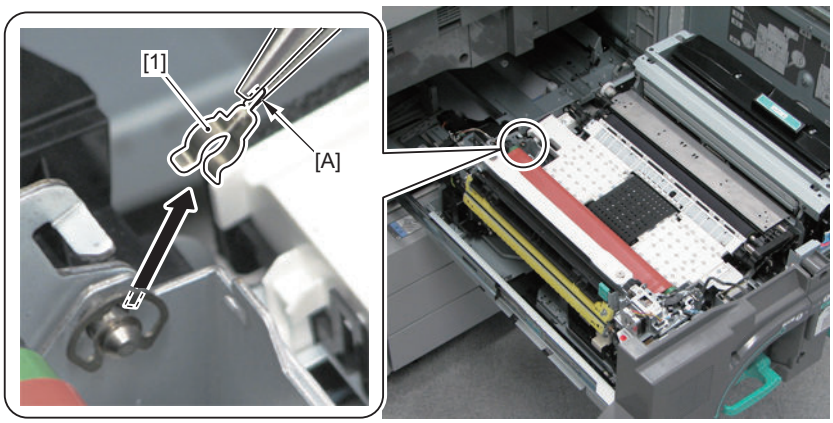
NOTE:
How to install the Fixing Feed Sub Cover
Put the [A] part of the Fixing Feed Sub Cover under the Fixing Feed Front Left Cover [4].



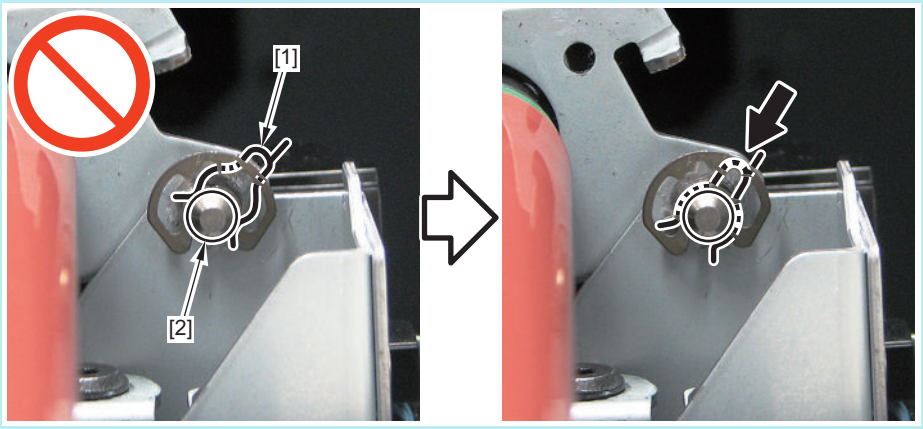
3. **Remove the PCB [1] from the groove [A], and disconnect the 2 connectors [2].**



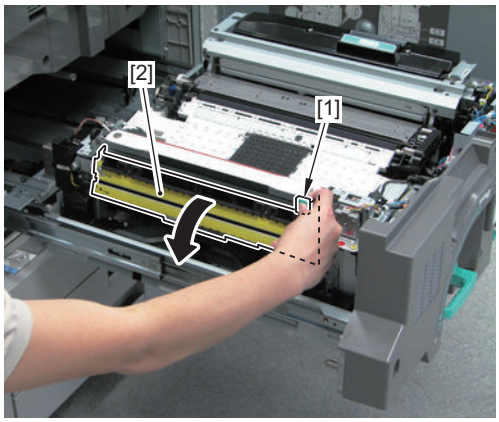
4. **Remove the Spacer Spring [1] by pinching its edge [A] using nippers.**



NOTE:
How to install the Spacer Spring
Fit the Spacer Spring [1] to the shaft [2] to install it.

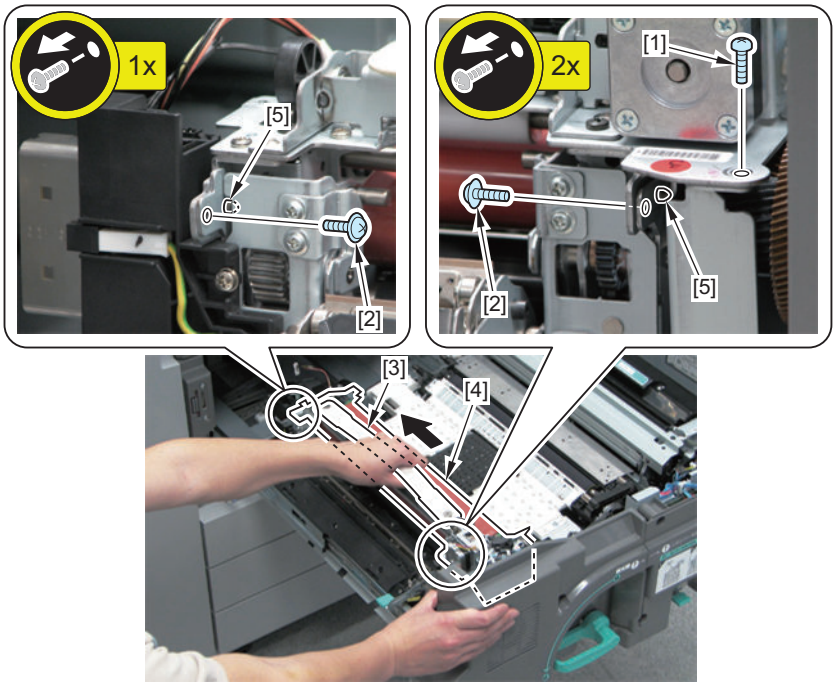


5. **Hold the handle [1], and open the Inner Delivery Unit [2].**



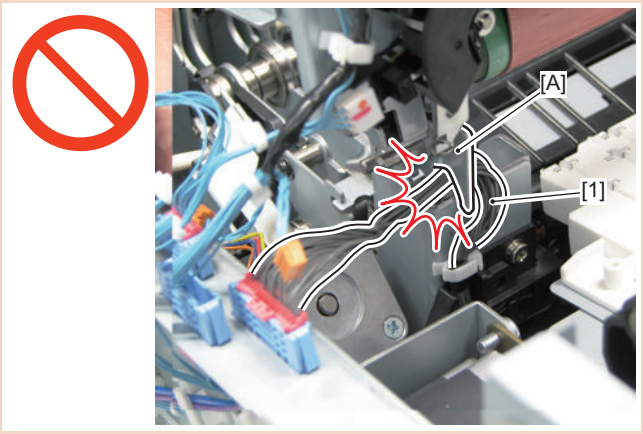
6. **Remove the screw (yellow) [1] and the 2 screws [2].**

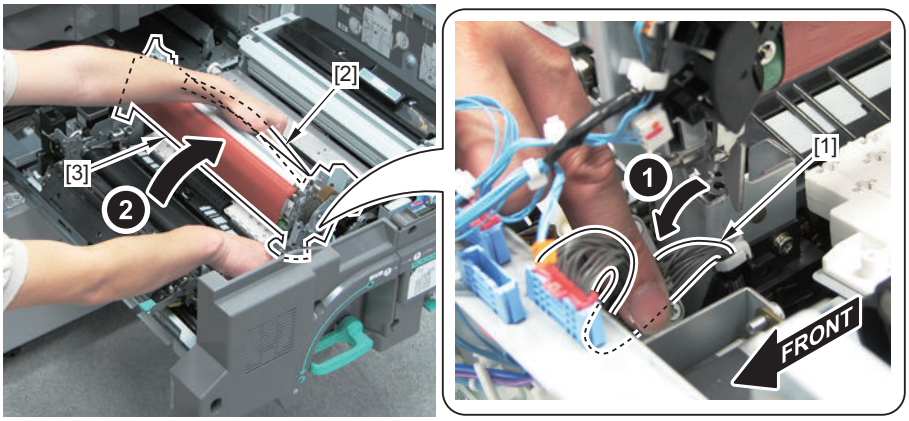
7. **Hold the handle [3], and remove the 2 bosses [5] of the Fixing Belt Unit [4].**



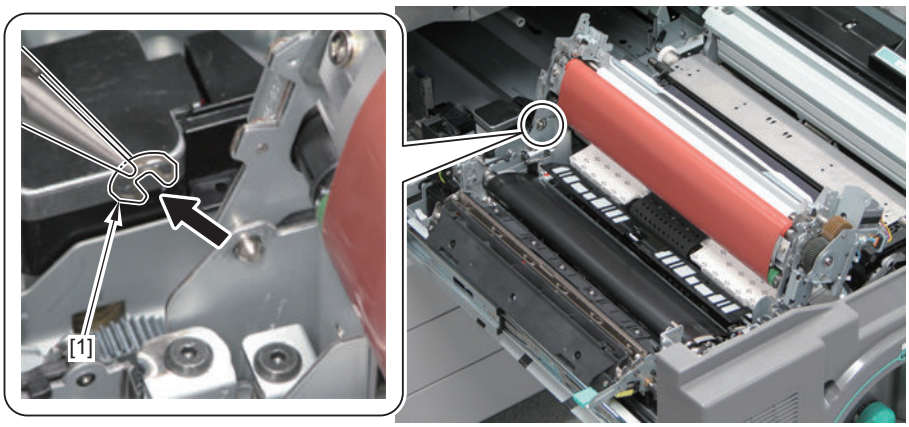
8. **While holding down the harness [1], hold the handle [2], and open the Fixing Belt Unit [3].**

CAUTION:
When opening the Fixing Belt Unit, do not get the harness [1] caught by the plate [A].



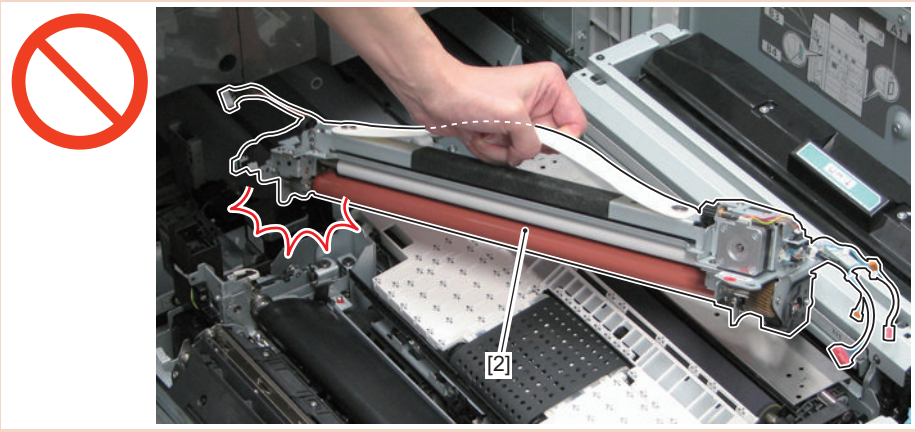


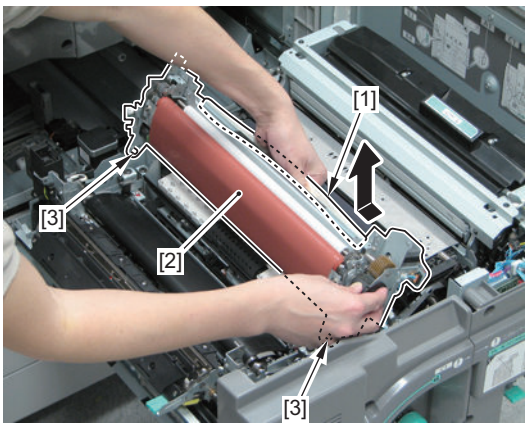
9. **Use nippers to remove the N-ring [1].**



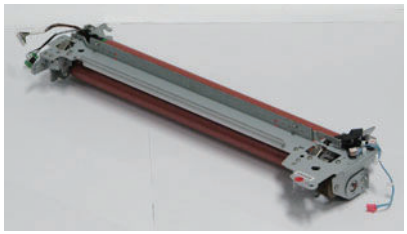
10. **Hold the handle [1], and remove the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit [2].**
    - 2 Shafts [3]

CAUTION:
Be careful not to drop the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit [2].





Removing the Fixing Belt Unit



■ Preparation

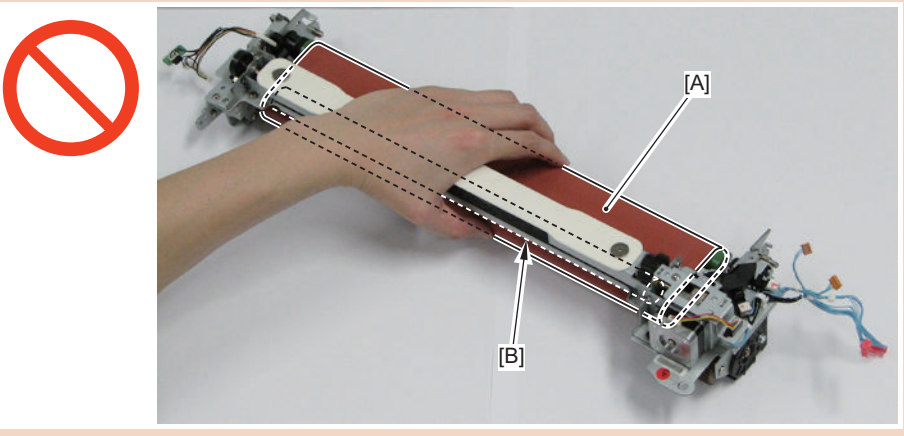
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

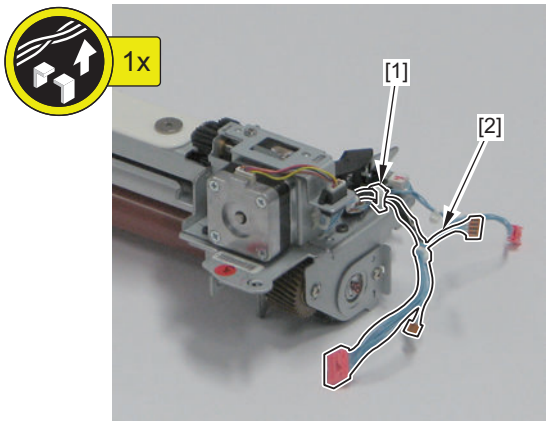
4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****"Removing the Fixing Belt Displacement Control Motor Unit" on page 794**
6. **Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit****"Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit" on page 803**

■ Procedure

CAUTION:
Do not touch the surface [A] of the Fixing Belt and the surface [C] of the Fixing Refresh Roller. Otherwise, it may cause fixing failure.

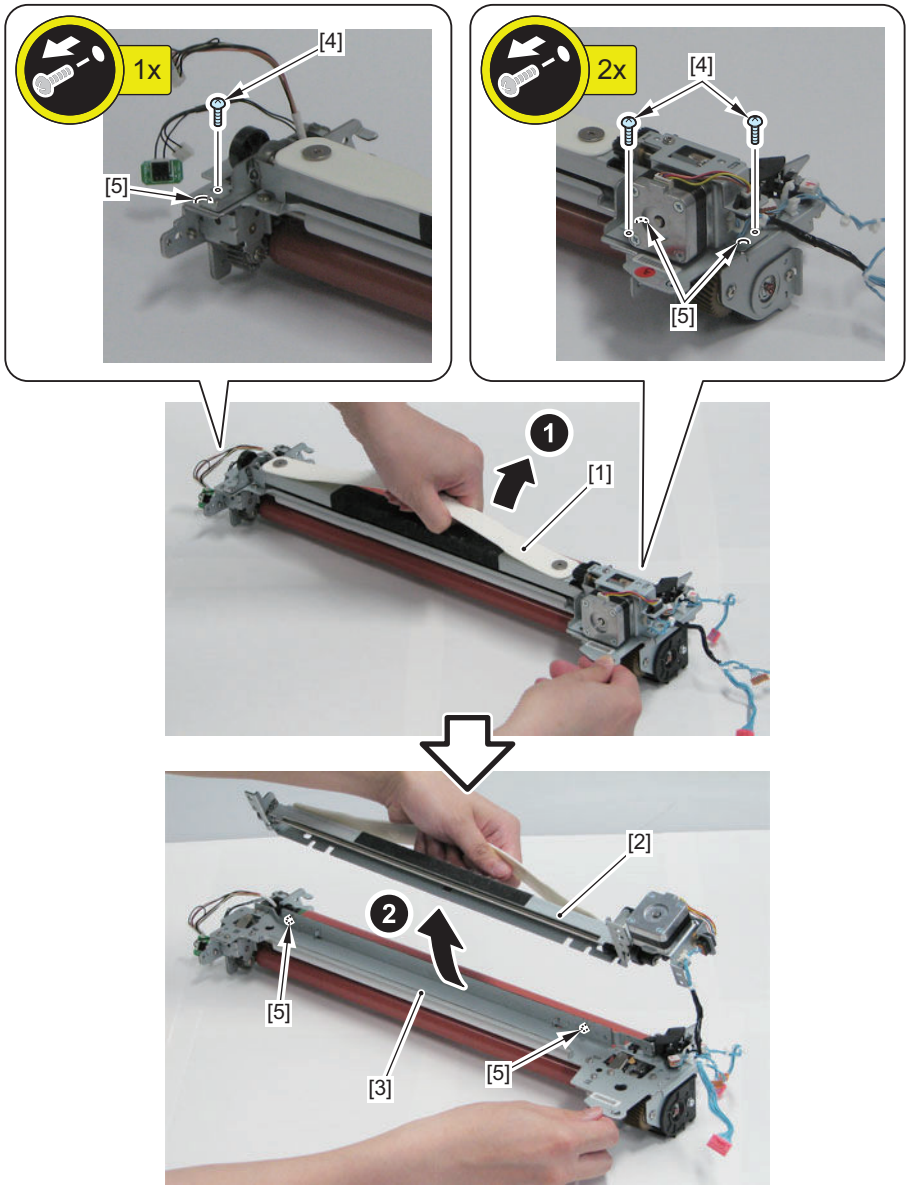


1. **Open the Wire Saddle [1] and free the harness [2].**

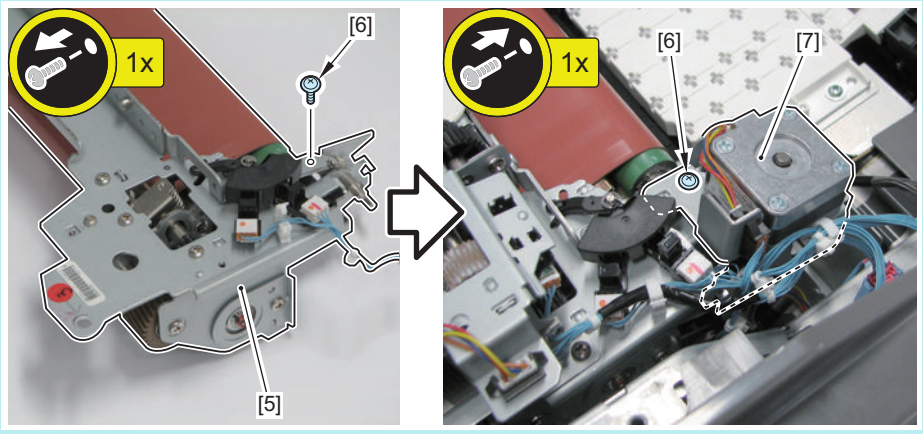


2. Hold the handle [1], and separate the Fixing Refresh Roller Pressure Unit [2] and the Fixing Belt Unit [3].

- 3 Screws [4]
- 5 Bosses [5]



NOTE:
Replacing the Fixing Belt Displacement Control Motor Unit Fixation Screw
When replacing the Fixing Belt Unit, remove the new Loose-proof Screw [6] of the Fixing Belt Unit [5] (service part), and use it to secure the Fixing Belt Displacement Control Motor Unit [7]. (Replace the Loose-proof Screw that was securing the Fixing Belt Displacement Control Motor Unit [7] with the new Loose-proof Screw [6].)



Cleaning and lubrication when replacing the Fixing Belt Unit

■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

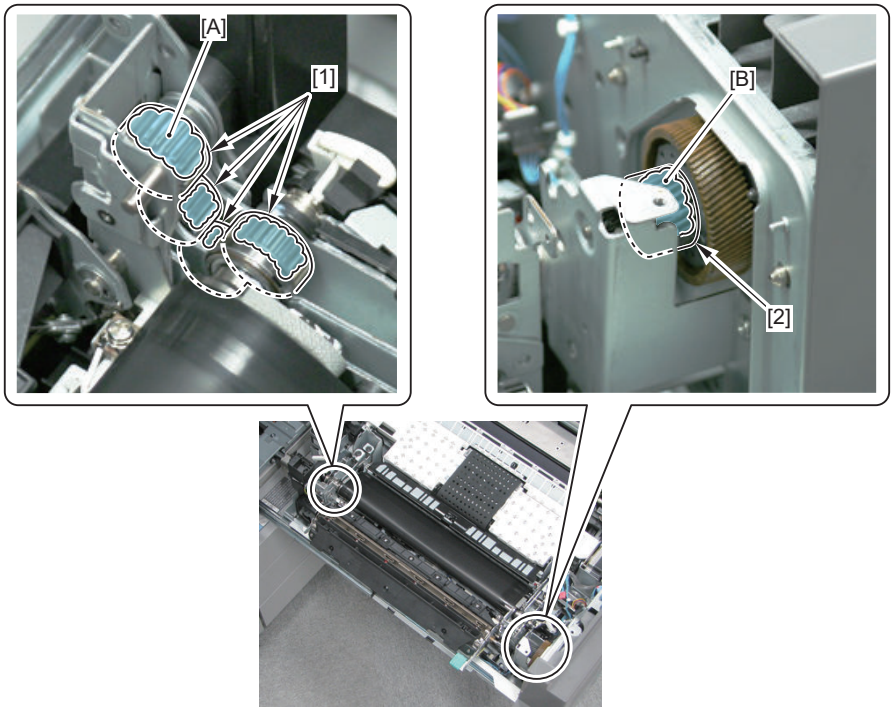
4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****"Removing the Fixing Belt Displacement Control Motor Unit" on page 794**
6. **Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit****"Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit" on page 803**
7. **Removing the Fixing Belt Unit****"Removing the Fixing Belt Unit" on page 809**

CAUTION:
Be sure to perform cleaning and lubrication when replacing the Fixing Belt Unit.
When the Pressure Belt Unit is also replaced at the same time, the application of grease to the gear of the Pressure Belt Unit mentioned in step 1 is not necessary (because grease is applied to the Fixing Belt Unit and the Pressure Belt Unit which are service parts).

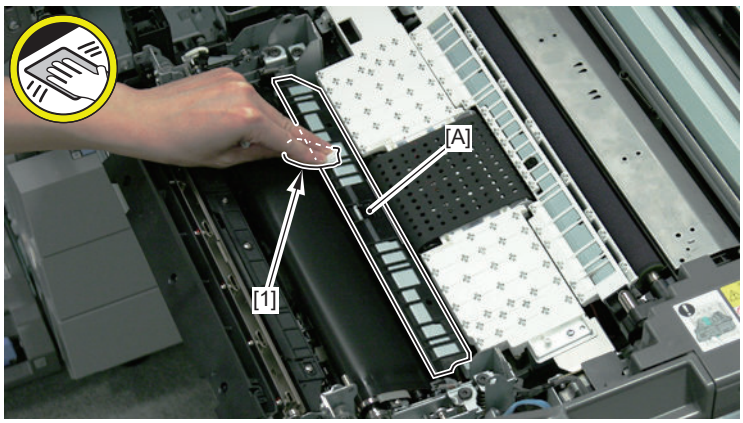
■ Procedure

1. **Apply grease (SE1107) to the tooth surfaces [A] of the 4 gears of the Pressure Belt Unit.**
   - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface

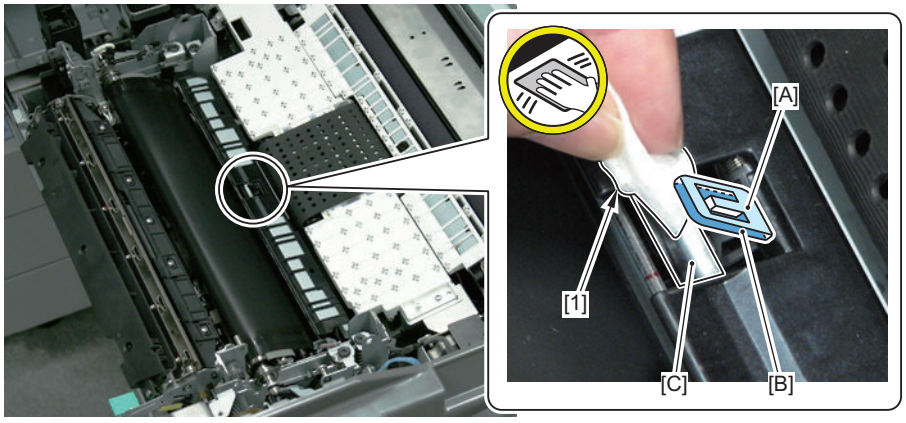
2. **Apply grease (SE1107) to the tooth surface [B] of the gear [2] of the Fixing Drive Unit.**
   - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface



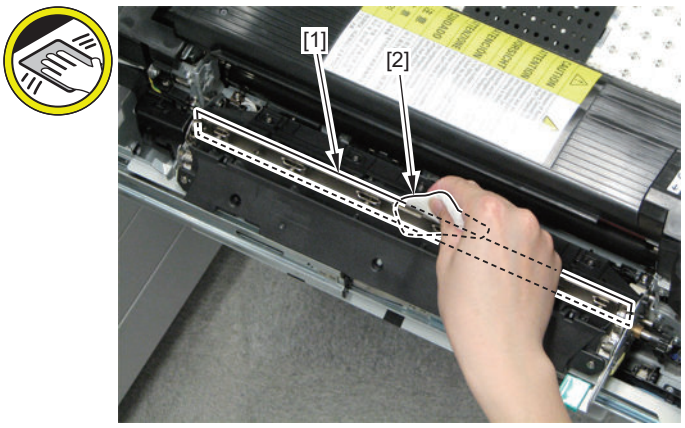
3. **Clean the surface [A] of the Fixing Inlet Guide with lint-free paper [1] moistened with alcohol.**



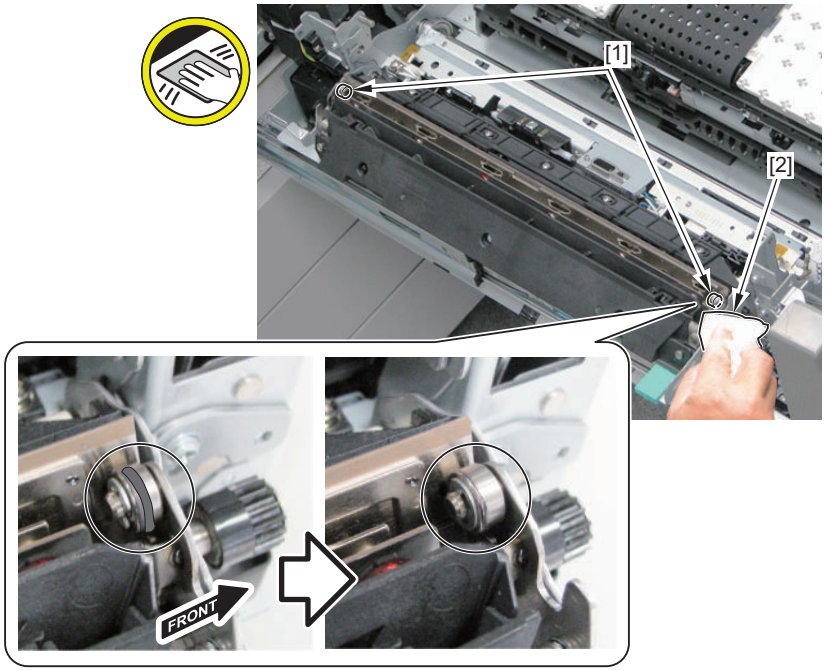
4. **Clean the Sensor Flag's surface side [A], back side [B], and the [C] part of the Fixing Inlet Guide (which comes in contact with the Sensor Flag) with lint-free paper [1] moistened with alcohol.**



5. **Clean the Separation Plate [1] for inner delivery Unit with lint-free paper [2] moistened with alcohol.**



6. **Clean the 2 Inner Delivery Unit Separation Plate Rollers [1] with lint-free paper [2] moistened with alcohol.**



CAUTION:
The cleaned Inner Delivery Unit Separation Plate Rollers should have a smooth surface with nothing attached, and should rotate without any load.
Reason: The Fixing Belt may be damaged.

7. **Install the removed parts in reverse order.**

8. **Clear the counter.**
   COPIER > COUNTER > DRBL-1 > FX-BLT-U

NOTE:
The following items are cleared when the above counter is cleared.
- COPIER > DISPLAY > FIXING > FX-U-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-U-STR
- COPIER > DISPLAY > FIXING > FX-R-TM
- COPIER > COUNTER > FIXING > FX-RF-RL
- COPIER > COUNTER > CLEANING > FX1-RFRL

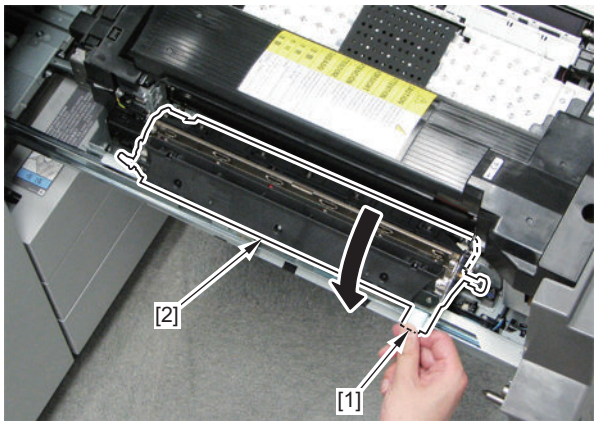
Cleaning the Inner Delivery Unit Separation Plate

■ Preparation

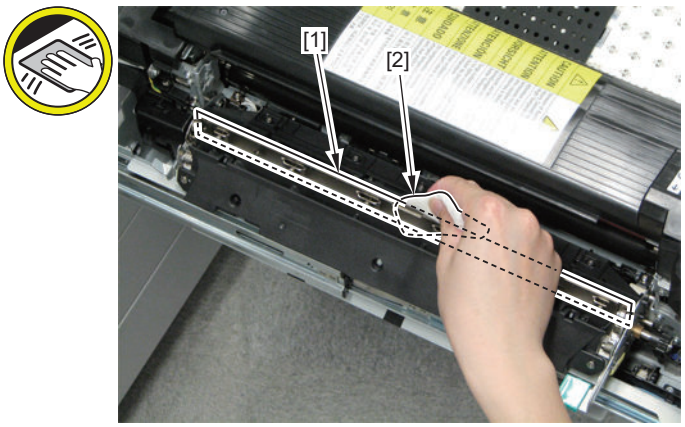
1. Open the Front Cover.
2. Pull out the Fixing Feed Unit.“Pulling out the Fixing Feed Unit” on page 859

■ Procedure

1. Hold the handle [1], and open the Inner Delivery Unit [2].



2. Clean the Separation Plate [1] for inner delivery Unit with lint-free paper [2] moistened with alcohol.



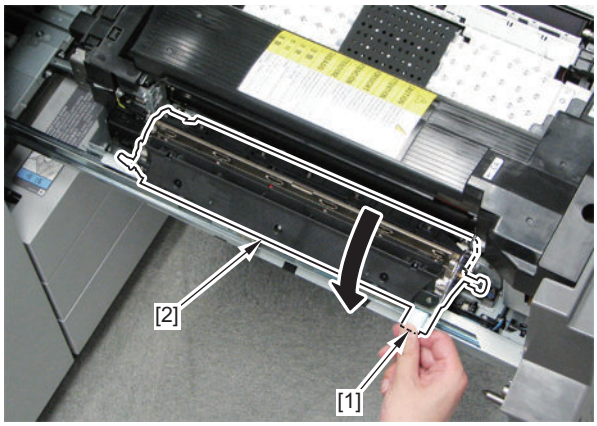
Cleaning the Inner Delivery Unit Separation Plate Rollers

■ Preparation

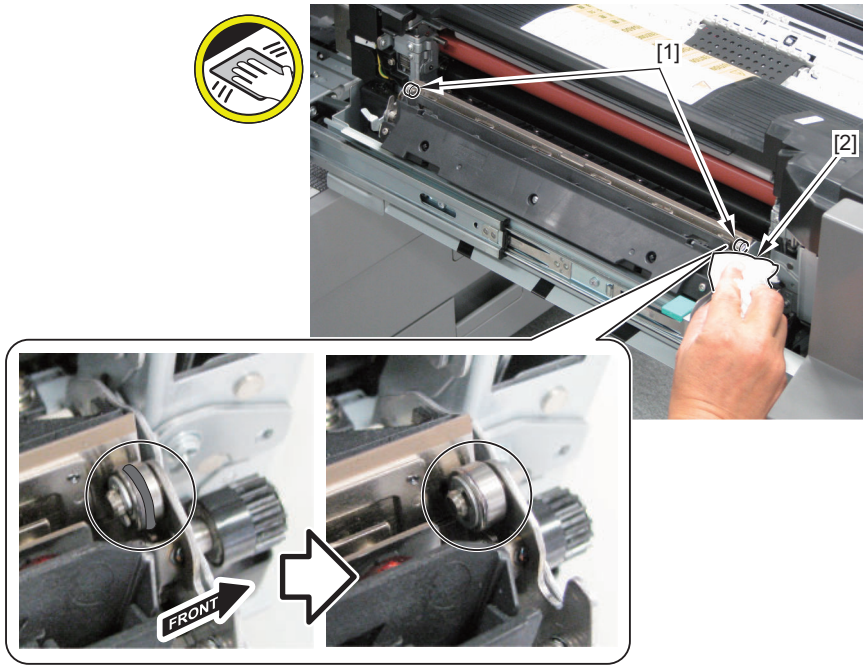
1. Open the Front Cover.
2. Pull out the Fixing Feed Unit.“Pulling out the Fixing Feed Unit” on page 859

■ Procedure

1. **Hold the handle [1], and open the Inner Delivery Unit [2].**

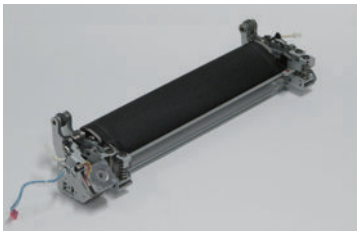


2. **Clean the 2 Inner Delivery Unit Separation Plate Rollers [1] with lint-free paper [2] moistened with alcohol.**



CAUTION:
The cleaned Inner Delivery Unit Separation Plate Rollers should have a smooth surface with nothing attached, and should rotate without any load.
Reason: The Fixing Belt may be damaged.

Removing the Fixing Lower Unit



■ Preparation

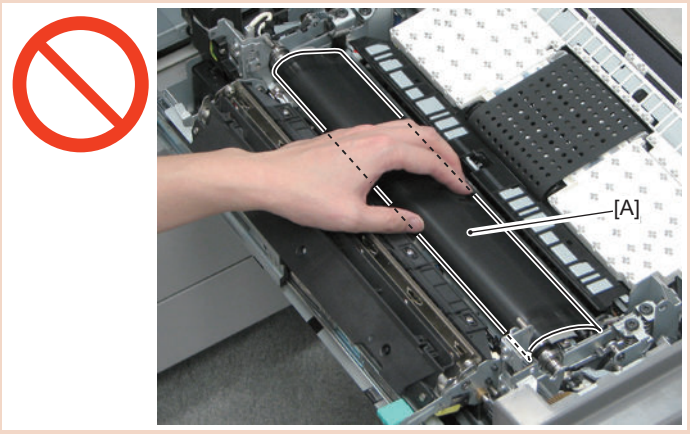
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

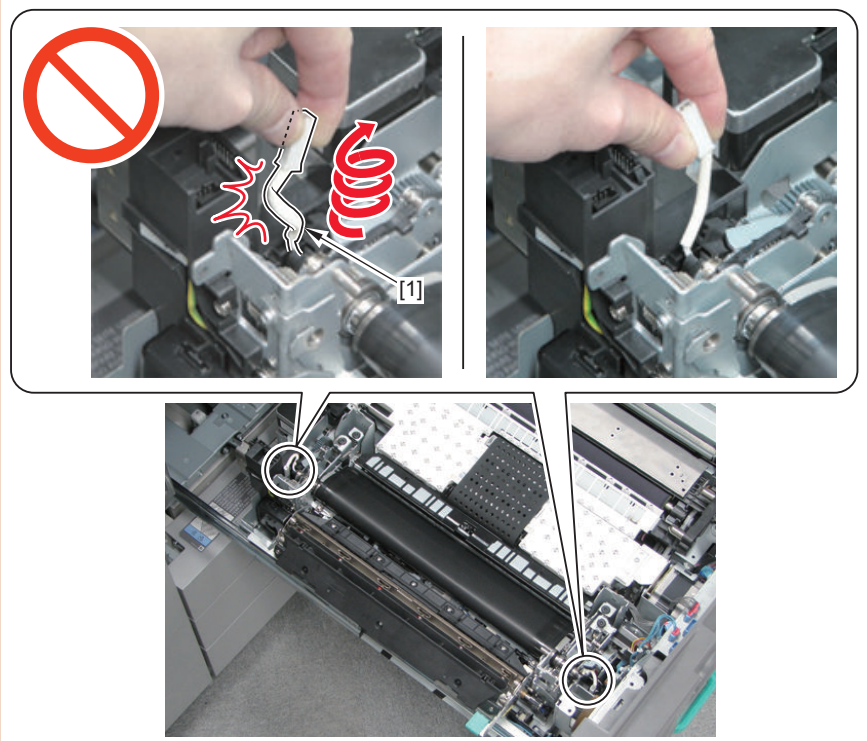
4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****"Removing the Fixing Belt Displacement Control Motor Unit" on page 794**
6. **Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit****"Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit" on page 803**

■ Procedure

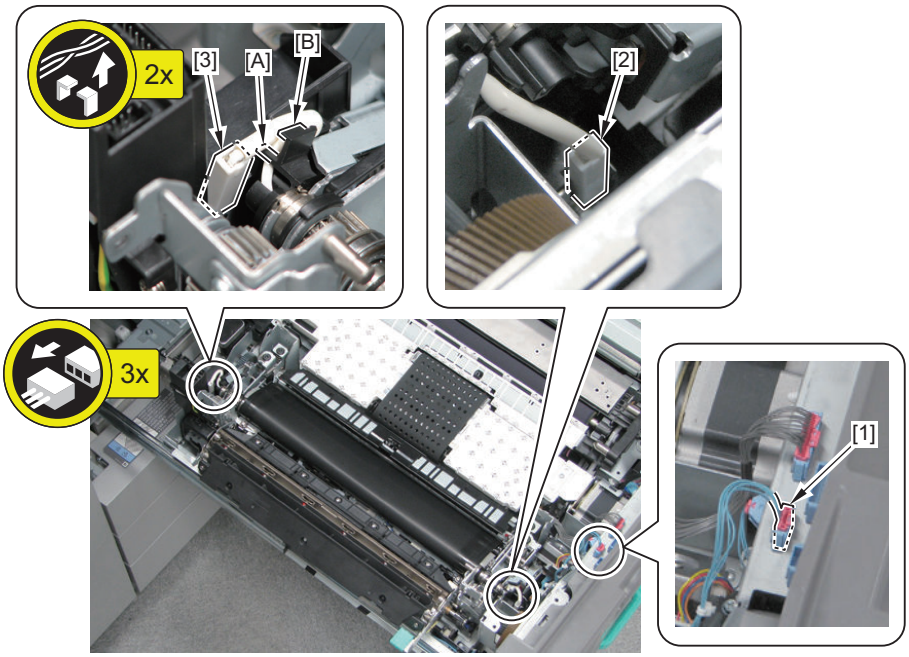
CAUTION:
Do not touch the surface [A] of the Pressure Belt. Otherwise, it may cause fixing failure.



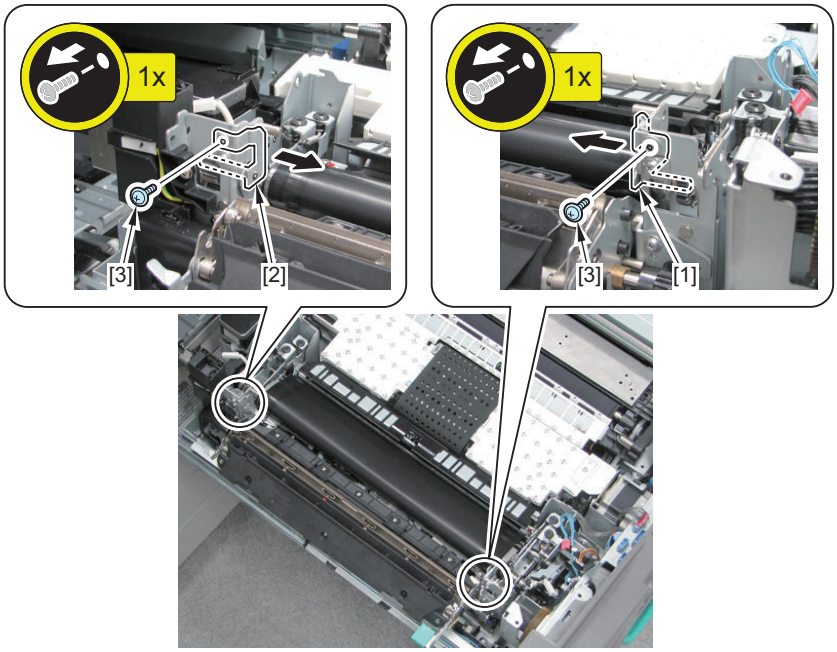
CAUTION:
Be careful not to twist the Heater Cord [1] when installing/removing the unit.
Otherwise, the Heater Cord [1] becomes overloaded, which may cause open circuit.



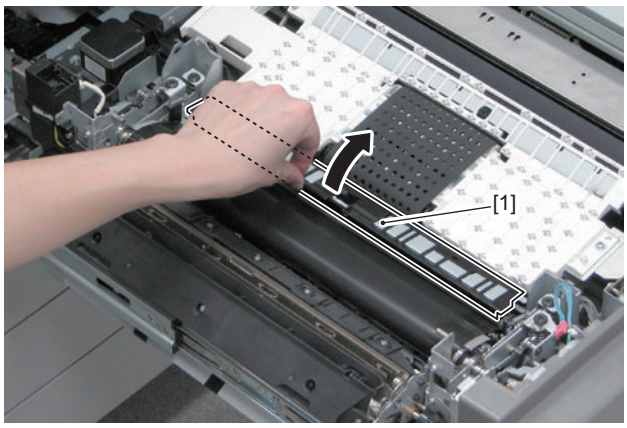
1. **Disconnect the connector [1].**
2. **Disconnect the Heater Connector Front [2], free the harness from the guides [A] and [B], and then disconnect the Heater Connector Rear [3].**



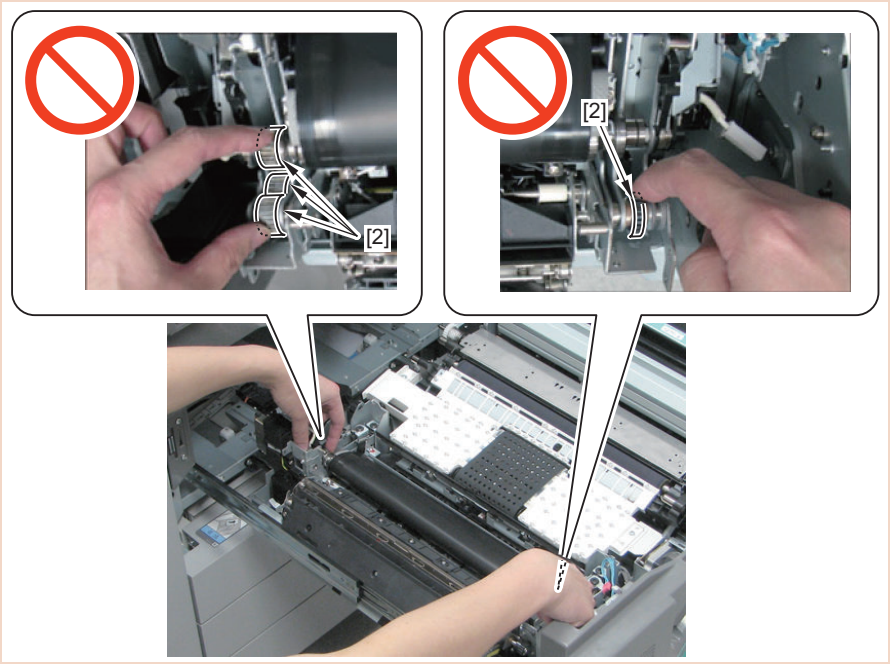
3. **Remove the Fixation Pin Front [1] and the Fixation Pin Rear [2].**
   - 2 Screws [3]



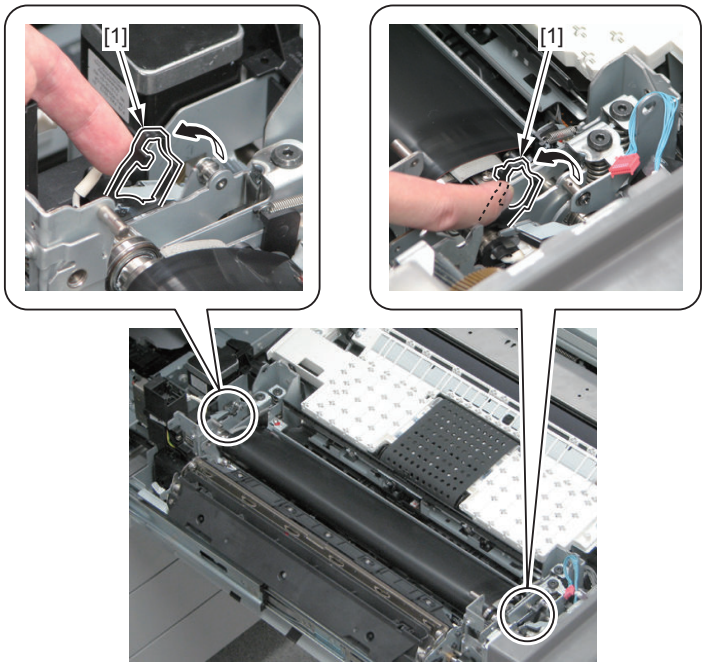
4. Open the Fixing Inlet Guide [1].



CAUTION:
Do not to touch the gear [2] of the Fixing Lower Unit since grease is applied.

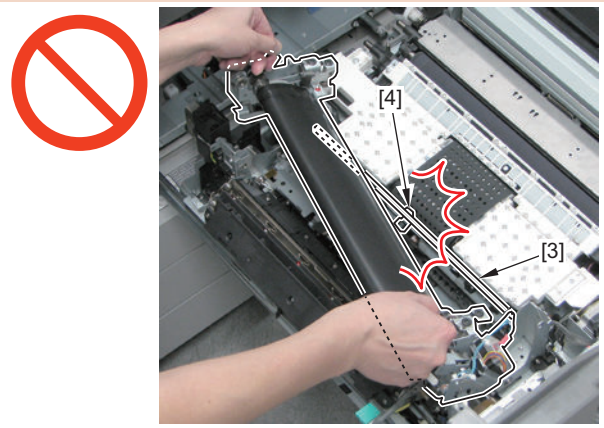


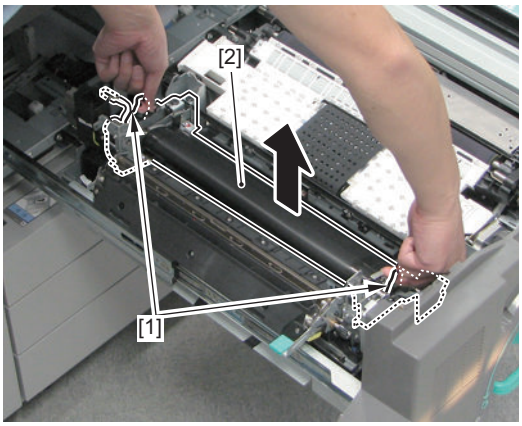
5. Raise the 2 handles [1].



6. Hold the 2 handles [1], and remove the Fixing Lower Unit [2].

CAUTION:
Do not hit it against the Fixing Inlet Guide [3] and the Sensor Flag [4] when installing/removing it.

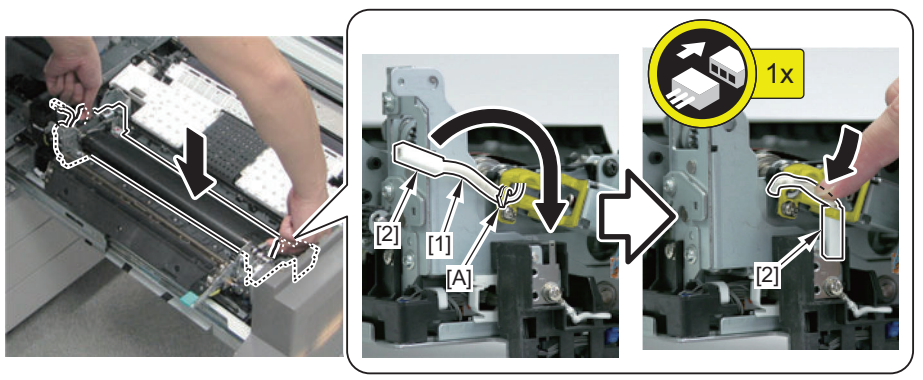




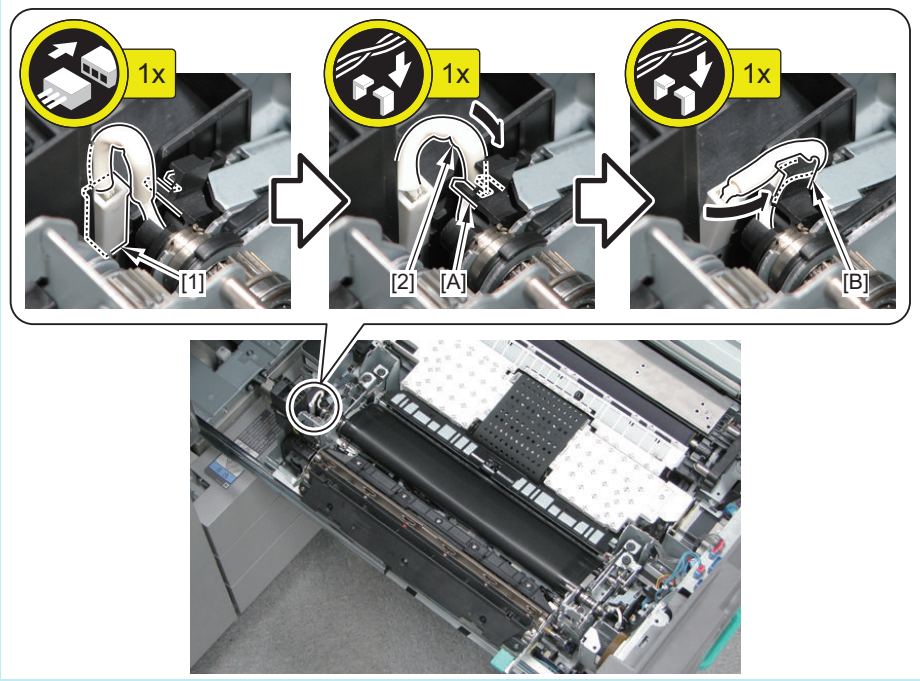
NOTE:
How to install the Heater Cord on the front side

- Be sure to pass the Heater Cord [1] through the Harness Guide [A] before placing the Fixing Lower Unit on the Fixing Assembly.

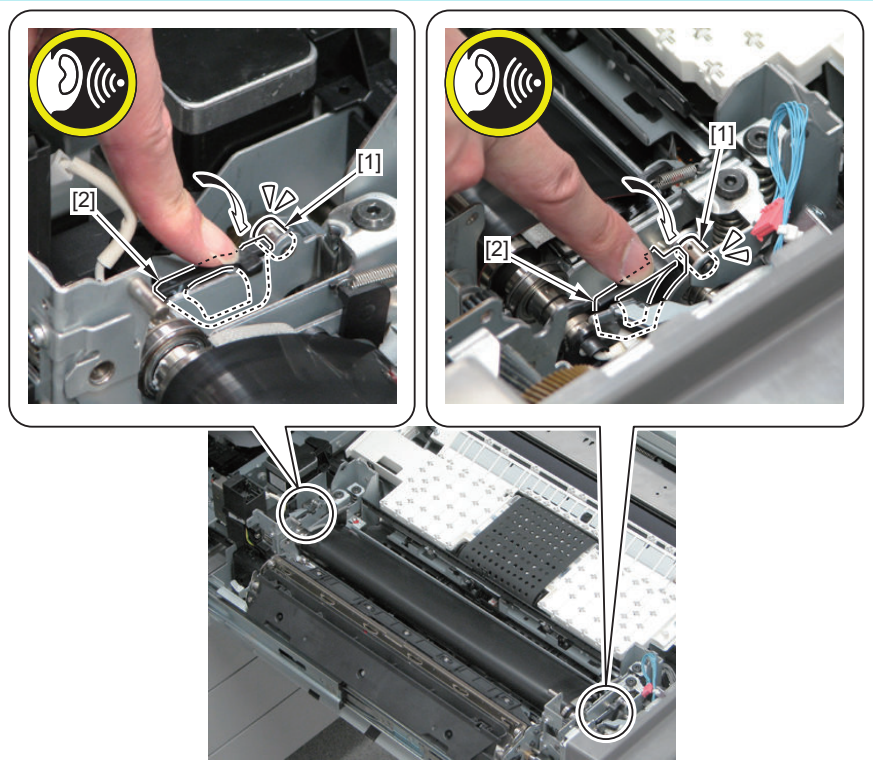
- Be sure to connect the Heater Connector [2] to prevent the Heater Cord [1] from coming off from the Harness Guide [A] after placing the Fixing Lower Unit on the Fixing Assembly.



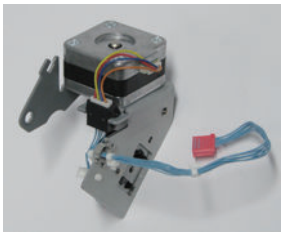
NOTE:
How to install the Heater Cord on the Rear Side
After placing the Fixing Lower Unit on the Fixing Assembly, install the Heater Connector [1], and pass the Heater Cord [2] through the Harness Guide [A], and then under the Harness Guide [B].



NOTE:
How to install the handle of the Fixing Lower Unit
Push the 2 handles [2] of the Fixing Lower Unit to the 2 shafts [1] located on the front and the rear sides of the Fixing Unit until you hear a click sound so that the handles are locked in place.



Removing the Pressure Belt Displacement Control Motor Unit



■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

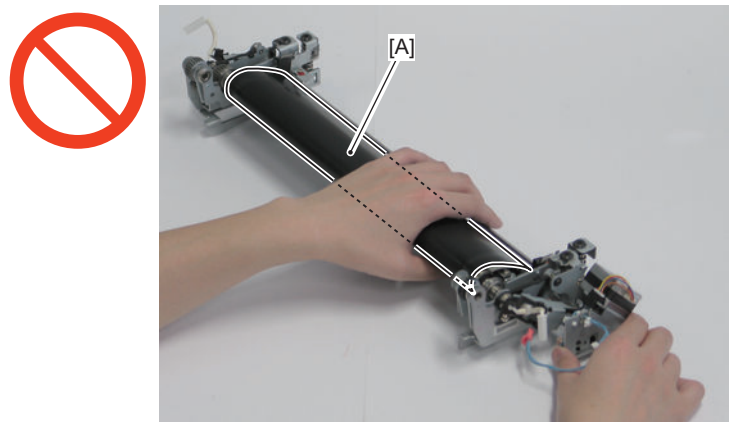
NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****"Removing the Fixing Belt Displacement Control Motor Unit" on page 794**
6. **Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit****"Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit" on page 803**

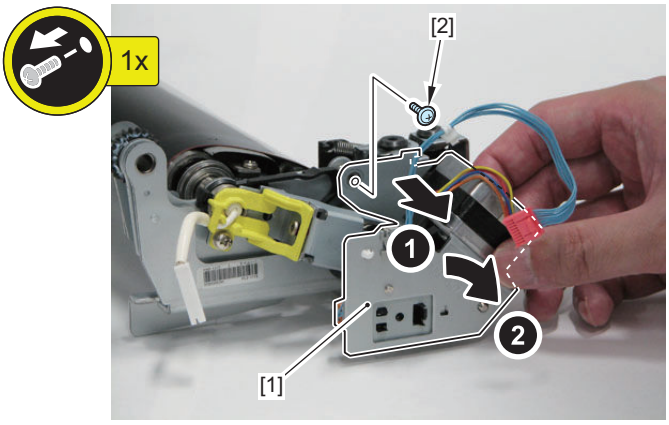
7. **Removing the Fixing Lower Unit****"Removing the Fixing Lower Unit" on page 816**

■ Procedure

CAUTION:
Do not touch the surface [A] of the Pressure Belt. Otherwise, it may cause fixing failure.

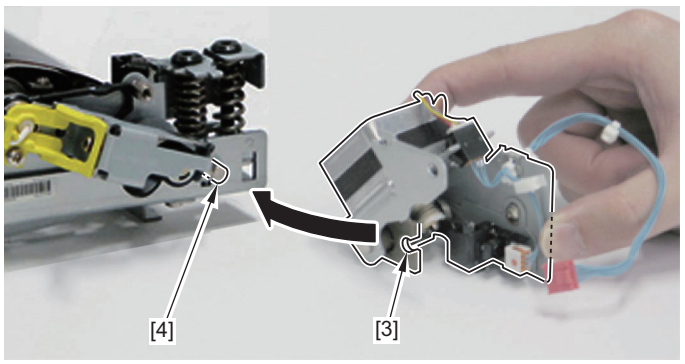


1. **Remove the Pressure Belt Displacement Control Motor Unit [1].**
   - 1 Screw [2]

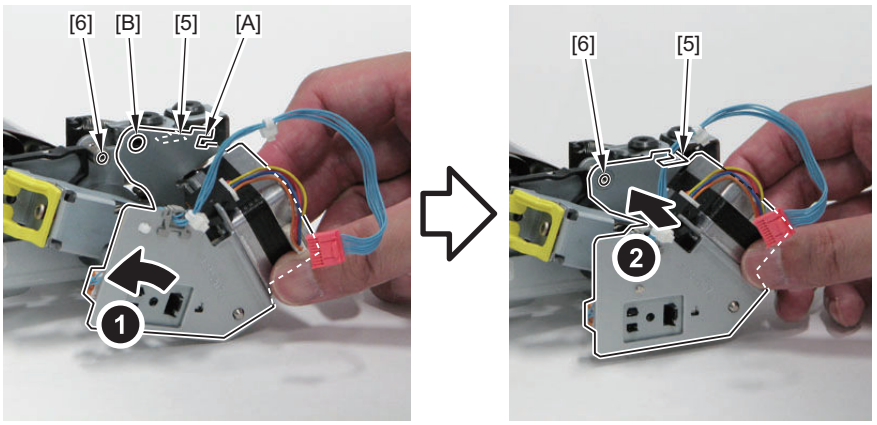


NOTE:
How to install the Pressure Belt Displacement Control Motor Unit

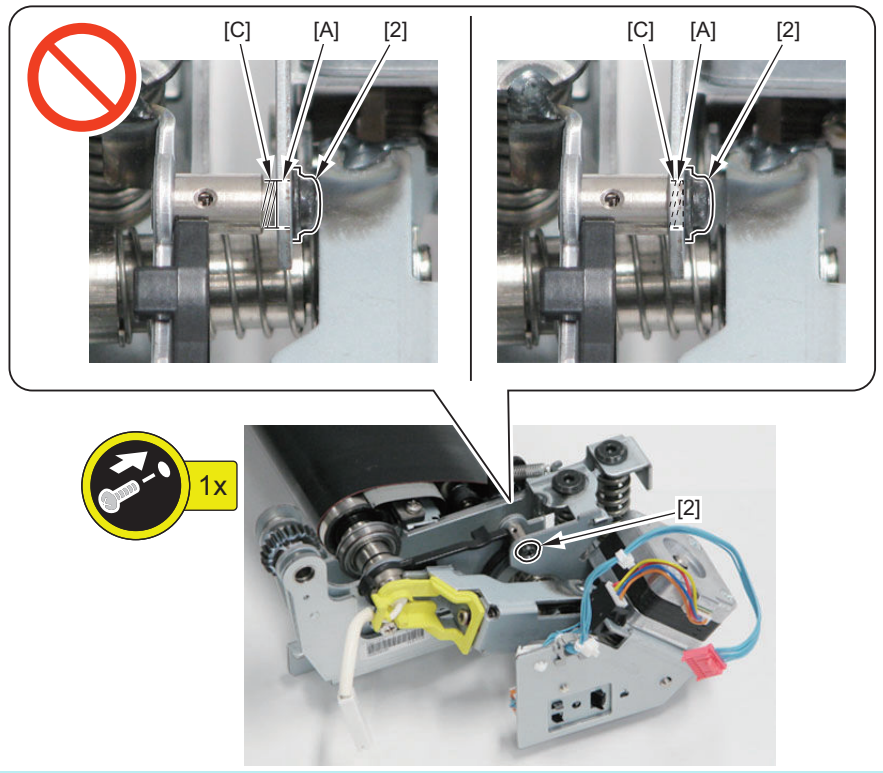
1. Align the hook [3] with the shaft [4] of the Fixing Lower Unit.



2. Rotate the Pressure Belt Displacement Control Motor [1] to align the cut-off [A] with the hook [5] of the Fixing Lower Unit and the hole [B] with the shaft [6] of the Fixing Lower Unit.



3. After tightening the removed screw [2], be sure that the stepped part [C] of the shaft of the Fixing Lower Unit is fit in the hole [A] of the Support Plate of the Motor Unit.



Separating the Pressure Belt Unit and the Pressure Heater

■ Preparation

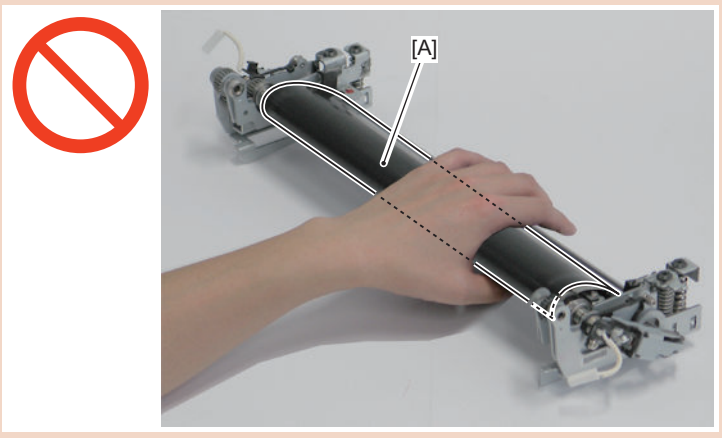
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

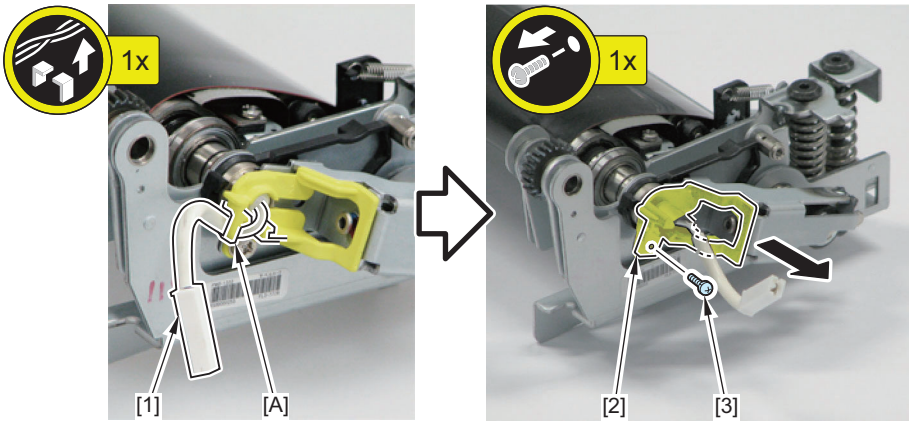
4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****"Removing the Fixing Belt Displacement Control Motor Unit" on page 794**
6. **Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit****"Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit" on page 803**
7. **Removing the Fixing Lower Unit****"Removing the Fixing Lower Unit" on page 816**
8. **Removing the Pressure Belt Displacement Control Motor Unit****"Removing the Pressure Belt Displacement Control Motor Unit" on page 824**

■ Procedure

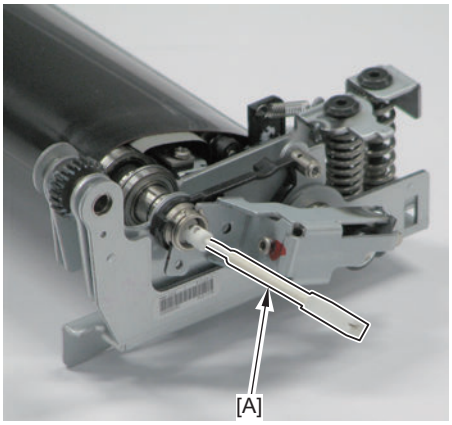
CAUTION:
Do not touch the surface [A] of the Pressure Belt. Otherwise, it may cause fixing failure.



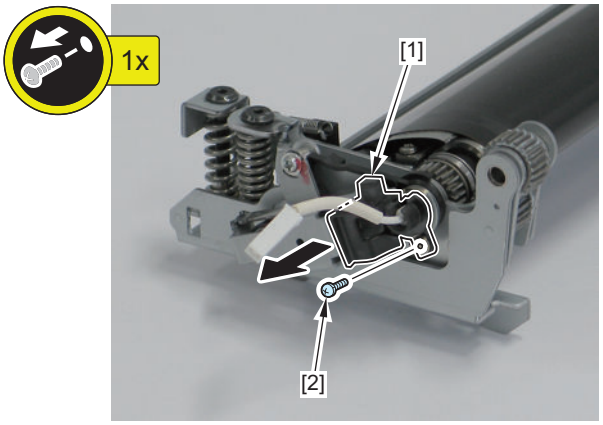
1. **Free the Heater Harness [1] on the front side from the guide [A], and remove the Heater Retainer Shaft Support Front [2].**
   - 1 Screw [3]



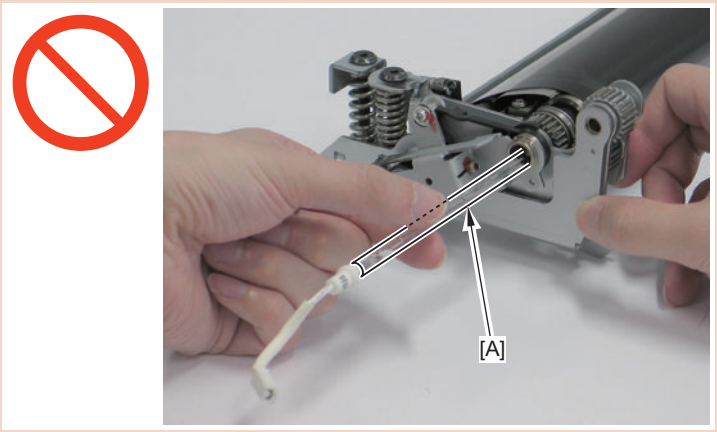
2. **Remove the bend in the [A] part of the Heater Harness on the front side to make it straight.**



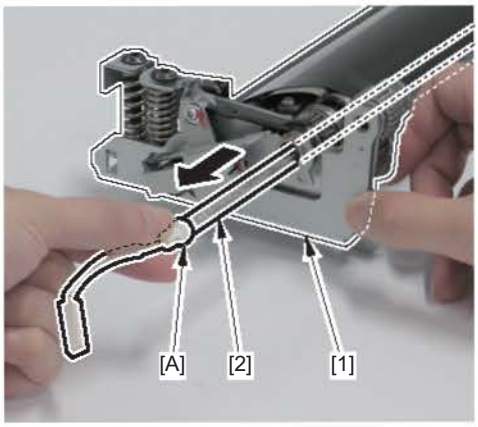
3. **Remove the Heater Retainer Shaft Support Rear [1].**
   - 1 Screw [2]



CAUTION:
Do not touch the surface [A] of the Pressure Heater.

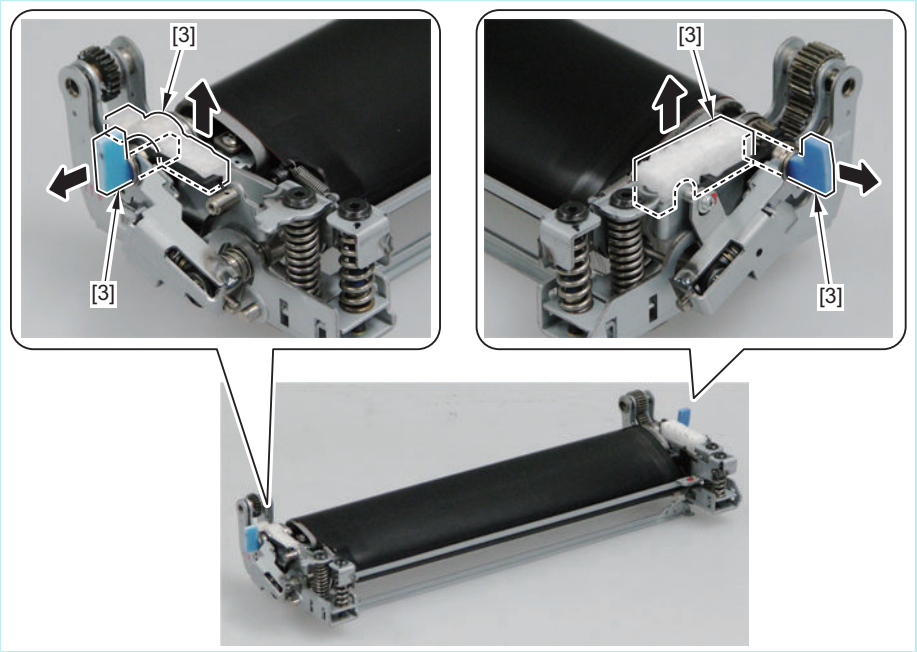


4. **Hold the rear side [A] of the Pressure Heater, and separate the Pressure Belt Unit [1] and the Pressure Heater [2].**

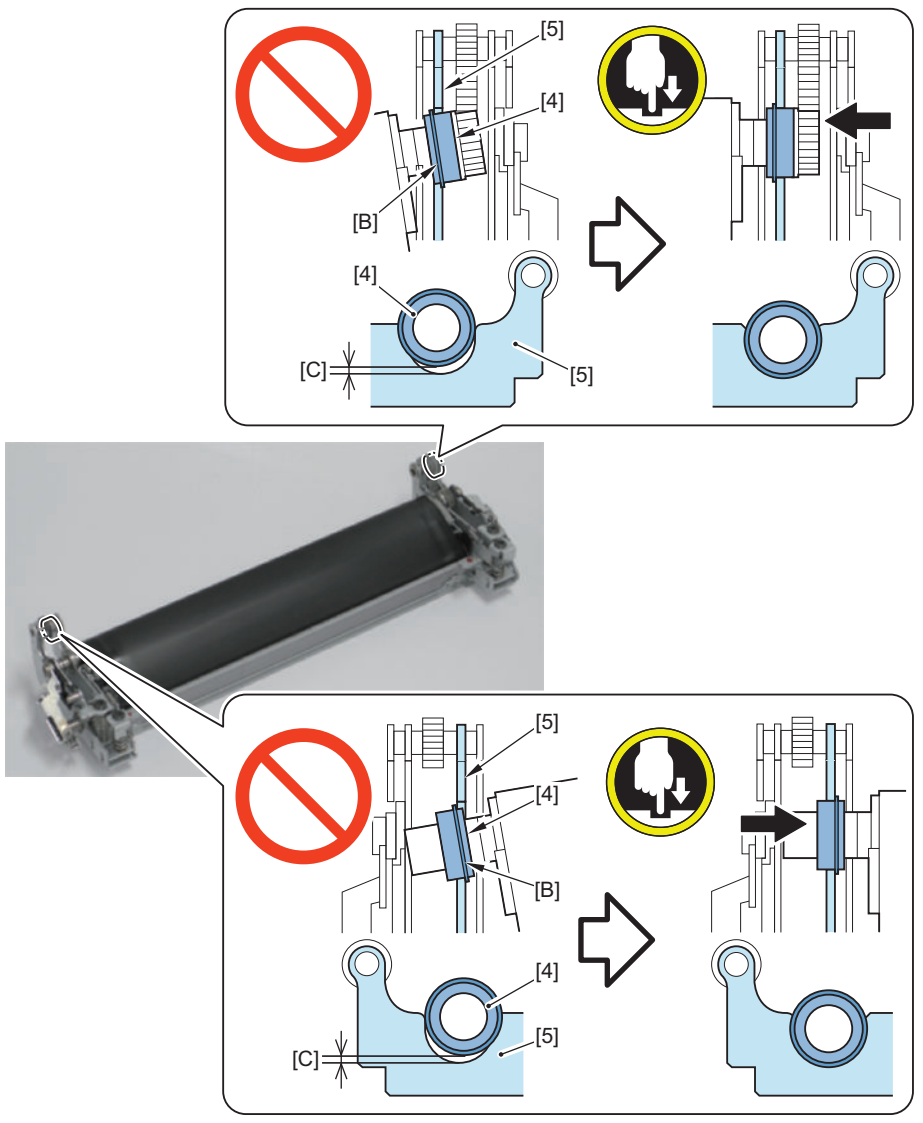


NOTE:
Checking before installing the new Pressure Belt Unit

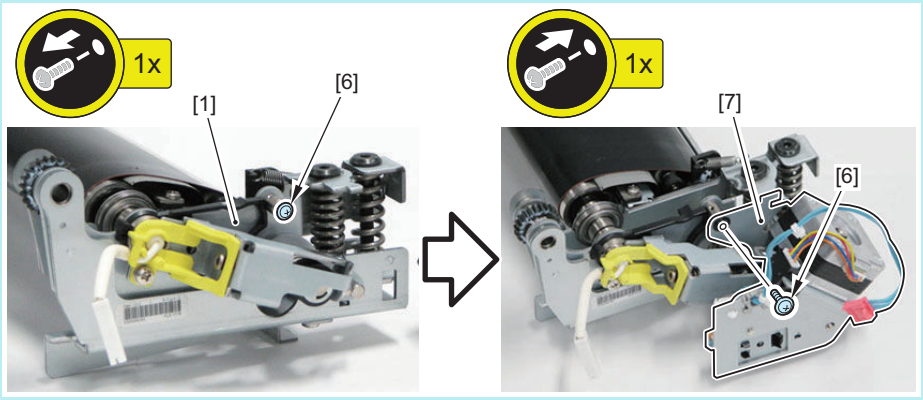
1. Remove the 4 Fixation Members [3].



2. Check the positions of the 2 bearings [4] of the Pressure Roller.
   - When viewed from above, the flanges [B] of the 2 bearings [4] should be located inside the 2 Support Plates [5].
   - When viewed from the side, there should be no space [C] between the 2 bearings [4] and the 2 Support Plates [5].

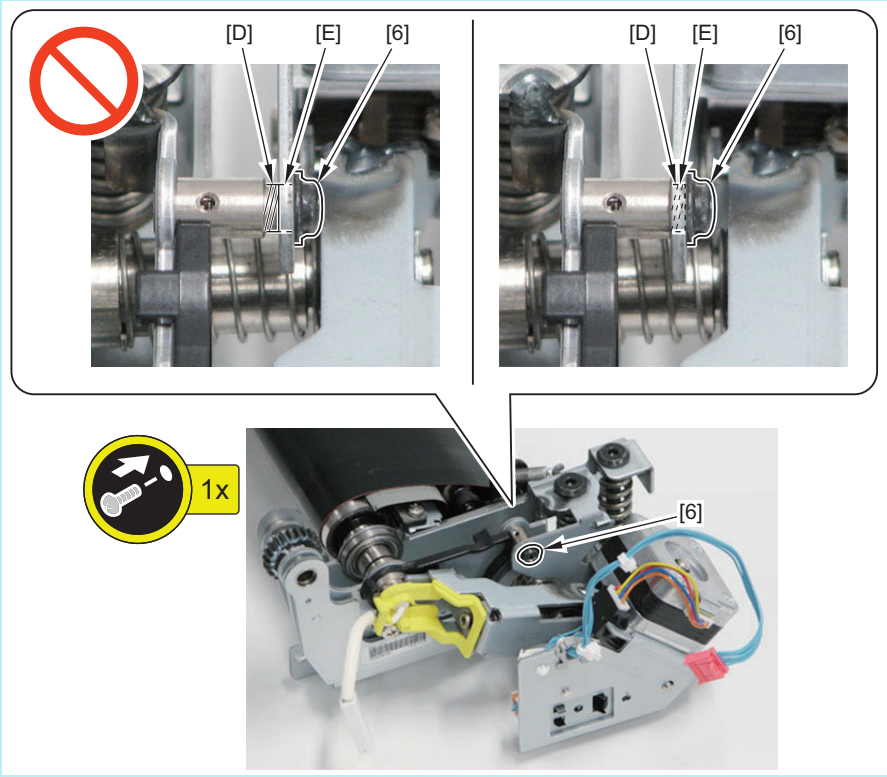


NOTE:
Replacing the Pressure Belt Displacement Control Motor Unit Fixation Screw
- When replacing the Pressure Belt Unit, remove the screw [6] of the Pressure Belt Unit [1] (service part), and use it to secure the Pressure Belt Displacement Control Motor Unit [7]. (Replace the Loose-proof Screw that was securing the Pressure Belt Displacement Control Motor Unit [7] with the screw [6].)



NOTE:

- After tightening the screw [6], be sure that the stepped part [D] of the shaft of the Fixing Lower Unit is fit in the hole [E] of the Support Plate of the Motor Unit.



Cleaning and Lubrication When Replacing the Pressure Belt Unit

■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

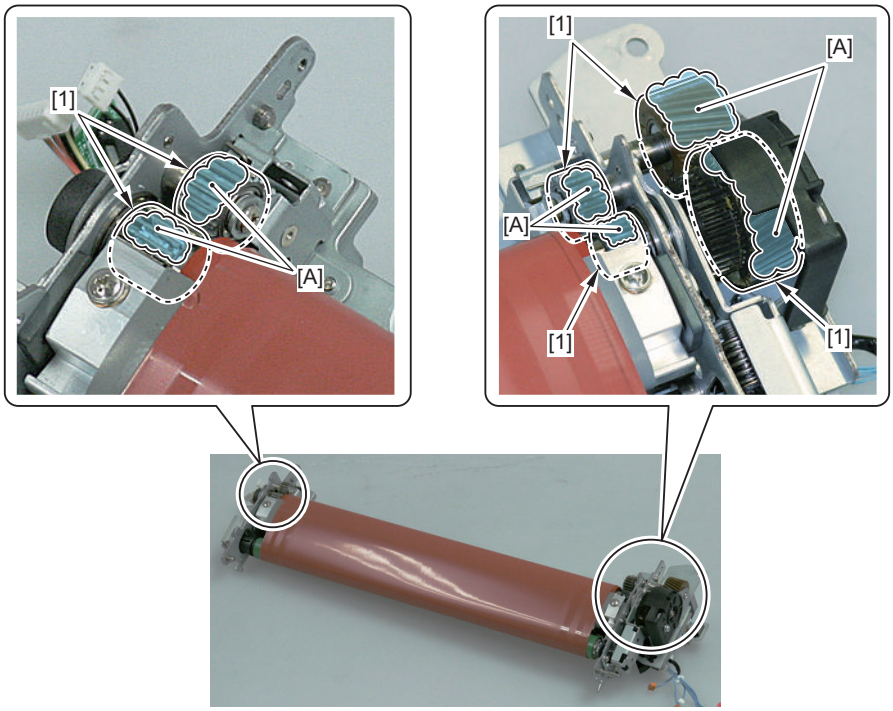
4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****"Removing the Fixing Belt Displacement Control Motor Unit" on page 794**
6. **Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit****"Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit" on page 803**
7. **Removing the Fixing Lower Unit****"Removing the Fixing Lower Unit" on page 816**
8. **Removing the Pressure Belt Displacement Control Motor Unit****"Removing the Pressure Belt Displacement Control Motor Unit" on page 824**

9. **Separating the Pressure Belt Unit and the Pressure Heater****"Separating the Pressure Belt Unit and the Pressure Heater" on page 828**

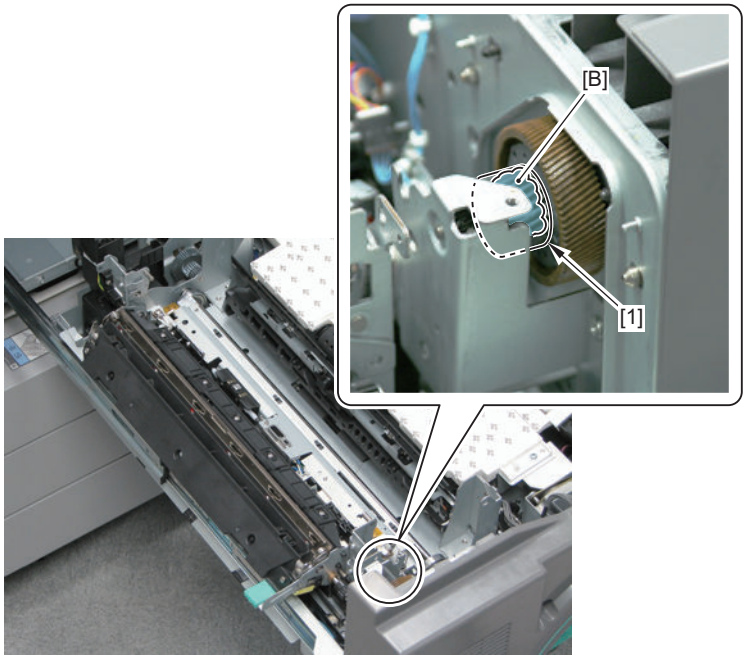
CAUTION:
Be sure to perform cleaning and lubrication when replacing the Pressure Belt Unit.
When the Fixing Belt Unit is also replaced at the same time, the application of grease to the gear of the Fixing Belt Unit mentioned in step 1 is not necessary (because grease is applied to the Fixing Belt Unit and the Pressure Belt Unit which are service parts).

■ Procedure

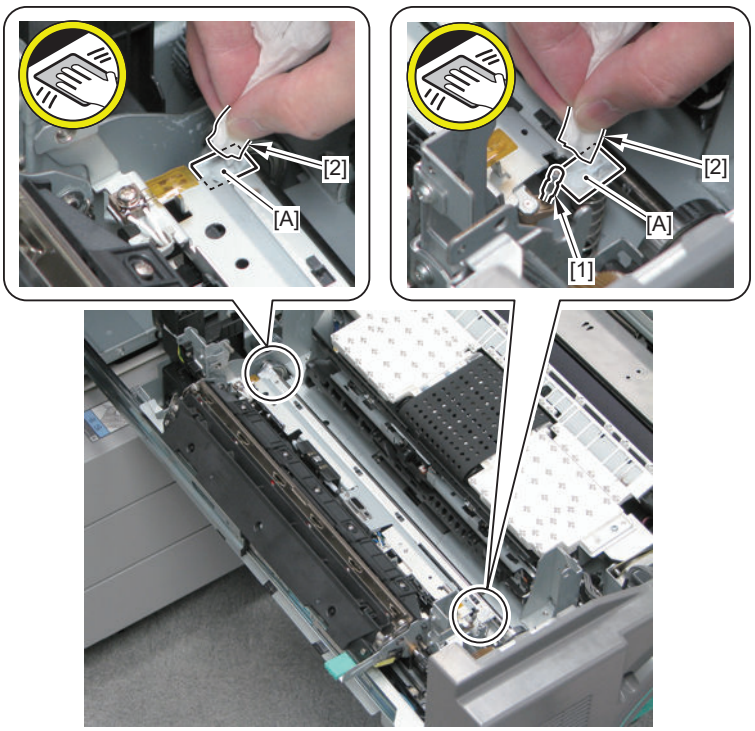
1. **Apply grease (SE1107) to the tooth surfaces [A] of the 6 gears of the Fixing Belt Unit.**
   - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface



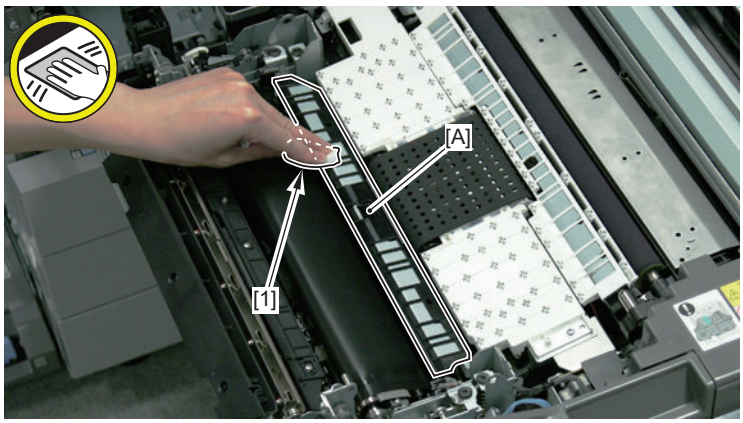
2. **Apply grease (SE1107) to the tooth surface [B] of the gear [1] of the Fixing Drive Unit.**
   - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface



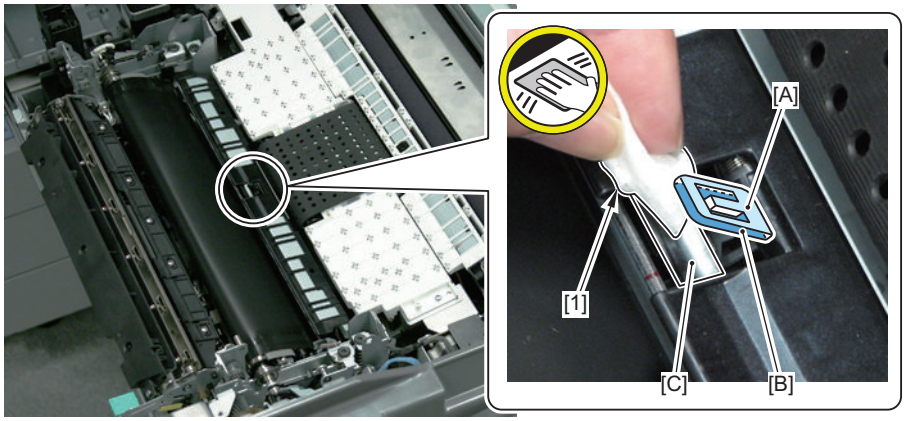
3. **Clean the soiling of the Contact Roller [1] on the Pressure Belt Position Sensor and the oil dripped from the Pressure Belt to the bottom side [A] of the Fixing Lower Unit with lint-free paper [2].**



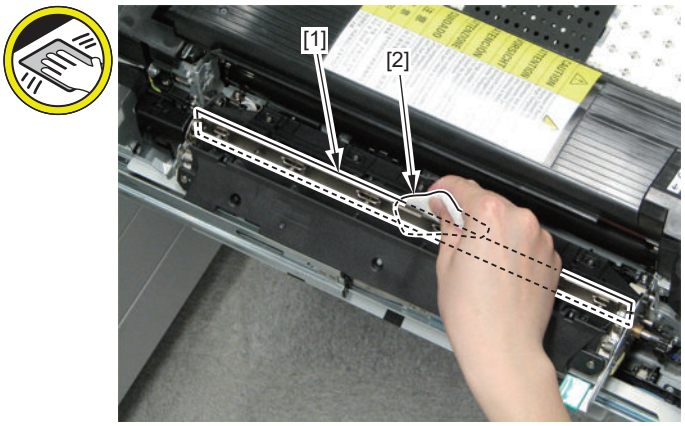
4. **Clean the surface [A] of the Fixing Inlet Guide with lint-free paper [1] moistened with alcohol.**



5. **Using lint-free paper [1] moistened with alcohol, clean the Sensor Flag's surface side [A], back side [B], and the [C] part which comes in contact with the Fixing Inlet Guide.**



6. **Clean the Separation Plate [1] for inner delivery Unit with lint-free paper [2] moistened with alcohol.**

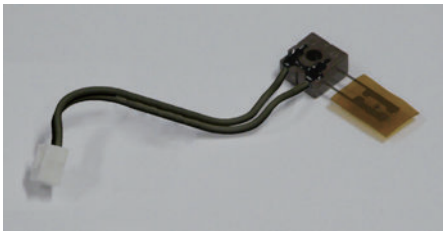


7. **Install the removed parts in reverse order.**

8. **Clear the counter.**
   COPIER > COUNTER > DRBL-1 > FX-BLT-L

NOTE:
The following items are cleared when the above counter is cleared.
COPIER > DISPLAY > FIXING > FX-L-TM1 to 5
COPIER > DISPLAY > FIXING > FX-MTR2 to 5

Removing the Pressure Sub Thermistor (Front)



■ Preparation

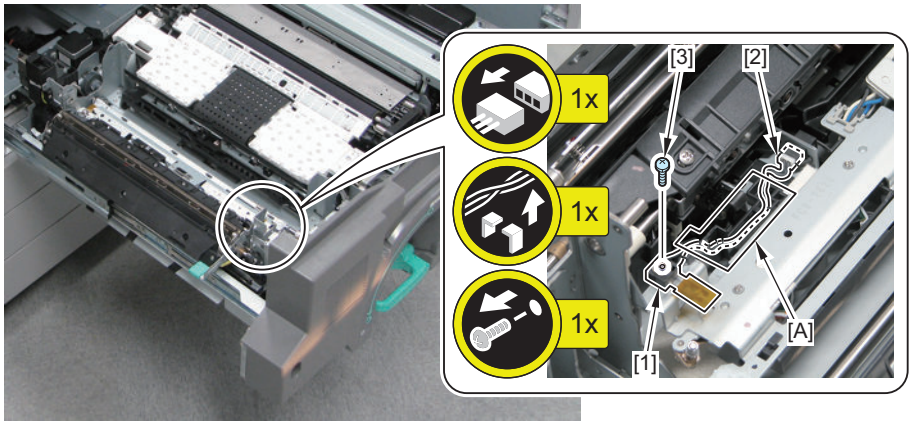
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****“Pulling out the Fixing Feed Unit” on page 859**
3. **Removing the Fixing Upper Cover** **“Removing the Fixing Upper Cover” on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow “Removing the Fixing Assembly” on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

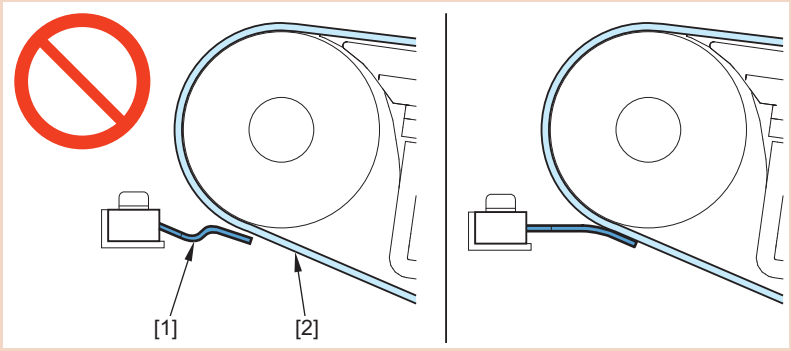
4. **Removing the Fixing IH Unit****“Removing the Fixing IH Unit” on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****“Removing the Fixing Belt Displacement Control Motor Unit” on page 794**
6. **Open the Fixing Belt Unit.****“Opening the Fixing Belt Unit” on page 798**
7. **Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit****“Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit” on page 803**
8. **Removing the Fixing Lower Unit****“Removing the Fixing Lower Unit” on page 816**

■ Procedure

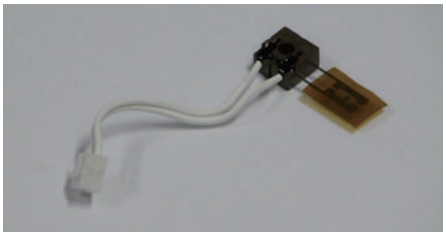
1. **Remove the Pressure Sub Thermistor (Front) [1].**
   - 1 Connector [2]
   - 1 Harness Guide [A]
   - Screw [3]



⚠ CAUTION:
Do not use the Pressure Sub Thermistor (Front) [1] when it is deformed. When not properly in contact with the Pressure Belt [2], the Pressure Sub Thermistor (Front) [1] does not function normally to detect the temperature, which may cause the Fixing Assembly to be hot.



Removing the Pressure Sub Thermistor (Rear)



■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

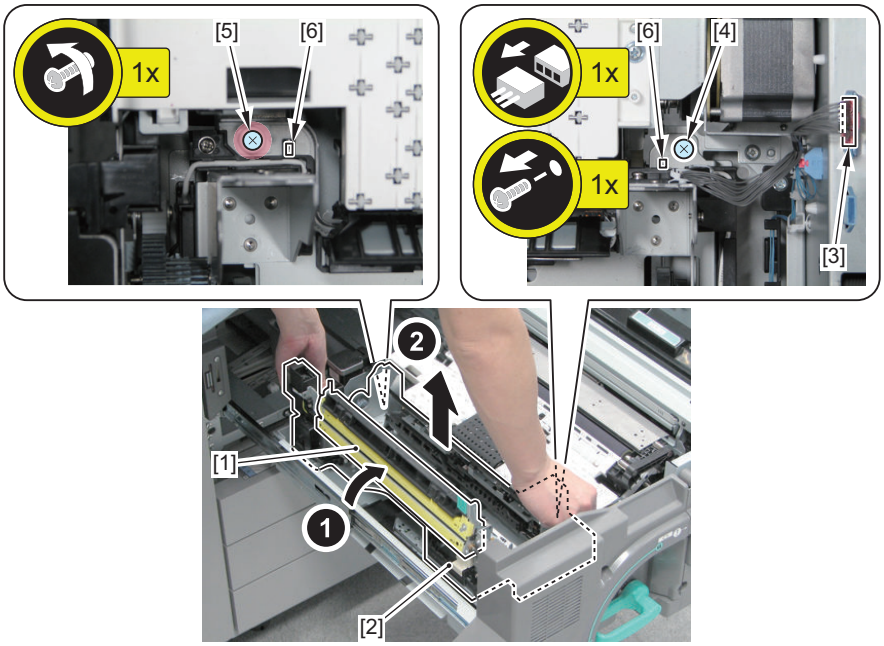
3. **Removing the Fixing Upper Cover** **“Removing the Fixing Upper Cover” on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow “Removing the Fixing Assembly” on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

4. **Removing the Fixing IH Unit****“Removing the Fixing IH Unit” on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****“Removing the Fixing Belt Displacement Control Motor Unit” on page 794**
6. **Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit****“Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit” on page 803**
7. **Removing the Fixing Lower Unit****“Removing the Fixing Lower Unit” on page 816**

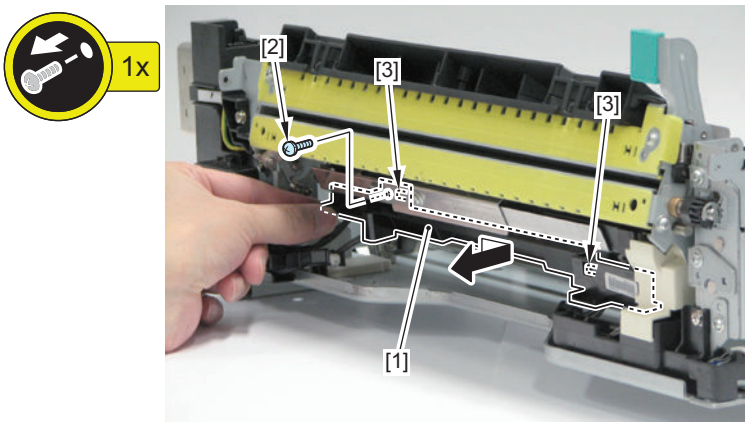
■ Procedure

1. **Close the Inner Delivery Unit [1], and remove the Fixing Frame [2].**
   - 1 Connector [3]
   - 1 Screw [4]
   - 1 Screw [5] (to loosen)
   - 2 Bosses [6]

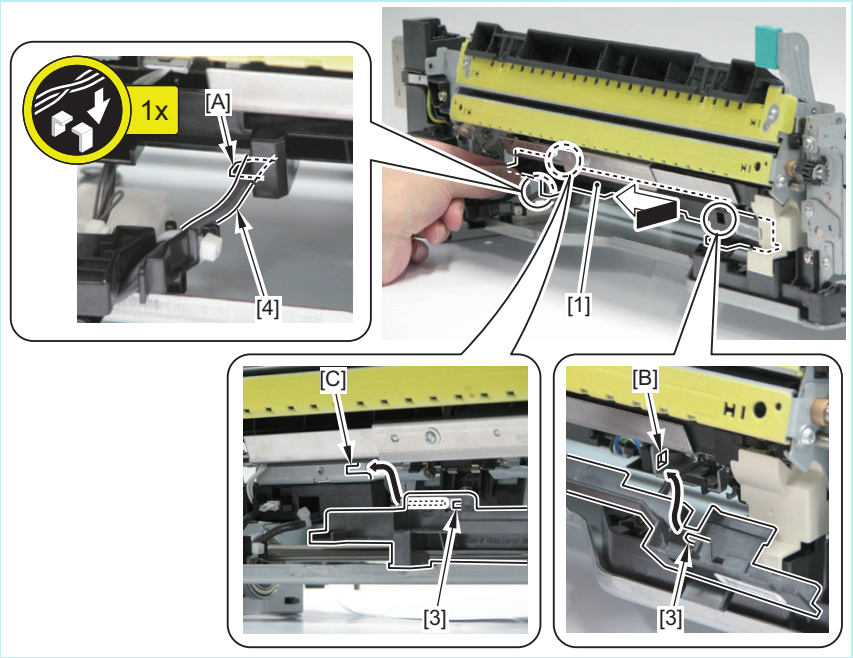


2. Remove the Connector Cover [1].

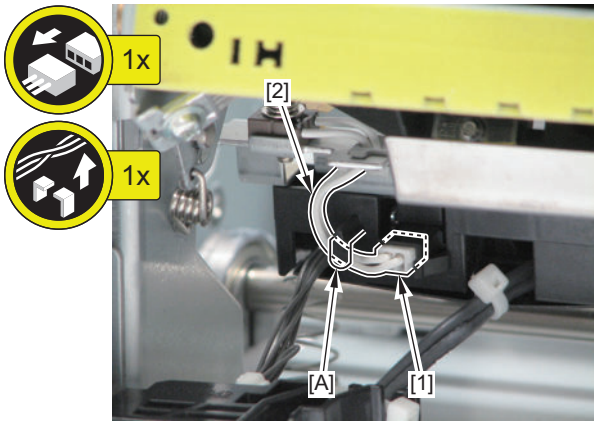
- 1 Screw [2]
- 2 Hooks [3]



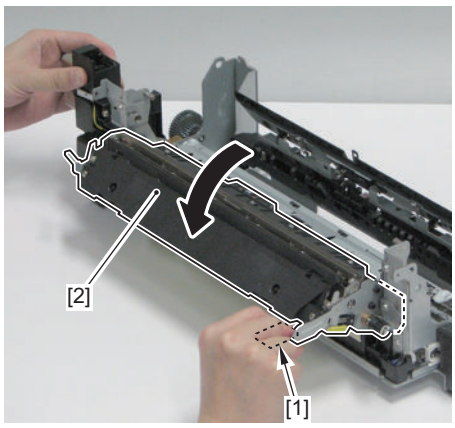
NOTE:
How to install the Upper Cover
Be sure to route the harness [4] on the guide [A] of the Connector Cover [1], and align the 2 hooks [3] with the hole [B] and the cut-off [C] of the Fixing Frame.



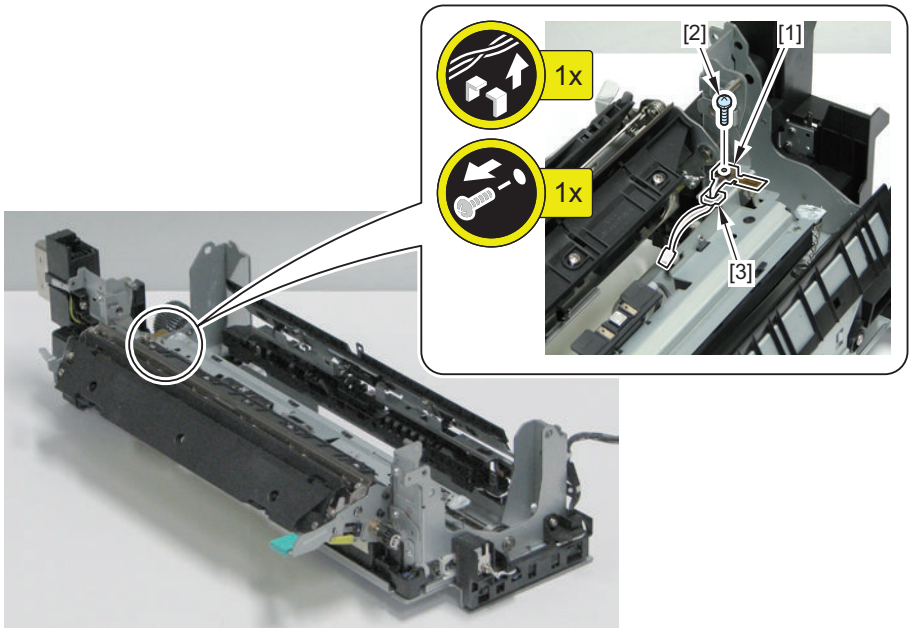
3. Disconnect the connector [1], and free the harness [2] from the Harness Guide [A].



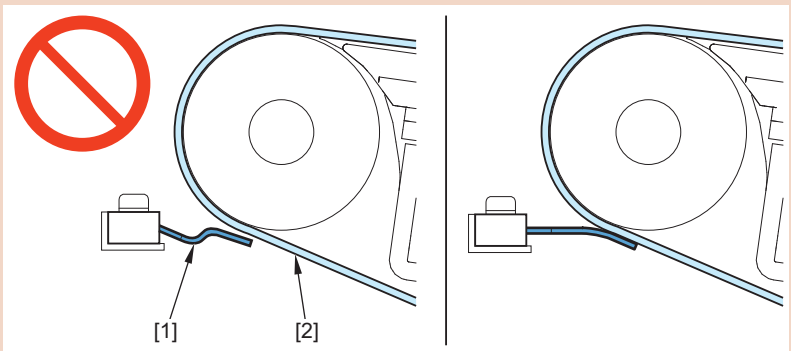
4. **Hold the handle [1], and open the Inner Delivery Unit [2].**



5. **Remove the Pressure Sub Thermistor (Rear) [1].**
   - 1 Screw [2]
   - 1 Edge Saddle [3]



⚠ CAUTION:
Do not use the Pressure Sub Thermistor (Rear) [1] when it is deformed. When not properly in contact with the Pressure Belt [2], the Pressure Sub Thermistor (Rear) [1] does not function normally to detect the temperature, which may cause the Fixing Assembly to be hot.



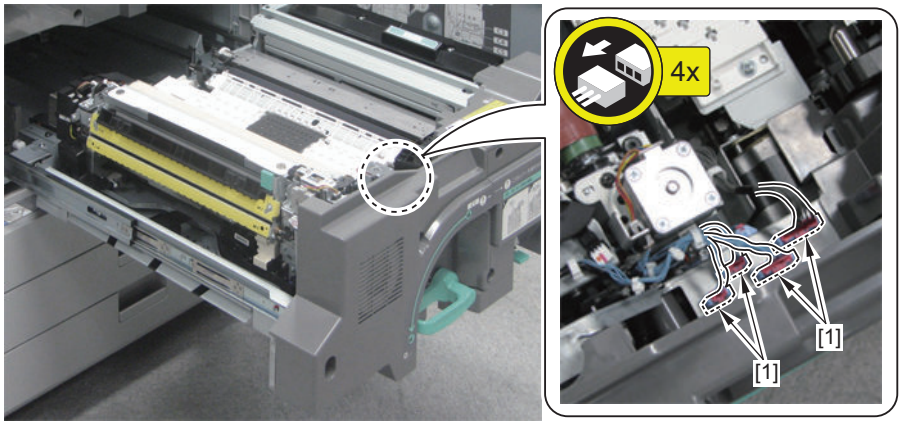
Removing the Fixing Assembly

■ Preparation

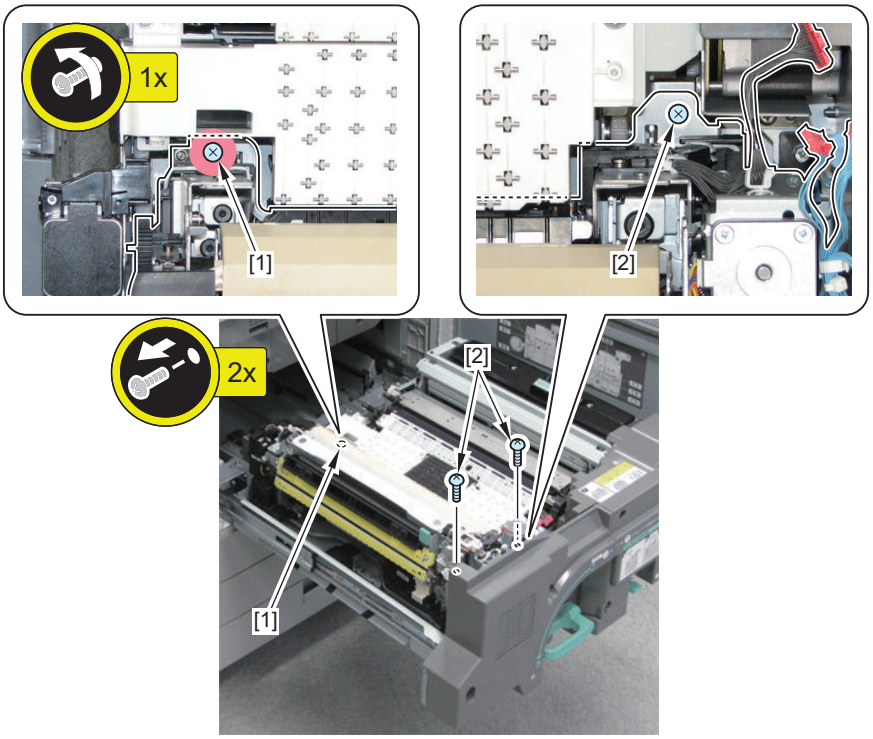
1. Open the Front Cover.
2. Pull out the Fixing Feed Unit.“Pulling out the Fixing Feed Unit” on page 859
3. Removing the Fixing Upper Cover “Removing the Fixing Upper Cover” on page 790

■ Procedure

1. Disconnect the 4 connectors [1].

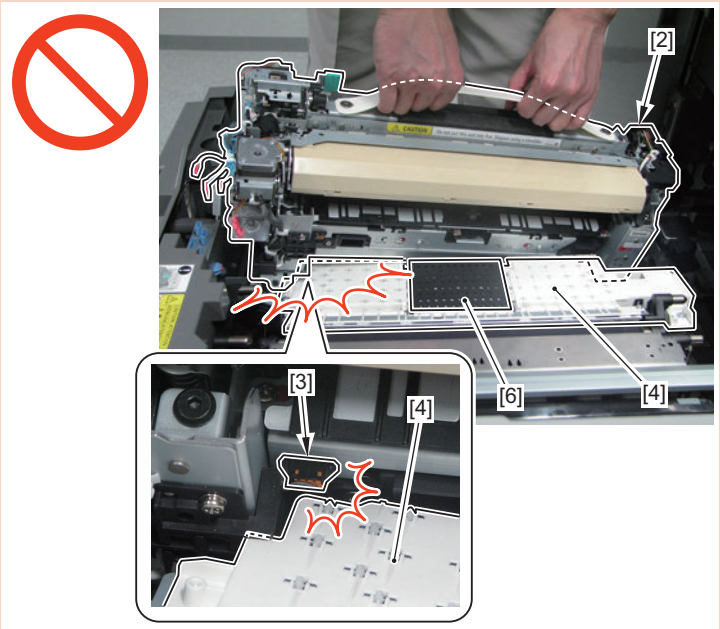


2. **Loosen the screw [1], and remove 2 screws [2].**



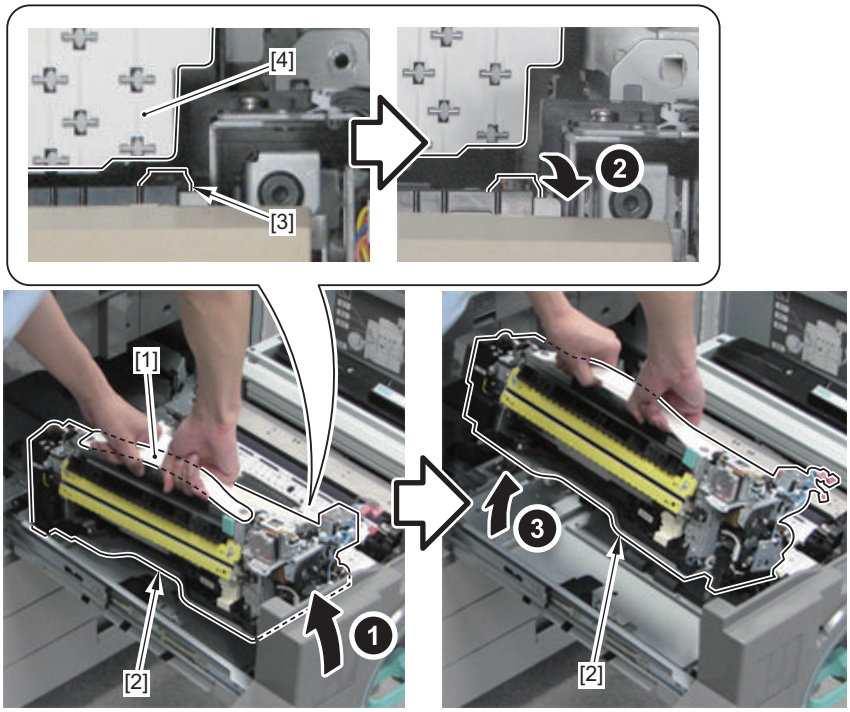
CAUTION:

- When installing/removing the Fixing Assembly [2], be careful not to hit the connector [3] with the Feed Guide [4].
- When installing/removing the Fixing Assembly [2], be careful not to hit the assembly with the Feed Guide [4] and the Feed Belt [6].

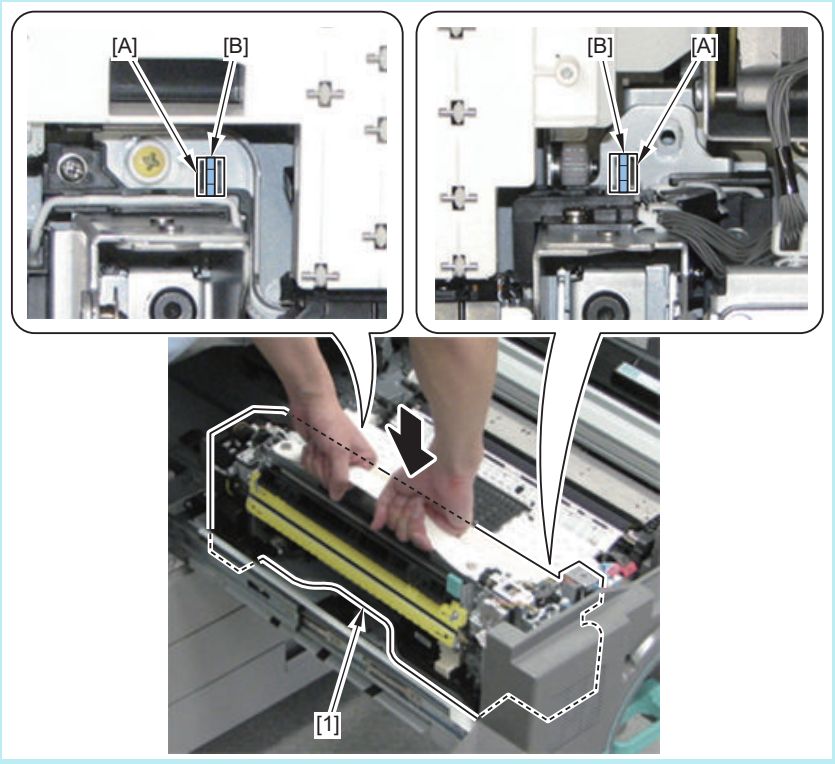


3. **Hold the handle [1] and lift the front side of the Fixing Assembly [2], and place the connector [3] on the Feed Guide [4].**

4. Lift the rear side, and remove the Fixing Assembly [2] while keeping the unit in a horizontal position.

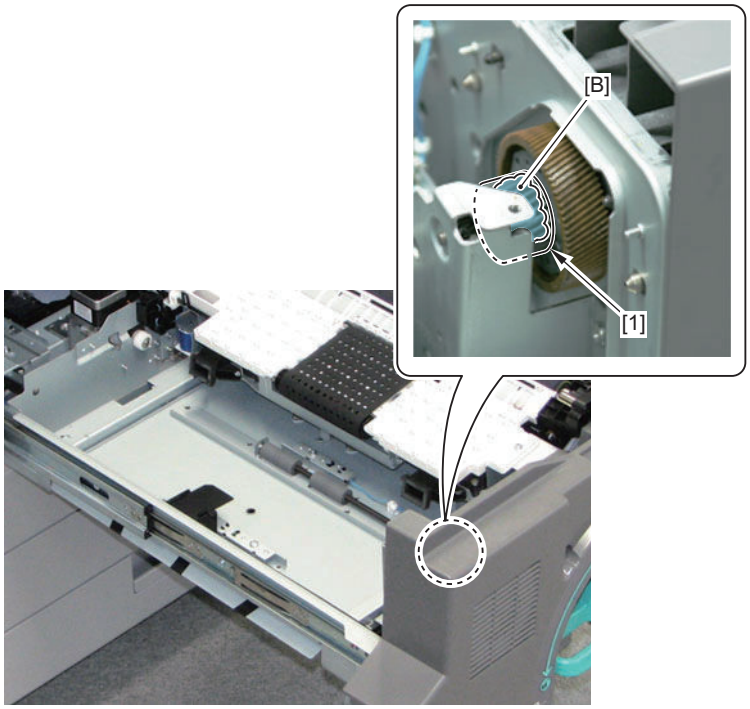


NOTE:
How to install the Fixing Assembly
Be sure to hold the Fixing Assembly [1] horizontally and align the 2 holes [A] with the 2 Positioning Protrusions [B] of the Fixing Feed Unit to install the assembly.



■ When Replacing the Fixing Assembly

1. **Apply grease (SE1107) to the tooth surface [B] of the gear [1] of the Fixing Drive Unit.**
   - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface



2. **Install the removed parts in reverse order.**
3. **Clear the counter.**
   COPIER > COUNTER > FIXING > FX-CNT
   COPIER > COUNTER > DRBL-1> FX-BLT-U / FX-BLT-L

NOTE:
The following items are cleared when the above counter is cleared.
- COPIER > DISPLAY > FIXING > FX-U-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-L-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-U-STR
- COPIER > DISPLAY > FIXING > FX-MTR2 to 5
- COPIER > DISPLAY > FIXING > FX-R-TM
- COPIER > COUNTER > FIXING > FX-RF-RL
- COPIER > COUNTER > CLEANING > FX1-RFRL
- COPIER > COUNTER > PRDC-1 > FXLW-TH1/2

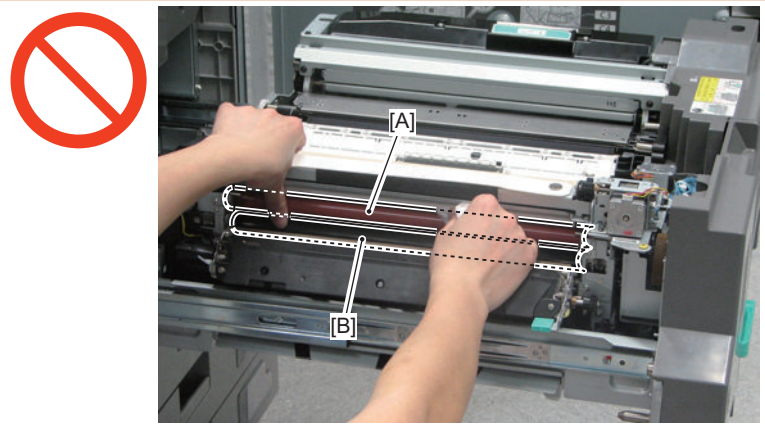
Cleaning the Fixing Refresh Roller

■ Preparation

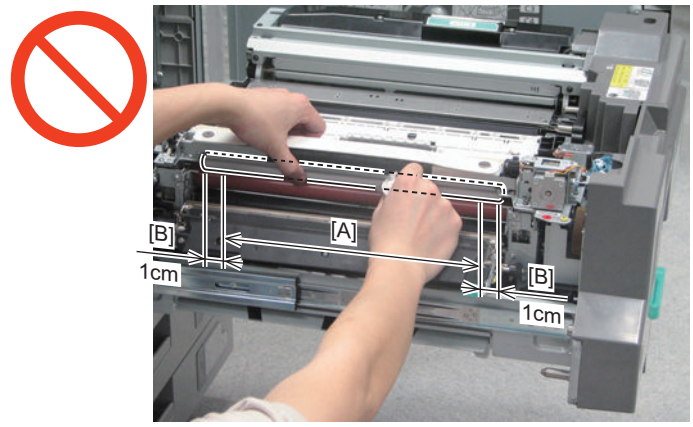
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

■ Procedure

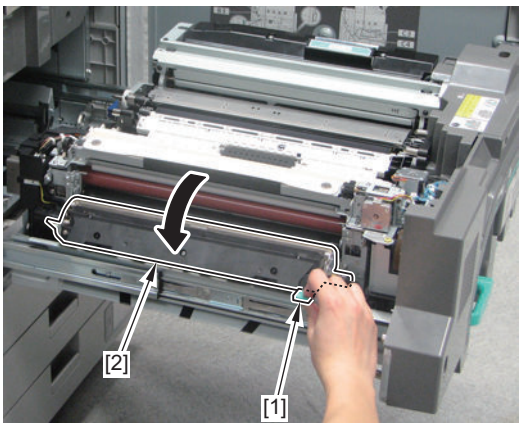
CAUTION:
- Do not touch the surface [A] of the Fixing Belt and the surface [B] of the Pressure Belt.



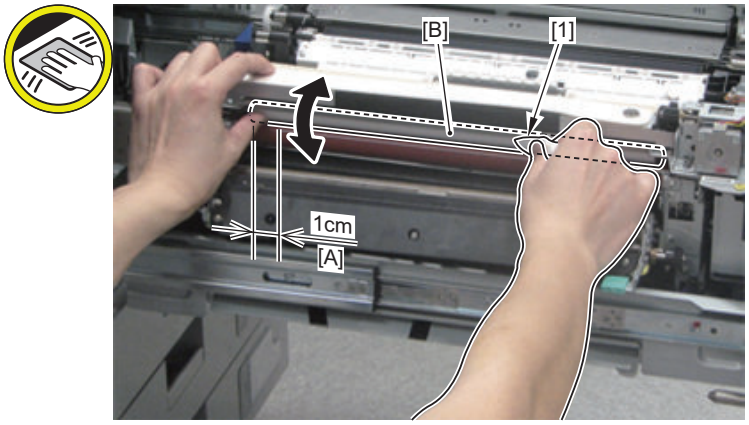
CAUTION:
- Do not touch the center [A] of the surface of the Fixing Refresh Roller (any area other than the area 1 cm from the two ends of the roller [B]).



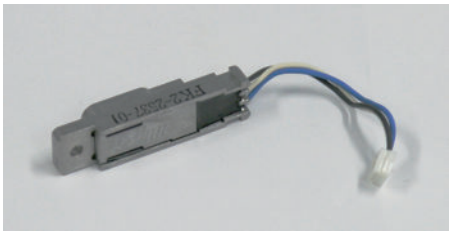
1. **Hold the handle [1], and open the Inner Delivery Unit [2].**



2. **By rotating the Fixing Refresh Roller while holding its edge [A] (the area 1 cm from the two ends of the roller), clean its surface [B] with lint-free paper [1] moistened with alcohol.**



Removing the Pressure Main Thermistor



■ Preparation

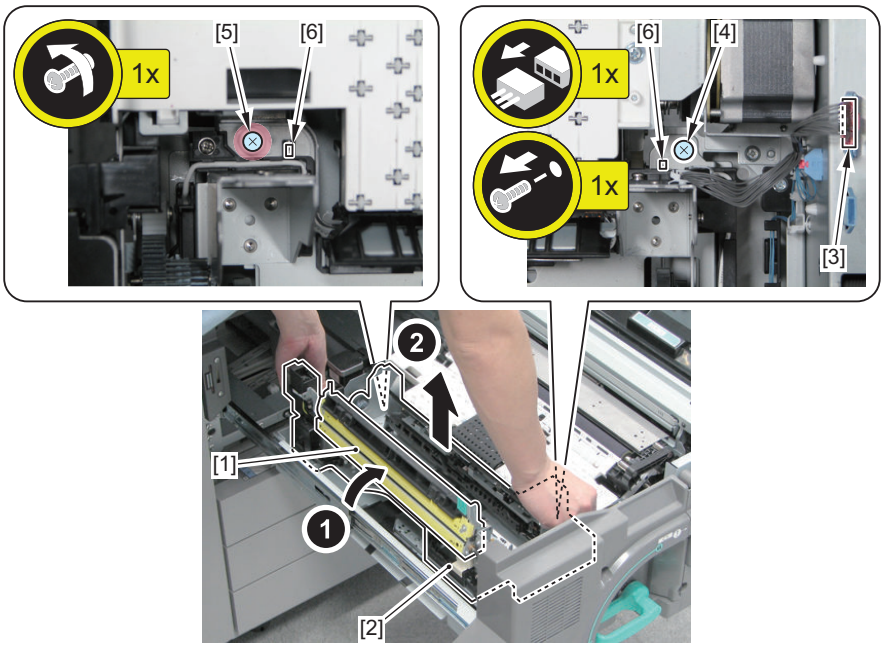
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****"Removing the Fixing Belt Displacement Control Motor Unit" on page 794**
6. **Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit****"Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit" on page 803**
7. **Removing the Fixing Lower Unit****"Removing the Fixing Lower Unit" on page 816**

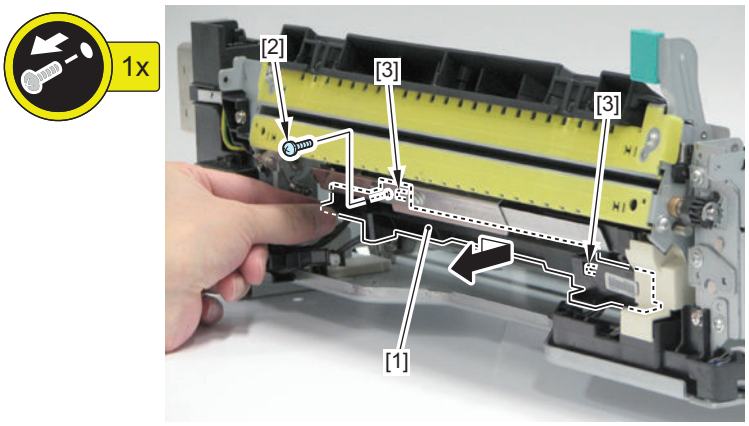
■ Procedure

1. **Close the Inner Delivery Unit [1], and remove the Fixing Frame [2].**
   - 1 Connector [3]
   - 1 Screw [4]
   - 1 Screw [5] (to loosen)
   - 2 Bosses [6]

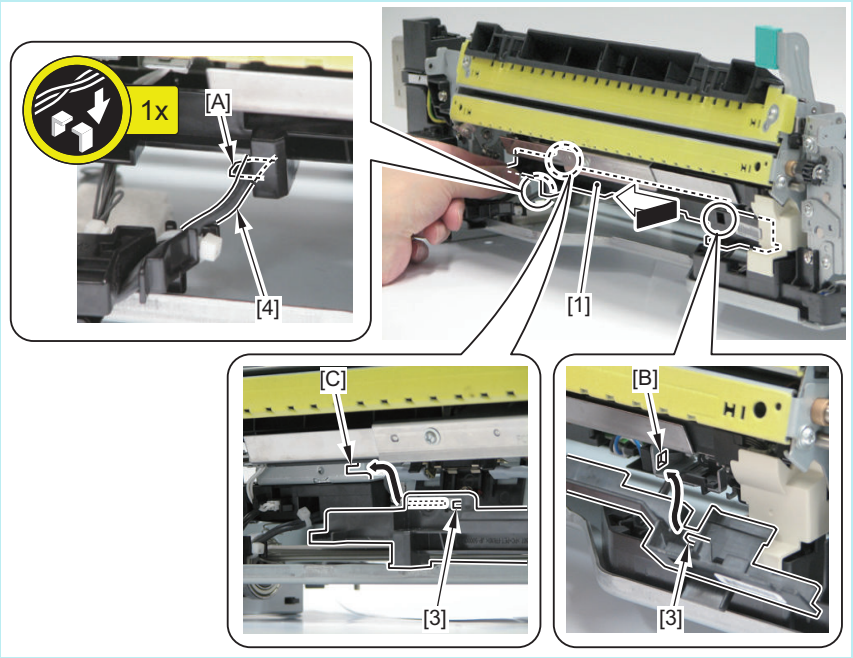


2. Remove the Connector Cover [1].

- 1 Screw [2]
- 2 Hooks [3]



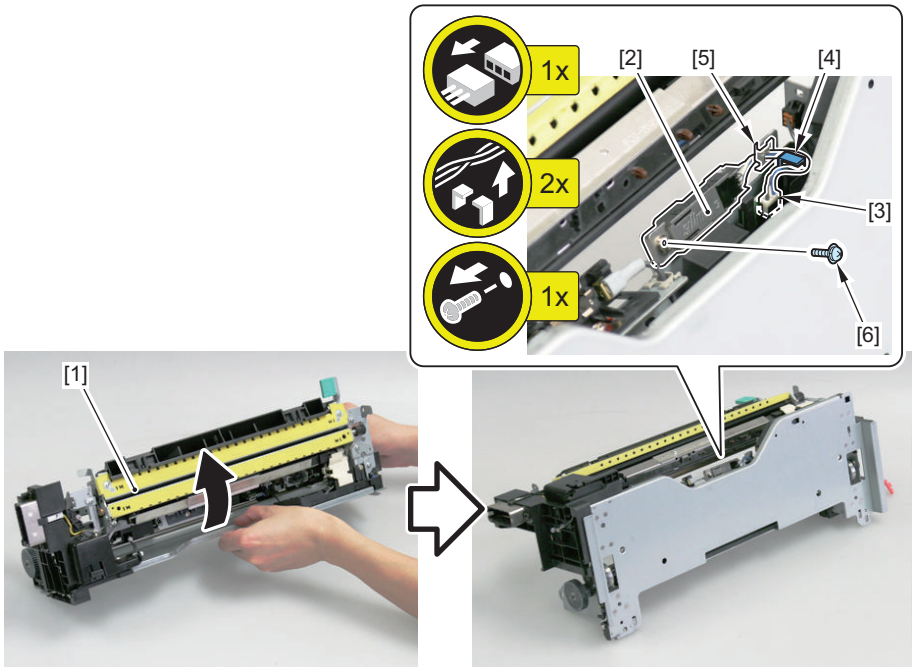
NOTE:
How to install the Upper Cover
Be sure to route the harness [4] on the guide [A] of the Connector Cover [1], and align the 2 hooks [3] with the hole [B] and the cut-off [C] of the Fixing Frame.



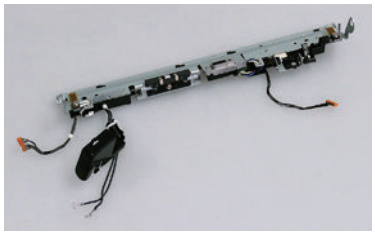
3. Change the direction of the Fixing Frame [1].

4. **Replace the Pressure Main Thermistor [2].**
   - 1 Connector [3]
   - 1 Harness Guide [4]
   - 1 Edge Saddle [5]
   - 1 Screw (with 2 washers) [6]

⚠ CAUTION:
Be sure to secure the Pressure Main Thermistor [2] in place when installing it.
Otherwise, temperature detection by the thermistor will not function normally so that the Fixing Assembly will become hot.



Removing the Pressure Thermal Switch



NOTE:
When replacing the Pressure Thermoswitch, be sure to do so on a Pressure Stay Unit basis.

■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

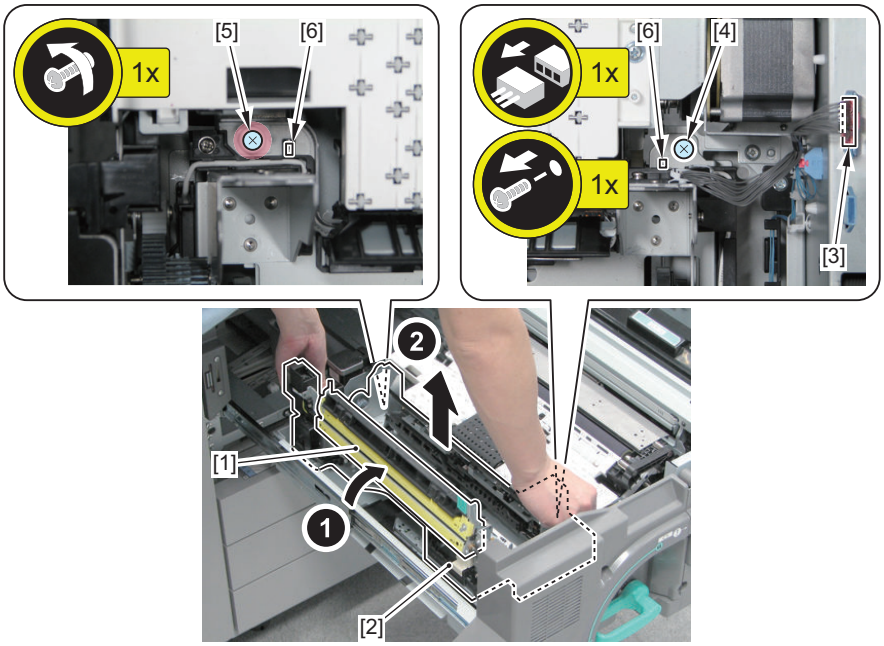
3. **Removing the Fixing Upper Cover** **"Removing the Fixing Upper Cover" on page 790**

NOTE:
The following procedure can also be performed with the Fixing Assembly removed from the Fixing Feed Unit.
If necessary, follow "Removing the Fixing Assembly" on page 843 to remove the Fixing Assembly from the Fixing Feed Unit for the work.

4. **Removing the Fixing IH Unit****"Removing the Fixing IH Unit" on page 792**
5. **Removing the Fixing Belt Displacement Control Motor Unit****"Removing the Fixing Belt Displacement Control Motor Unit" on page 794**
6. **Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit****"Removing the Fixing Belt Unit + Fixing Refresh Roller Pressure Unit" on page 803**
7. **Removing the Fixing Lower Unit****"Removing the Fixing Lower Unit" on page 816**

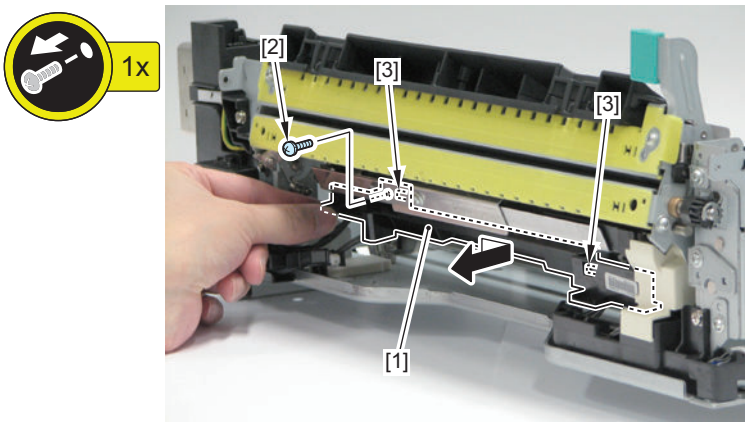
■ Procedure

1. **Close the Inner Delivery Unit [1], and remove the Fixing Frame [2].**
   - 1 Connector [3]
   - 1 Screw [4]
   - 1 Screw [5] (to loosen)
   - 2 Bosses [6]

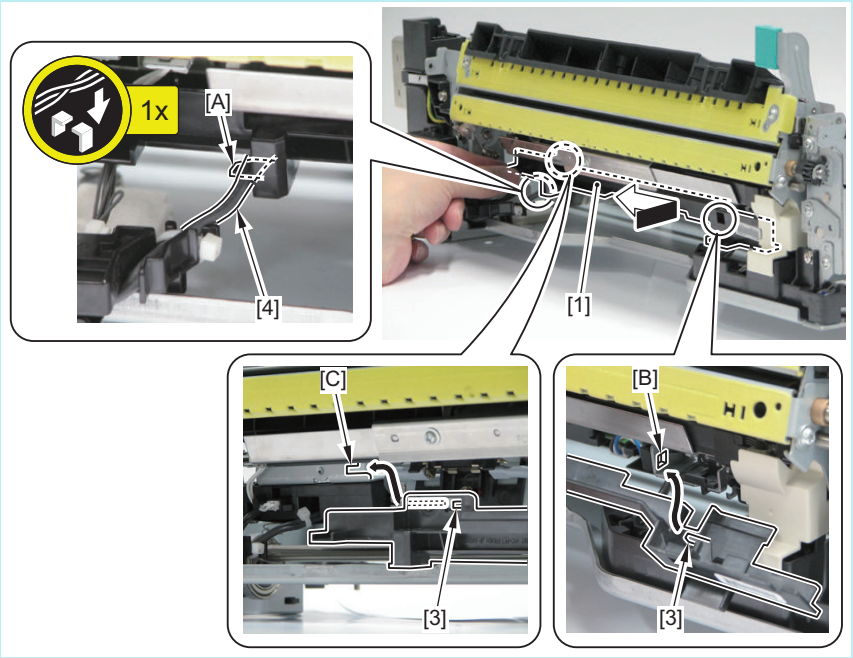


2. Remove the Connector Cover [1].

- 1 Screw [2]
- 2 Hooks [3]

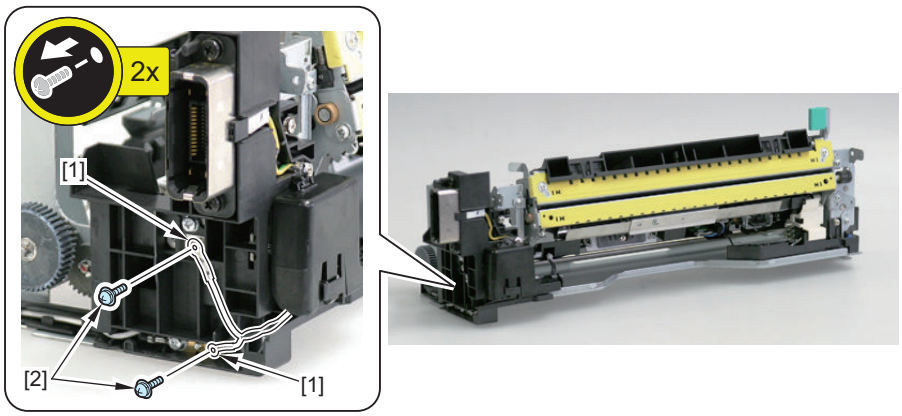


NOTE:
How to install the Connector Cover
Be sure to route the harness [4] on the guide [A] of the Connector Cover [1], and align the 2 hooks [3] with the hole [B] and the cut-off [C] of the Fixing Frame.

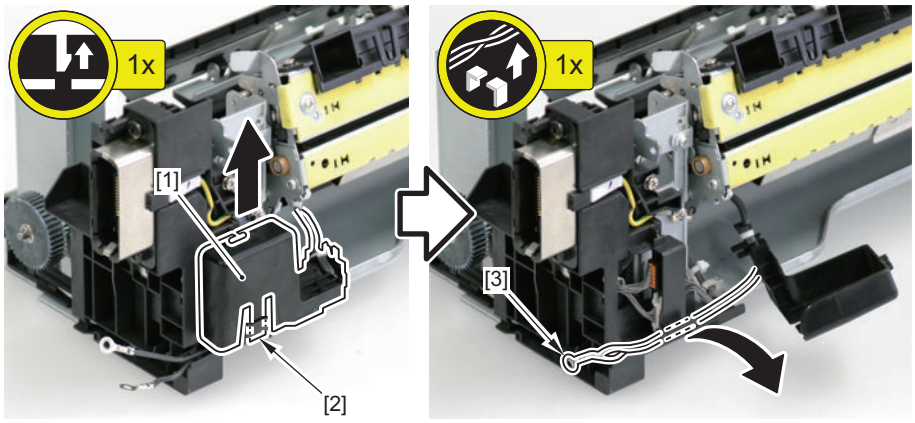


3. Free the 2 AC Harnesses [1].

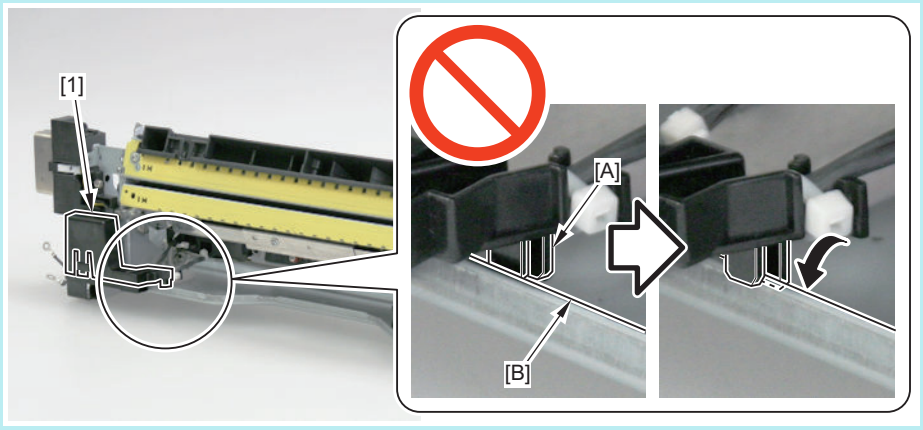
- 2 Screws (with 2 washers) [2]



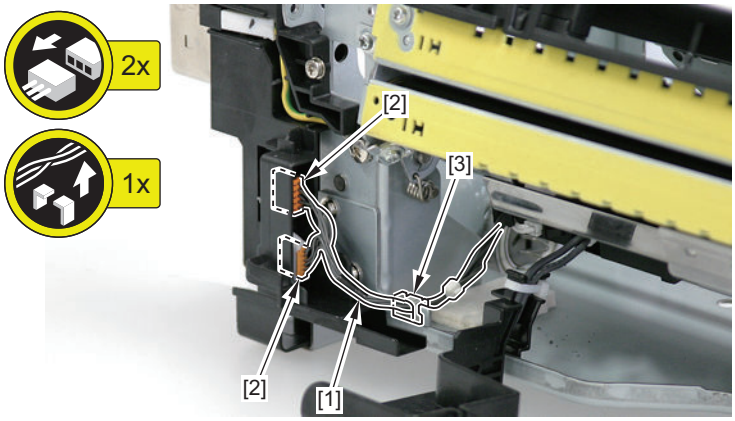
4. **Remove the Connector Cover [1].**
   - 1 Claw [2]
   - 1 Harness [3]



NOTE:
How to install the Connector Cover
Be sure to align the groove [A] of the Connector Cover [1] with the edge [B] of the plate of the Fixing Frame.

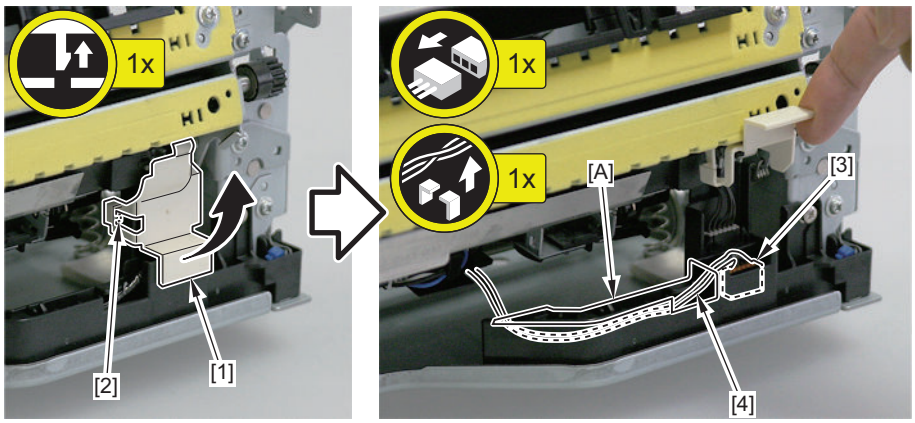


5. **Free the harness [1].**
   - 2 Connectors [2]
   - 1 Edge Saddle [3]

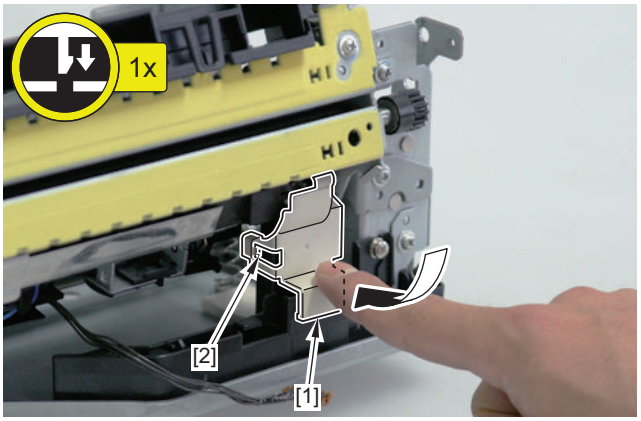


6. **Open the Connector Cover [1].**
   - 1 Claw [2]

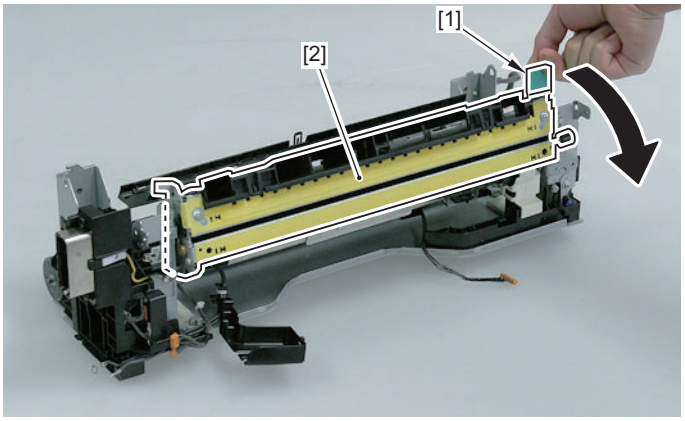
7. **Disconnect the connector [3], and free the harness [4] from the guide [A].**



8. **Close the Connector Cover [1].**
   - 1 Claw [2]

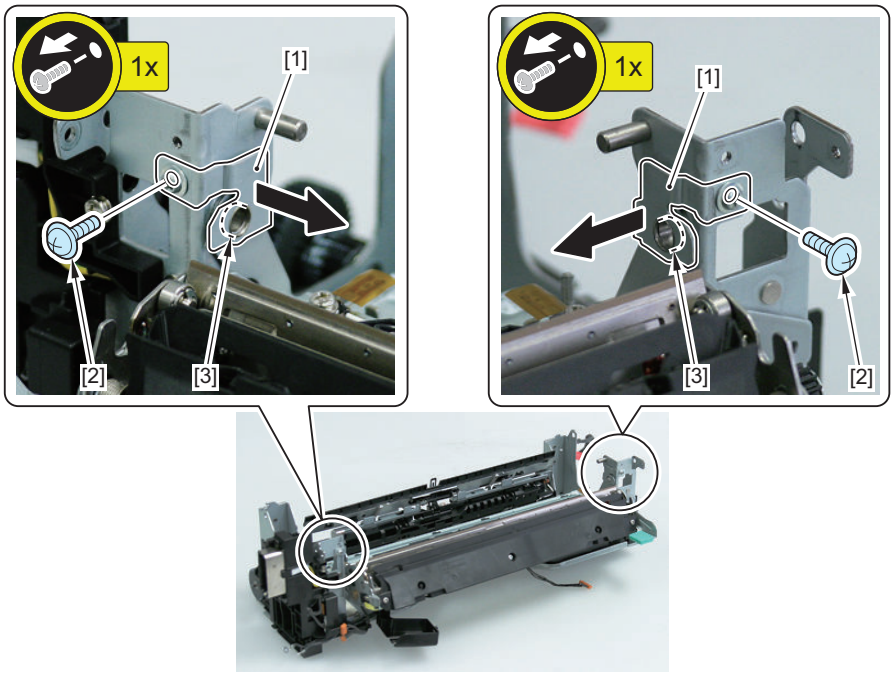


9. **Hold the handle [1], and open the Inner Delivery Unit [2].**

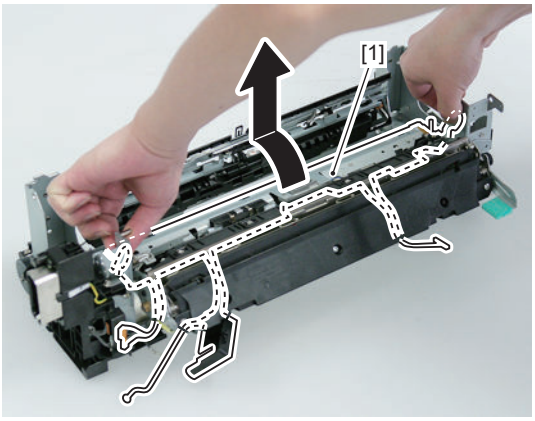


10. Remove the 2 Fixation Pins [1].

- 2 Screws [2]
- 2 Shafts [3]

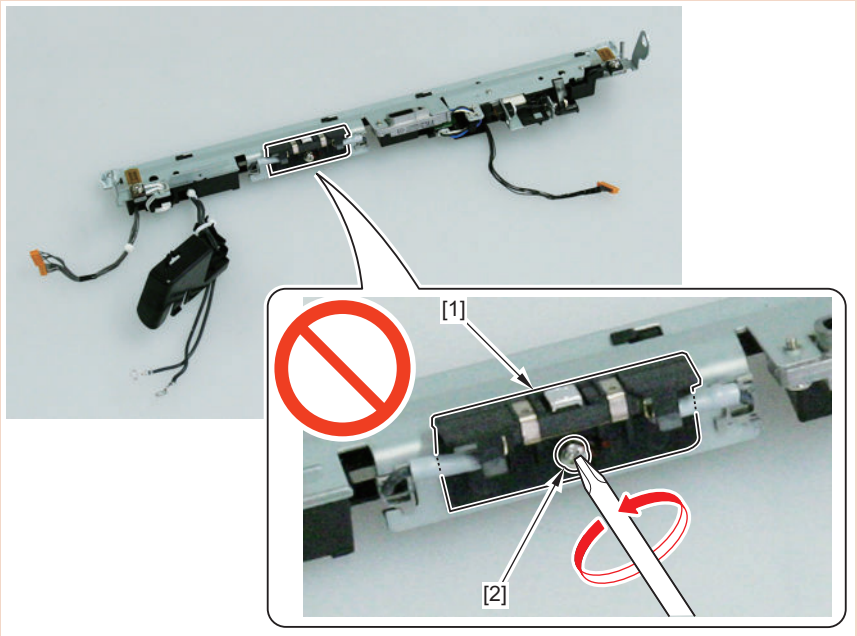


11. Remove the Pressure Stay Unit [1].

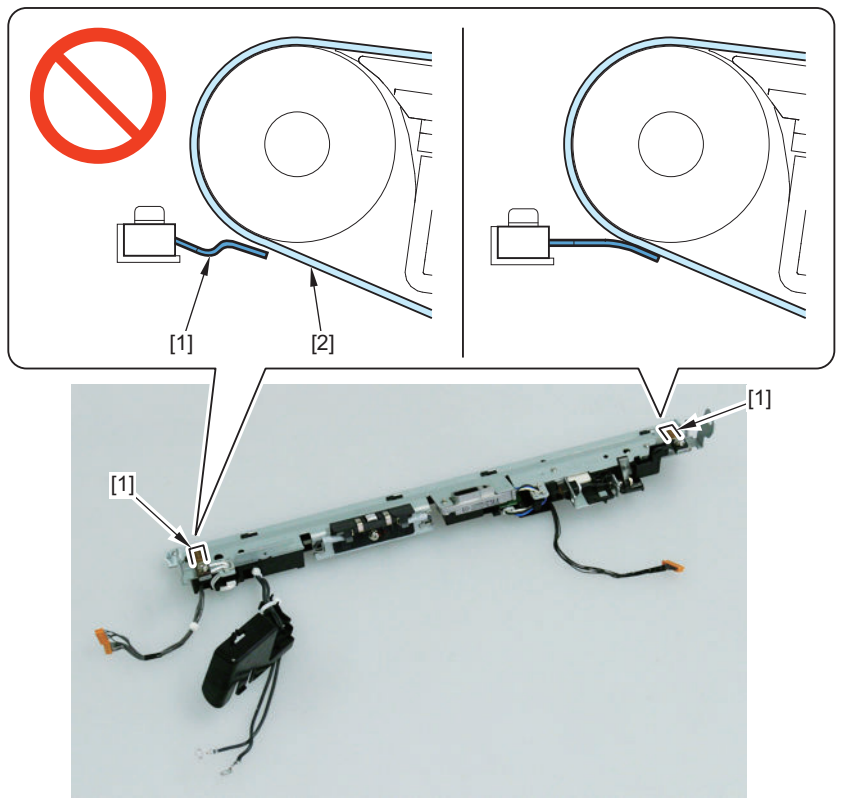


CAUTION:

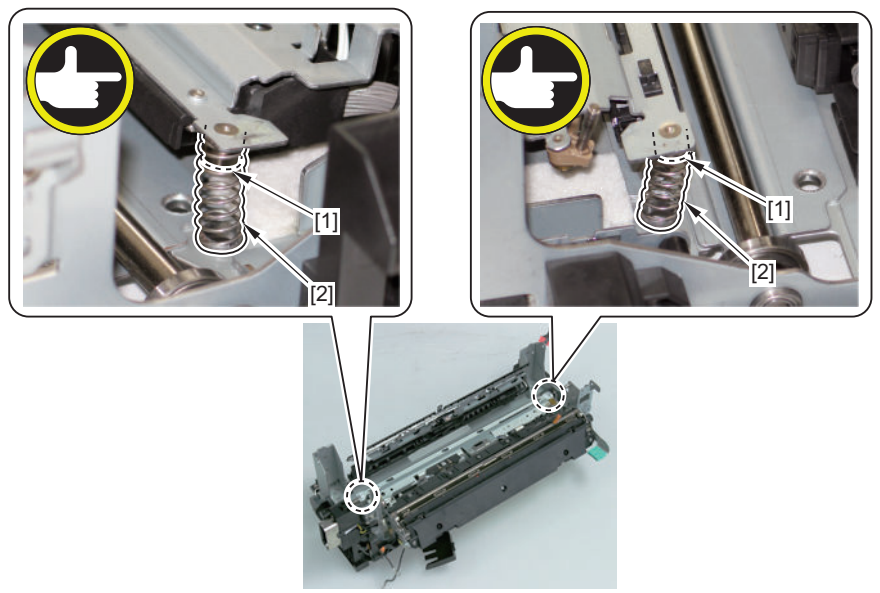
- When replacing the Pressure Thermoswitch [1], be sure to do so on a Pressure Stay Unit basis.
- Since the distance with the Pressure Belt is adjusted with the Pressure Stay Unit, do not loosen the screw [2] securing the Pressure Thermoswitch [1].



⚠ CAUTION:
If the thermistor [1] is deformed, do not use it. If contact with the Pressure Belt [2] is insufficient, temperature detection by the thermistor [1] will not function normally so that the Fixing Assembly will become hot.



NOTE:
How to install the Pressure Stay Unit
Be sure to fit the spring [2] to the boss [1] of the Pressure Stay Unit.



Pickup Feed System

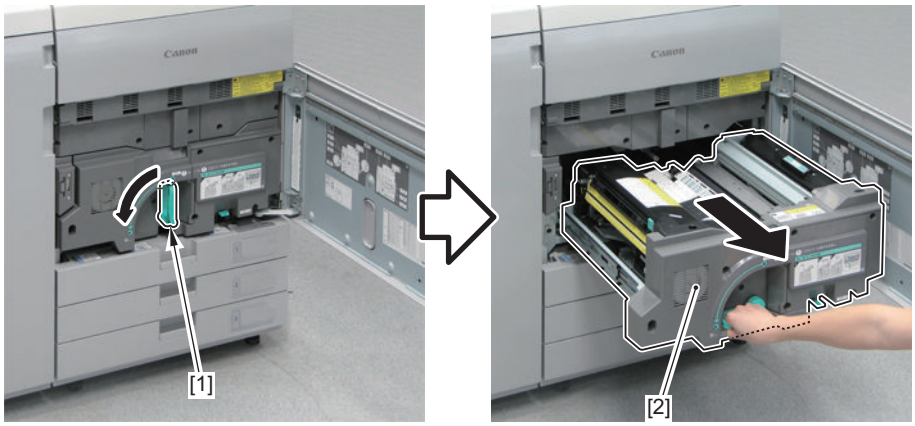
Pulling out the Fixing Feed Unit

■ Preparation

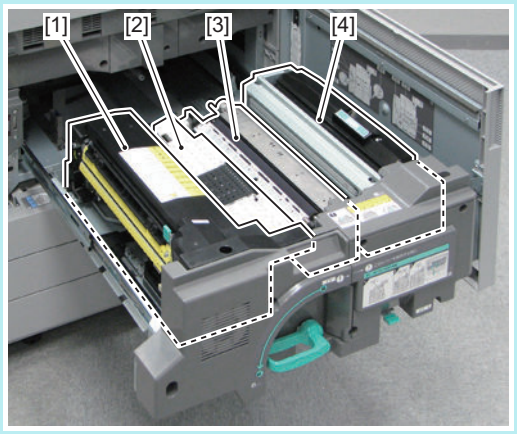
1. **Open the Front Cover.**

■ Procedure

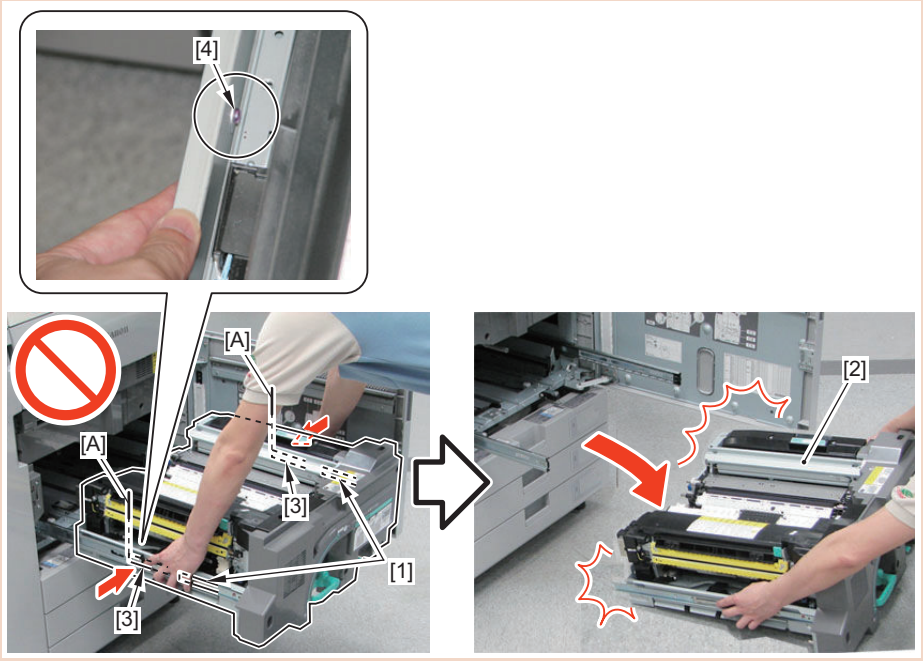
1. **Turn over the lever [1] and pull out the Fixing Feed Unit [2].**



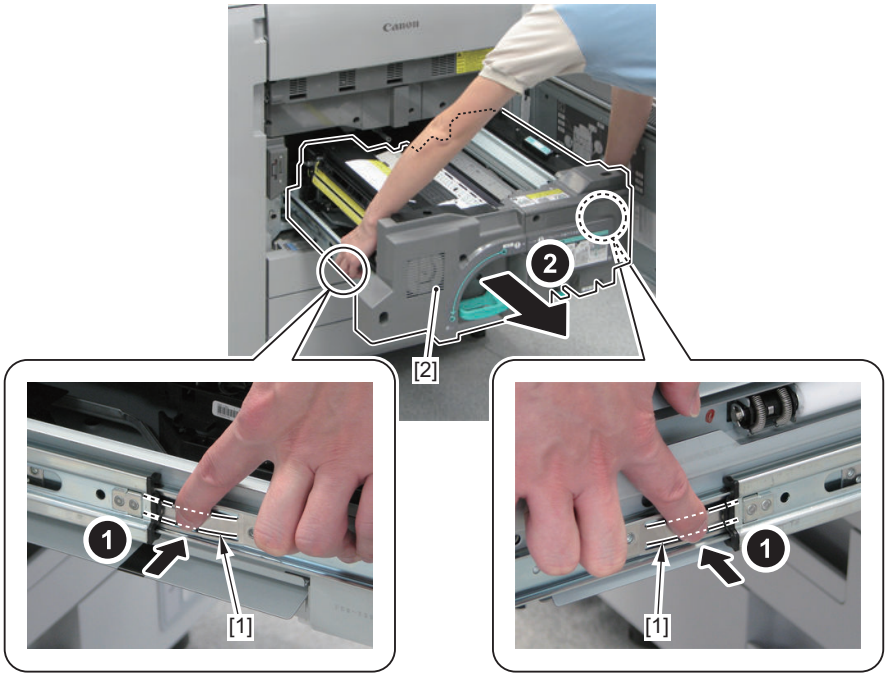
NOTE:
Perform step 2 as necessary when installing/removing the units (Fixing Assembly [1], Pre-fixing Feed Belt Unit [2], Secondary Transfer Unit [3], Registration Unit [4], etc.) installed in the Fixing Feed Unit.



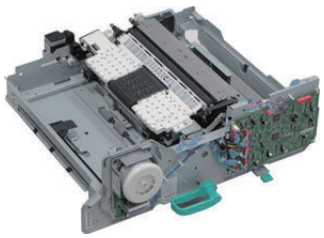
⚠ CAUTION:
Do not release the locks of the 2 Release Springs [3] at the rear on the rails of both sides.
Pulling out the Fixing Feed Unit [2] further than the trailing edge [A] of the Release Springs at the rear side may cause the unit to fall (when the red screw [4] securing the Fixing Feed Unit Rail has come off).



2. **Press the 2 Release Springs [1] at both sides of the rail to release the locks, and further pull out the Fixing Feed Unit [2] until it stops.**



Removing the Fixing Feed Unit



■ Preparation

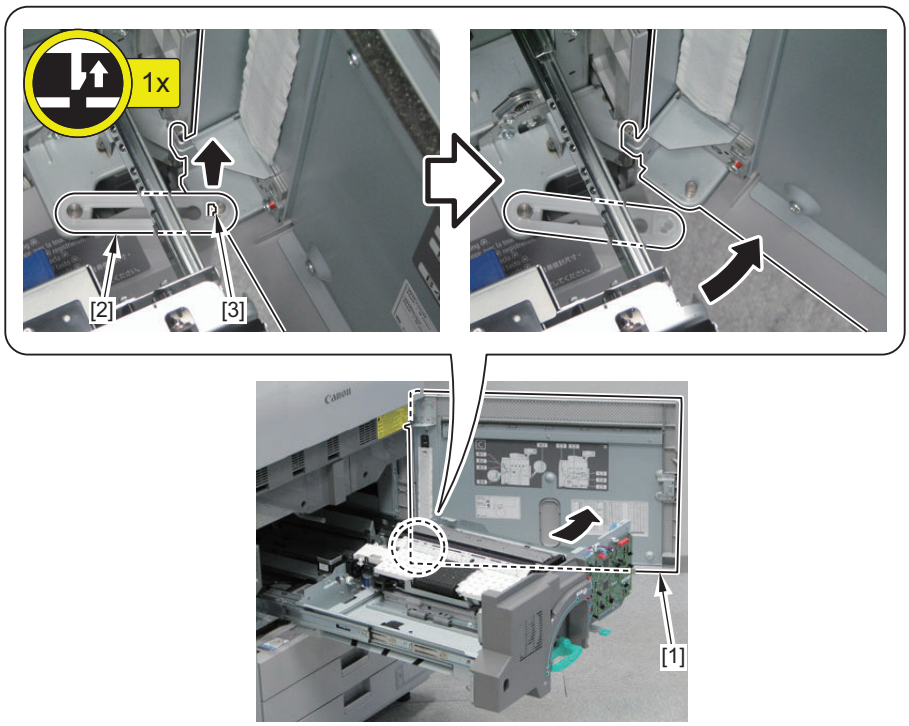
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Fixing Upper Cover****"Removing the Fixing Upper Cover" on page 790**
4. **Removing the Fixing Assembly****"Removing the Fixing Assembly" on page 843**
5. **Removing the Registration Unit****"Removing the Registration Unit" on page 892**

■ Procedure

⚠ CAUTION:
When removing the Fixing Feed Unit by referring to this section, be sure to work with 2 or more people, and prepare 4 bases (such as paper stack 40 mm in height or higher and 100 mm by 100 mm in size or larger) to prevent deformation.

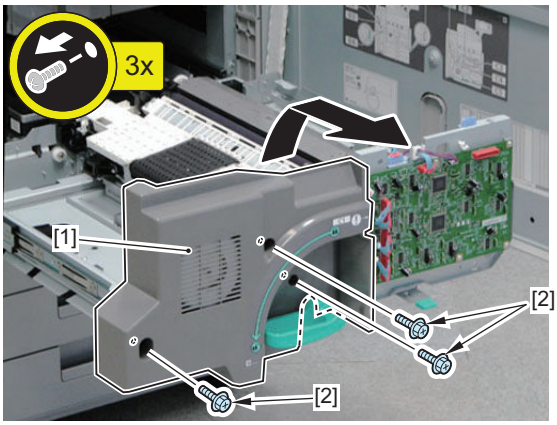
NOTE:
This machine allows the maintenance of all service parts without the removal of Fixing Feed Unit.

1. **Remove the Open/Close Stopper [2] of the Front Cover [1].**
   - 1 Claw [3]

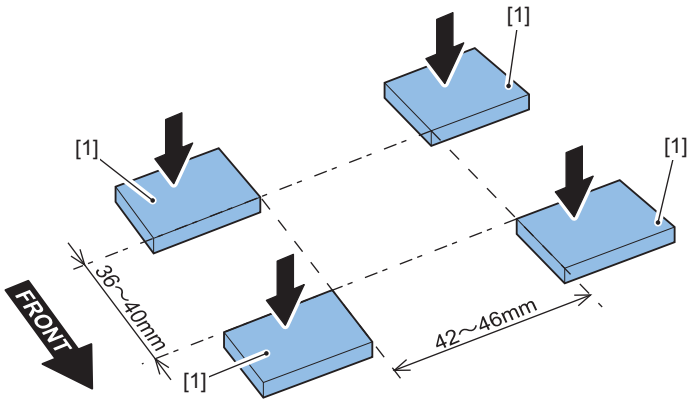


NOTE:
When the angle by which to open the Front Cover is limited due to pickup system options being connected, remove the Front Cover by opening the Toner Replacement Cover, removing the Hinge Shaft on the upper side, and then pulling out the Shaft Pin on the lower side.

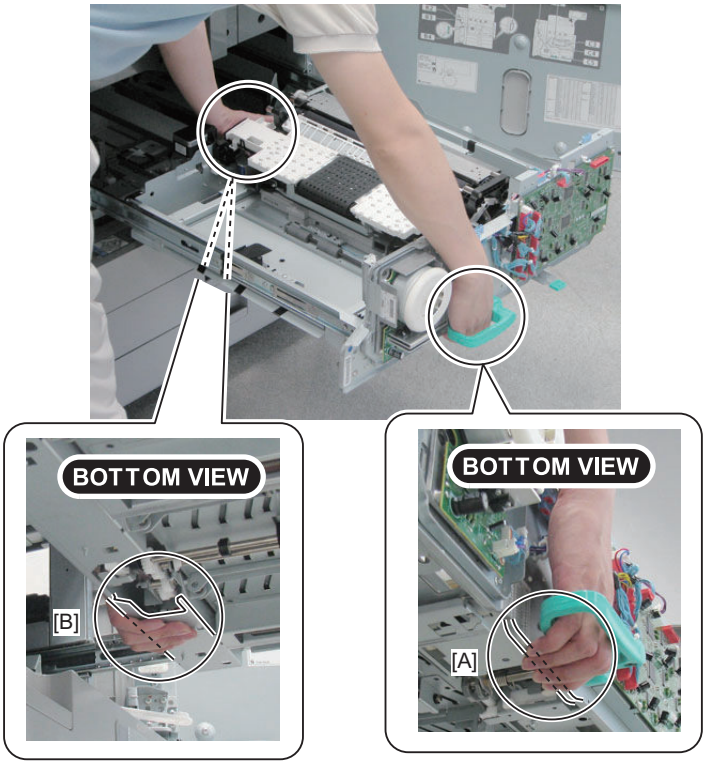
2. **Remove the Fixing Feed Front Left Cover [1].**
   - 3 Screws [2]



3. **Put the 4 bases [1] at where the Fixing Feed Unit is to be placed as shown in the figure below.**

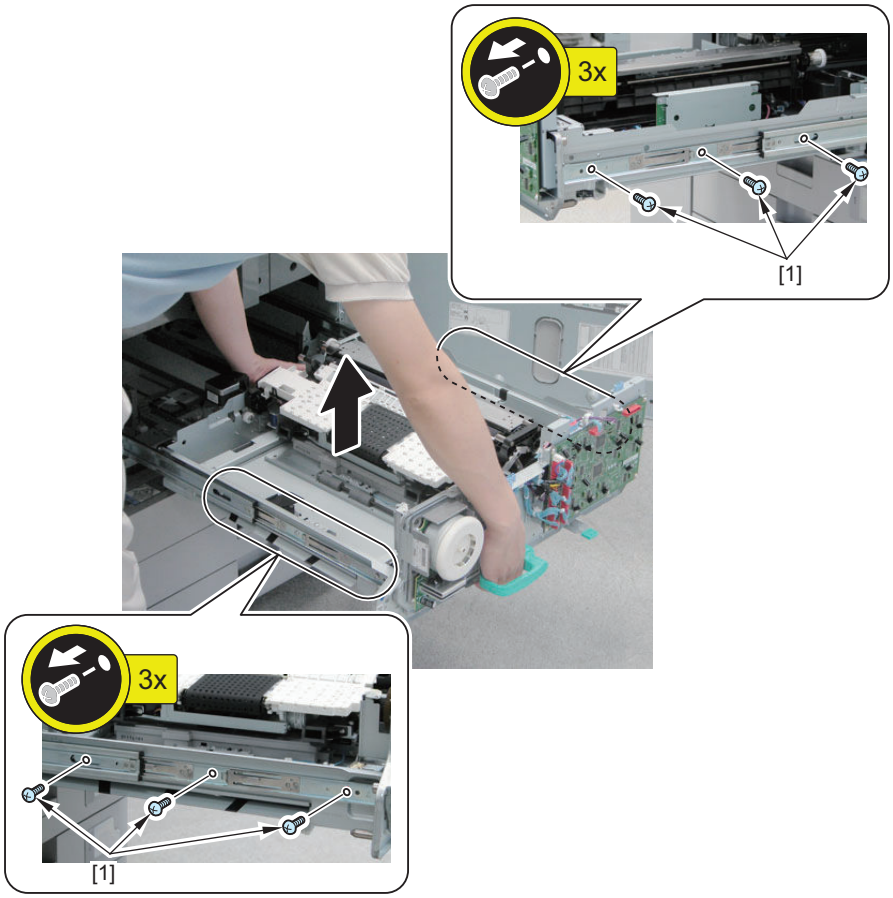


4. **Hold the [A] and [B] at the bottom of the Fixing Feed Unit.**

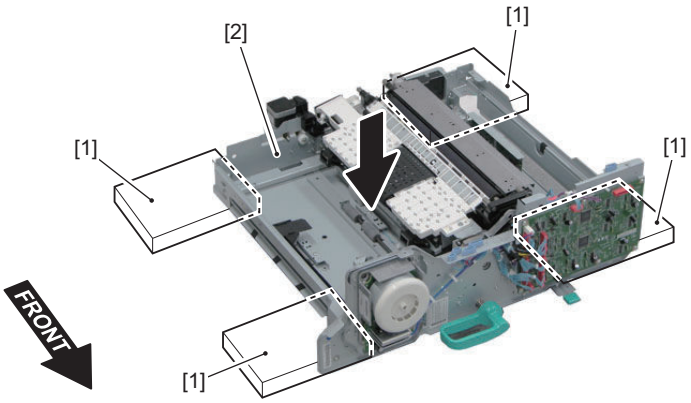


5. Remove the 6 screws [1].

⚠ CAUTION:
Be sure to work with 2 or more people to prevent dropping the unit.
- Support the Fixing Feed Unit.
- Remove the screws.

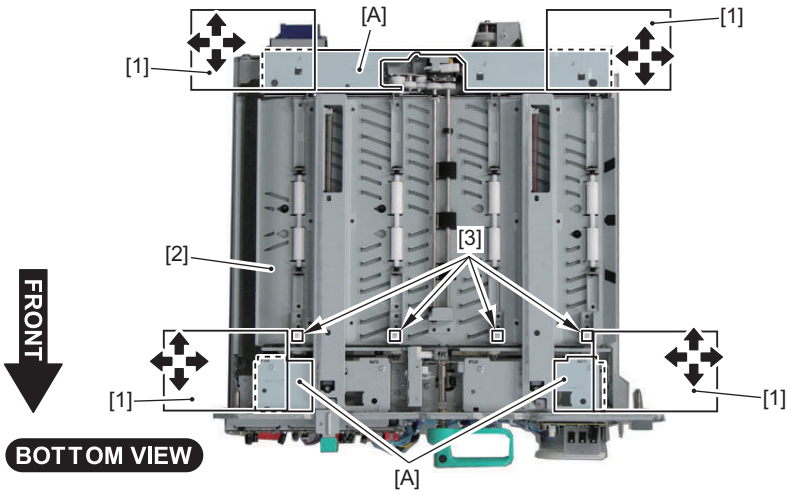


6. Place the Fixing Feed Unit [2] on the 4 bases [1].

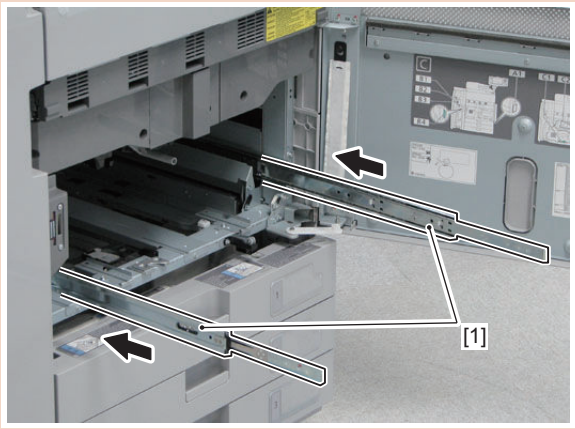


7. Adjust the positions of the 4 bases [1] to prevent the Fixing Feed Unit from being deformed.

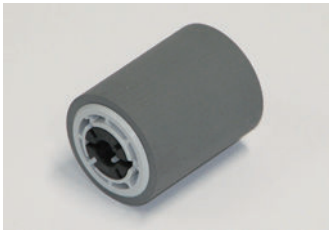
CAUTION:
- Be sure that the Fixing Feed Unit [2] is horizontal.
- Ensure that only [A] parts at the bottom are in contact with the bases [1] after placing the Fixing Feed Unit [2].
- The sliding members [3] should not be in contact with the bases [1].



CAUTION:
Put the 2 rails [1] pulled out back in the host machine as needed.



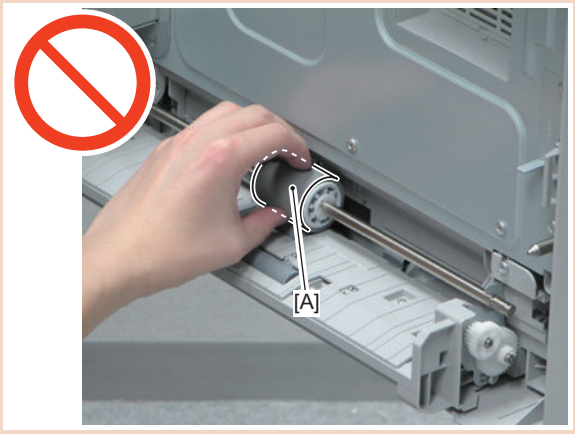
Removing the Multi-purpose Tray Pickup Roller (Option)



NOTE:
The Multi-purpose Tray Pickup Roller is included in the Multi-purpose Tray Pickup Unit which is an option.
Be sure to refer to this procedure in the case the Multi-purpose Tray Pickup Unit is installed.

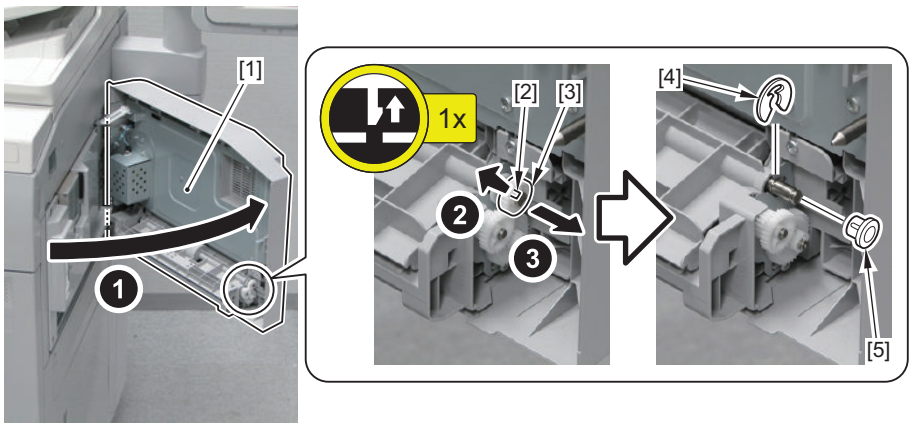
■ Procedure

CAUTION:
Do not touch the surface [A] of the roller when disassembling/assembling.



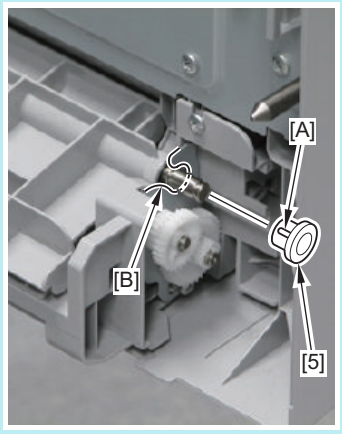
1. **Open the Multi-purpose Tray Pickup Unit [1].**
2. **Release the claw [2] to remove the gear [3].**

3. **Remove the Resin Ring [4] to remove the Shaft Support [5].**

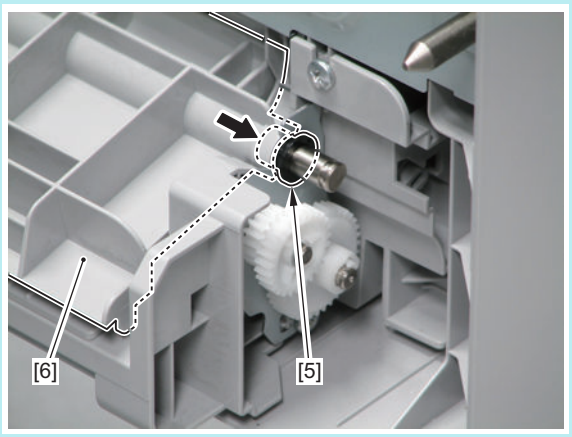


NOTE:
How to Install the Shaft Support and the Resin Ring

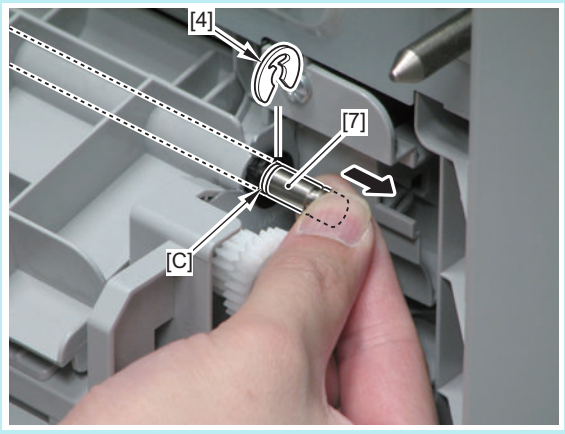
1. Align the protrusion [A] with the groove [B] of the plate to install the Shaft Support [5].



2. Place the Feed Upper Cover [6] on the Shaft Support [5].

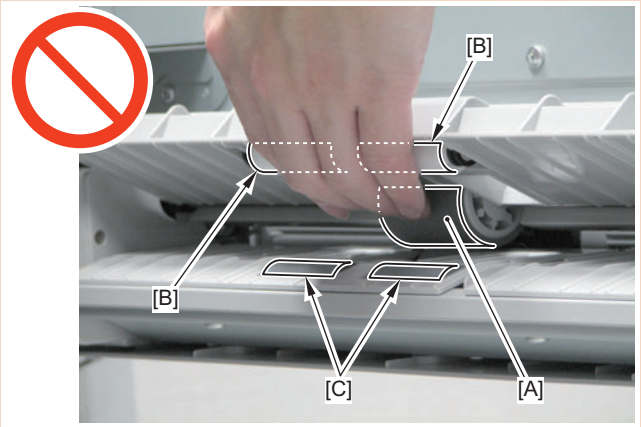


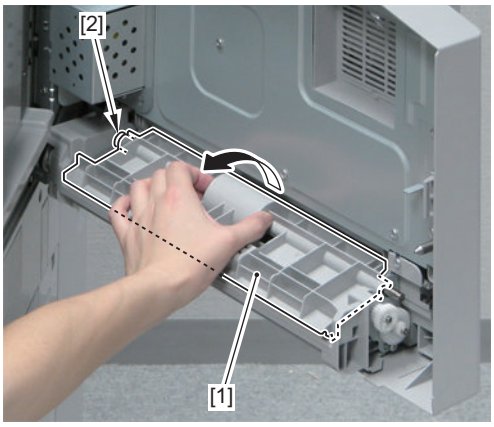
3. Install the Resin Ring [4] in the groove [C] while pulling the shaft [7].



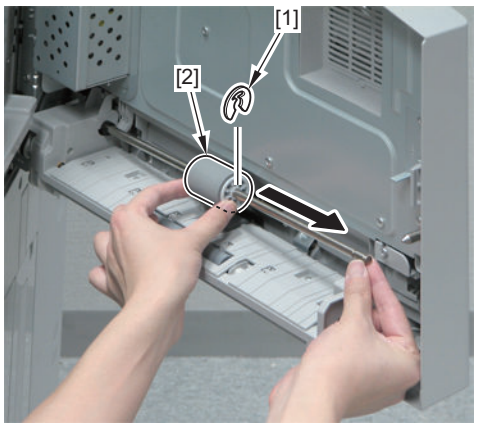
4. **Remove the Feed Upper Cover [1].**
   - 1 Shaft Support [2]

CAUTION:
Do not touch the surface [A] of the Multi-purpose Tray Pickup Roller, the surface [B] of the 2 rollers of the Feed Upper Cover and the surface [C] of the 2 rollers when disassembling/assembling.

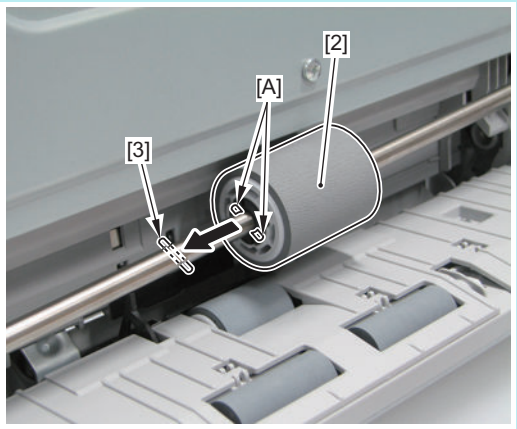




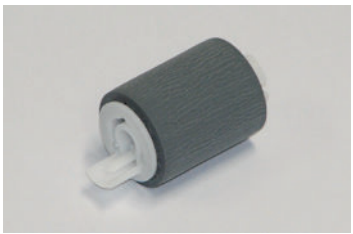
5. **Remove the Resin Ring [1] and the Multi-purpose Tray Pickup Roller [2].**



NOTE:
How to install the Multi-purpose Tray Pickup Roller
Be sure to align the groove [A] of the Multi-purpose Tray Pickup Roller [2] with the spring pin [3] to install the roller.



Removing the Multi-purpose Tray Separation Roller (Option)



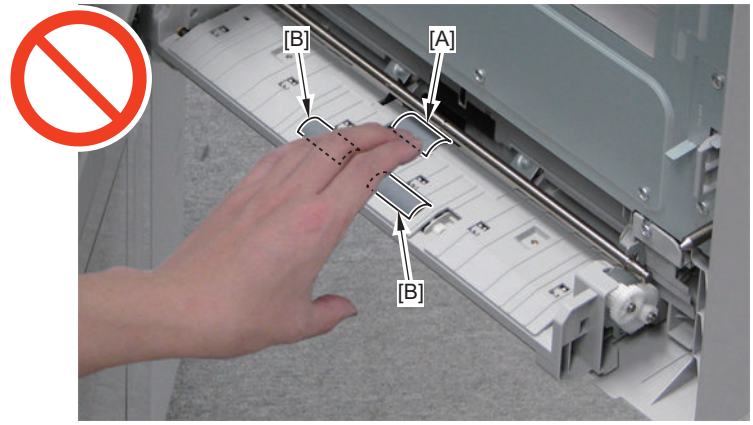
NOTE:
The Multi-purpose Tray Separation Roller is included in the Multi-purpose Tray Pickup Unit which is an option.
Be sure to refer to this procedure in the case the Multi-purpose Tray Pickup Unit is installed.

■ Preparation

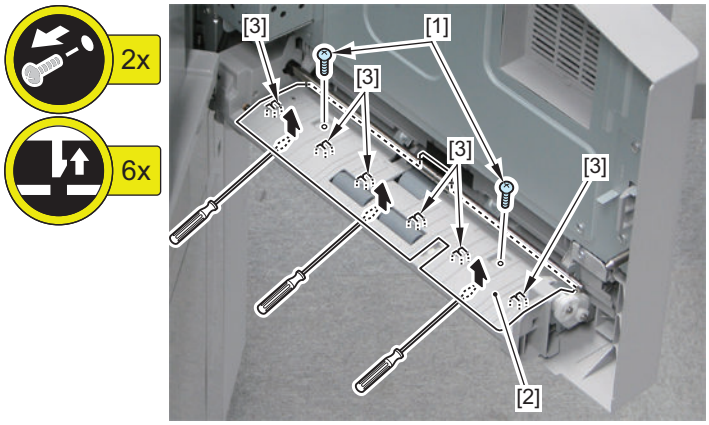
1. **Removing the Multi-purpose Tray Pickup Roller (Option)****"Removing the Multi-purpose Tray Pickup Roller (Option)" on page 866**

■ Procedure

CAUTION:
Do not touch the surface [A] of the Multi-purpose Tray Separation Roller, and the surface [B] of the 2 rollers when disassembling/assembling.

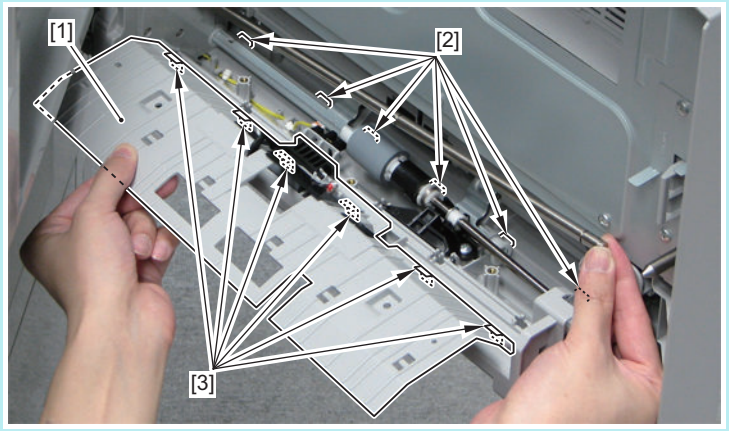


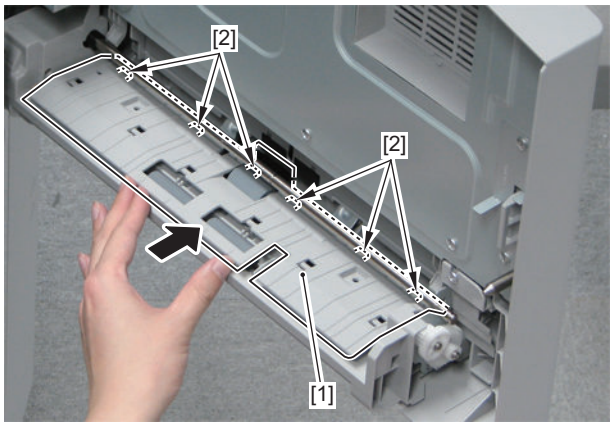
1. **Remove the 2 screws [1], and release the 6 claws [3] of the Feed Guide [2].**



2. Push the Feed Guide [1], and unhook the 6 hooks [2].

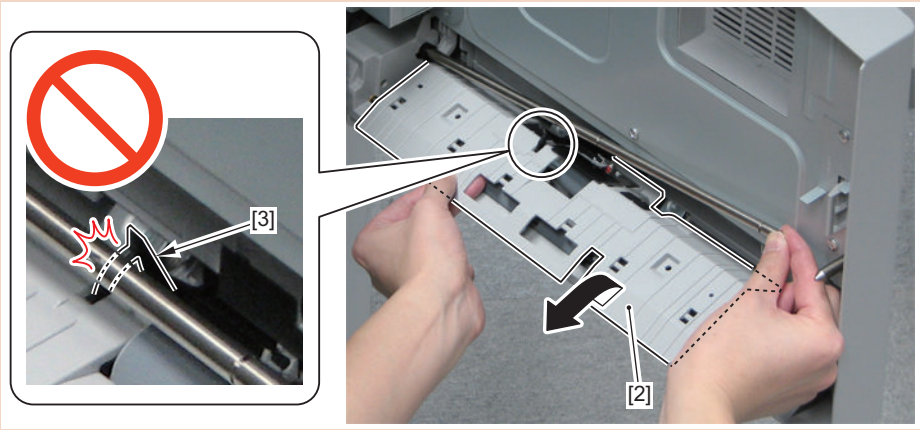
NOTE:
The following shows the locations of the 6 hooks [2] and the 6 grooves [3] of the Feed Guide [1].

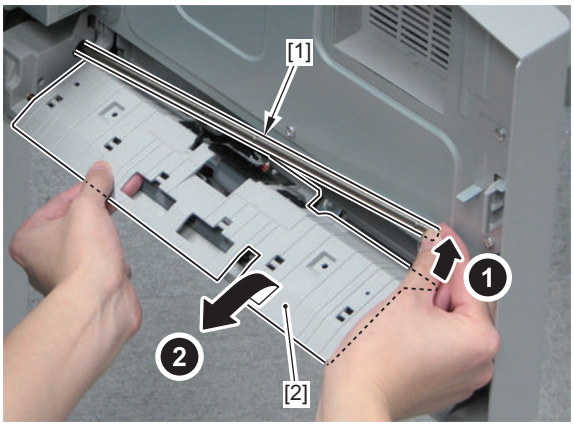




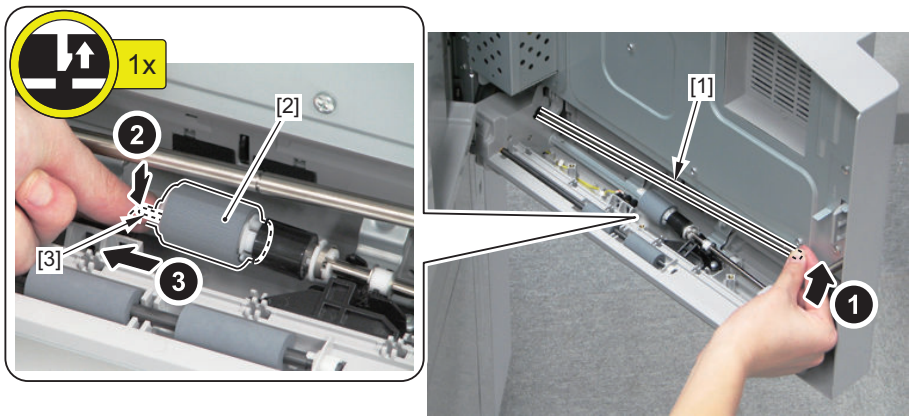
3. **Remove the Feed Guide [2] while lifting the shaft [1].**

CAUTION:
Be careful not to damage the flag [3] of the Feed Guide [2].

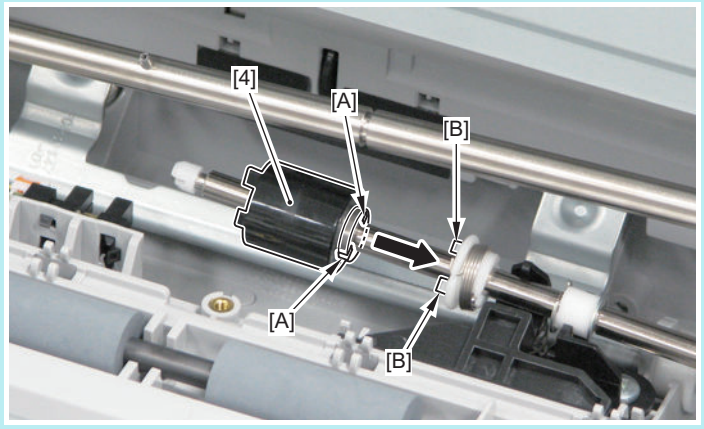




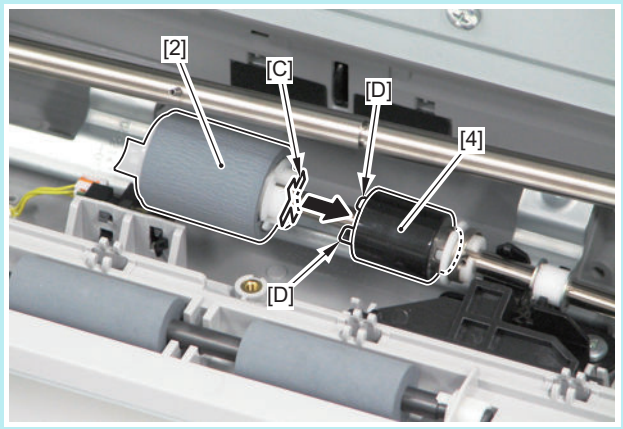
4. **Remove the Multi-purpose Tray Separation Roller [2] while lifting the shaft [1].**
   - 1 Claw [3]



NOTE:
How to install the Multi-purpose Tray Separation Roller
- Be sure to align the 2 grooves [A] of the Torque Limiter [4] with the 2 protrusions [B] of the shaft to install the roller.

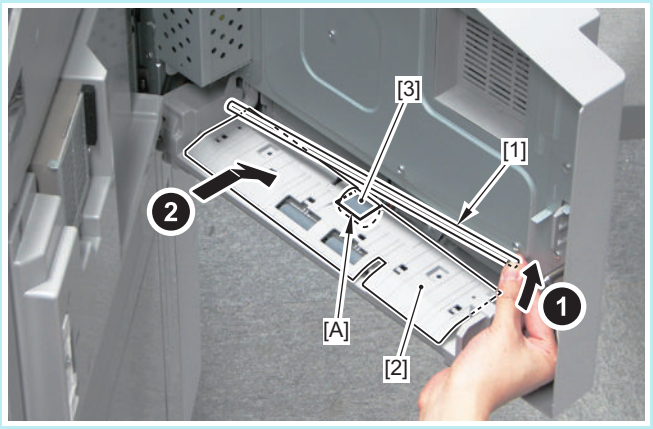


NOTE:
- Be sure to align the groove [C] of the Multi-purpose Tray Separation Roller [2] with the 2 protrusions [D] of the Torque Limiter [4] to install the roller.

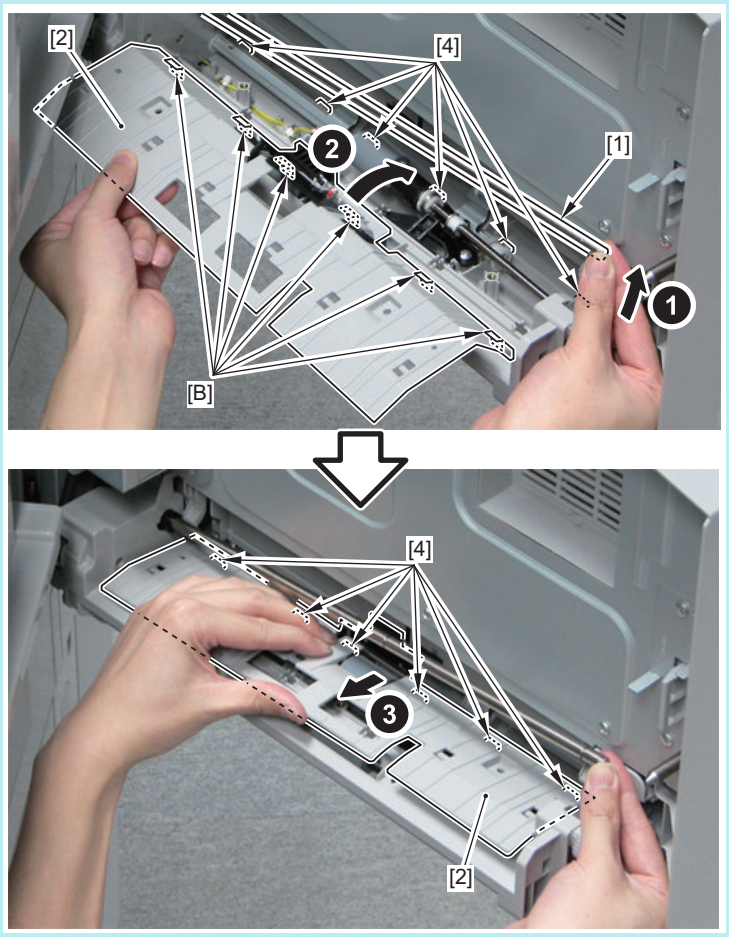


NOTE:
How to install the Feed Guide

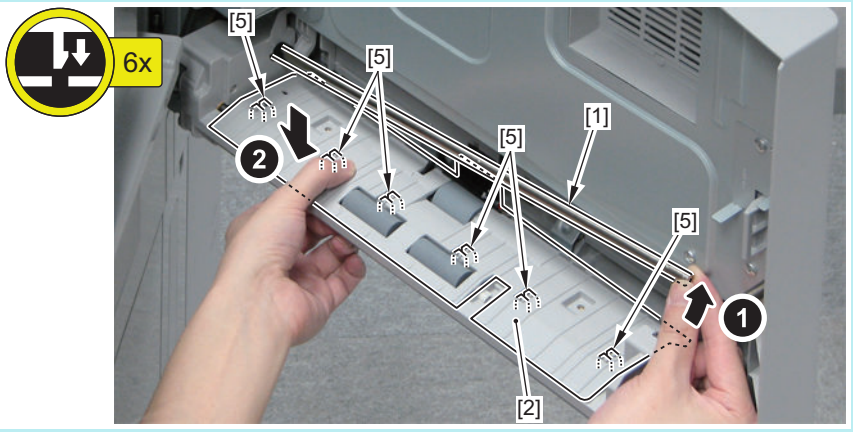
1. While lifting the shaft [1], place the Feed Guide [2] with its cut-off [A] fit to the Multi-purpose Tray Separation Roller [3].



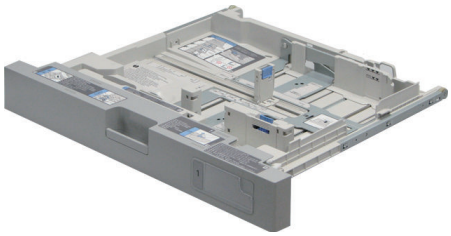
2. While lifting the shaft [1], hook the 6 [B] parts of the Feed Guide [2] on the 6 hooks [4].



3. While lifting the shaft [1], push the Feed Guide [2] and install the 6 claws [5] to secure the Feed Guide [2].



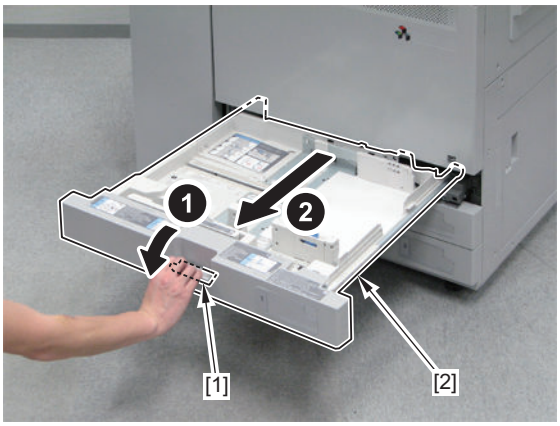
Removing the Cassette 1/ Cassette 2/ Cassette 3



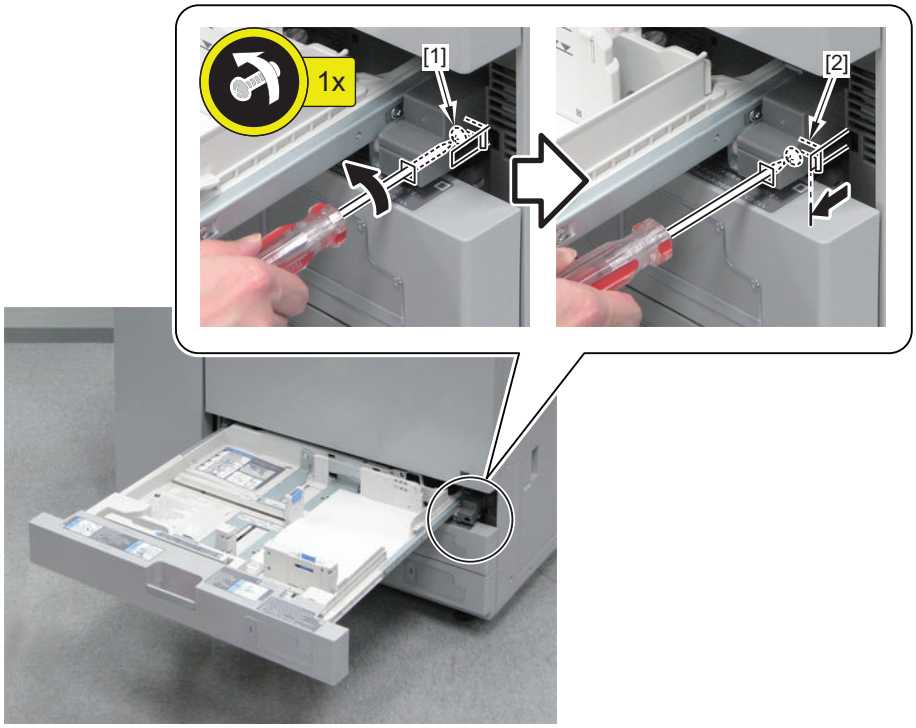
■ Procedure

NOTE:
In this procedure, the procedure for the Cassette 1 is described.
Be sure to perform the same procedure for the Cassette 2 and Cassette 3.

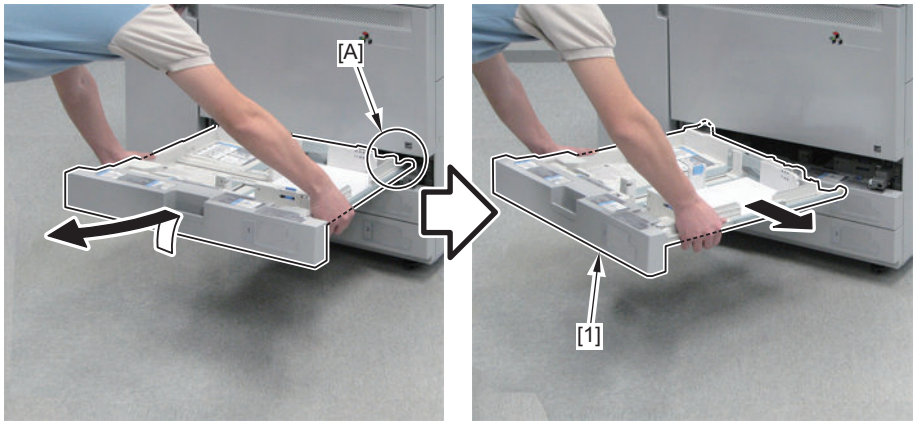
1. Pull the Open/Close Lever [1], and pull out the Cassette 1 [2].



2. **Loosen the screw [1], and move the stopper [2] until it stops.**

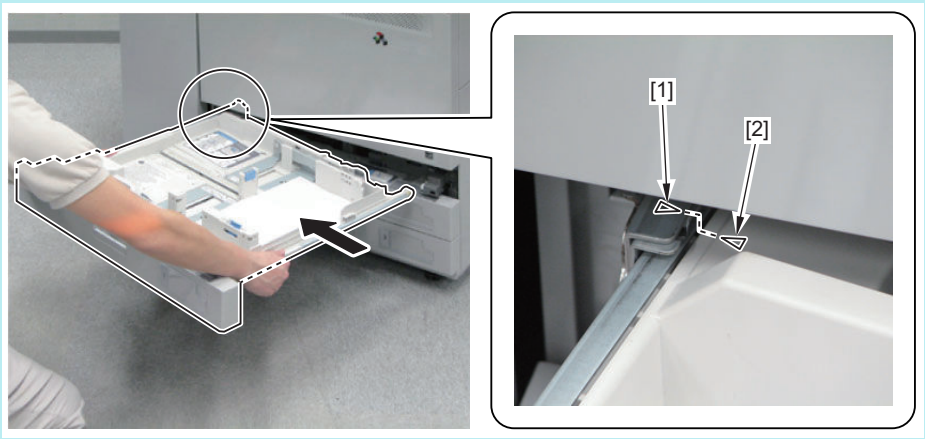


3. **Pull out the [A] part on the right side of the cassette while lifting its front side, and then move it toward the right to remove the Cassette 1.**

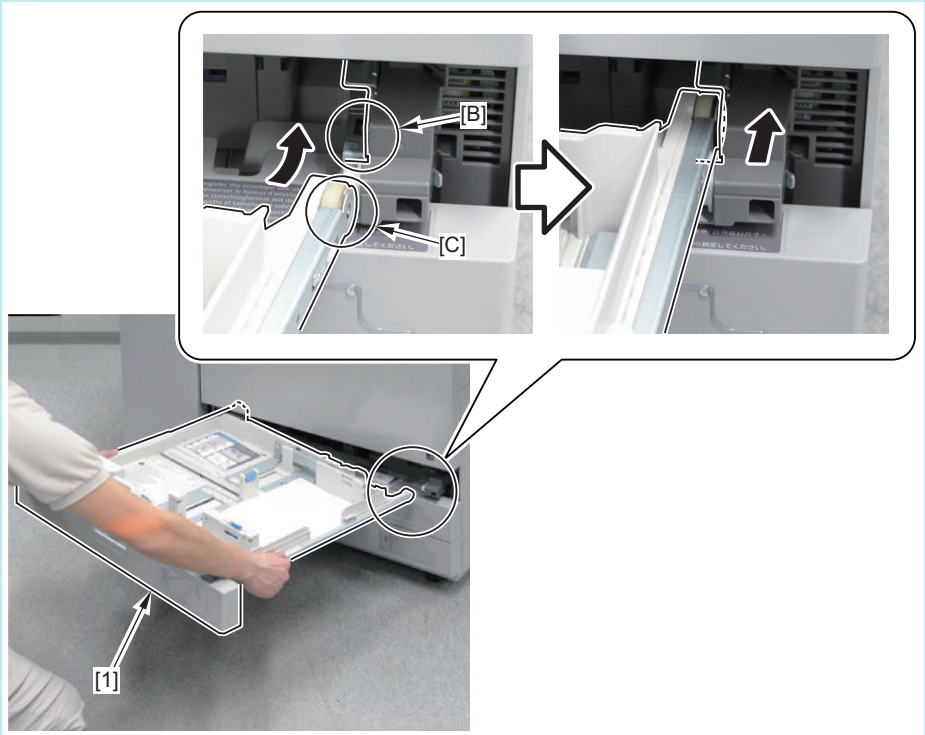


NOTE:
How to install the Cassette 1

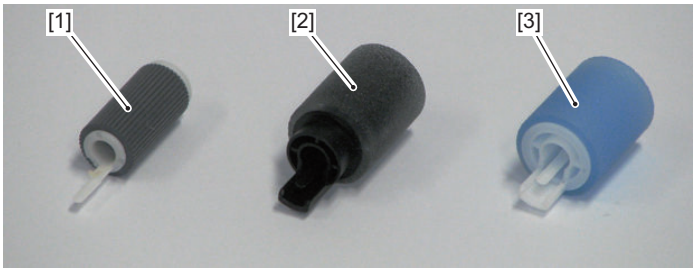
1. Align the triangle mark [2] of the rail on the left side with the triangle mark [3] of the cassette.



2. Put the [C] part in the [B] part of the rail on the right side to install the Cassette 1 [1].



Removing the Cassette 1, 2, 3 Pickup Roller / Cassette 1, 2, 3 Feed Roller / Cassette 1, 2, 3 Separation Roller



- Cassette 1 Pickup Roller / Cassette 2 Pickup Roller / Cassette 3 Pickup Roller [1]
- Cassette 1 Feed Roller / Cassette 2 Feed Roller / Cassette 3 Feed Roller [2]
- Cassette 1 Separation Roller / Cassette 2 Separation Roller / Cassette 3 Separation Roller [3]

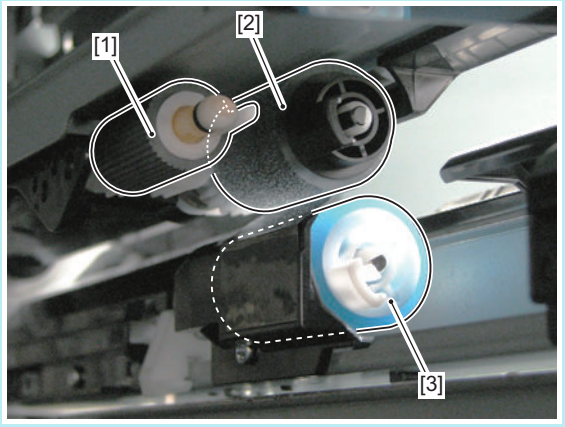
■ Preparation

1. **Removing the Cassette 1/2/3 (remove the Cassette 1, 2, or 3 as needed).****"Removing the Cassette 1/ Cassette 2/ Cassette 3" on page 877**

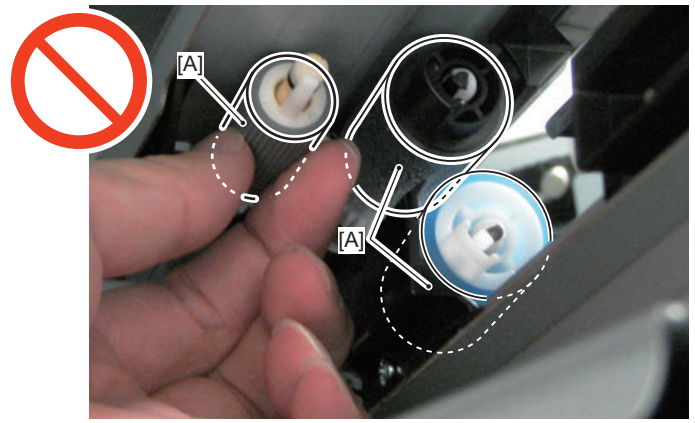
■ Procedure

NOTE:
In this procedure, the procedure for the Cassette 1 Pickup Roller/Cassette 1 Feed Roller/Cassette 1 Separation Roller is described. Be sure to perform the same procedure for the Cassette 2, 3 Pickup Roller/Cassette 2, 3 Feed Roller/Cassette 2, 3 Separation Roller.

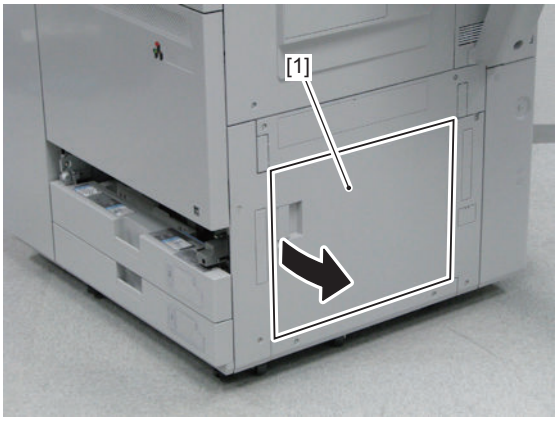
NOTE:
The layout for the Cassette 1 Pickup Roller [1]/Cassette 1 Feed Roller [2]/Cassette 1 Separation Roller [3] is shown below.



CAUTION:
Be sure not to touch the surface [A] of the roller when disassembling/assembling.

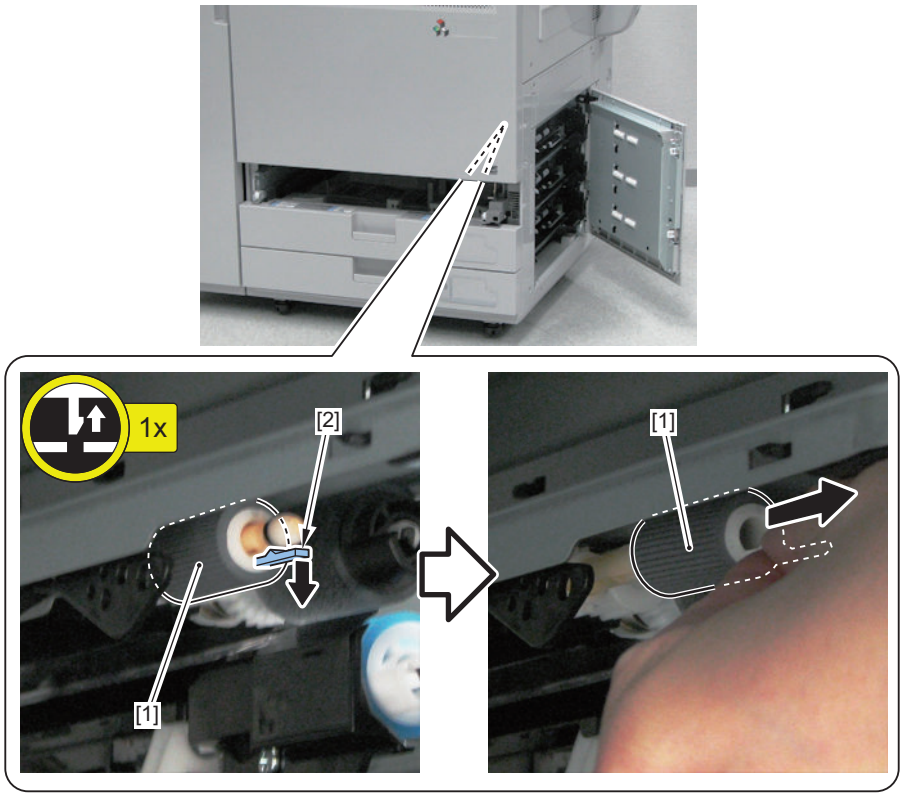


1. Open the Right Cover [1].

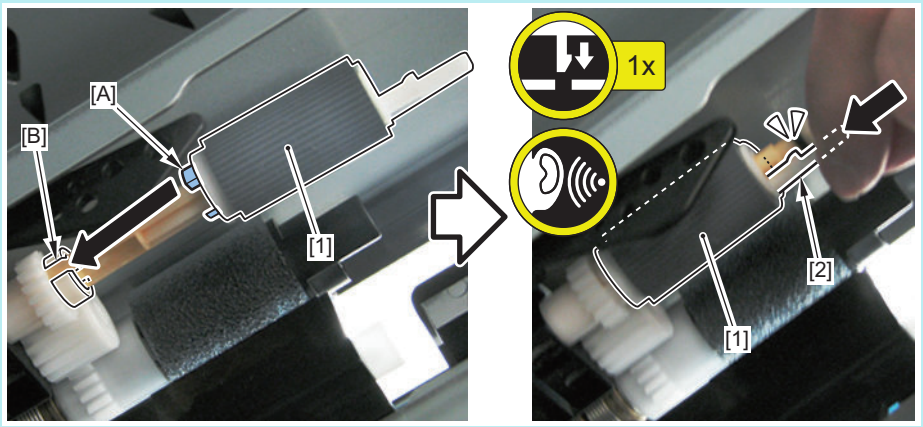


● When removing the Cassette 1 Pickup Roller

1. **Remove the Cassette 1 Pickup Roller [1].**
   - 1 Claw [2]

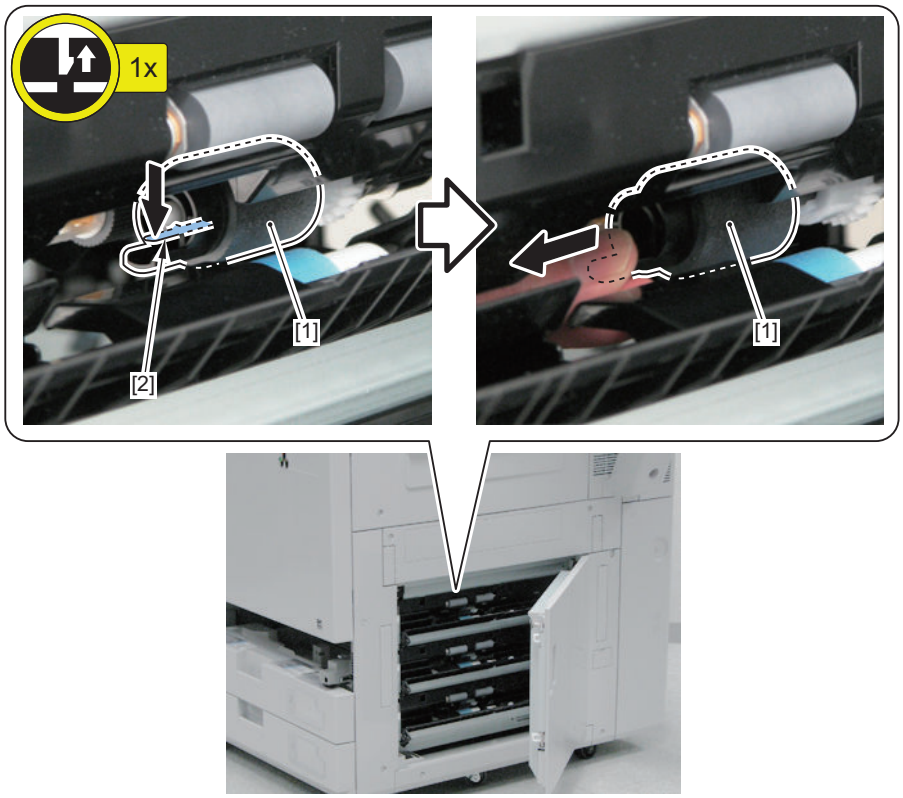


NOTE:
How to install the Cassette 1 Pickup Roller
- Be sure to align the protrusion [A] of the Cassette 1 Pickup Roller [1] with the groove [B] of the gear to install the roller.
- Be sure to insert the Cassette 1 Pickup Roller [1] until the claw [2] is hooked.

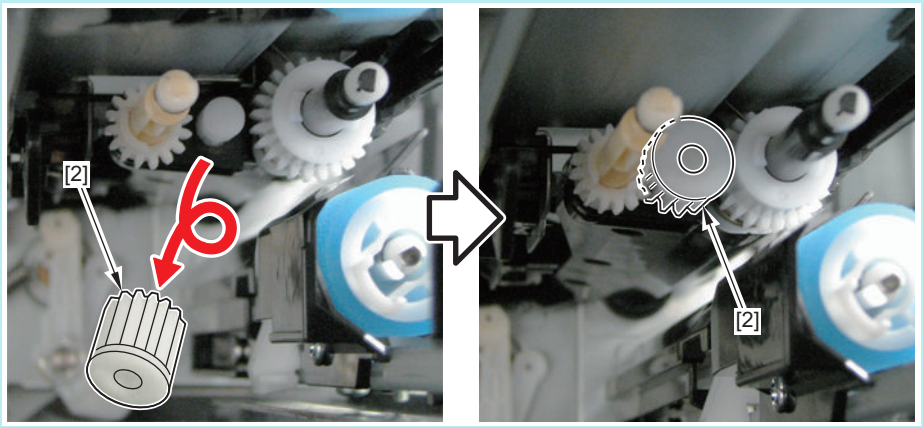


● When removing the Cassette 1 Feed Roller

1. **Remove the Cassette 1 Feed Roller [1].**
   - 1 Claw [2]

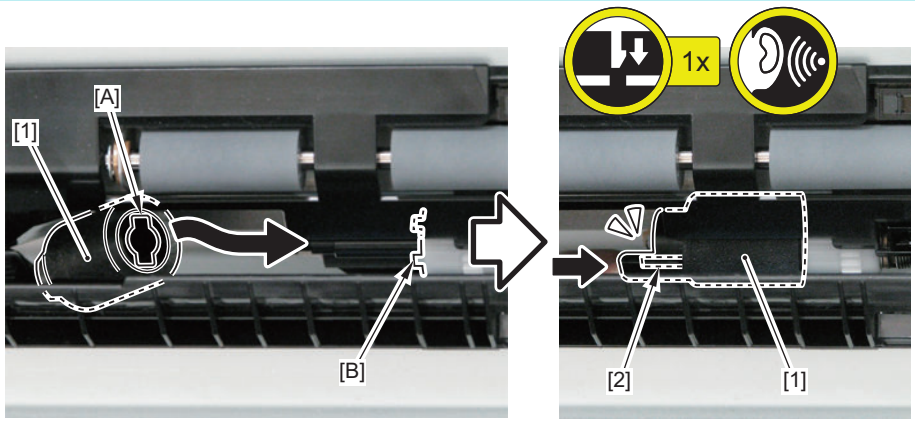


NOTE:
If both the Cassette 1 Pickup Roller and the Cassette 1 Feed Roller are removed, the Slave Gear [2] comes off easily. If it comes off, be sure to put it back in the installation position.



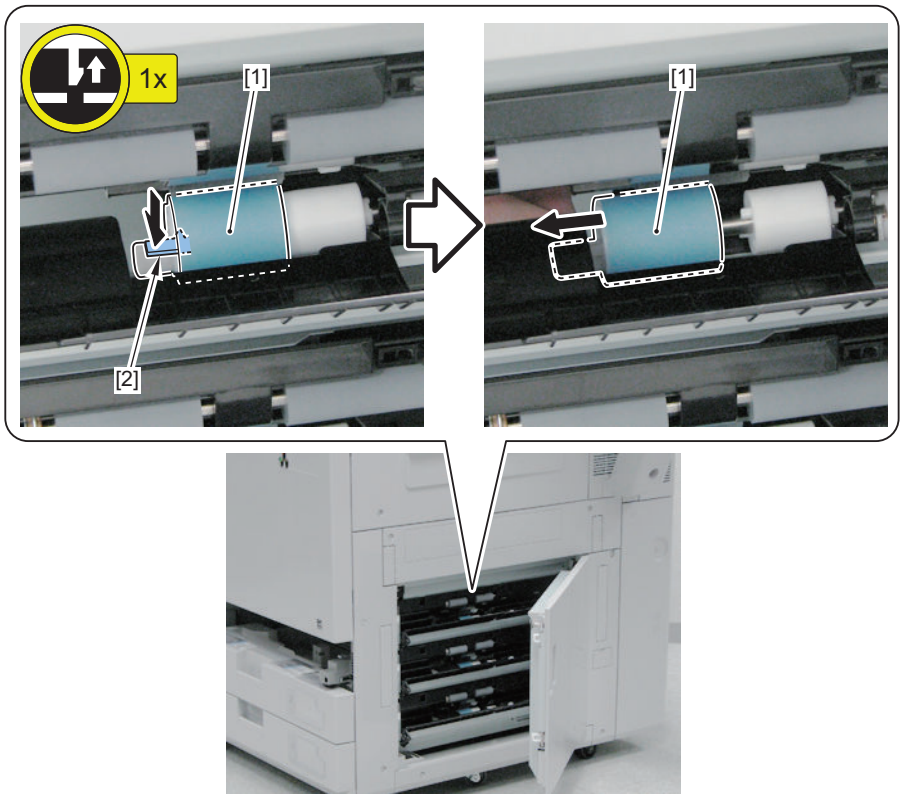
NOTE:
How to install the Cassette 1 Feed Roller

- Be sure to align the groove [A] of the Cassette 1 Feed Roller [1] with the protrusion [B] of the Torque Limiter to install the roller.
- Be sure to insert the Cassette 1 Feed Roller [1] until the claw [2] is hooked.



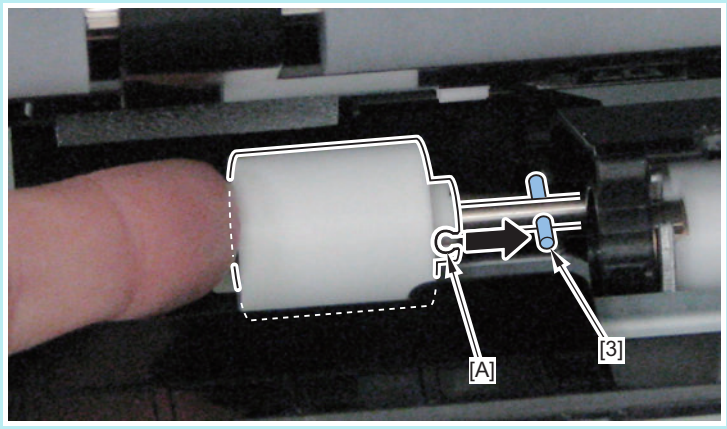
● When removing the Cassette 1 Separation Roller

1. **Remove the Cassette 1 Separation Roller [1].**
   - 1 Claw [2]

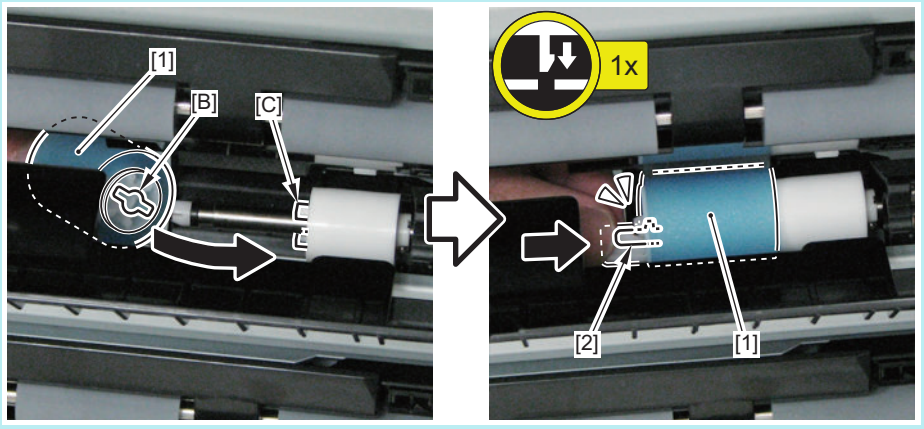


NOTE:
How to install the Cassette 1 Separation Roller

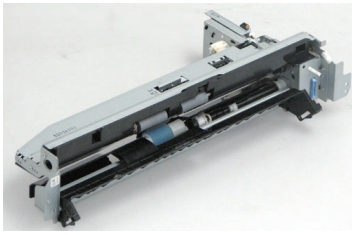
- Be sure to align the groove [A] of the Torque Limiter with the spring pin [3] to install the roller.



- Be sure to align the groove [B] of the Cassette 1 Separation Roller [1] with the protrusion [C] of the Torque Limiter to install the roller.
- Be sure to insert the Cassette 1 Separation Roller [1] until the claw [2] is hooked.



Removing the Cassette 1 Pickup Unit / Cassette 2 Pickup Unit / Cassette 3 Pickup Unit



■ Preparation

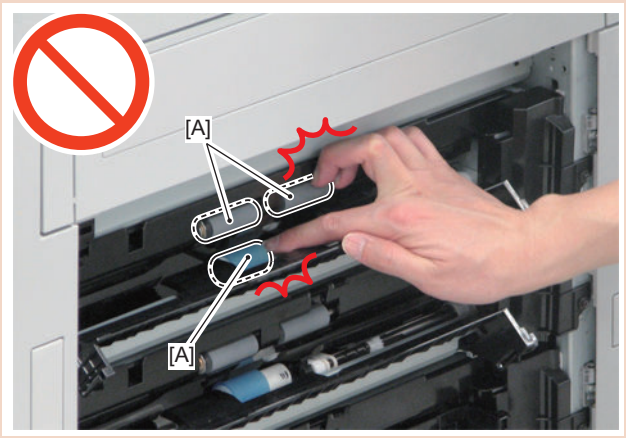
NOTE:
When pickup system options are installed, be sure to disconnect them from the host machine as needed.

1. **Removing the Vertical Path Unit****"Removing the Vertical Path Unit" on page 890**
2. **Pull out the Cassette 1 (pull out the Cassette 1, 2, or 3 as needed).**

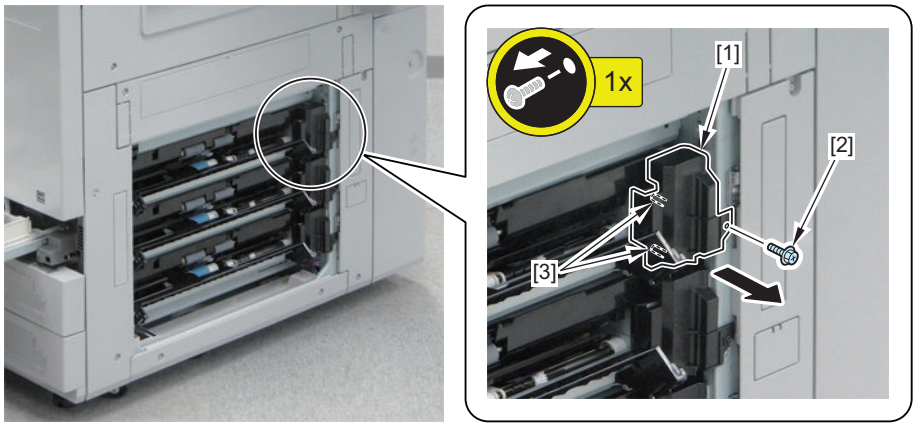
■ Preparation

NOTE:
This procedure explains the case for Cassette 1 Pickup Unit.
Perform the same procedure also for the Cassette 2 Pickup Unit and Cassette 3 Pickup Unit.

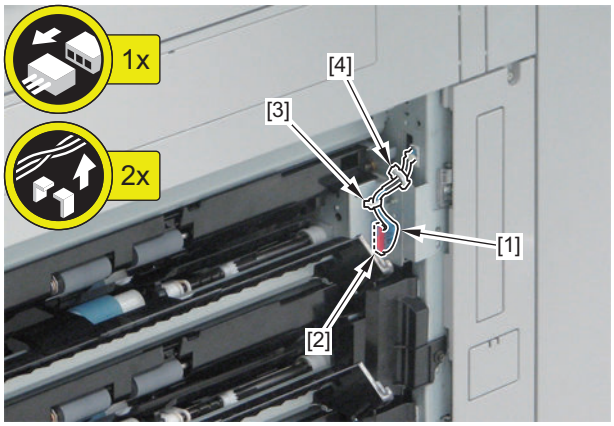
CAUTION:
Do not touch the 3 areas on the roller surface [A] when disassembling/assembling



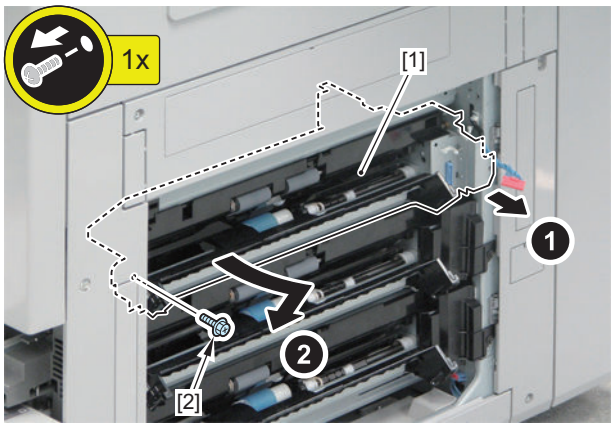
1. **Remove the Connector Cover [1].**
   - 1 Screw [2]
   - 2 Bosses [3]



2. **Free the harness [1].**
   - 1 Connector [2]
   - 1 Wire Saddle [3]
   - 1 Edge Saddle [4]



3. **Remove the Pickup Unit [1].**
   - 1 Screw [2]



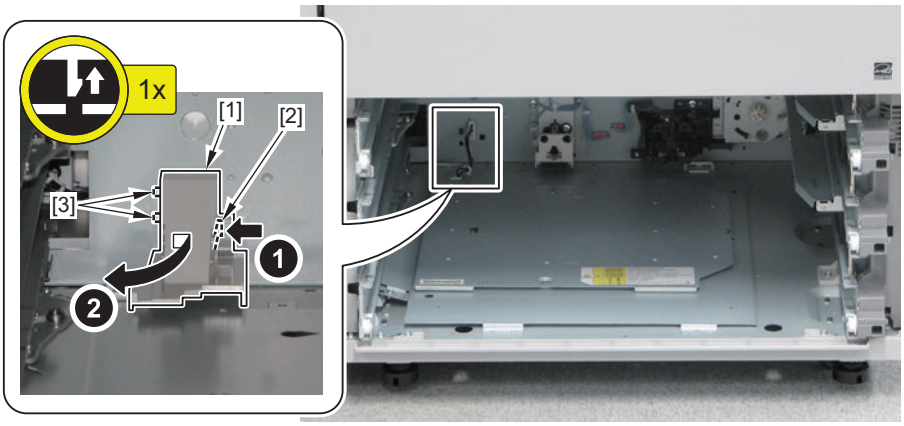
Removing the Cassette Heater Unit

■ Preparation

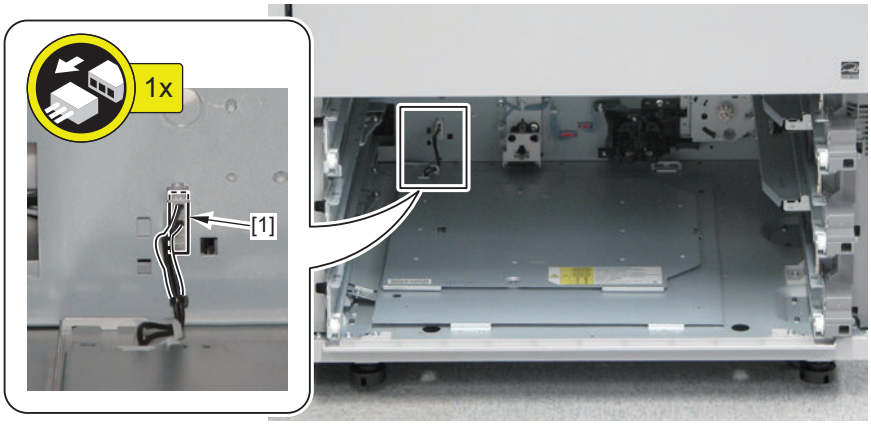
1. **Remove the Cassette 1/2/3.****“Removing the Cassette 1/ Cassette 2/ Cassette 3” on page 877**

■ Procedure

1. **Remove the Connector Cover [1].**
   - 1 Claw [2]
   - 2 Protrusions [3]

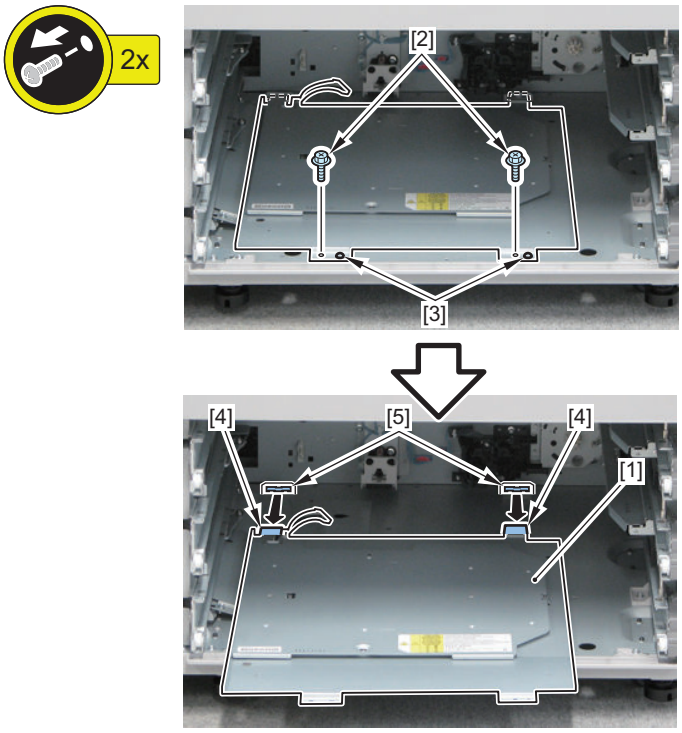


2. **Disconnect the connector [1].**



3. **Remove the Cassette Heater Unit [1].**
   - 2 Screws [2]
   - 2 Bosses [3]
   - 2 Protrusions [4]
   - 2 Holes [5]

CAUTION:
- At assembly, align the 2 protrusions [4] with the 2 holes [5] of the Rear Plate.
- When securing the Cassette Heater Unit, secure it with the 2 screws [2] with the 2 bosses [3] in the correct positions.



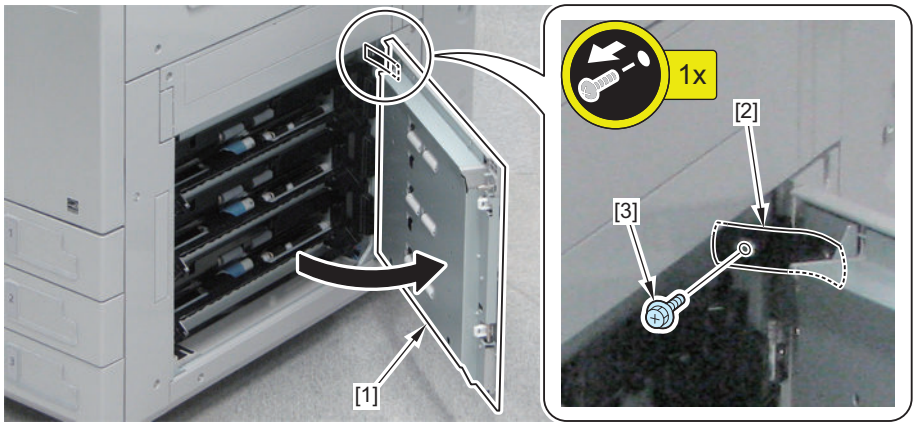
Removing the Vertical Path Unit

■ Preparation

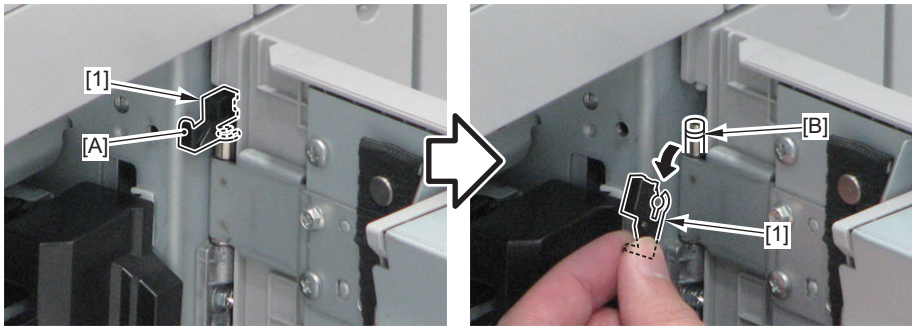
NOTE:
When pickup system options are installed, be sure to disconnect them from the host machine as needed.

■ Procedure

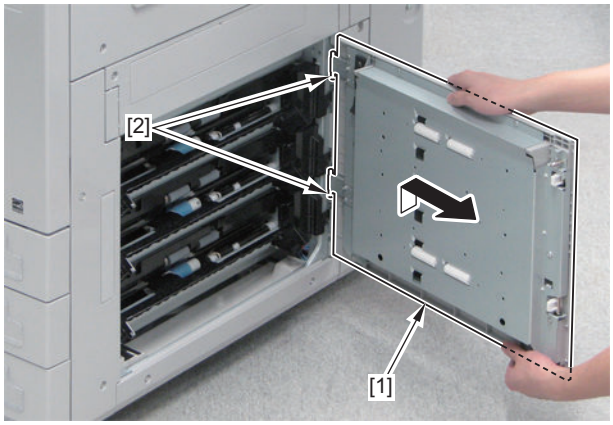
1. **Open the Vertical Path Unit [1], and remove the strap [2].**
   - 1 Screw [3]



2. **Hold the [A] part, and remove the stopper [1] from the groove [B] of the shaft.**



3. **Remove the Vertical Path Unit [1].**
   - 1 Shaft [2]

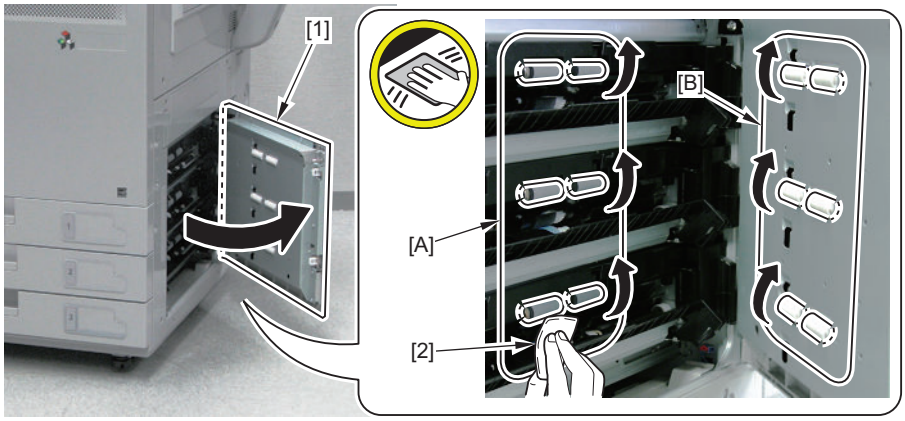


Cleaning the Vertical Path Feed Roller and the Slave Roller

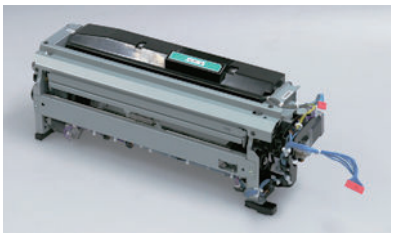
■ Procedure

1. **Open the Vertical Path Unit [1].**

2. **Clean the surface [A] of the 3 Vertical Path Feed Rollers and the surface [B] of the 3 Slave Rollers with lint-free paper [2] moistened with alcohol while rotating them by hand.**



Removing the Registration Unit



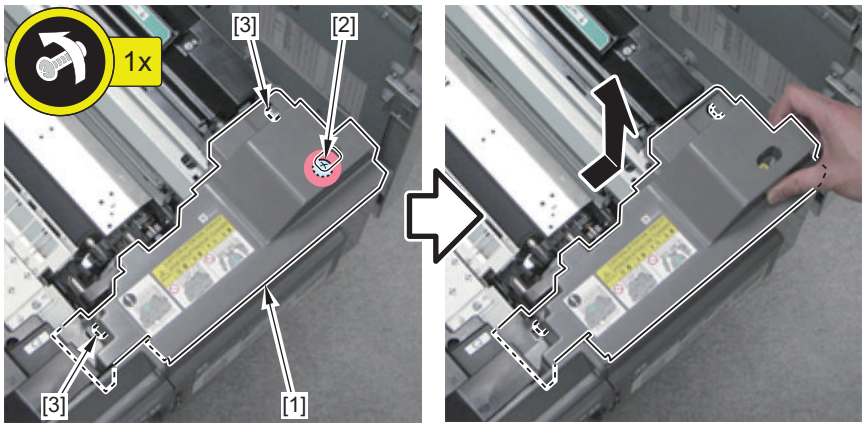
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

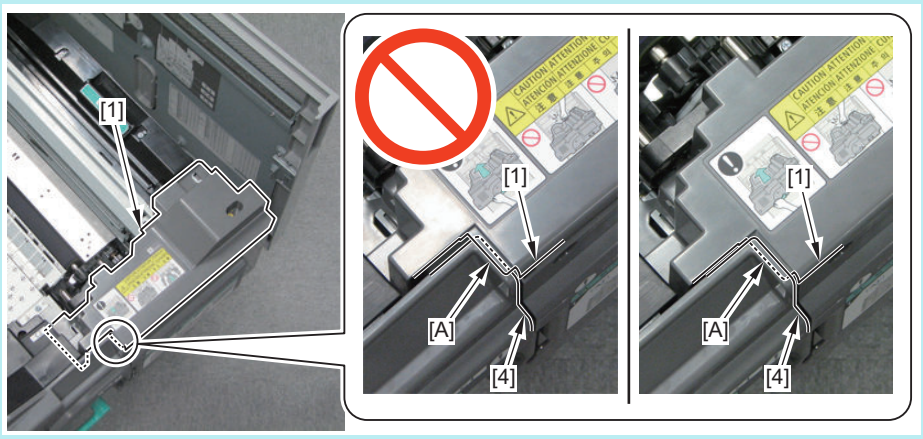
■ Procedure

CAUTION:
When removing/installing or replacing this part, execute "When Removing/Installing the Registration Unit" on page 895.

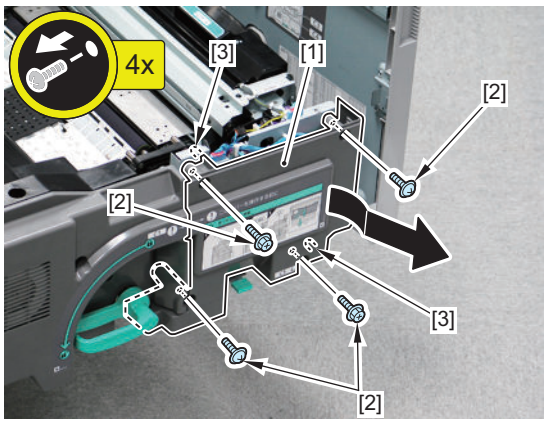
1. **Remove the Fixing Feed Sub Cover [1].**
   - 1 Screw [2] (to loosen)
   - 2 Hooks [3]



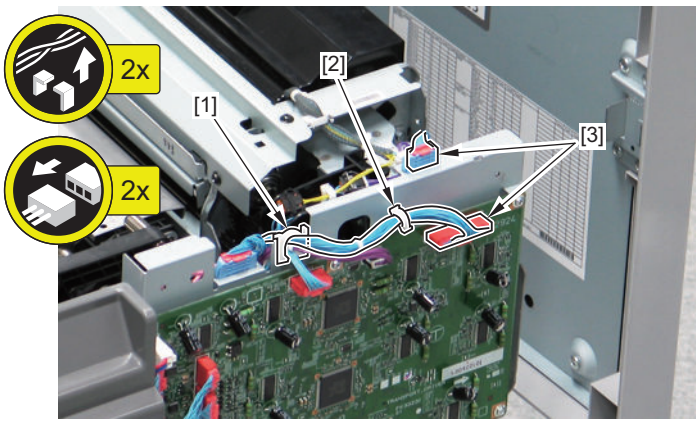
NOTE:
How to install the Fixing Feed Sub Cover
Put the [A] part of the Fixing Feed Front Left Cover [4].



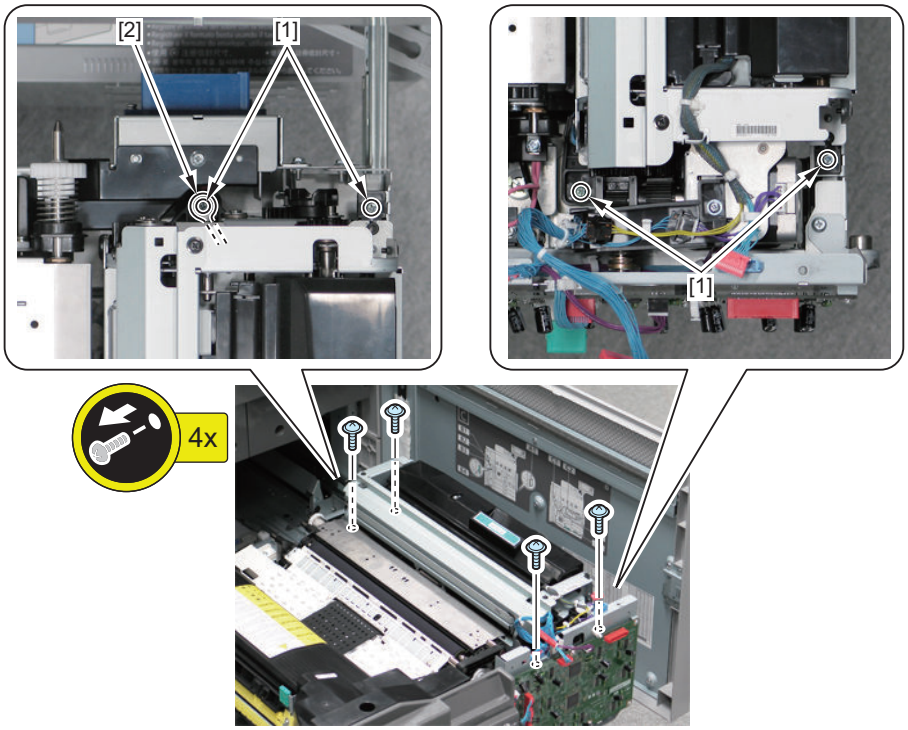
2. **Remove the Fixing Feed Front Right Cover [1].**
   - 4 Screws [2]
   - 2 Bosses [3]



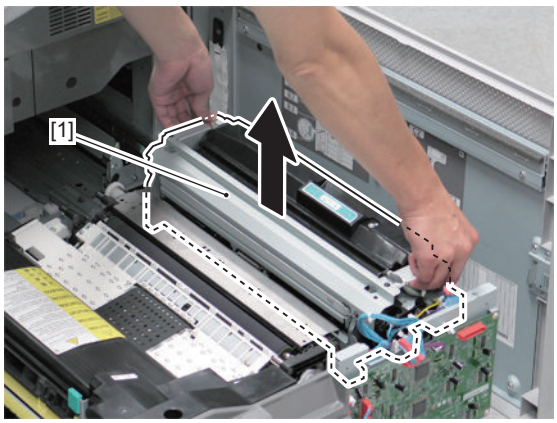
3. **Open the Edge Saddle [1] and the Wire Saddle [2], and disconnect the 2 connectors [3].**



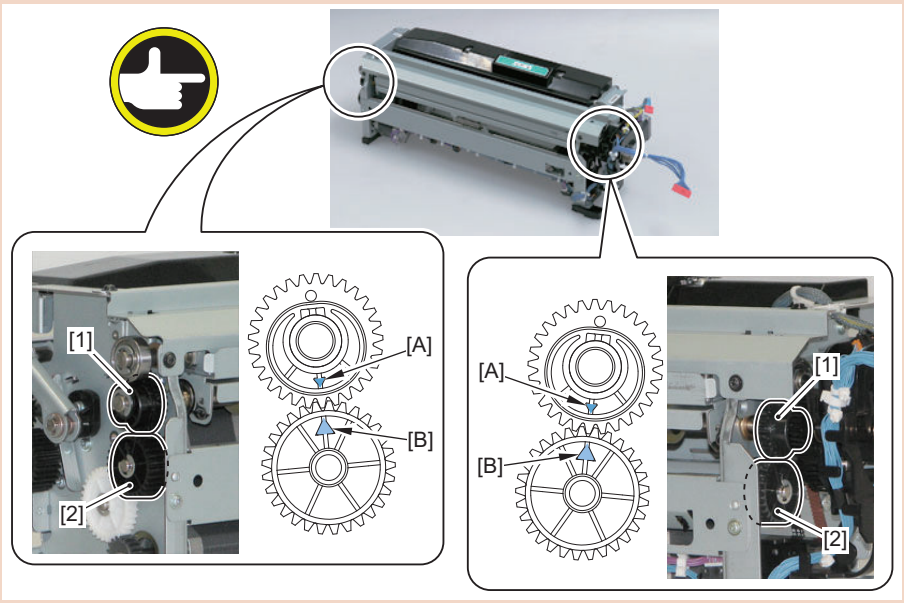
4. **Remove the 4 screws [1] and disconnect the round shape terminal [2].**



5. **Remove the Registration Unit [1].**



CAUTION:
When removing/installing any one of the 2 Cam Gears [1] and the 2 gears [2] in the Registration Unit as shown in the figure below, the phase of the Cam Gears [1] and the gears [2] needs to be aligned.
Method: Be sure to align the leading edge of the arrow [A] of the Cam Gear with the leading edge of the arrow [B] of the gear to install the gears.



When Removing/Installing the Registration Unit

■ Procedure

1. **Execute image position adjustment.****"Image Position Adjustment <Overview>" on page 981**

Cleaning the area from the Pre-registration Path to the Registration Path

■ Preparation

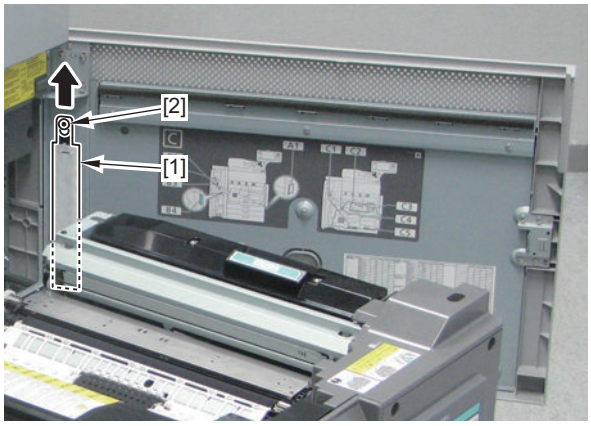
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

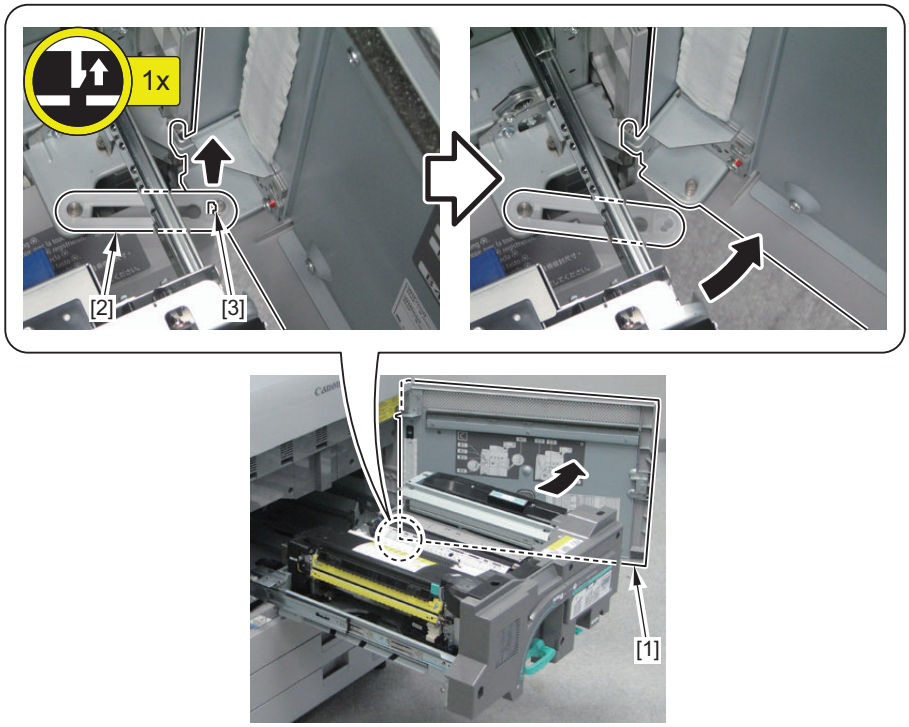
CAUTION:
Do not touch the cleaned parts (the guide and rollers) after cleaning them.

NOTE:
If the feed area which can be cleaned by dry lint-free paper is dirty after cleaning it with the paper lint cleaning tool, clean it with lint-free paper moistened with alcohol.

1. **Unhook the paper lint cleaning tool [1] from the Stepped Screw [2]**



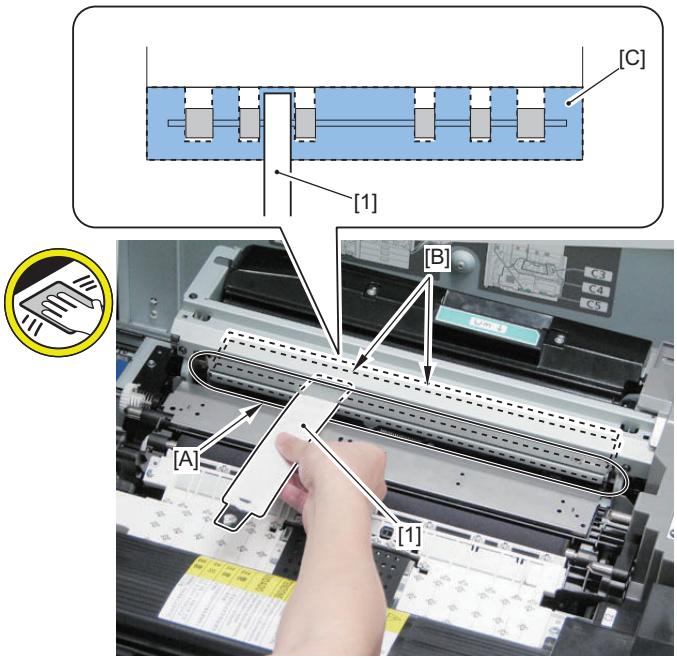
2. **Remove the Open/Close Stopper [2] of the Front Cover [1].**
   - 1 Claw [3]



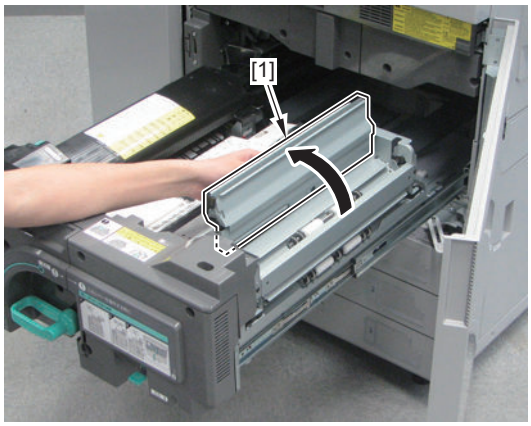
NOTE:
When the angle by which to open the Front Cover is limited due to pickup system options being connected, remove the Front Cover by opening the Toner Replacement Cover, removing the Hinge Shaft on the upper side, and then pulling out the Shaft Pin on the lower side.

3. **Insert the paper lint cleaning tool [1] from the gap [A] of the Registration Guide, and clean the 2 feed areas [B].**

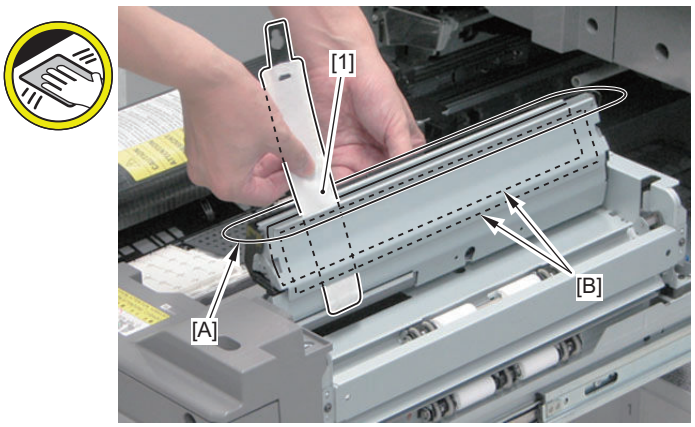
NOTE:
Clean the area [C] which can be cleaned as there is a roller inside.



4. **Open the Registration Unit Inlet Guide [1].**

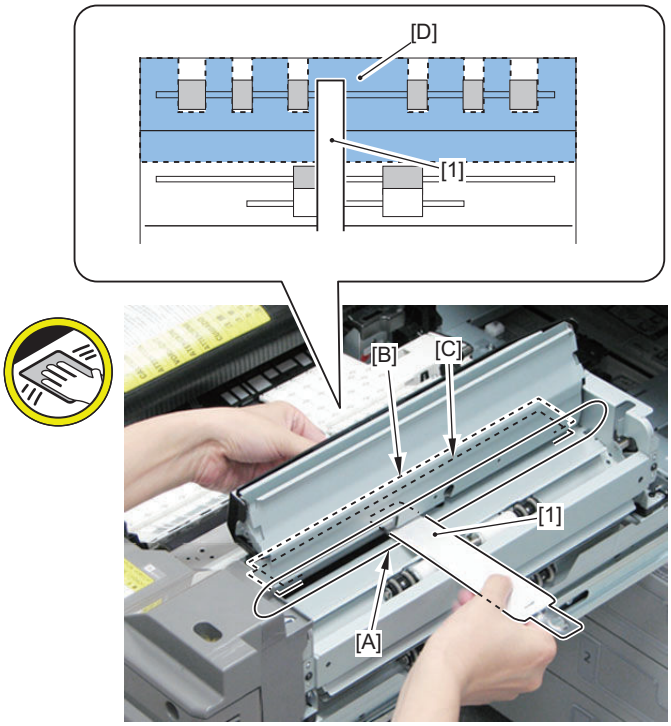


5. **Insert the paper lint cleaning tool [1] from the gap [A] of the Pre-registration Guide Unit (Upper), and clean the 2 feed areas [B].**



6. **Insert the paper lint cleaning tool [1] from the gap [A], and clean the feed area [B] of the Pre-registration Guide Unit (Upper) and the feed area [C] of the Pre-registration Lower Guide.**

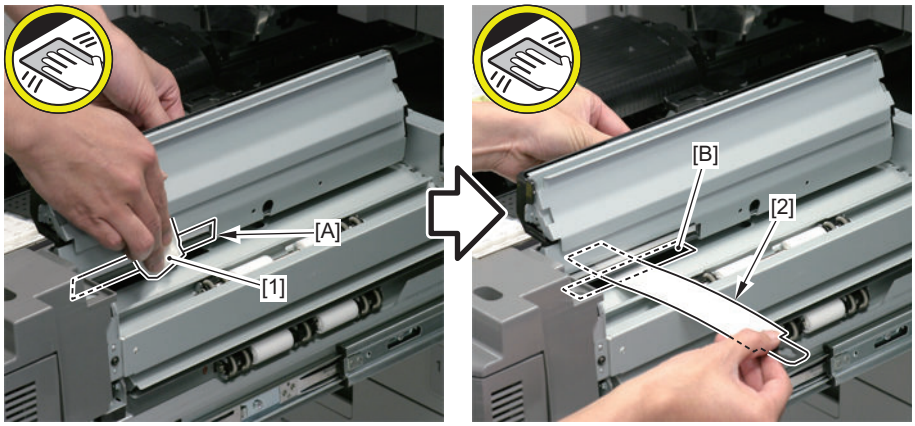
NOTE:
Clean the area [D] which can be cleaned as there is a roller inside.



7. **Clean the surface [A] of the Contact Image Sensor with lint-free paper [1] moistened with alcohol.**

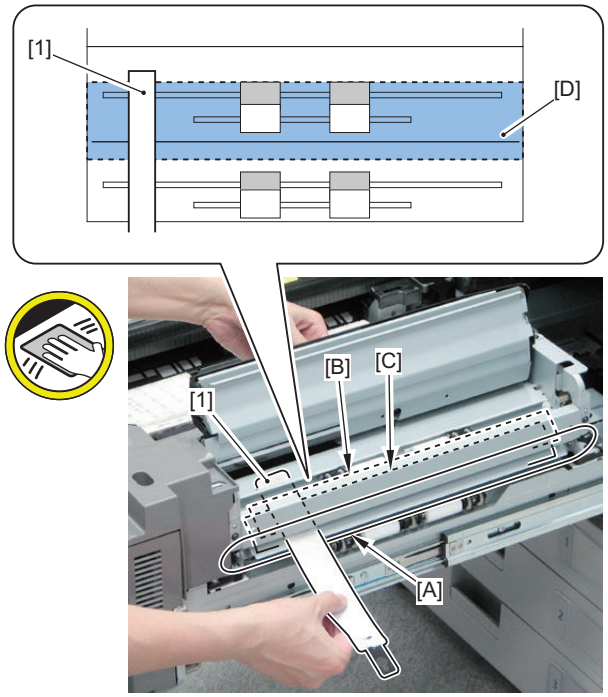
CAUTION:
Do not dry wipe the Contact Image Sensor as it may be charged.

8. **Clean the surface [B] of the CIS Sheet with the paper lint cleaning tool [2].**



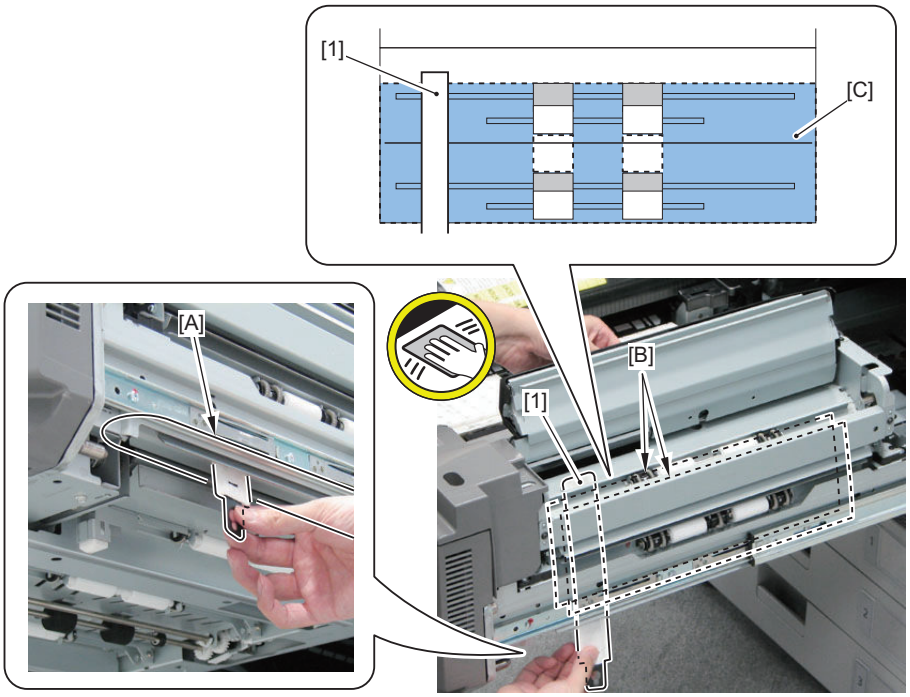
9. **Insert the paper lint cleaning tool [1] from the gap [A] of the Fixing Feed Unit, and clean the surface [B] of the feed area of the Pre-registration Upper Guide and the feed area [C] of the Pre-registration Lower Guide.**

NOTE:
Clean the area [D] which can be cleaned as there is a roller inside.



10. **Insert the paper lint cleaning tool [1] from the gap [A] of the Duplex Merging Guide, and clean the 2 feed areas [B].**

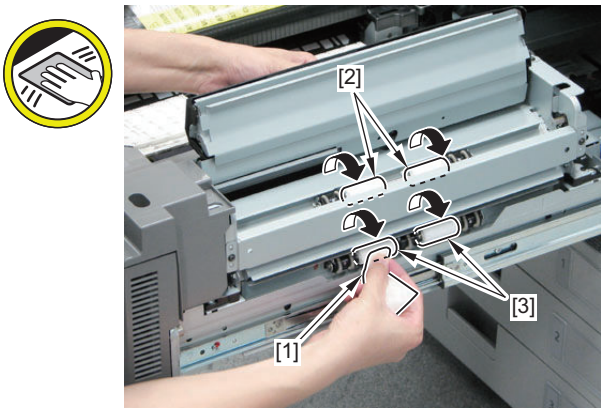
NOTE:
Clean the area [C] which can be cleaned as there is a roller inside.



11. Clean each of the following rollers with lint-free paper [1] moistened with alcohol while rotating the roller by hand.

- 2 areas [2] of the Slave Roller Unit (for the Pre-registration Roller)
- 2 areas [3] of the Slave Roller Unit (for the Shift Roller)

CAUTION:
Be sure to use lint-free paper to rotate the rollers instead of directly touching them by hand.



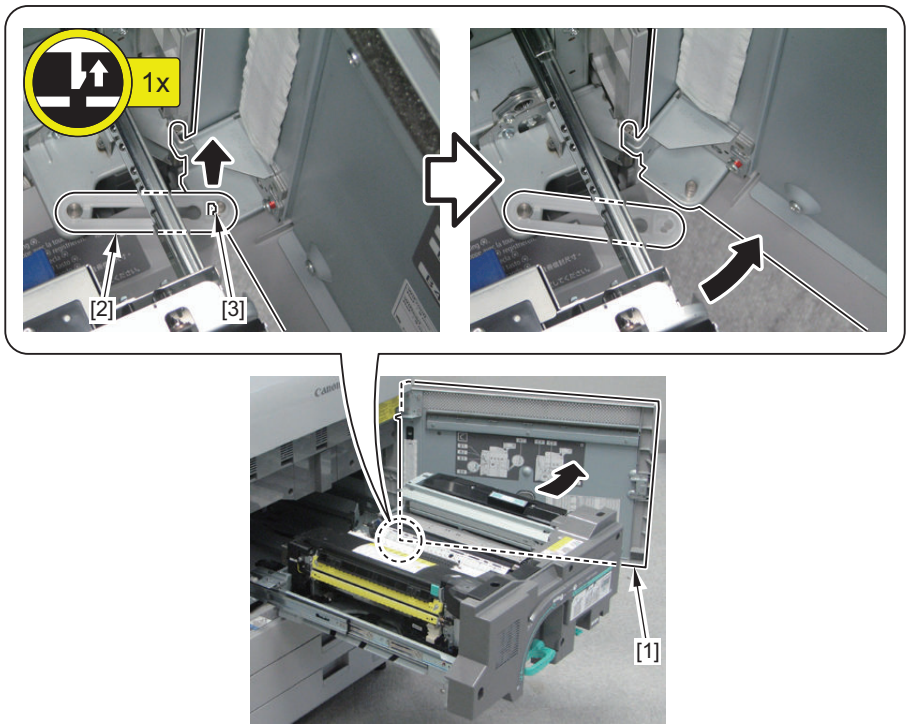
Cleaning the Contact Image Sensor

■ Preparation

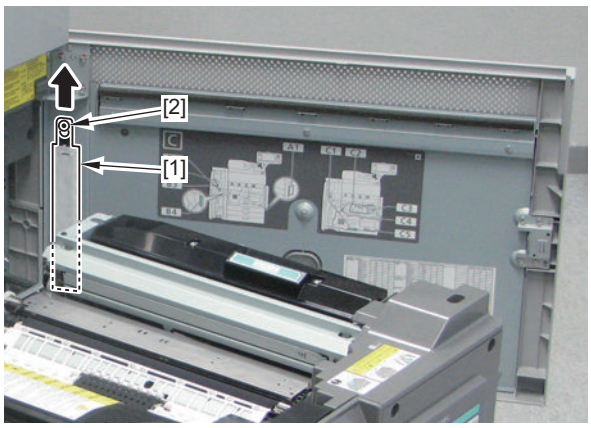
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

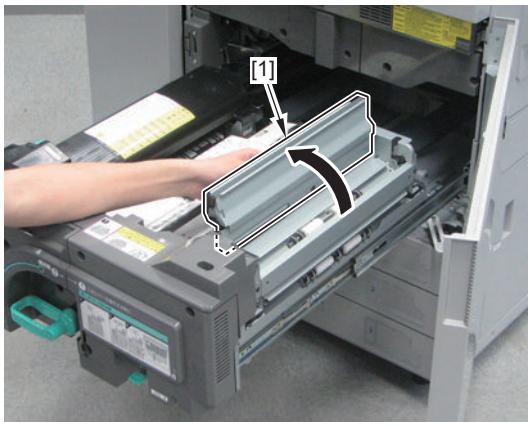
1. **Release the Open/Close Stopper [2] of the Front Cover [1].**
   - 1 Claw [3]



2. **Remove the paper lint cleaning tool [1] from the Stepped Screw [2].**



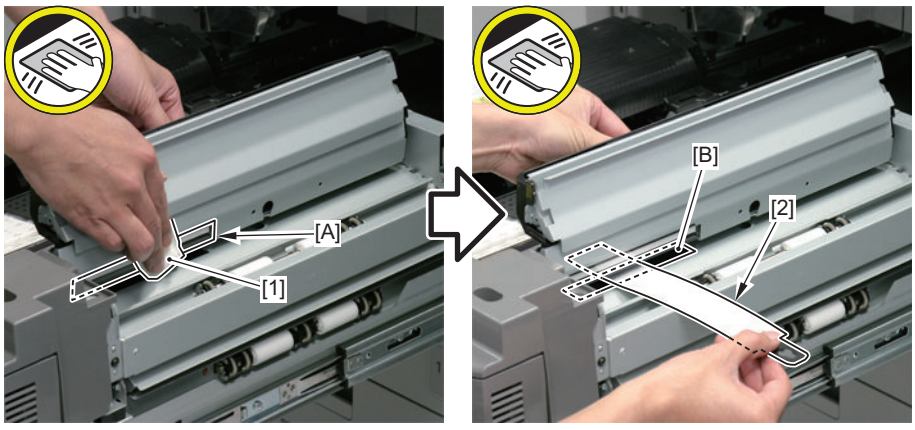
3. **Open the Registration Unit Inlet Guide [1].**



4. **Clean the surface [A] of the Contact Image Sensor with lint-free paper [1] moistened with alcohol.**

CAUTION:
Do not dry wipe the Contact Image Sensor as it may be charged.

5. **Clean the surface [B] of the CIS Sheet with the paper lint cleaning tool [2].**



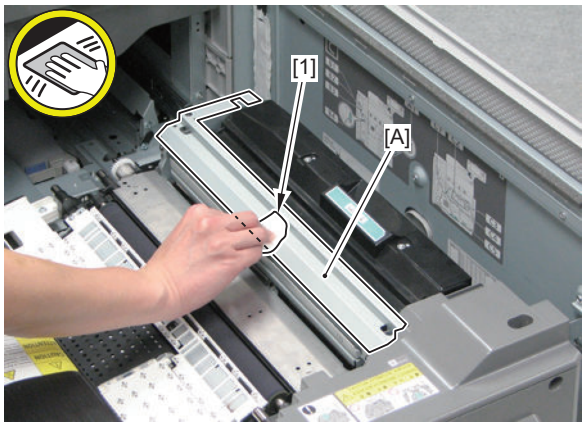
Cleaning the Registration Unit Upper Guide

■ Preparation

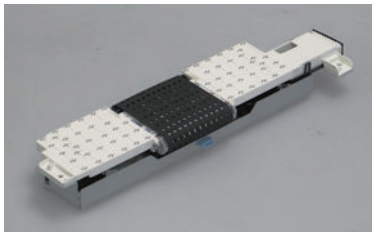
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

1. **Clean the surface [A] of the Registration Unit Upper Guide with lint-free paper [1] moistened with alcohol.**



Removing the Pre-fixing Feed Unit

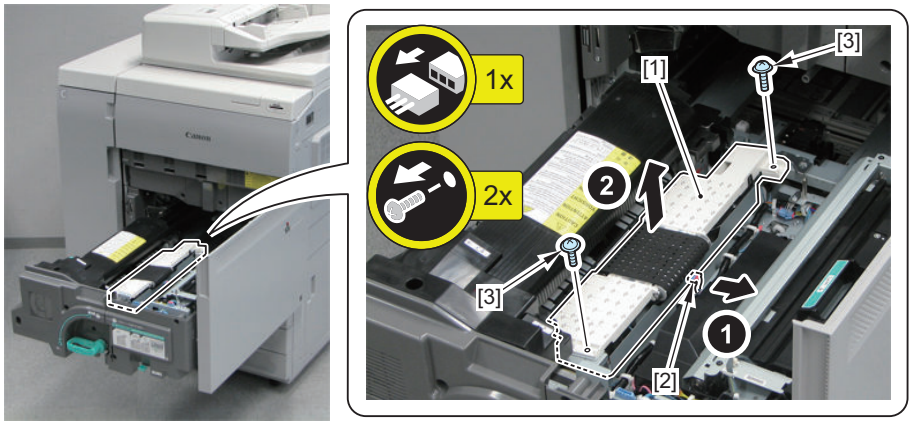


■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Removing the Secondary Transfer Unit****"Removing the Secondary Transfer Unit" on page 617**

■ Procedure

1. **Remove the Pre-fixing Feed Unit [1].**
   - 1 Connector [2]
   - 2 Screws [3]



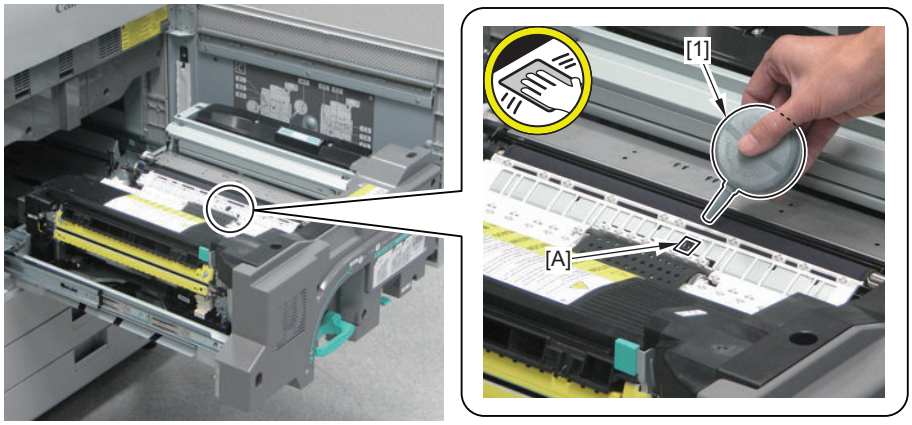
Cleaning the Post-secondary Transfer Sensor / Pre-fixing Feed Belt

■ Preparation

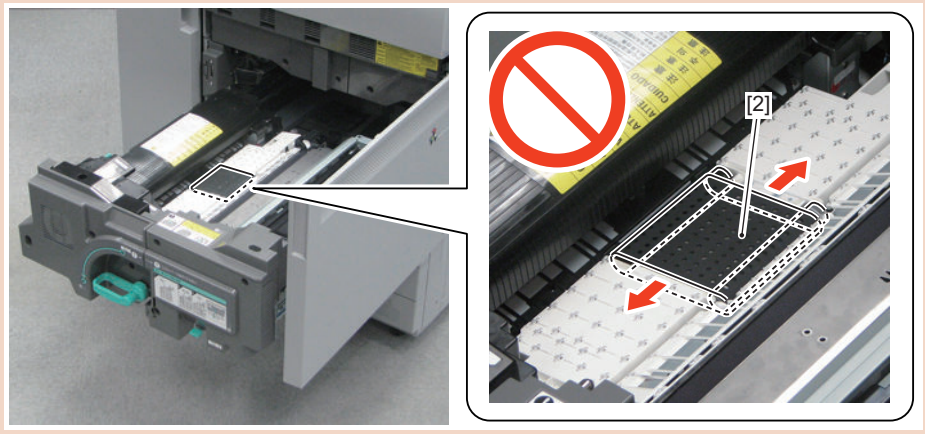
1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

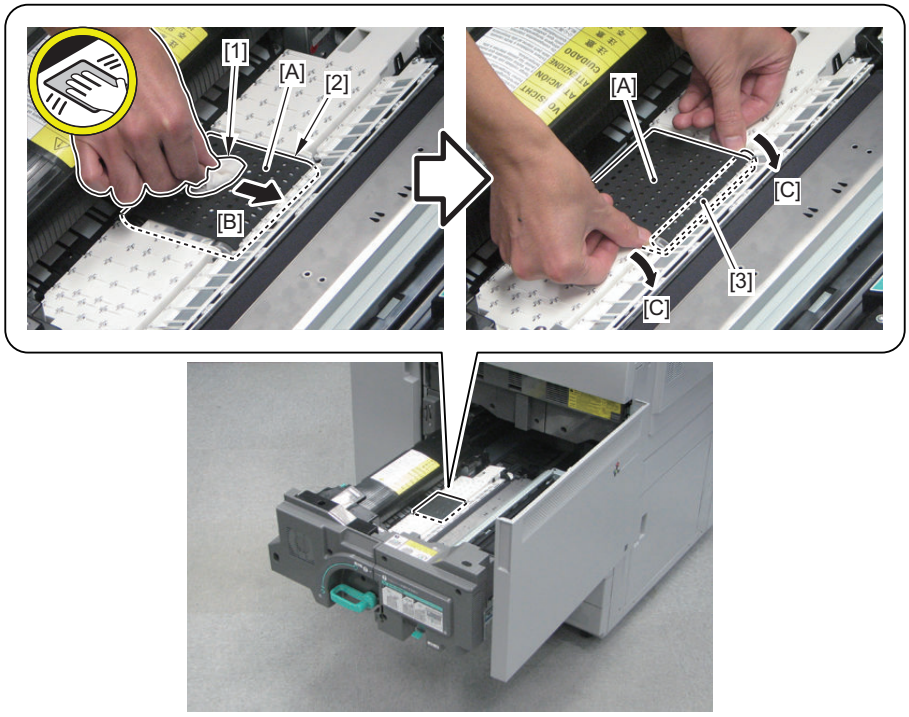
1. **Use a blower [1] to clean the soiling on the surface of the Post-secondary Transfer Sensor from the hole [A] of the guide.**



CAUTION:
Do not move the Fixing Feed Belt [2] toward the front/rear.



2. **Clean the surface [A] of the Fixing Feed Belt [2] with lint-free paper [1] moistened with alcohol.**
   - Move the lint-free paper in the direction of [B] to wipe it.
   - Rotate the Belt Roller [3] in the direction of [C] to clean the whole circumference of the surface [A] of the belt.



Cleaning the Duplex Path

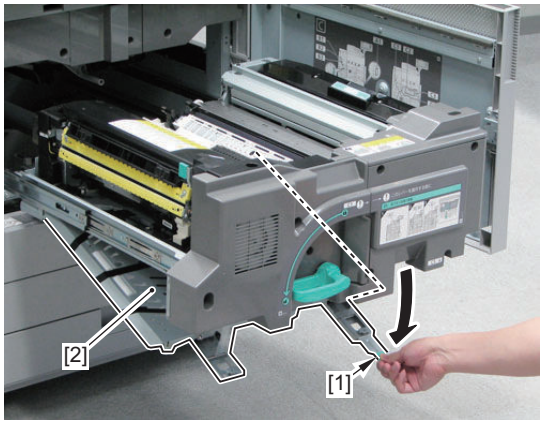
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**

■ Procedure

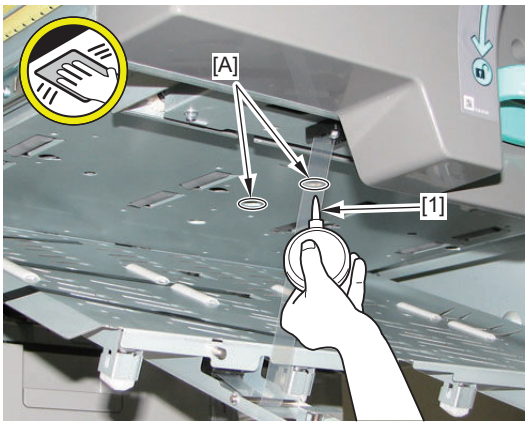
CAUTION:
Do not touch the cleaned parts (the guide and rollers) after cleaning them.

1. **Hold the handle [1], and open the Duplex Guide (Lower) [2].**



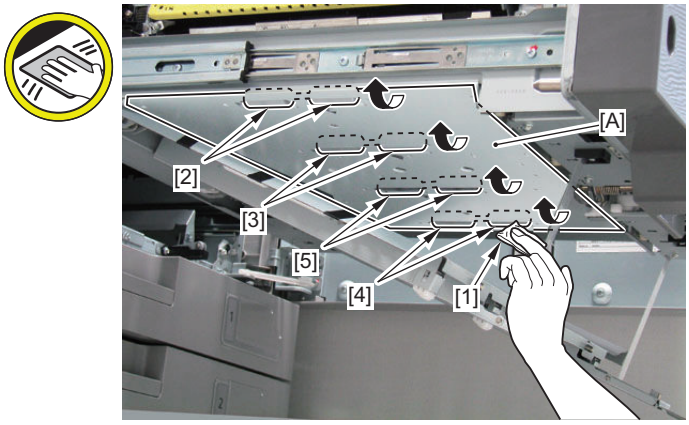
2. **While directing the edge of the blower [1] toward the 2 holes [A] of the Duplex Guide (Upper), clean the paper lint attached to the sensor surface of the Color Sensor with the blower [1].**

NOTE:
Do so only when the Color Sensor (option) is installed.



3. **Clean the feed area [A] of the Duplex Guide (Upper) with lint-free paper [1] moistened with alcohol.**
4. **While rotating the following rollers, clean the whole circumference of their surface with lint-free paper [1] moistened with alcohol.**
   - 2 areas [2] of the Duplex Feed Roller 1
   - 2 areas [3] of the Duplex Feed Roller 2
   - 2 areas [4] of the Duplex Feed Roller 3
   - 2 areas [5] of the Duplex Feed Roller 4

CAUTION:
Be sure to use lint-free paper to rotate the rollers instead of directly touching them by hand.

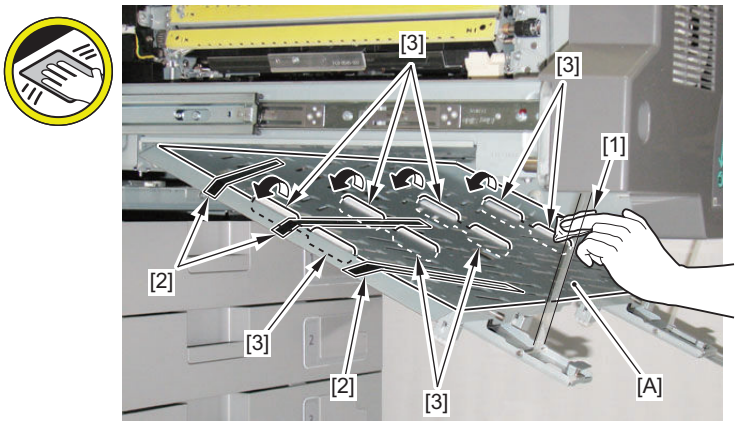


5. **Clean the feed area [A] of the Duplex Guide (Lower) with lint-free paper [1] moistened with alcohol.**

CAUTION:
Be careful not to get the 3 Guide Tapes [2] peeled off or damaged.Otherwise, it may cause feed failure.

6. **While rotating the following rollers, clean the whole circumference of their surface with lint-free paper [1] moistened with alcohol.**
   - 8 areas [3] of the Slave Rollers for the Duplex Feed Roller

CAUTION:
Be sure to use lint-free paper to rotate the rollers instead of directly touching them by hand.



Removing the Delivery Unit

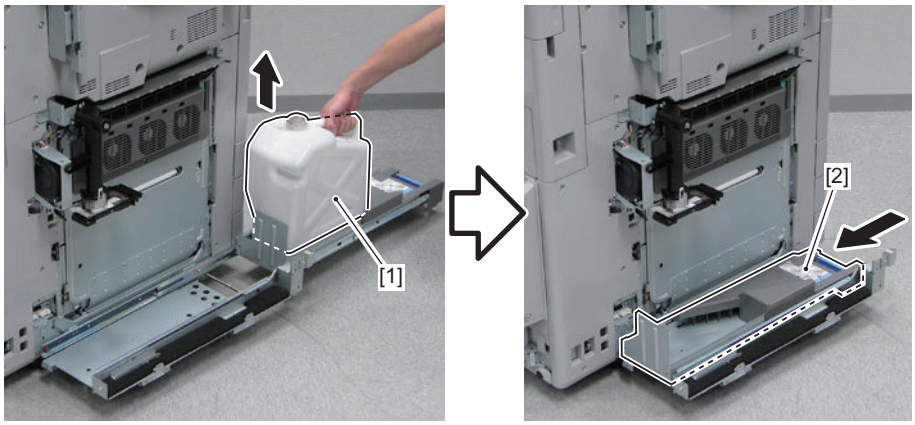
■ Preparation

1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**
2. **Removing the Decurler Unit****"Removing the Decurler Unit" on page 910**

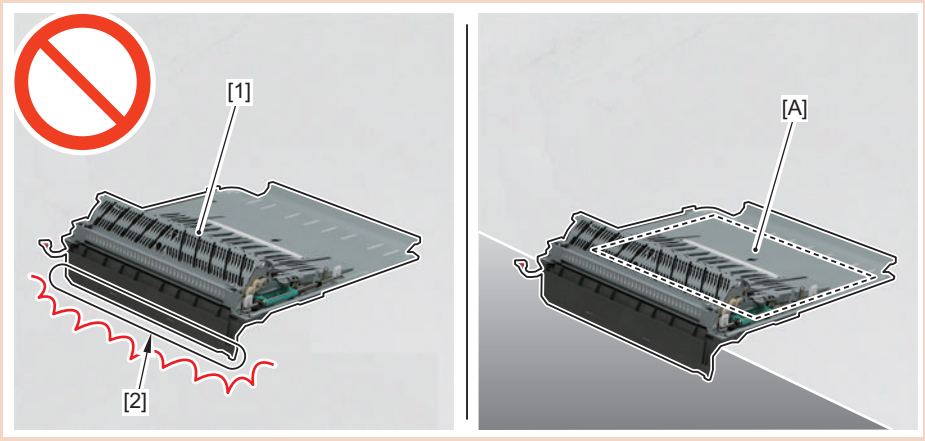
■ Procedure

1. **Remove the Waste Toner Container [1] and store the Waste Toner Container Storage Tray [2].**

CAUTION:
Be sure to install the Waste Toner Container Cap to the removed Waste Toner Container [1] so as not to scatter toner.

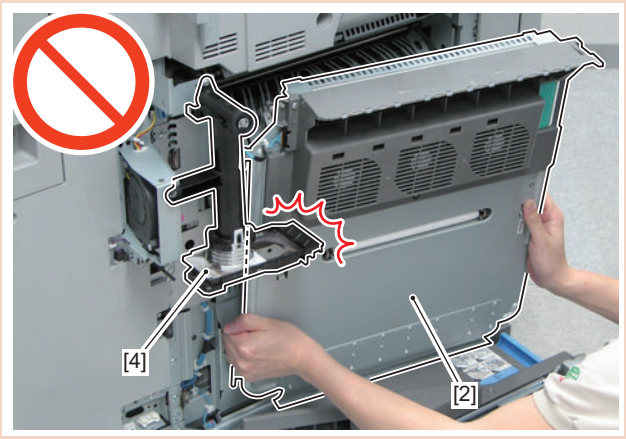


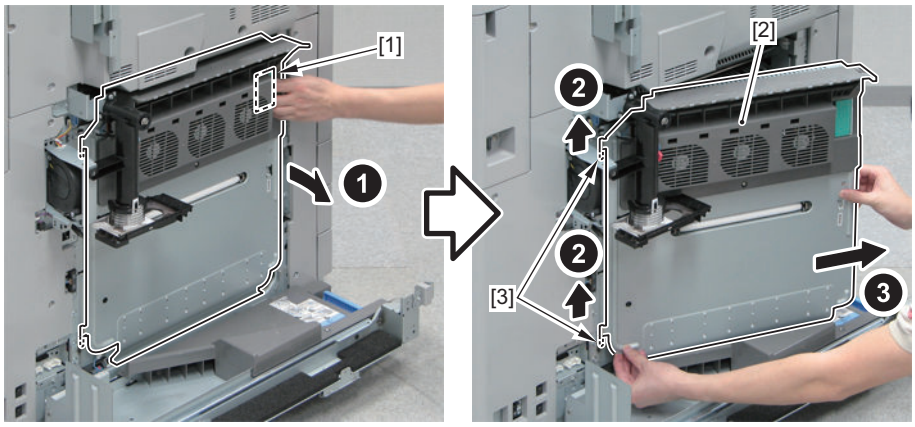
CAUTION:
- When placing the Delivery Unit [1], be sure to do so with the [A] side of the delivery side down.
- Be sure to place the unit on a place where there is a difference in level of the floor (such as an edge of a working table) for not allowing the Slave Roller [2] to contact with the floor to prevent deformation.



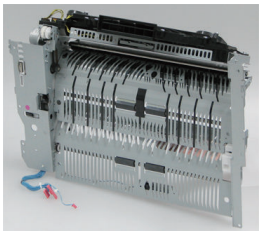
2. **Pull the Lock Lever [1], and remove the Delivery Unit [2].**
   - 2 Shafts [3]

CAUTION:
Do not hit the Delivery Unit [2] against the Waste Toner Vertical Pipe Unit [4].





Removing the Reverse Unit

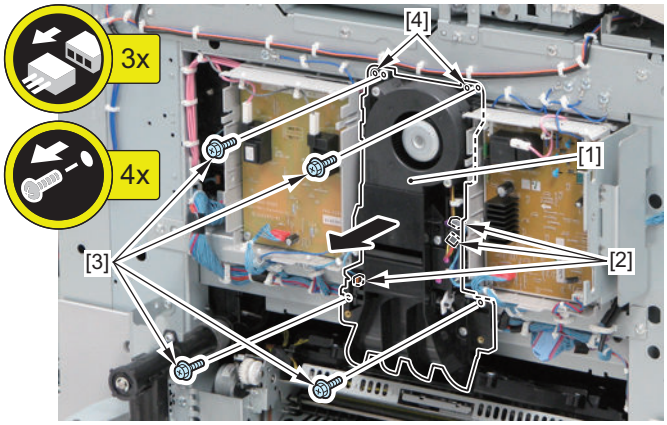


■ Preparation

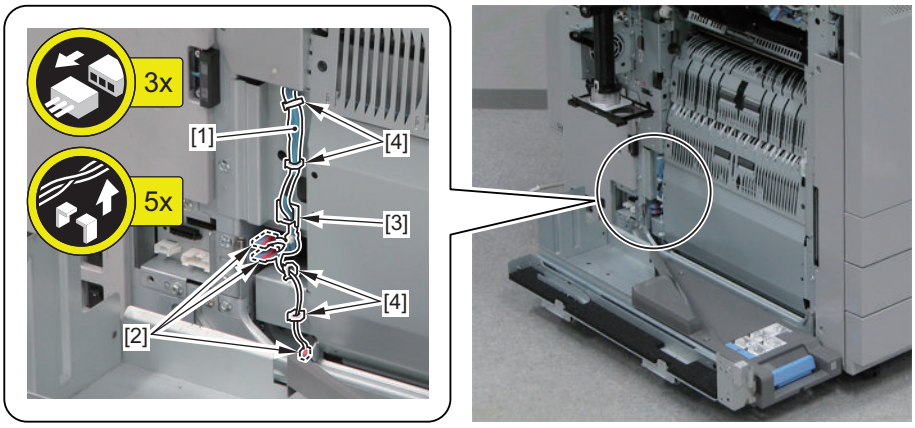
1. **Removing the Front Left Cover**"Removing the Front Left Cover" on page 949
2. **Removing the Decurler Unit**"Removing the Decurler Unit" on page 910
3. **Removing the Delivery Unit**"Removing the Delivery Unit" on page 906
4. **Removing the Box Left Cover**"Removing the Box Left Cover" on page 947
5. **Removing the Left Upper Cover**"Removing the Left Upper Cover" on page 950
6. **Removing the Left Middle Cover**"Removing the Left Middle Cover" on page 951

■ Procedure

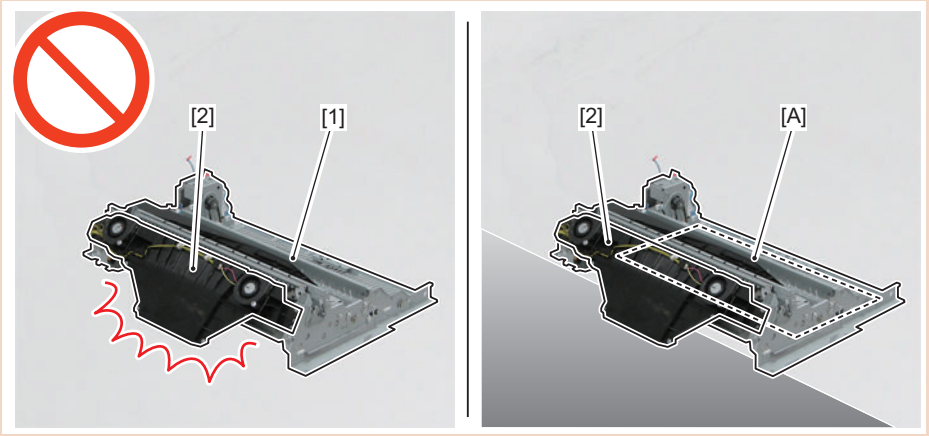
1. **Remove the Fan Unit [1].**
   - 3 Connectors [2]
   - 4 Screws [3]
   - 2 Bosses [4]



2. **Free the harness [1].**
   - 3 Connectors [2]
   - 1 Edge Saddle [3]
   - 4 Wire Saddles [4]

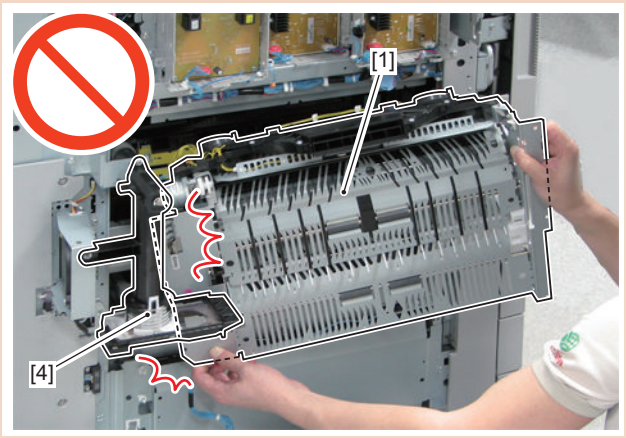


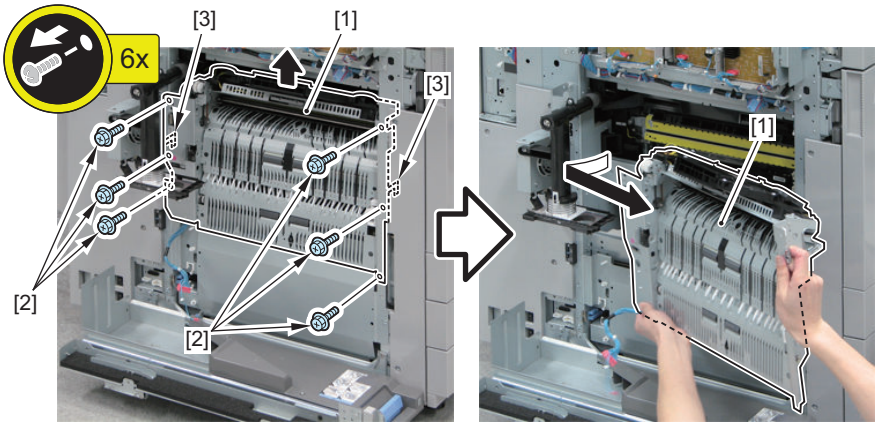
CAUTION:
- When placing the Reverse Unit [1], be sure to do so with the [A] side of the delivery side down.
- Be sure to place the unit on a place where there is a difference in level of the floor (such as an edge of a working table) for not allowing the Fan Duct [2] to contact with the floor to prevent deformation.



3. **Remove the Reverse Unit [1].**
   - 6 Screws [2]
   - 2 Hooks [3]

CAUTION:
Do not hit the Reverse Unit [1] against the Waste Toner Vertical Pipe Unit [4].





Removing the Decurler Unit

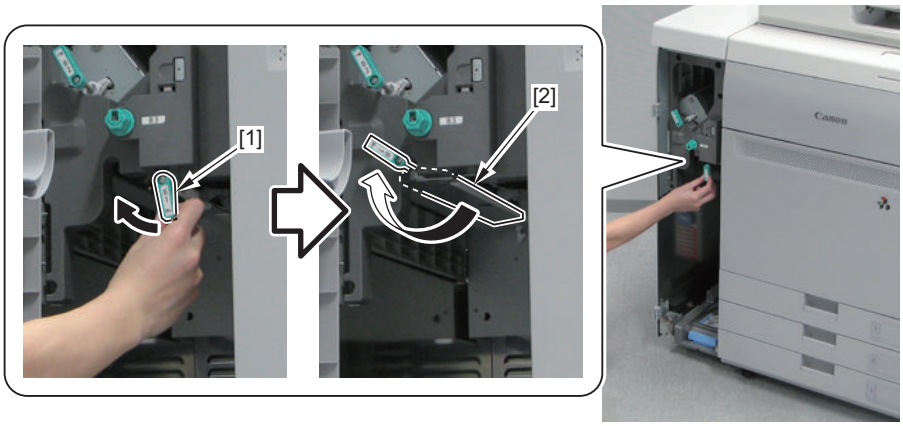
■ Preparation

NOTE:
When removing the Decurler Unit from the host machine, be sure to remove the delivery system options in advance.

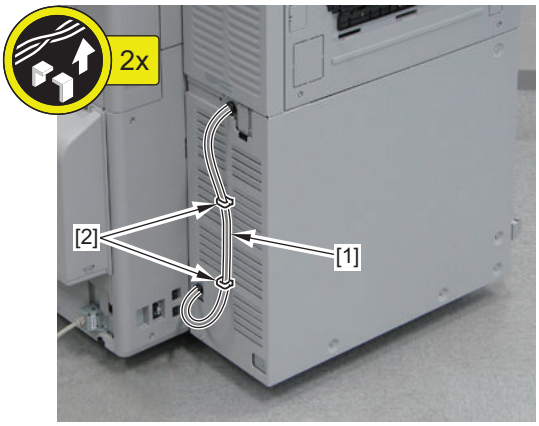
1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**

■ Procedure

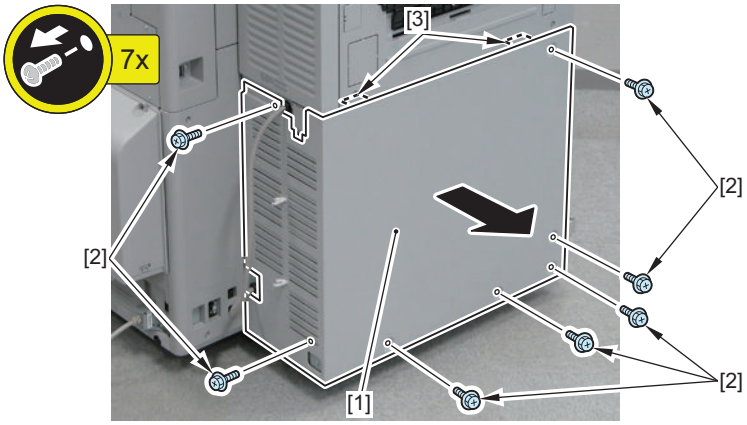
1. **Pull the Open/Close Lever [1], and open the Feed Guide [2].**



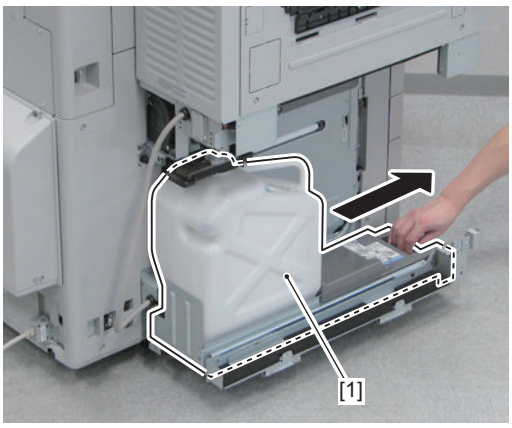
2. **Disconnect the Decurler Cable [1].**
   - 1 Wire Saddle [2]



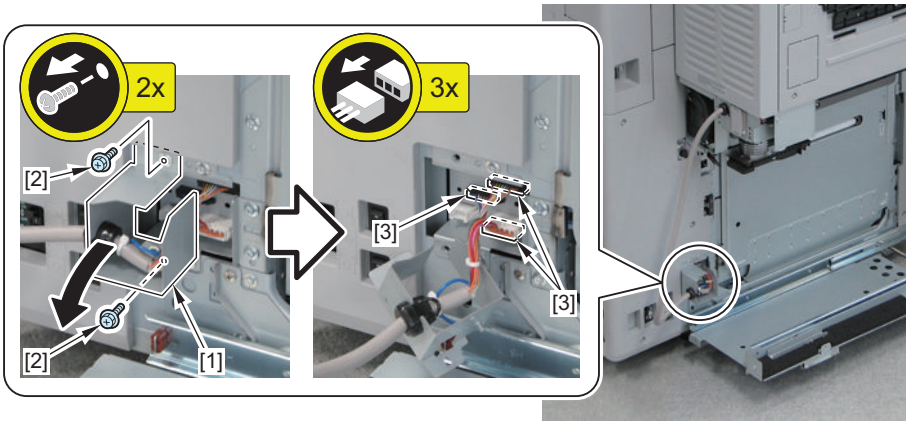
3. **Remove the Left Cover [1].**
   - 7 Screws [2]
   - 2 Protrusions [3]



4. **Pull out the Waste Toner Container Storage Tray [1].**



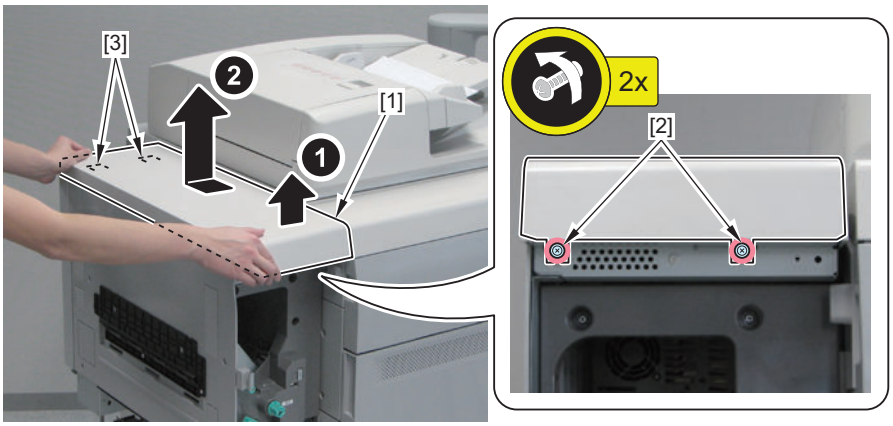
5. **Remove the Connecting Harness Stopping Plate [1].**
   - 2 Screws [2]
   - 3 Connectors [3]



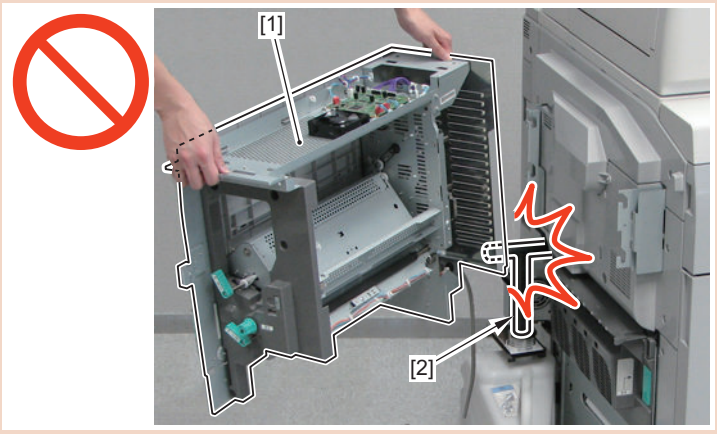
6. **Store the removed Waste Toner Container Storage Tray.**

7. Remove the Decurler Upper Cover [1].

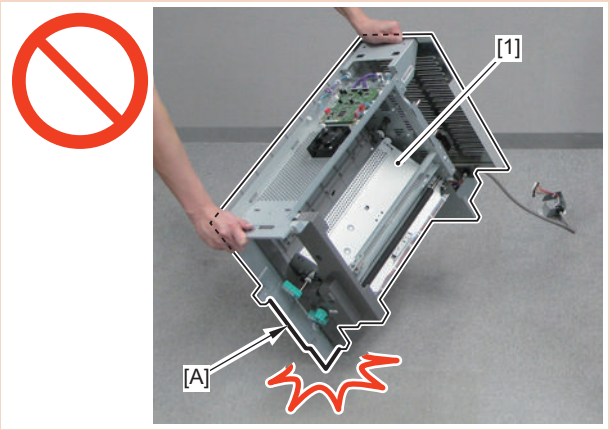
- 2 Screws [2] (Loosen)
- 2 Hooks [3]



CAUTION:
When installing/removing the Decurler Unit, do not hit it against the Waste Toner Pipe [2].

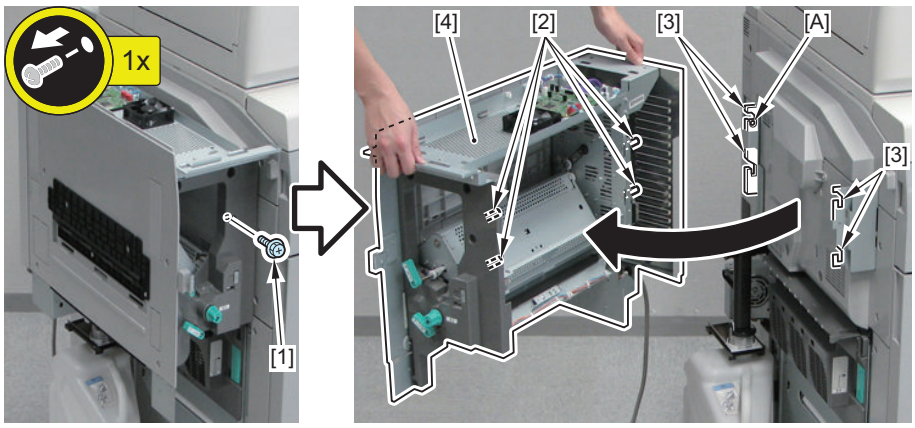


CAUTION:
Do not place the Decurler Unit [1] on the floor while being tilted; otherwise the [A] part may be deformed.

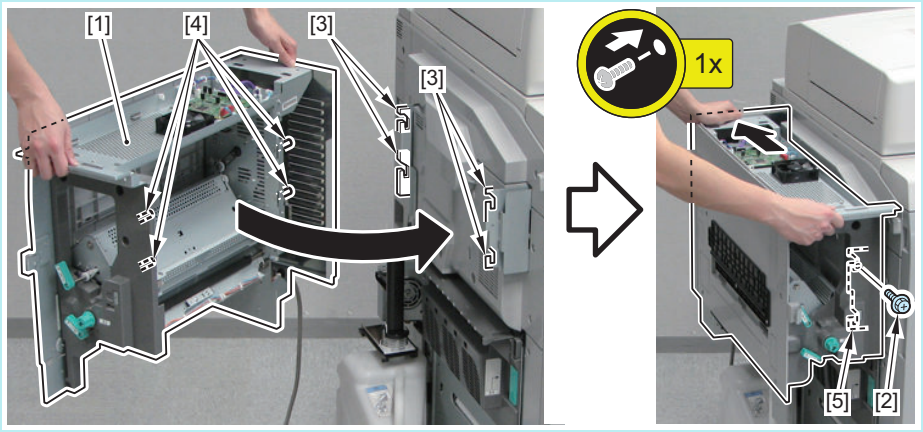


8. Remove the screw [1].

9. **Release the 4 shafts [2] from the hole [A] and the 4 hooks [3], and remove the Decurler Unit [4].**



NOTE:
How to install the Decurler Unit
1. Align the 4 shafts [4] of the Decurler Unit [1] with the 4 hooks [3] of the host machine.
2. Secure the Decurler Unit in place with the screw [2] while it is pushed against the Decurler Mounting Plate (Front) [5].

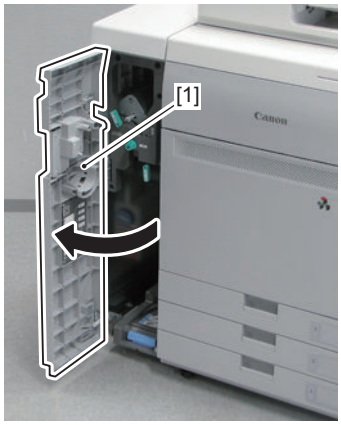


Cleaning the Decurler Unit and Reverse/Delivery Unit

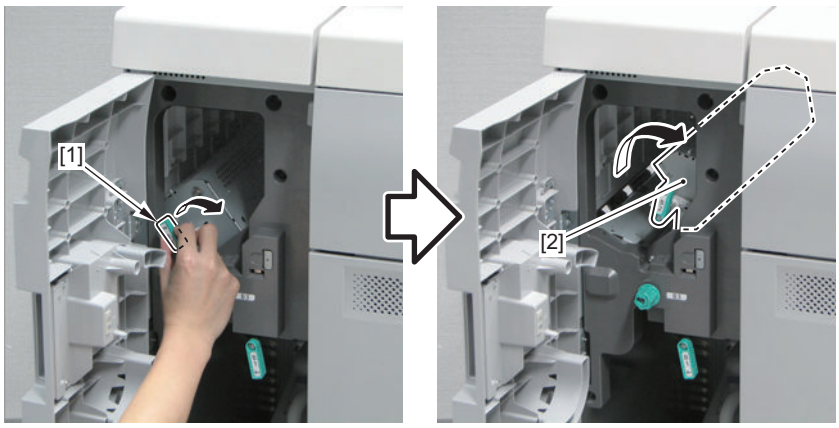
CAUTION:
After cleaning, do not touch the cleaned parts (the guide and rollers).

■ Procedure

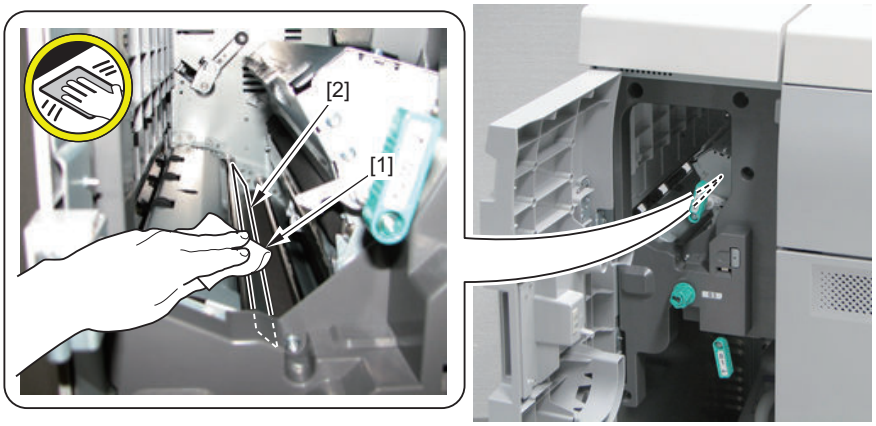
1. **Open the Front Left Cover [1].**



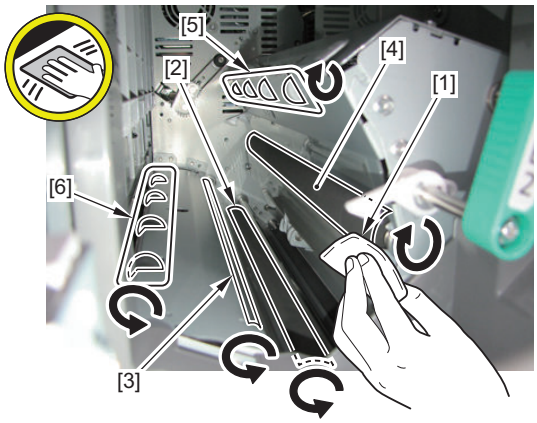
2. **Pull the Open/Close Lever [1], and open the Rotary Frame Unit [2].**



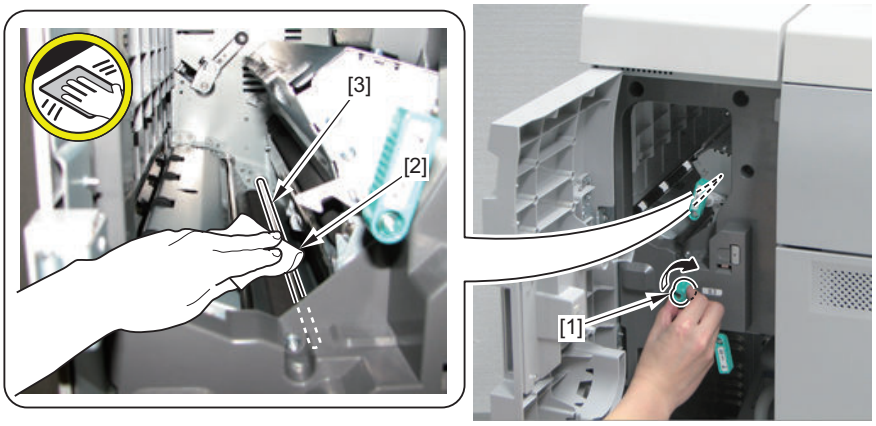
3. **Clean the Decurler Guide [2] with lint-free paper [1] moistened with alcohol.**



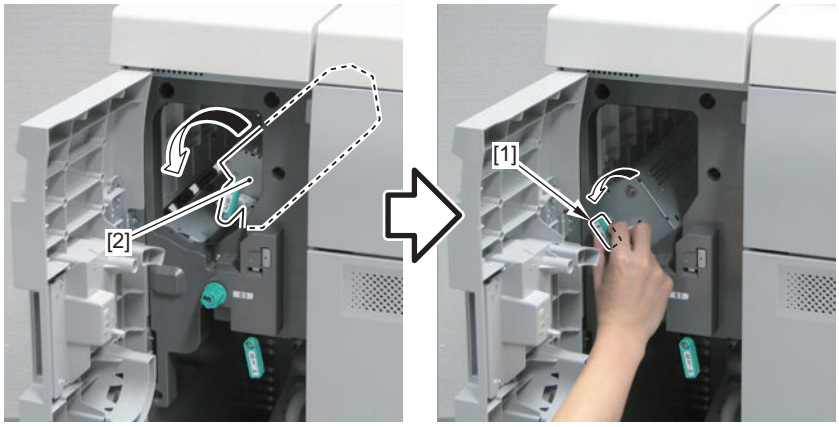
4. **Clean each of the following rollers with lint-free paper [1] moistened with alcohol while rotating the roller by hand.**
   - Decurler Adjustment Roller 2 [2]
   - Decurler Roller 2 [3]
   - Decurler Adjustment Roller 1 [4]
   - Buffer Feeding Roller 2 Slave Roller [5]
   - Buffer Feeding Roller 2 [6]



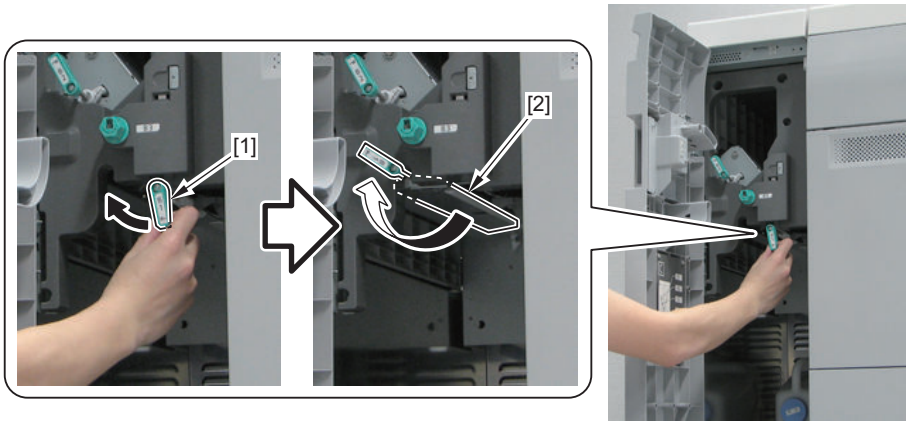
5. **While rotating the knob [1], clean the Decurler Roller 1 [3] with lint-free paper [2] moistened with alcohol.**



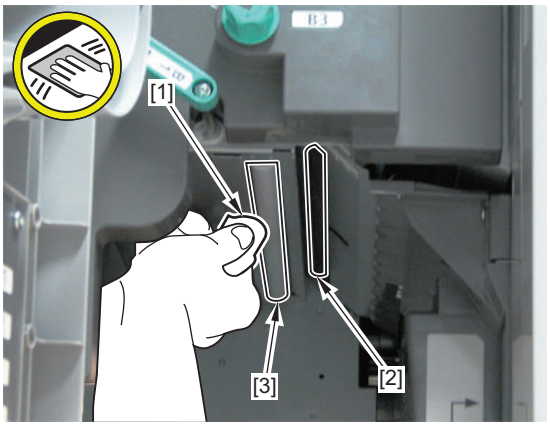
6. **Holding the Open/Close Lever [1], close the Rotary Frame Unit [2].**



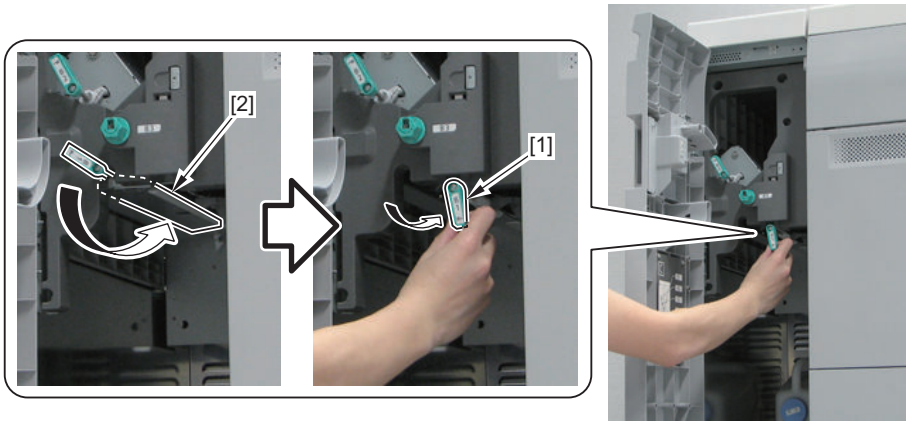
7. **Pull the Open/Close Lever [1], and open the Feed Guide [2].**



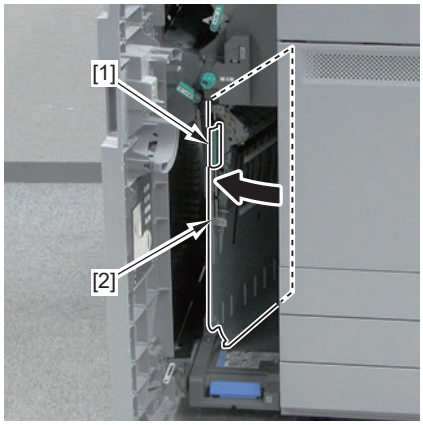
8. **Clean each of the following rollers with lint-free paper [1] moistened with alcohol while rotating the roller by hand.**
   - Decurler Inlet Roller [2]
   - Decurler Inlet Roller Slave Roller [3]



9. **Holding the Open/Close Lever [1], close the Feed Guide [2].**

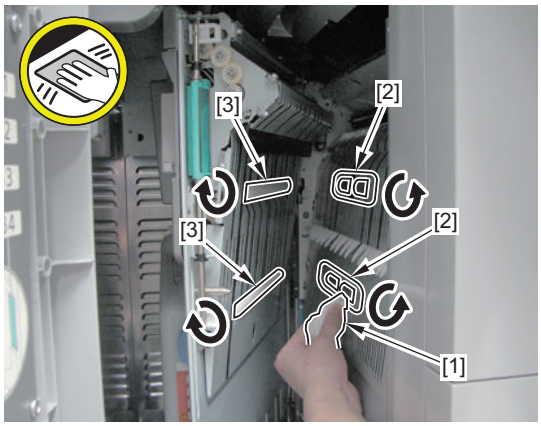


10. **Pull the Lock Lever [1] to open the Delivery Unit [2].**

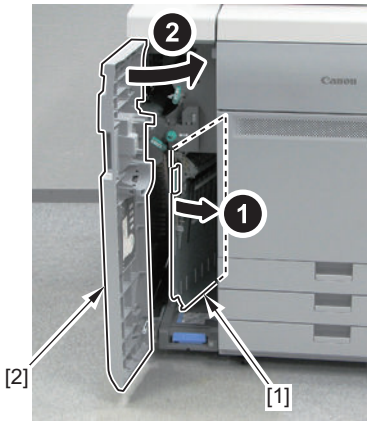


11. Clean each of the following rollers with lint-free paper [1] moistened with alcohol while rotating the roller by hand.

- 2 Feed Rollers [2]
- 2 Feed Roller Slave Rollers [3]



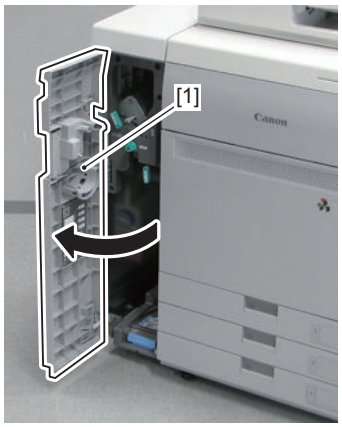
12. Close the Delivery Unit [1] and the Front Left Cover [2].



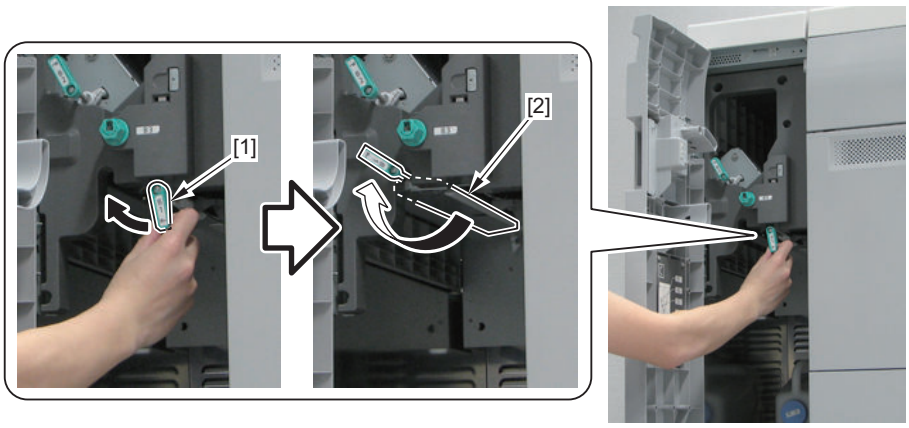
Cleaning the Decurler Sensor 1

■ Procedure

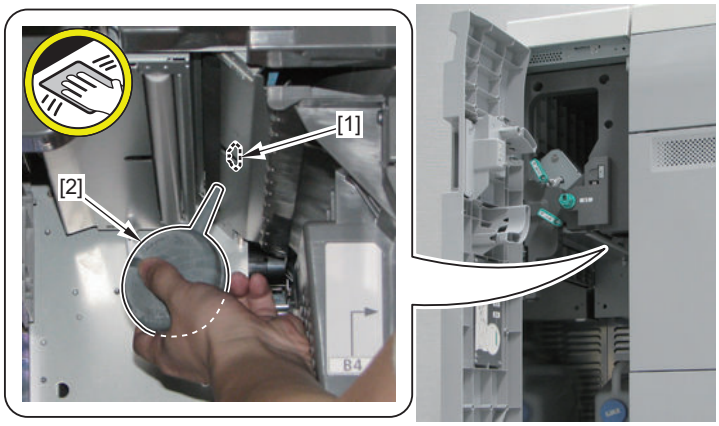
1. Open the Front Left Cover [1].



2. **Pull the Open/Close Lever [1], and open the Feed Guide [2].**



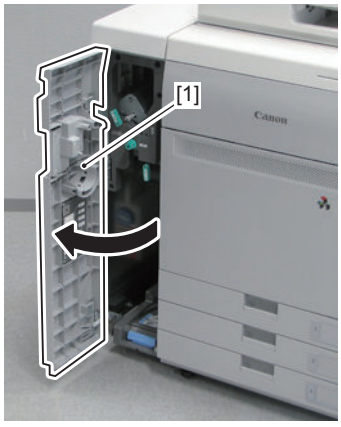
3. **Clean the Decurler Sensor 1 [1] with a blower [2].**



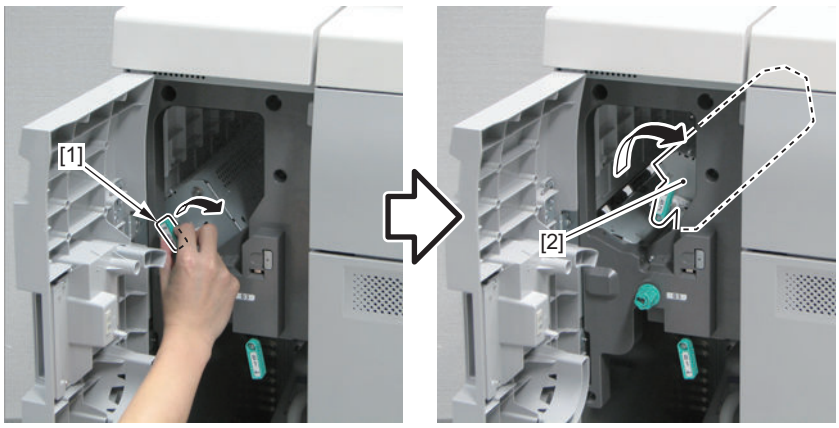
Cleaning the Decurler Sensor 2

■ Procedure

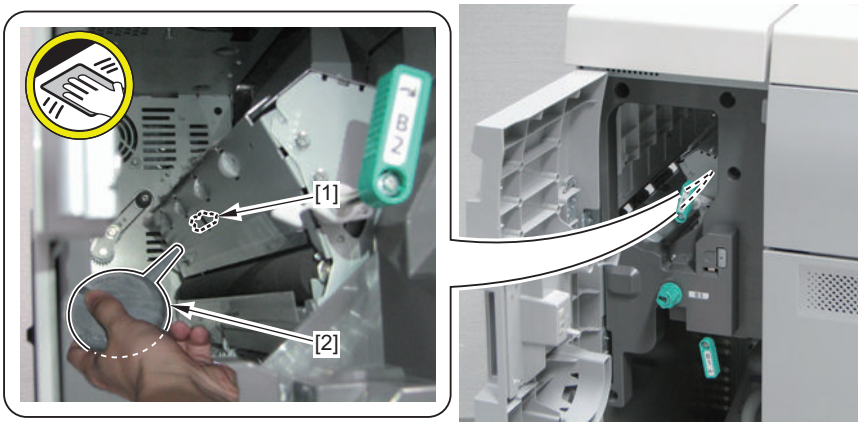
1. **Open the Front Left Cover [1].**



2. **Pull the Open/Close Lever [1], and open the Rotary Frame Unit [2].**



3. **Clean the Decurler Sensor 2 [1] with a blower [2].**



Removing the Rotary Frame Unit

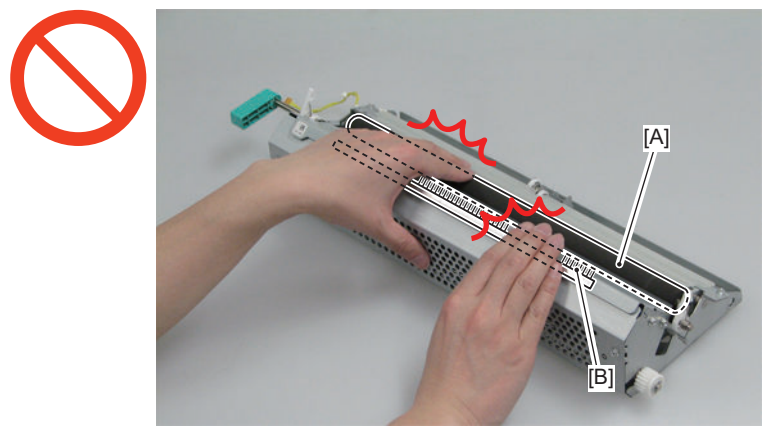
■ Preparation

NOTE:
When delivery system options are installed, be sure to disconnect them from the host machine in advance.

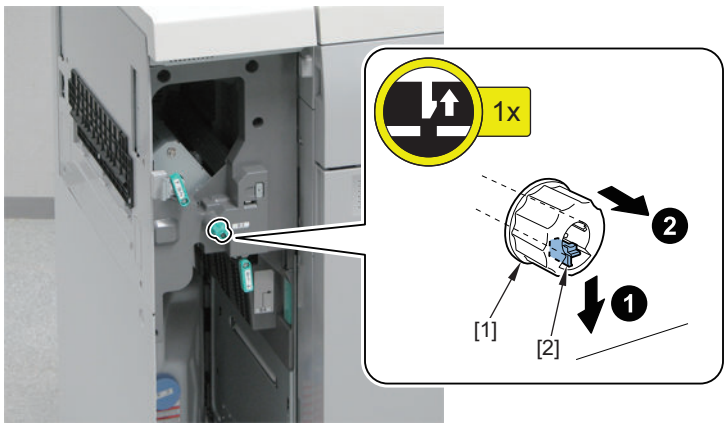
1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**

■ Procedure

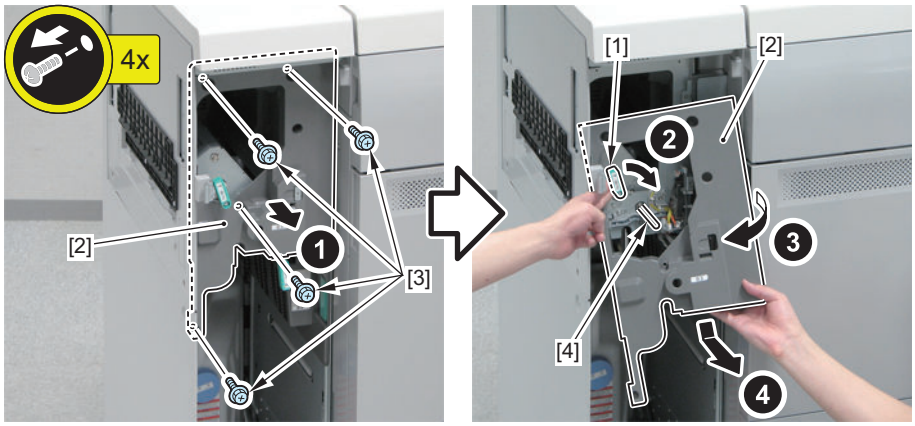
CAUTION:
Do not touch the surface [A] of the Decurler Adjustment Roller 1 and the [B] part of the Static Eliminator when disassembling/assembling.



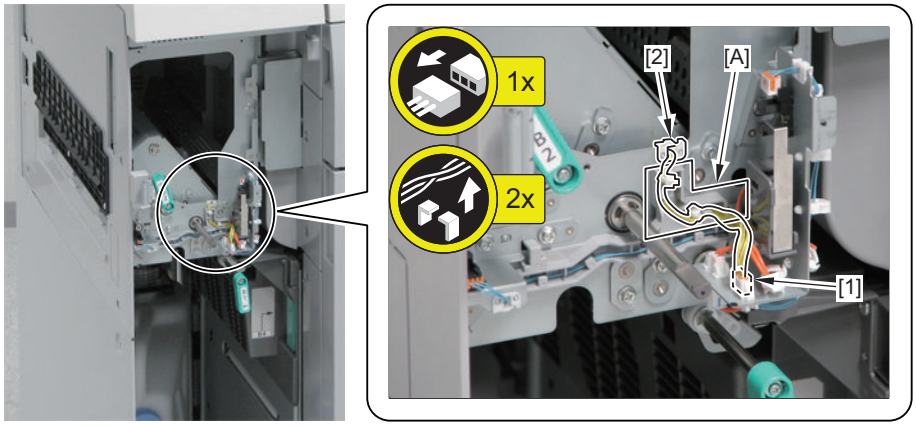
1. **Remove the knob [1].**
   - 1 Claw [2]



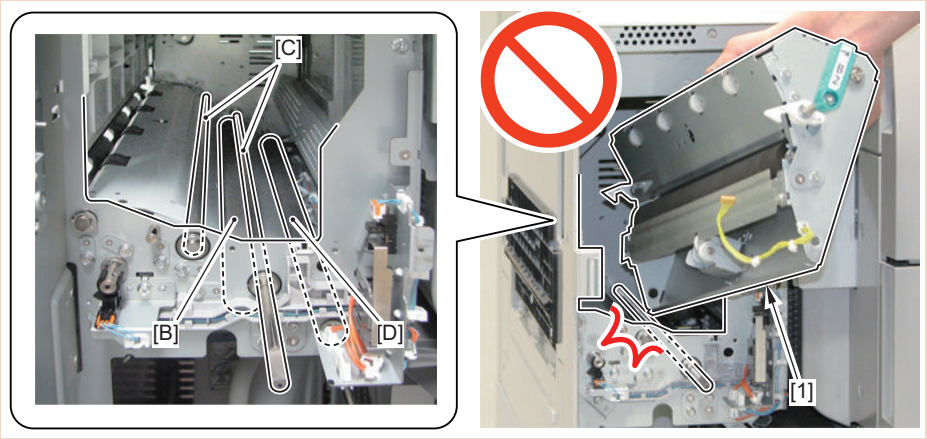
2. **Remove the Decurler Inner Cover [2] while avoiding contact with the Open/Close Lever [1].**
   - 4 Screws [3]
   - 1 Shaft [4]



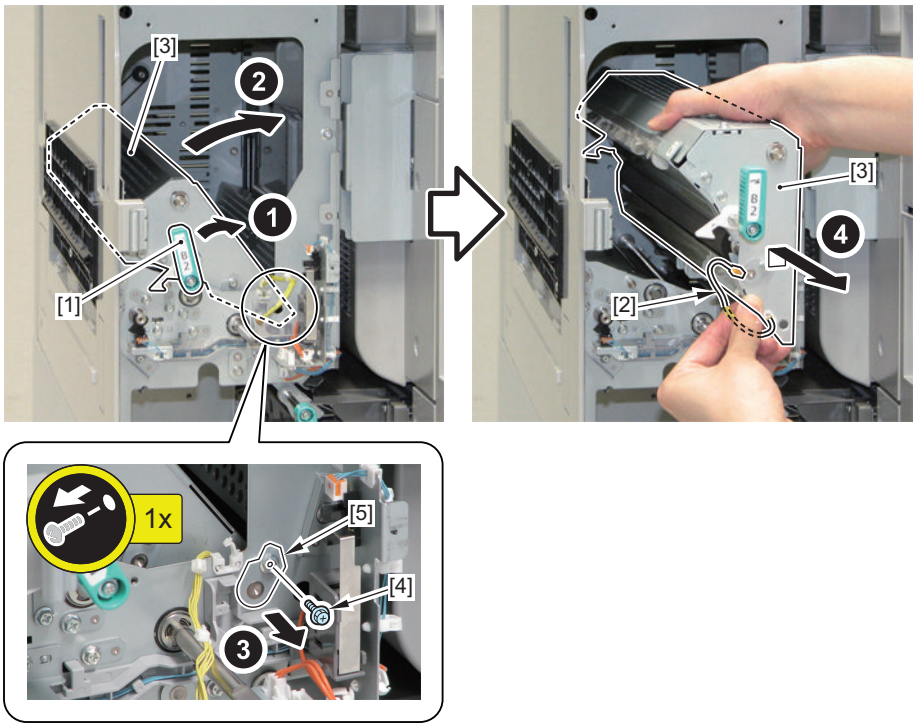
3. **Disconnect the connector [1].**
   - 1 Harness Guide [A]
   - 1 Edge Saddle [2]



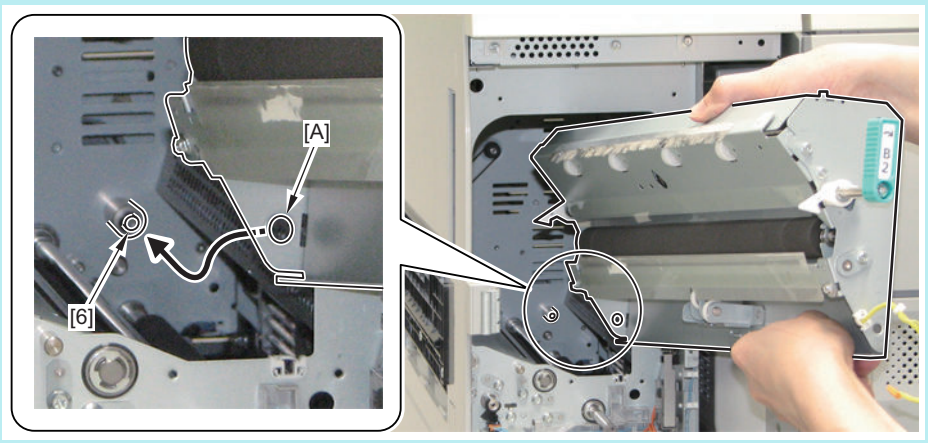
CAUTION:
When installing/removing the Rotary Frame Unit [1], do not hit it against the 1 area on the Sponge Roller surface [B], the 2 areas on the Decurler Roller surface [C] and the 1 area on the Feed Roller surface [D] on the Decurler Unit side.



4. **Pull the Open/Close Lever [1], and remove the Rotary Frame Unit [3] while holding the harness [2].**
   - 1 Screw [4]
   - 1 Fixation Pin [5]



NOTE:
How to install the Rotary Frame Unit
Be sure to fit the hole [A] on the Rotary Frame Unit to the Positioning Pin [6] on the host machine to install the unit.



Removing the Outlet Guide Unit (Upper)

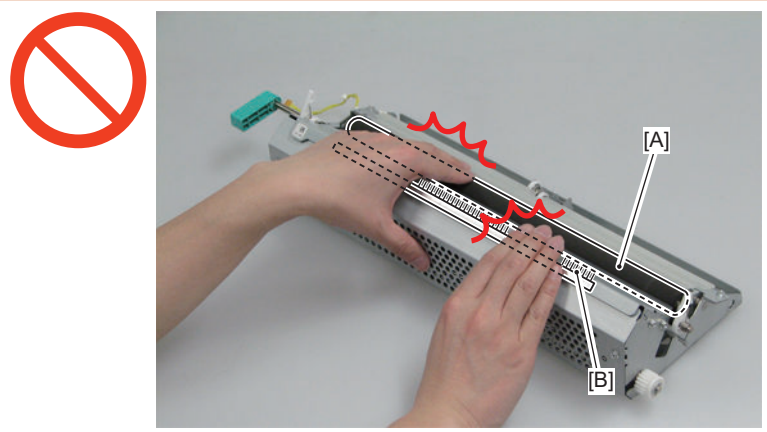
■ Preparation

1. **Removing the Front Left Cover**"Removing the Front Left Cover" on page 949

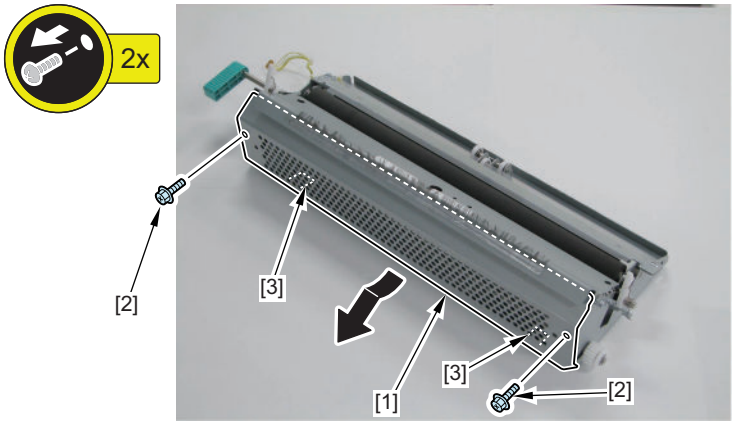
2. **Removing the Rotary Frame Unit****"Removing the Rotary Frame Unit" on page 920**

■ Procedure

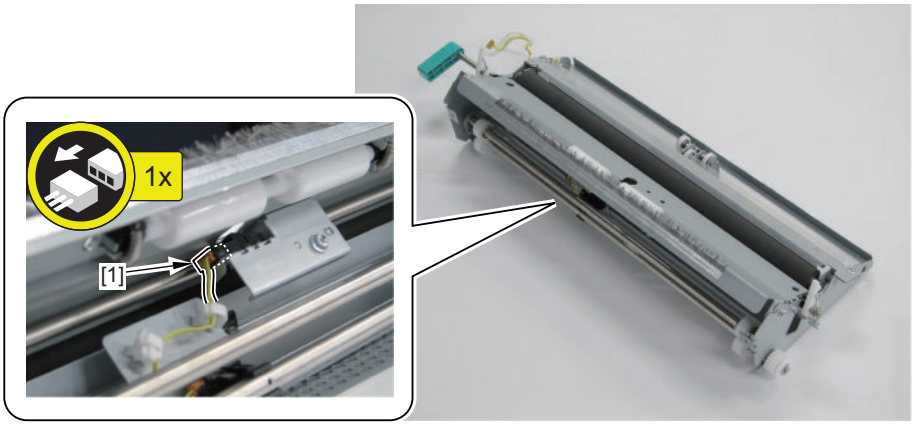
CAUTION:
Do not touch the surface [A] of the Decurler Adjustment Roller 1 and the [B] part of the Static Eliminator when disassembling/assembling.



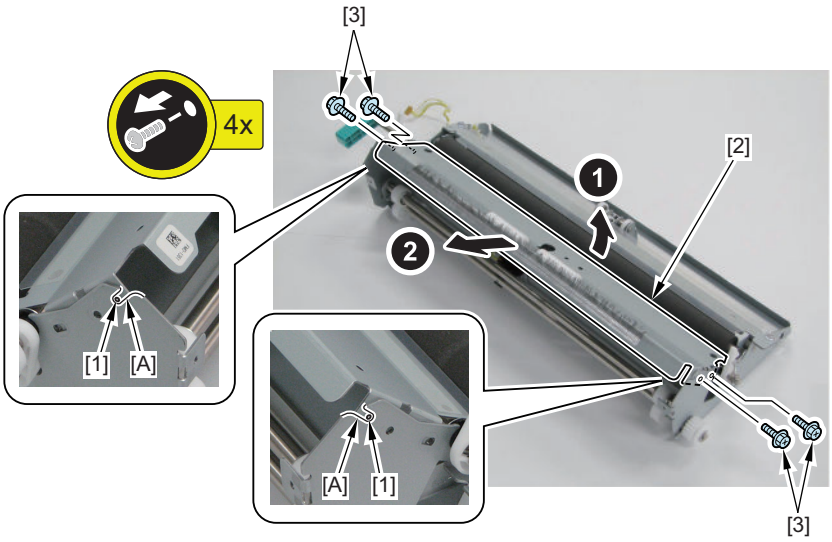
1. **Remove the Guide Cover [1].**
   - 2 Screws [2]
   - 2 Protrusions [3]



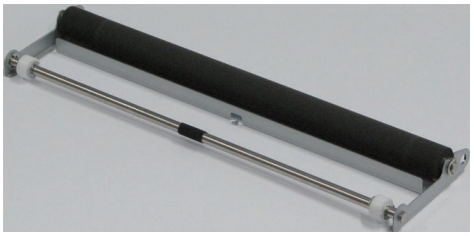
2. **Disconnect the connector [1].**



3. **Slide the 2 bosses [1] from the groove [A], and remove the Outlet Guide Unit (Upper) [2].**
   - 4 Screws [3]



Removing the Decurler Adjustment Roller 1 Support Plate Unit

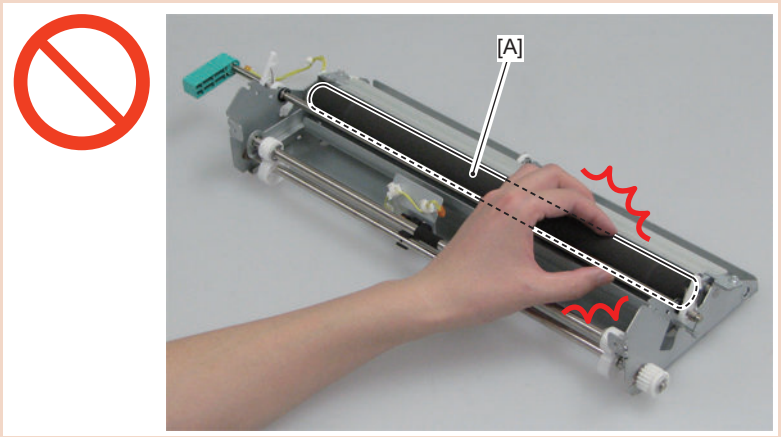


■ Preparation

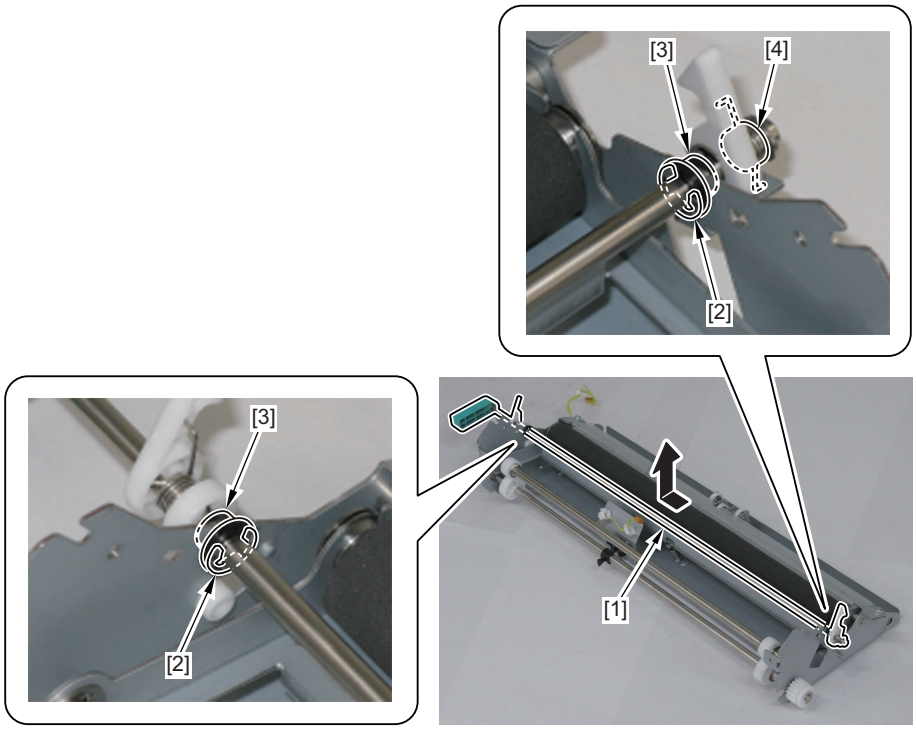
1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**
2. **Removing the Rotary Frame Unit****"Removing the Rotary Frame Unit" on page 920**
3. **Removing the Outlet Guide Unit (Upper)****"Removing the Outlet Guide Unit (Upper)" on page 923**

■ Procedure

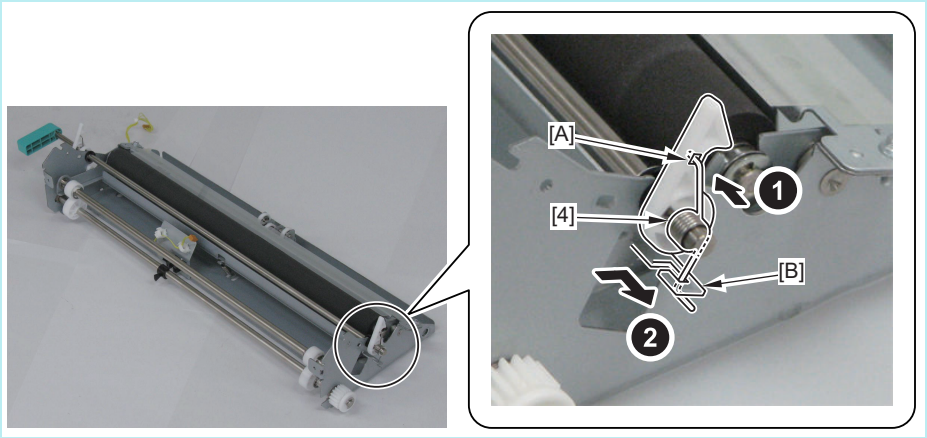
CAUTION:
Be sure not to touch the surface [A] of the Decurler Adjustment Roller 1 when disassembling/assembling.



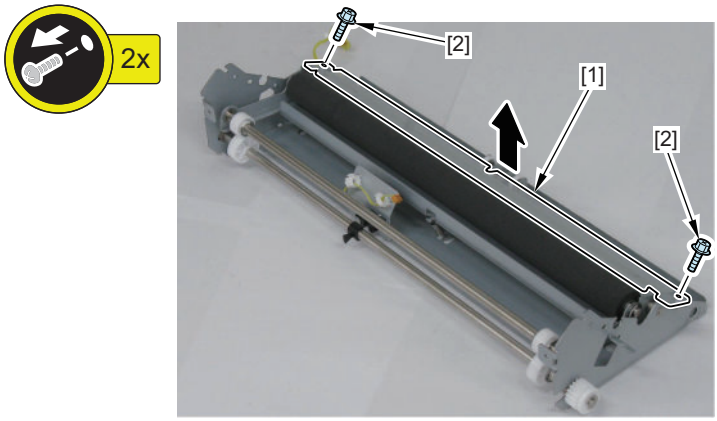
1. **Remove the Open/Close Lever Shaft [1].**
   - 2 E-rings [2]
   - 2 Bushings [3]
   - 1 Spring [4]



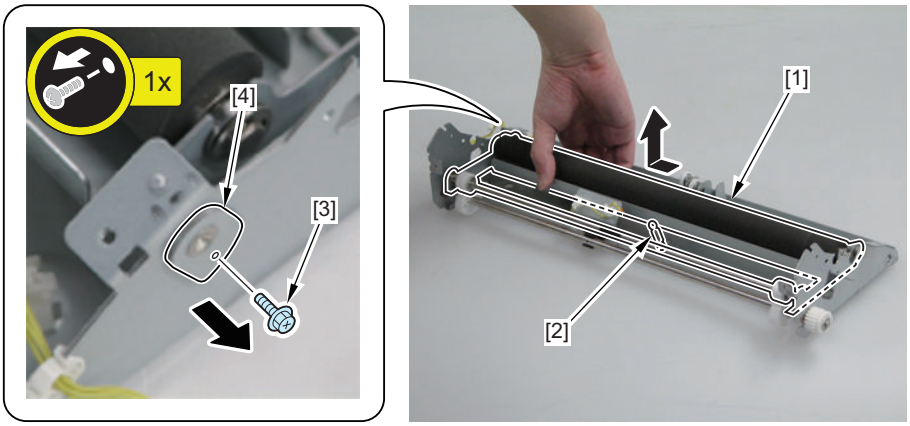
NOTE:
How to hook the spring [4]
Hook the 2 ends of the spring [4] to the hole [A] and the hook [B] on the Support Plate to install the spring.



2. **Remove the Short Guide (Upper) [1].**
   - 2 Screws [2]



3. **Remove the Decurler Adjustment Roller 1 Support Plate Unit [1].**
   - 1 Tension Spring [2]
   - 1 Screw [3]
   - 1 Fixation Pin [4]



Removing the Decurler Adjustment Roller 1

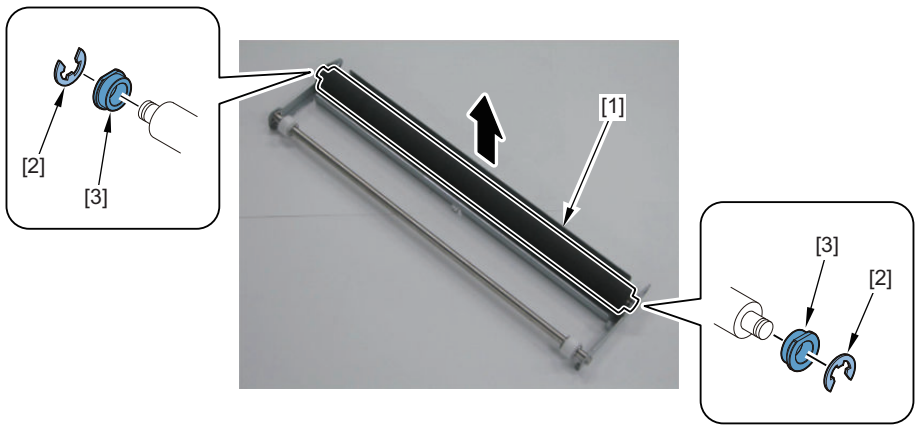
■ Preparation

1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**
2. **Removing the Rotary Frame Unit****"Removing the Rotary Frame Unit" on page 920**
3. **Removing the Outlet Guide Unit (Upper)****"Removing the Outlet Guide Unit (Upper)" on page 923**
4. **Removing the Decurler Adjustment Roller 1 Support Plate Unit****"Removing the Decurler Adjustment Roller 1 Support Plate Unit" on page 925**

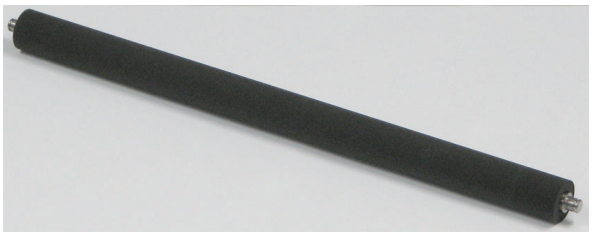
■ Procedure

1. **Remove the Decurler Adjustment Roller 1 [1].**
   - 2 E-rings [2]
   - 2 Bearings [3]

CAUTION:
Do not touch the surface of the Decurler Adjustment Roller 1 [1].



Removing the Decurler Adjustment Roller 2

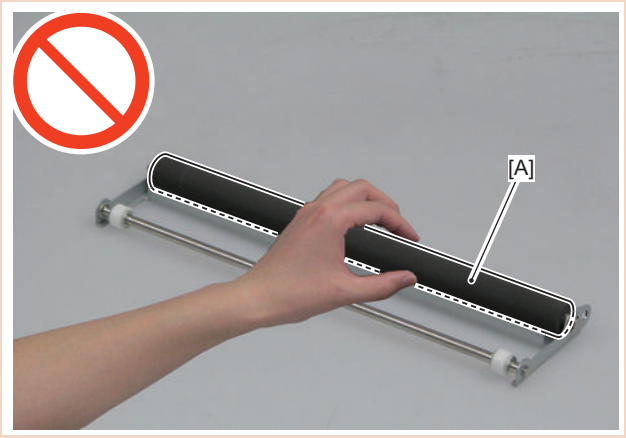


■ Preparation

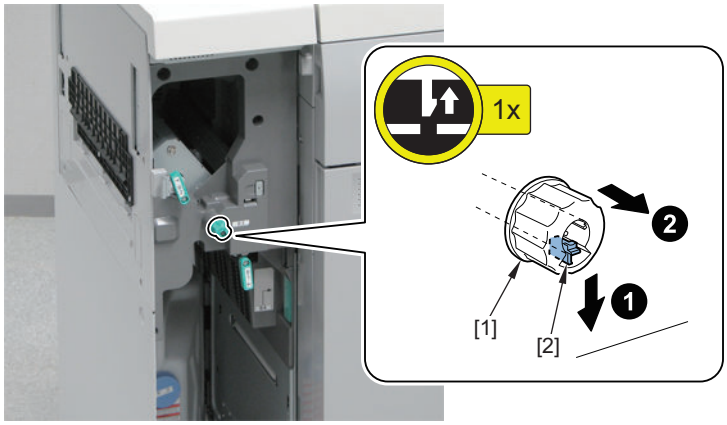
1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**

■ Procedure

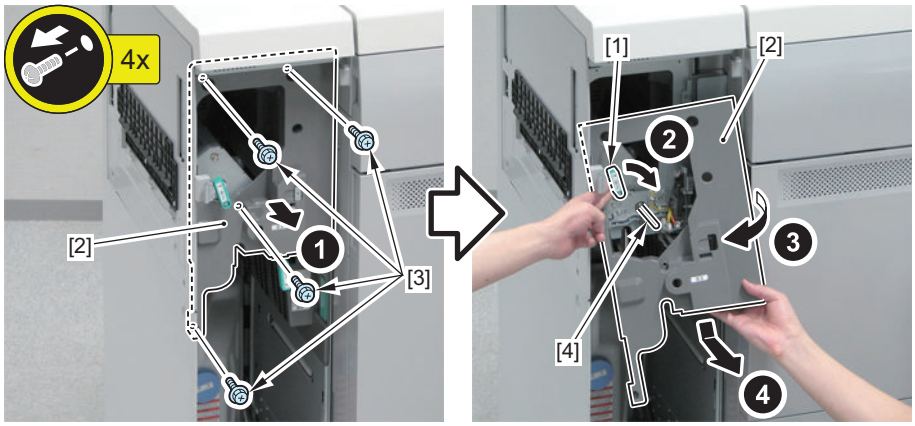
CAUTION:
Be sure not to touch the surface [A] of the Decurler Adjustment Roller 2 when disassembling/assembling.



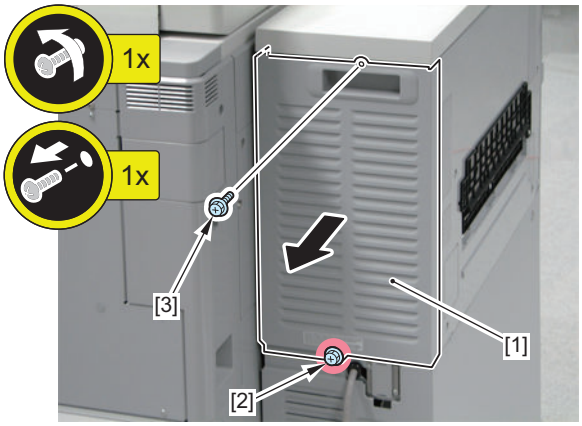
1. **Remove the knob [1].**
   - 1 Claw [2]



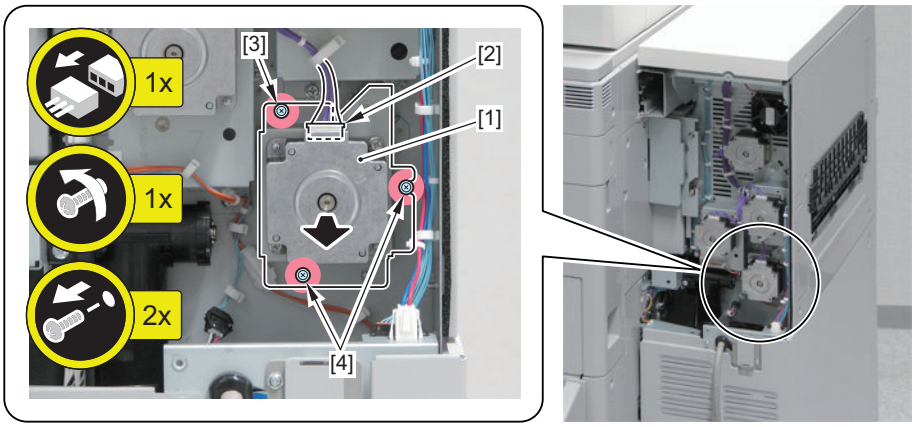
2. **Remove the Decurler Inner Cover [2] while avoiding contact with the Open/Close Lever [1].**
   - 4 Screws [3]
   - 1 Shaft [4]



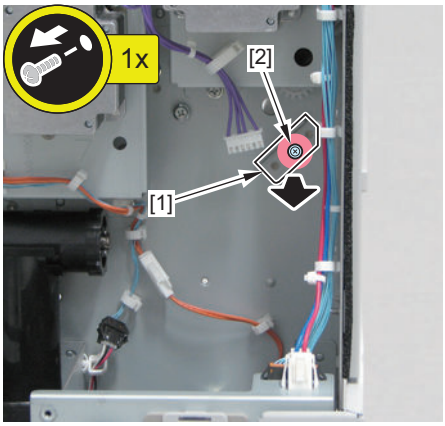
3. **Remove the Decurler Rear Cover [1].**
   - 1 Screw [2] (to loosen)
   - 1 Screw [3] (to remove)



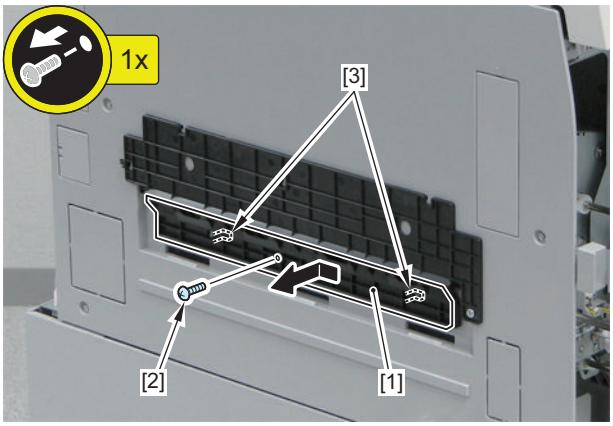
4. **Remove the Decurler Compression Distance Adjustment Motor 1 [1].**
   - 1 Connector [2]
   - 1 Screw [3] (to loosen)
   - 2 Screws [4] (to be removed)



5. **Remove the Fixation Pin [1].**
   - 1 Screw [2]

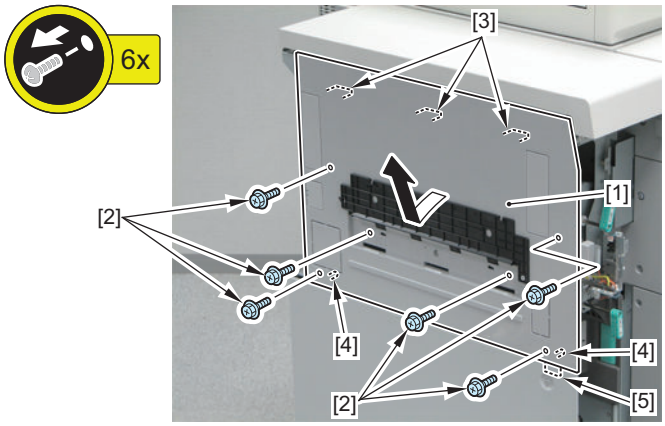


6. **Remove the Finisher Guide (Lower) [1].**
   - 1 Screw [2]
   - 2 Hooks [3]

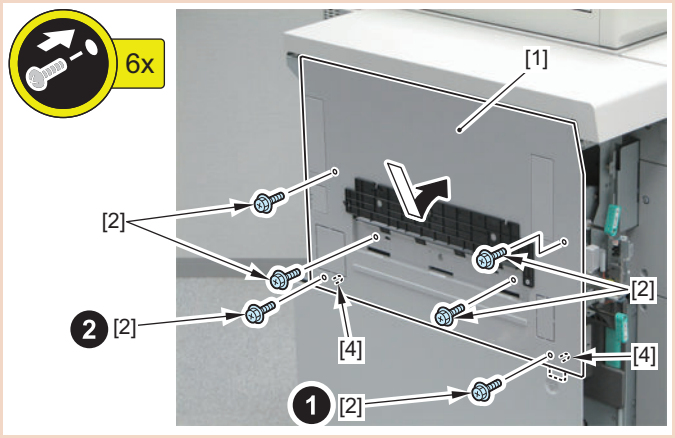


7. Remove the Left Upper Cover [1].

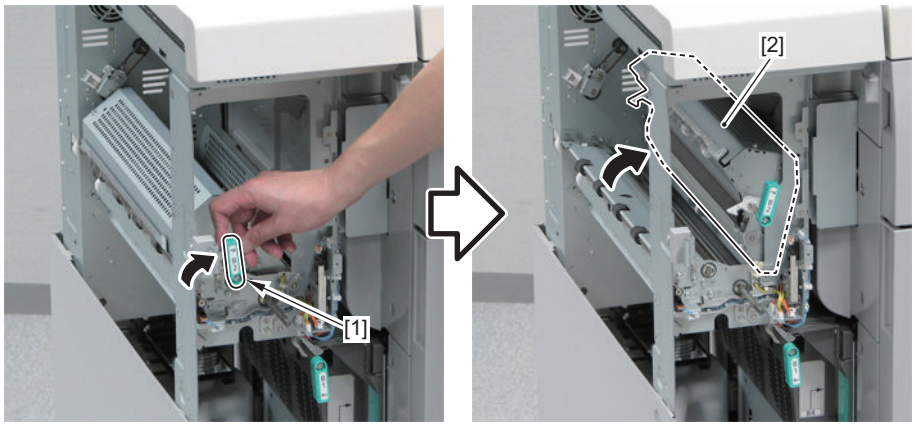
- 6 Screws [2]
- 3 Protrusions [3]
- 2 Bosses [4]
- 1 Hook [5]



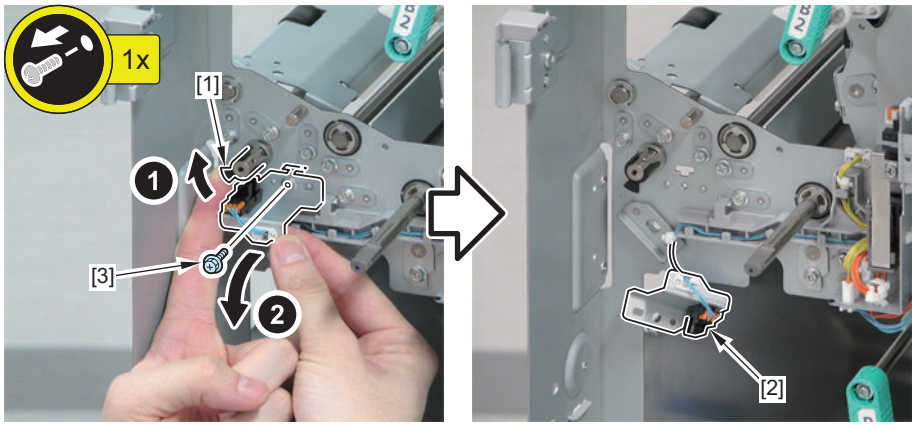
CAUTION:
When installing the Left Upper Cover [1], be sure to install the 2 out of 6 screws [2] in the following order. (There is not installation order for other 4 screws.) Otherwise, there is a possibility that the cover is installed while the 2 bosses [4] of the cover are not fit in the holes on the Decurler Unit.



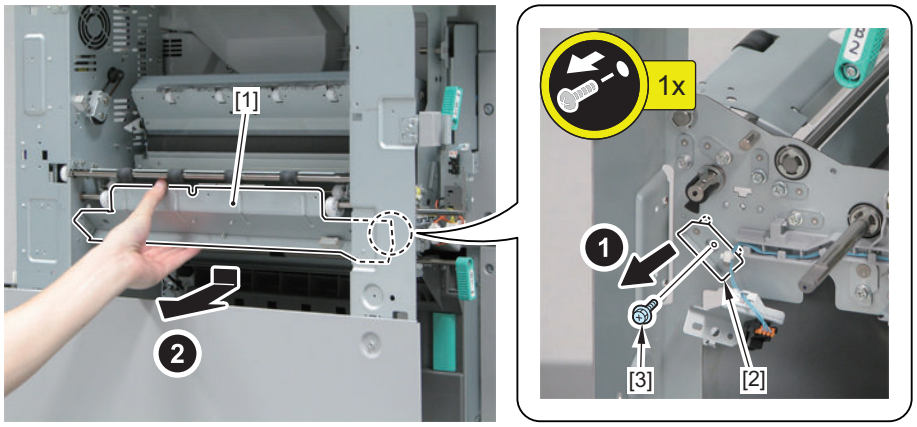
8. Pull the Open/Close Lever [1], and open the Rotary Frame Unit [2].



9. **Remove the Sensor Support Plate [2] while avoiding contact with the Sensor Flag [1].**
   - 1 Screw [3]

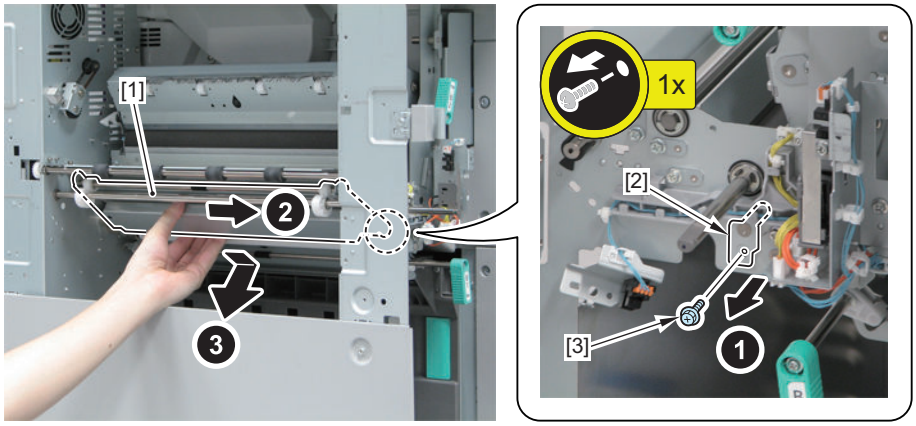


10. **While supporting the stay [1], remove the Fixation Pin [2] and then remove the Stay [1].**
    - 1 Screw [3]



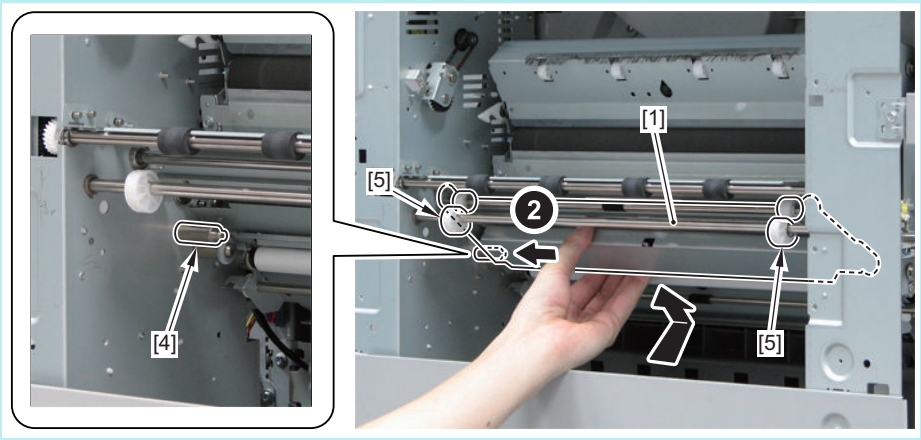
11. While supporting the Decurler Adjustment Roller 2 Support Plate Unit [1], remove the Fixation Pin [2] and then remove the unit [1].

- 1 Screw [3]



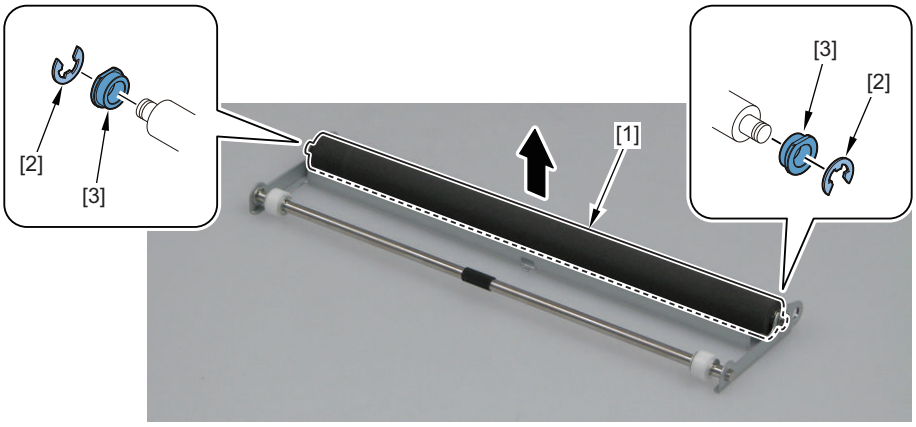
NOTE:
How to install the Decurler Adjustment Roller 2 Support Plate Unit

- Install the Decurler Adjustment Roller 2 Support Plate Unit [1] by inserting it into the pin on the rear side of the Decurler Unit.
- When installing the Decurler Adjustment Roller 2 Support Plate Unit [1], be sure to place the unit at the upper side of the 2 cams [5] of the Decurler Unit.



12. Remove the Decurler Adjustment Roller 2 [1].

- 2 E-rings [2]
- 2 Shaft Supports [3]



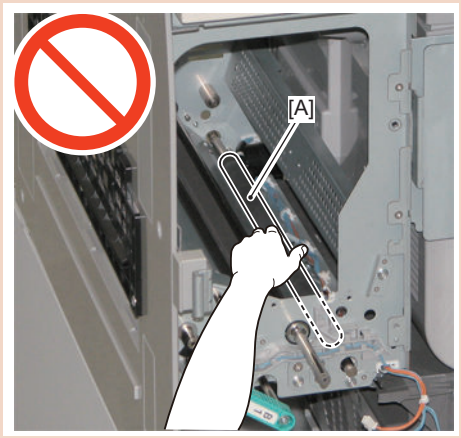
Removing the Decurler Inlet Roller

■ Preparation

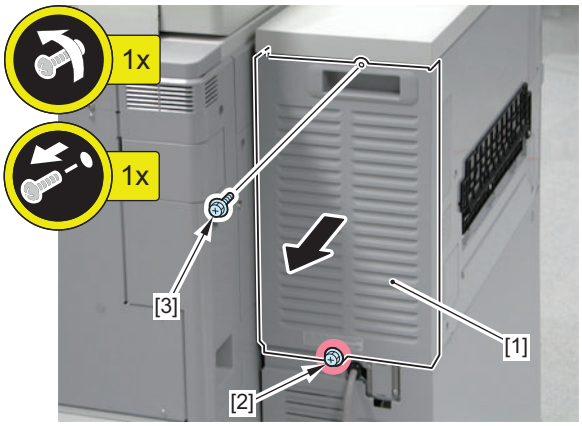
1. **Removing the Front Left Cover**"Removing the Front Left Cover" on page 949
2. **Removing the Rotary Frame Unit**"Removing the Rotary Frame Unit" on page 920

■ Procedure

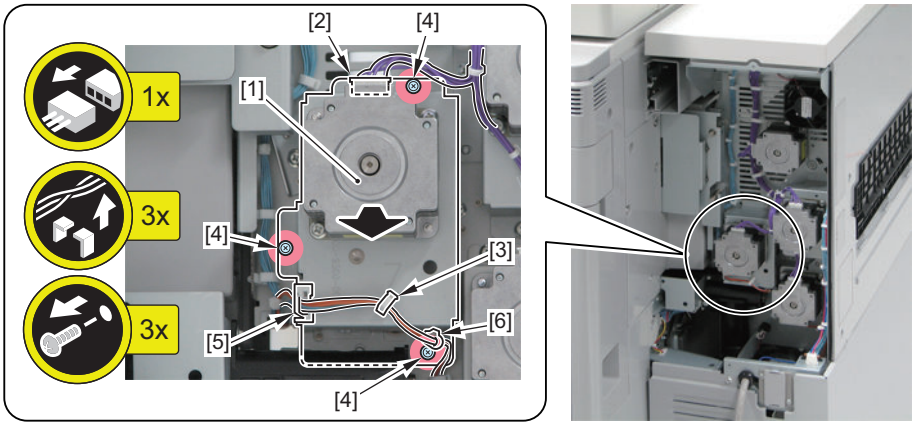
CAUTION:
Be sure not to touch the surface [A] of the Decurler Inlet Roller when disassembling/assembling.



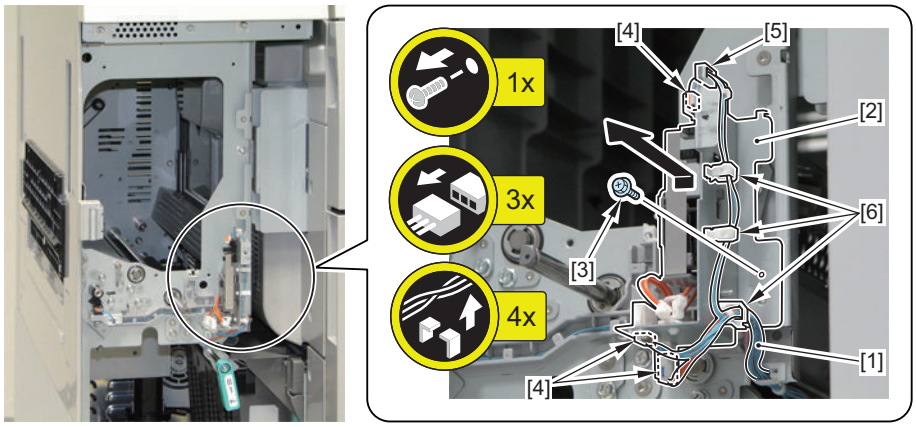
1. **Remove the Decurler Rear Cover [1].**
   - 1 Screw [2] (to loosen)
   - 1 Screw [3] (to remove)



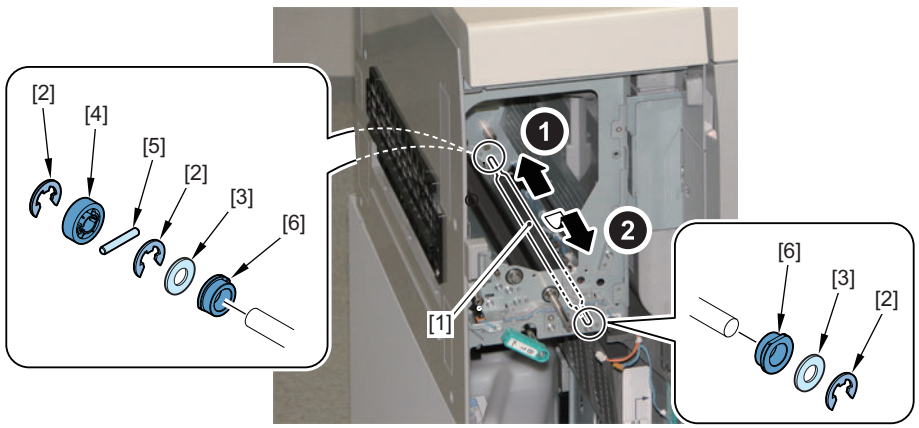
2. **Remove the Decurler Feed Motor [1].**
   - 1 Connector [2]
   - 1 Wire Saddle [3]
   - 3 Screws [4]
   - 1 Edge Saddle [5]
   - 1 Reuse Band [6]



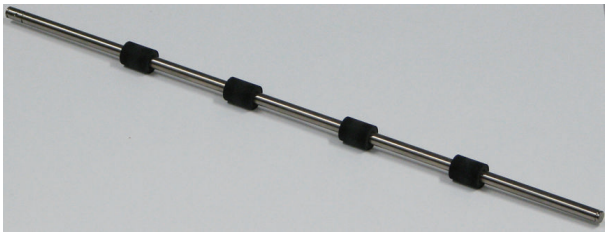
3. **Free the harness [1], and remove the Door Sensor Support Plate [2].**
   - 1 Screw [3]
   - 3 Connectors [4]
   - 1 Edge Saddle [5]
   - 3 Wire Saddles [6]



4. **Remove the Decurler Inlet Roller [1].**
   - 3 E-rings [2]
   - 2 Washers [3]
   - 1 Gear [4]
   - 1 Parallel Pin [5]
   - 2 Shaft Supports [6]



Removing the Buffer Feeding Roller 2

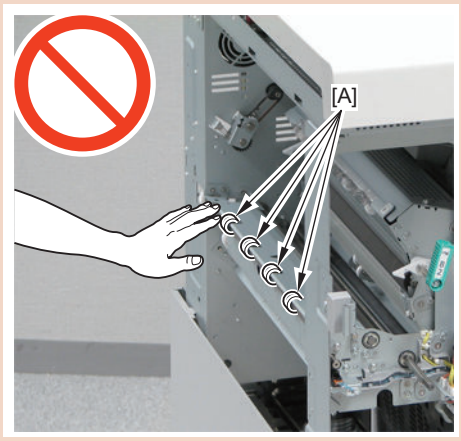


■ Preparation

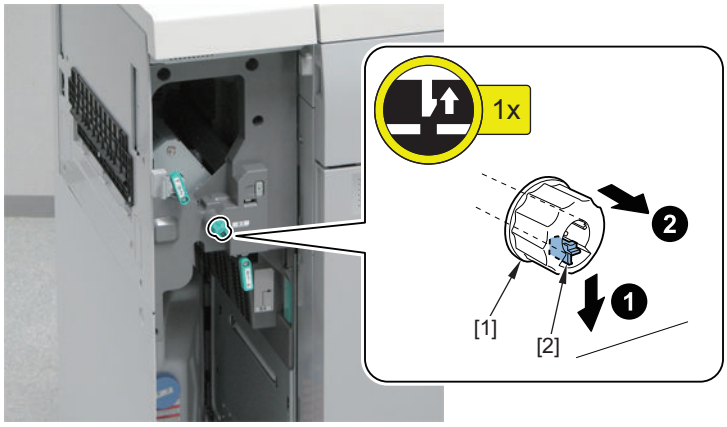
1. **Removing the Front Left Cover**"Removing the Front Left Cover" on page 949

■ Procedure

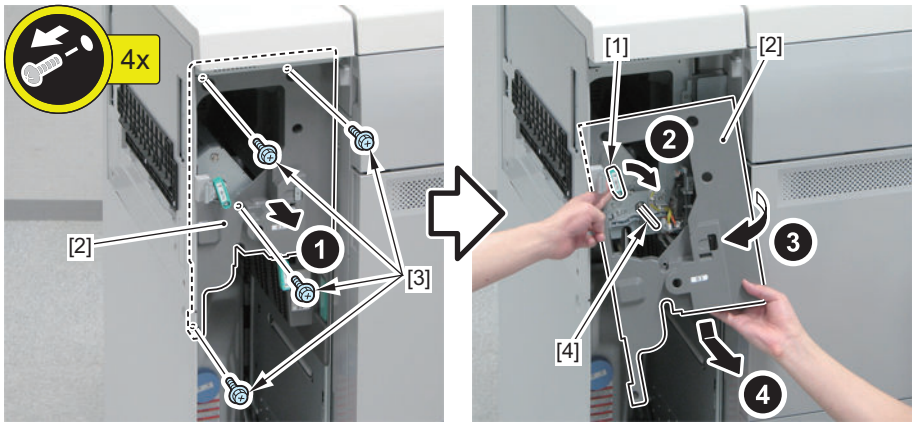
CAUTION:
Be sure not to touch the surface [A] of the Buffer Feeding Roller 2 when disassembling/assembling.



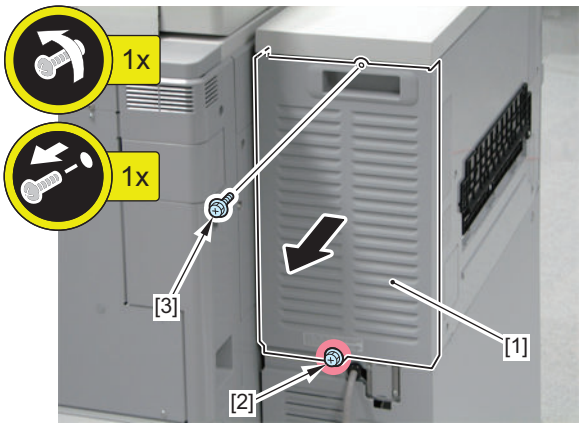
1. **Remove the knob [1].**
   - 1 Claw [2]



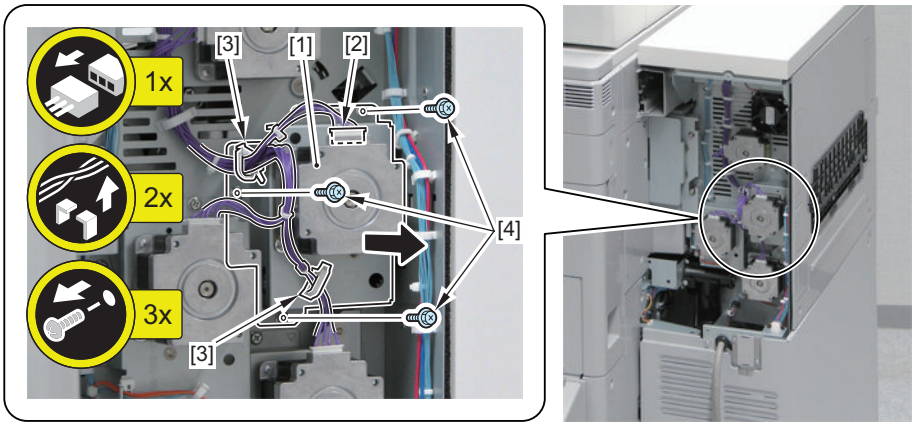
2. **Remove the Decurler Inner Cover [2] while avoiding contact with the Open/Close Lever [1].**
   - 4 Screws [3]
   - 1 Shaft [4]



3. **Remove the Decurler Rear Cover [1].**
   - 1 Screw [2] (to loosen)
   - 1 Screw [3] (to remove)

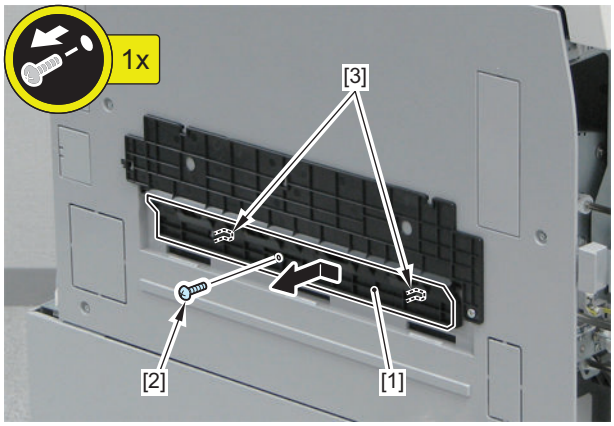


4. **Remove the Decurler Compression Distance Adjustment Motor 2 [1].**
   - 1 Connector [2]
   - 2 Wire Saddles [3]
   - 3 Screws [4]



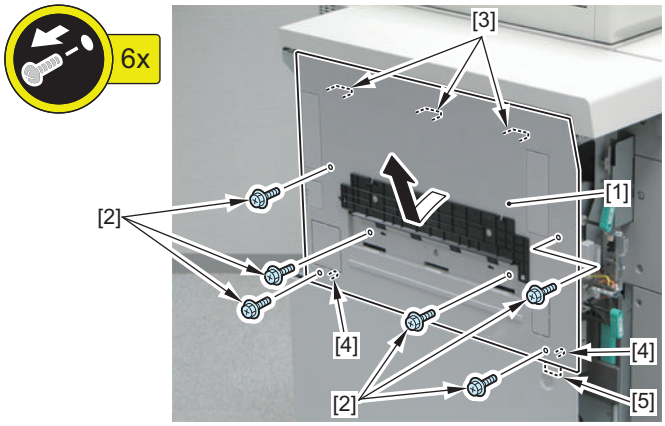
5. Remove the Finisher Guide (Lower) [1].

- 1 Screw [2]
- 2 Hooks [3]

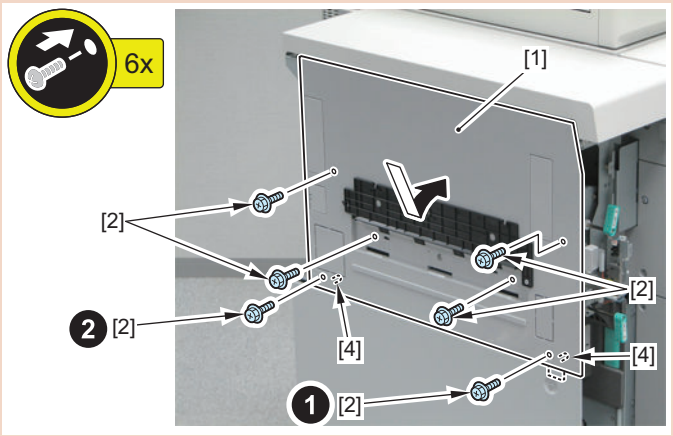


6. Remove the Left Upper Cover [1].

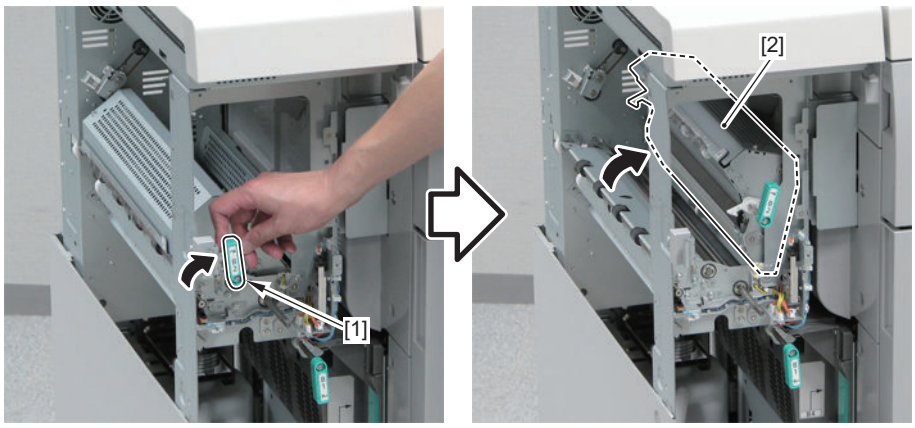
- 6 Screws [2]
- 3 Protrusions [3]
- 2 Bosses [4]
- 1 Hook [5]



CAUTION:
When installing the Left Upper Cover [1], be sure to install the 2 out of 7 screws [2] in the following order. (There is not installation order for other 5 screws.) Otherwise, there is a possibility that the cover is installed while the 2 bosses [4] of the cover are not fit in the holes on the Decurler Unit.

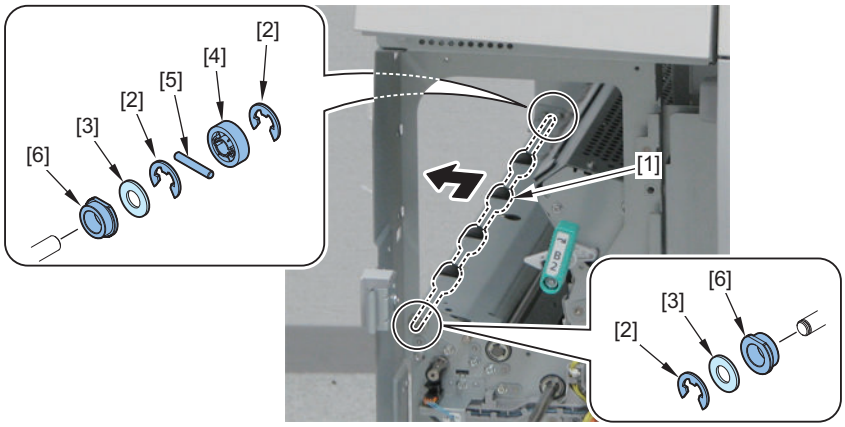


7. **Pull the Open/Close Lever [1], and open the Rotary Frame Unit [2].**



8. **Remove the Buffer Feeding Roller 2 [1].**
   - 3 E-rings [2]
   - 2 Washers [3]
   - 1 Gear [4]
   - 1 Parallel Pin [5]
   - 2 Shaft Supports [6]

CAUTION:
Be careful not to drop and lose the Parallel Pin [5] in the gear [4].

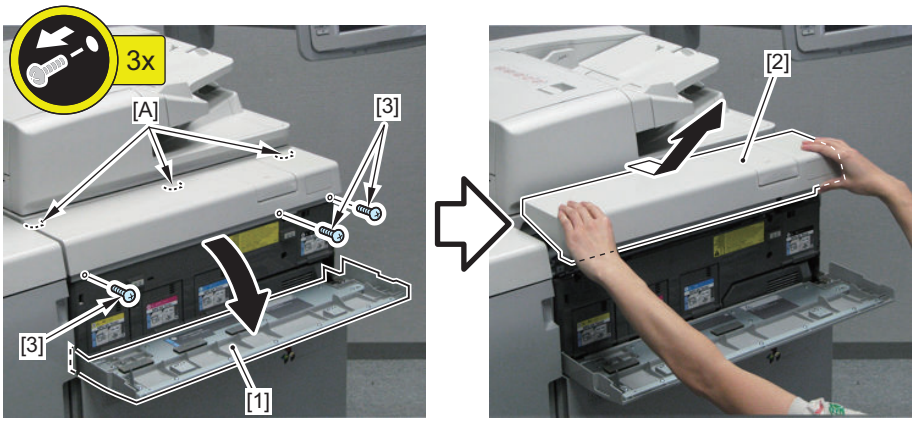


External/Auxiliary System

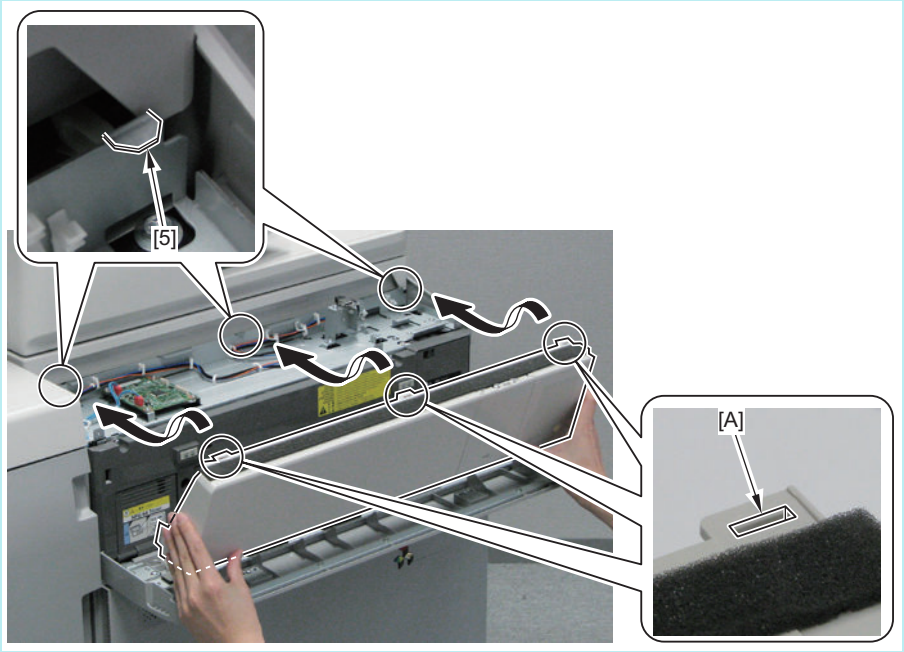
Removing the Upper Front Cover

■ Procedure

1. **Open the Toner Replacement Cover [1].**
2. **Remove the Upper Front Cover [2].**
   - 3 Screws [3]
   - 3 Hook Holes [A]



NOTE:
How to install the Upper Front Cover
Be sure to fit the 3 hook holes [A] of the Upper Front Cover to the 3 protrusions [5] of the host machine to install the cover.



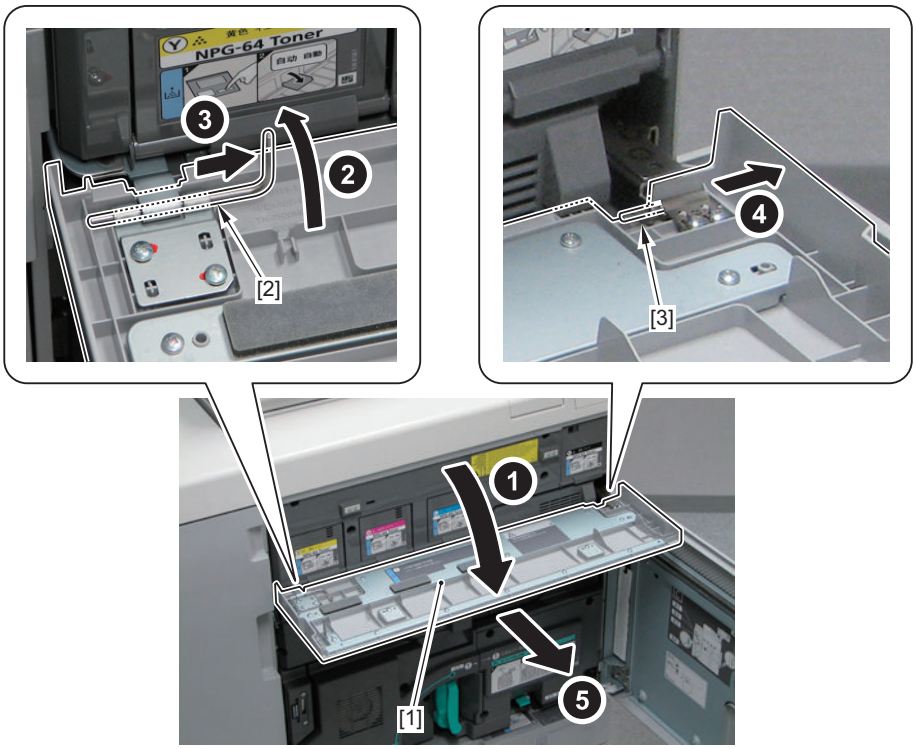
Removing the Toner Replacement Cover

■ Preparation

1. **Open the Front Cover.**

■ Procedure

1. **Open the Toner Replacement Cover [1].**
2. **Remove the Hinge Pin [2], and then remove the Toner Replacement Cover [1].**
   - 1 Shaft [3]



Removing the Toner Container Replacement Cover

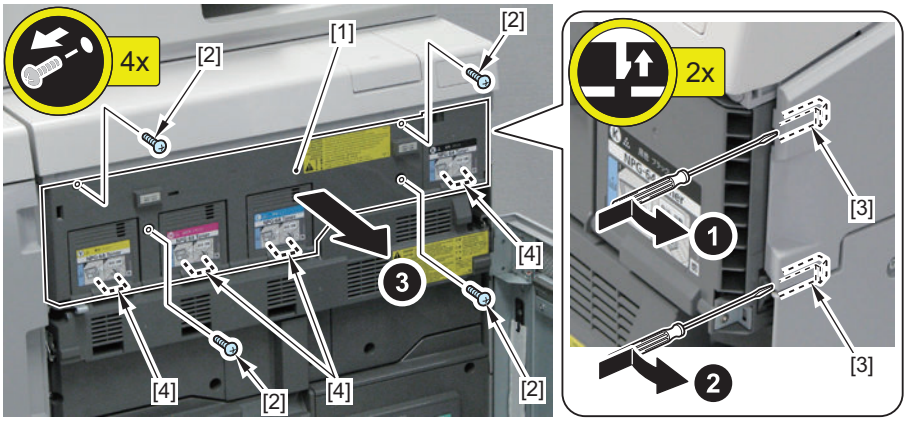
■ Preparation

1. **Open the Front Cover.**

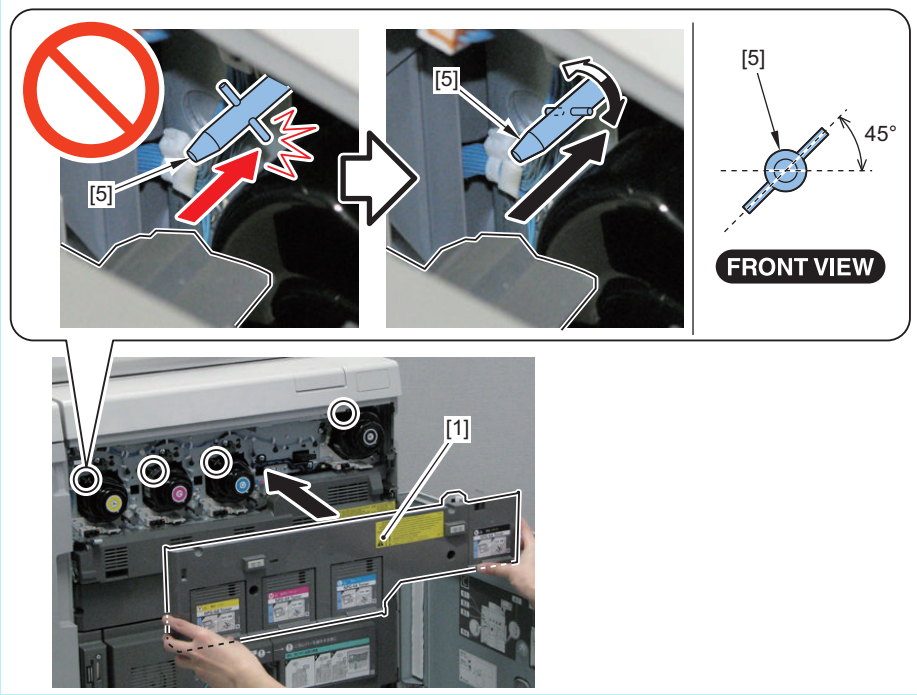
2. **Removing the Toner Replacement Cover****“Removing the Toner Replacement Cover” on page 941**

■ Procedure

1. **Remove the Toner Container Replacement Cover [1].**
   - 4 Screws [2]
   - 2 Claws [3]
   - 4 Protrusions [4]

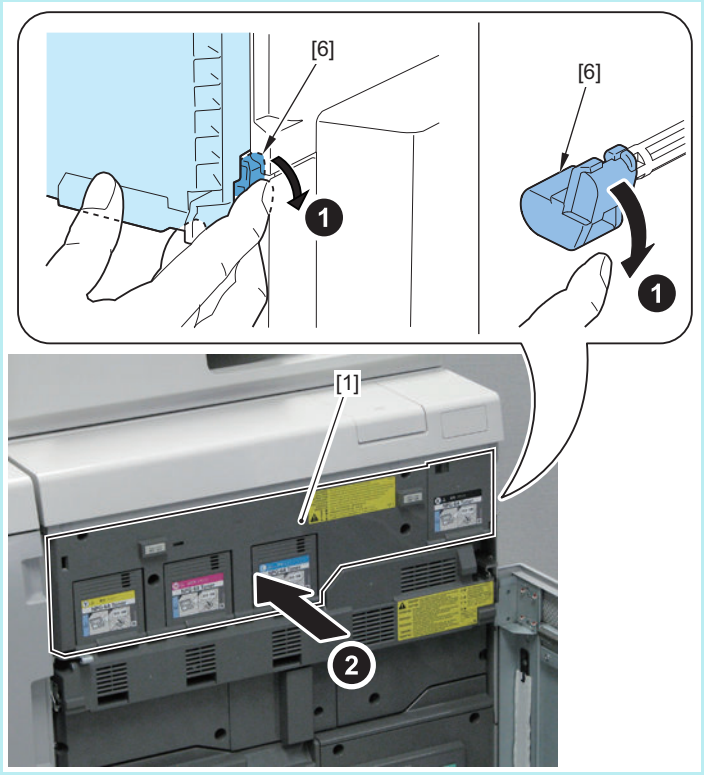


NOTE:
How to install the Toner Container Replacement Cover
- Be sure to install the Toner Container Replacement Cover [1] after tilting the 4 Parallel Pins [5] of the Inner Door Link Shaft at an angle of approx. 45 degrees.



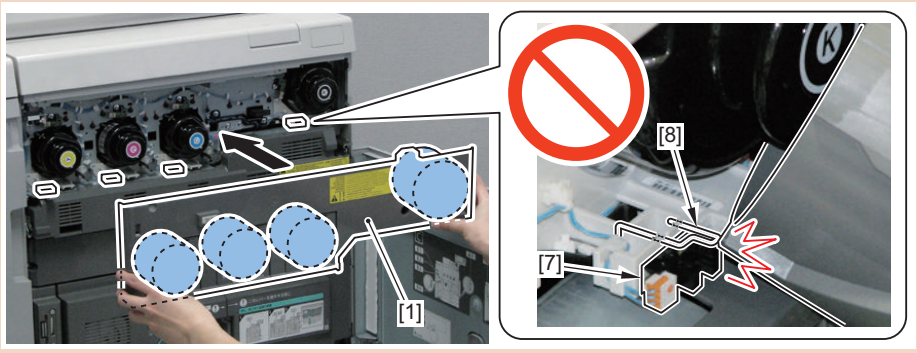
NOTE:

- If the Toner Container (Bk) is not installed, be sure to install the Toner Container Replacement Cover [1] while opening the Lock Lever [6] of the Toner Container (Bk).



CAUTION:

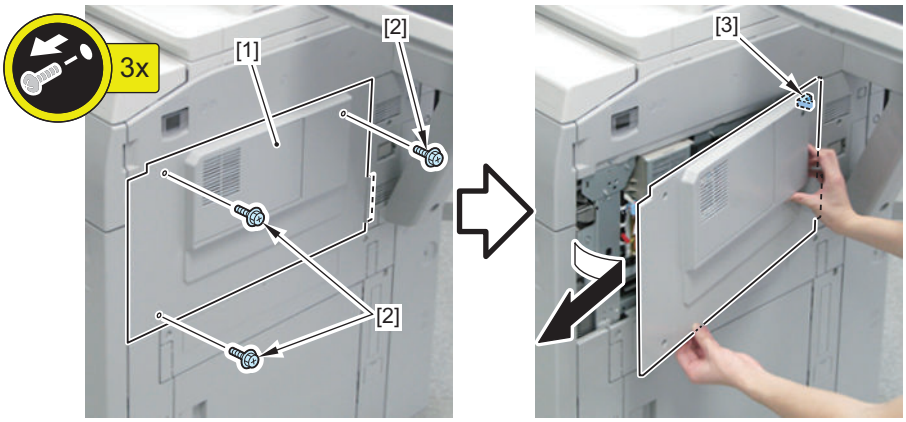
When installing the Toner Container Replacement Cover [1], be sure to prevent the cover from interfering with and damaging the 4 Toner Insertion Inlet Cover Open/Close Sensors [7] and the 4 groundings [8] on the upper side of the sensors.



Removing the Right Middle Front Cover 1

■ Procedure

1. **Remove the Right Middle Front Cover 1 [1].**
   - 3 Screws [2]
   - 1 Hook [3]



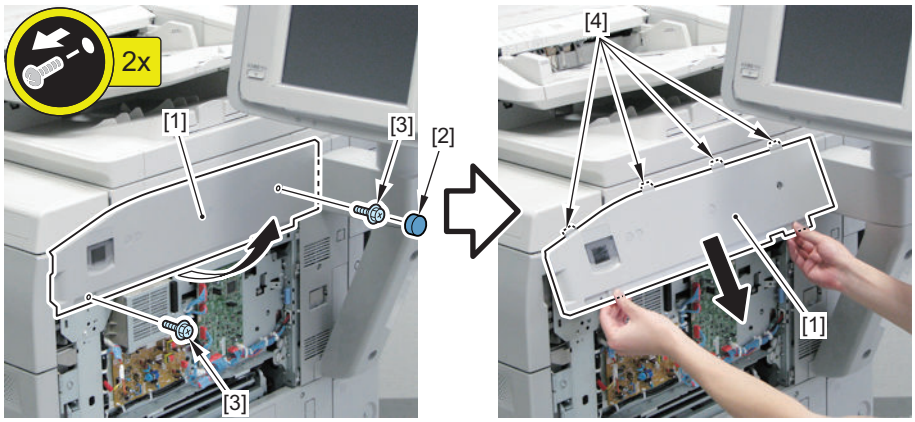
Removing the Right Upper Front Cover

■ Preparation

1. **Removing the Right Middle Front Cover 1****"Removing the Right Middle Front Cover 1" on page 944**

■ Procedure

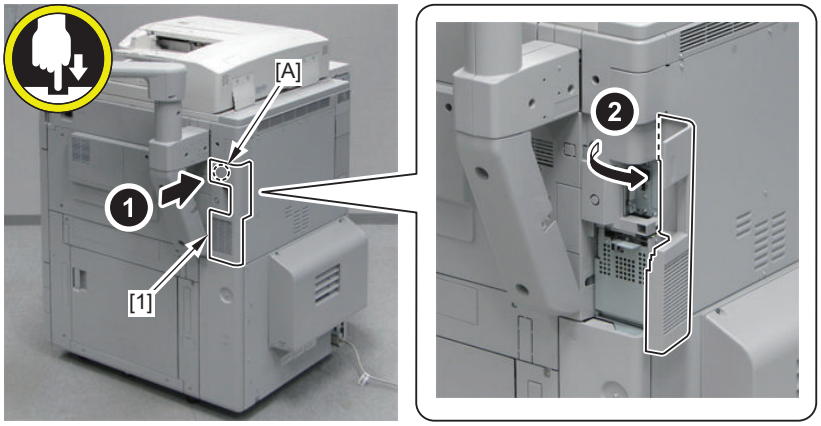
1. **Remove the Right Upper Front Cover [1].**
   - 1 Rubber Cap [2]
   - 2 Screws [3]
   - 4 Hooks [4]



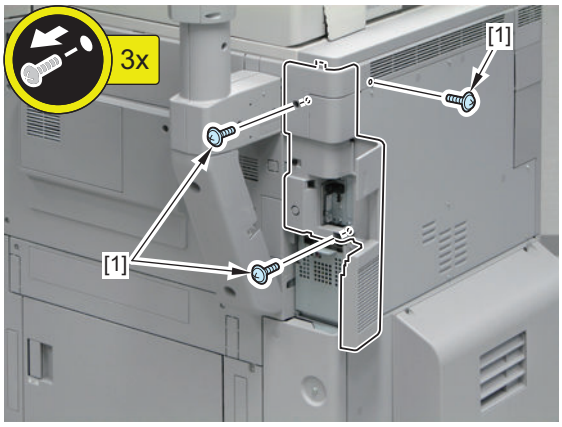
Removing the Box Right Cover

■ Procedure

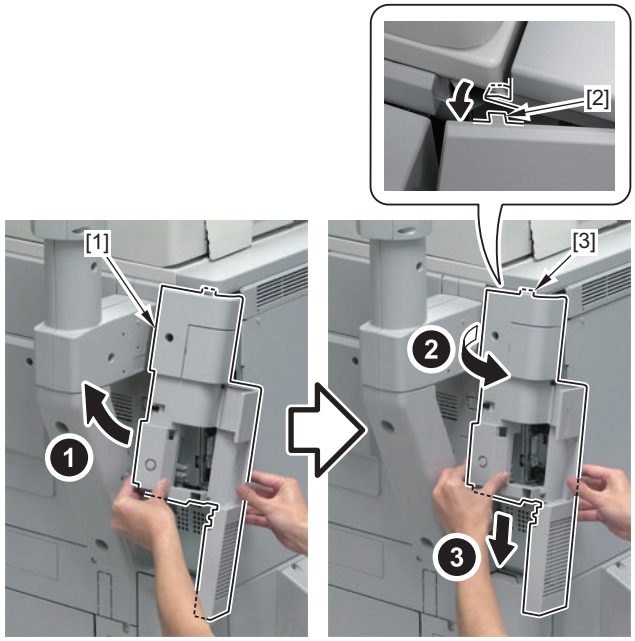
1. **Push the [A] part to open the HDD Cover [1].**



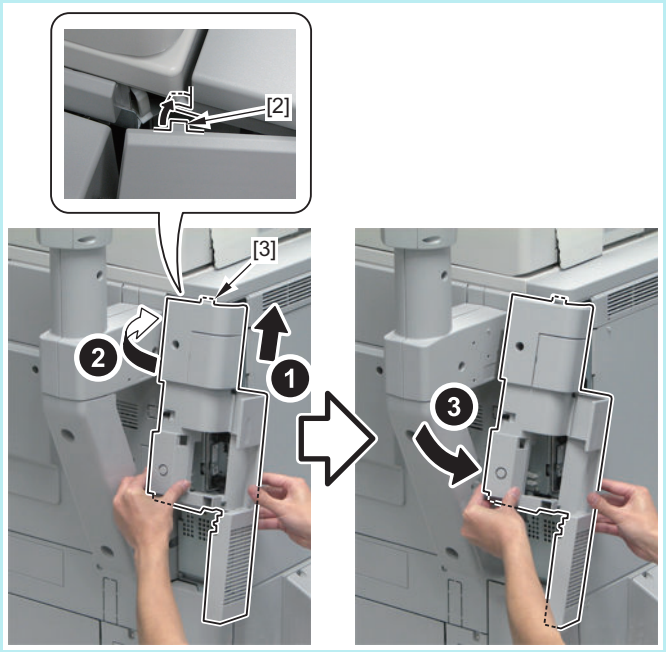
2. **Remove 3 Screws [1].**



3. **Remove the Box Right Cover [1].**
   - 1 Hook [2]
   - 1 Protrusion [3]



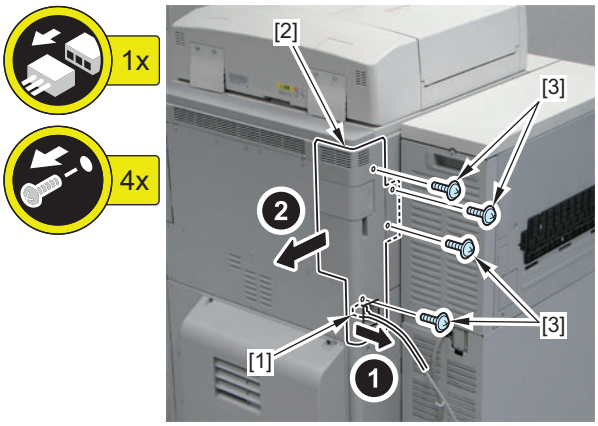
NOTE:
How to install the Box Right Cover
Install the Box Right Cover to the host machine by inserting its protrusion [3] and hooking its hook [2].



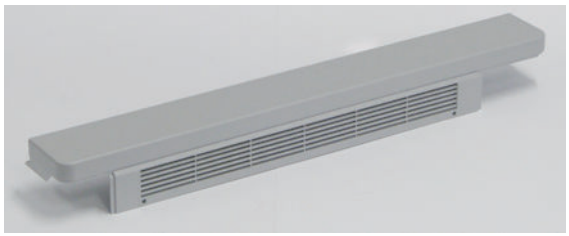
Removing the Box Left Cover

■ Procedure

1. **Remove the Network Cable [1], andRemove the Box Left Cover [2].**
   - 4 Screws [3]



Removing the Box Upper Cover



■ Preparation

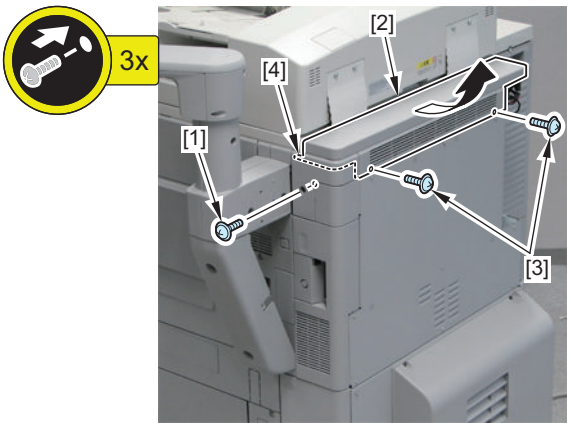
1. **Removing the Box Left Cover****“Removing the Box Left Cover” on page 947**

■ Procedure

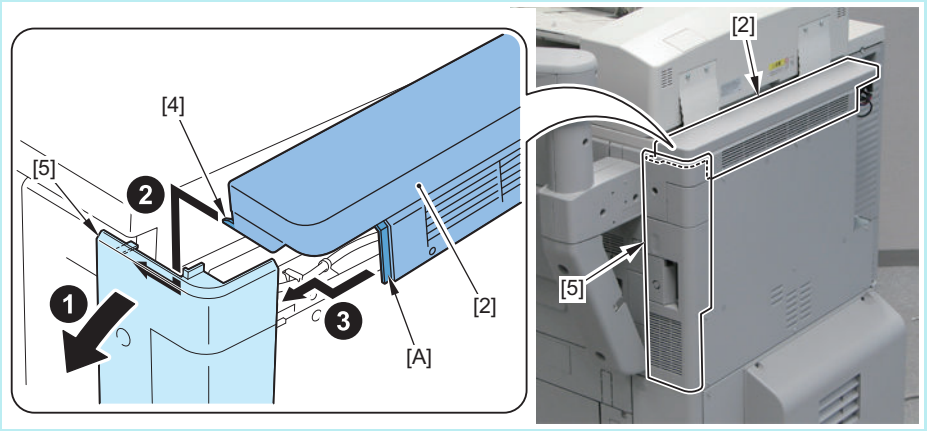
1. **Remove the screw [1] of the Box Right Cover.**

2. Remove the Box Upper Cover [2].

- 2 Screws [3]
- 1 Protrusion [4]



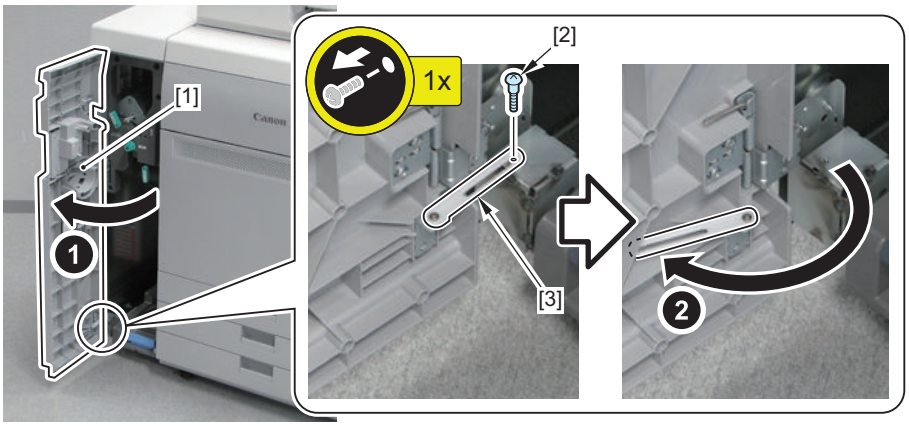
NOTE:
How to install the Box Upper Cover
Be sure to put the [A] part of the Box Upper Cover [2] and the protrusion [4] inside the Box Right Cover [5] to install the cover.



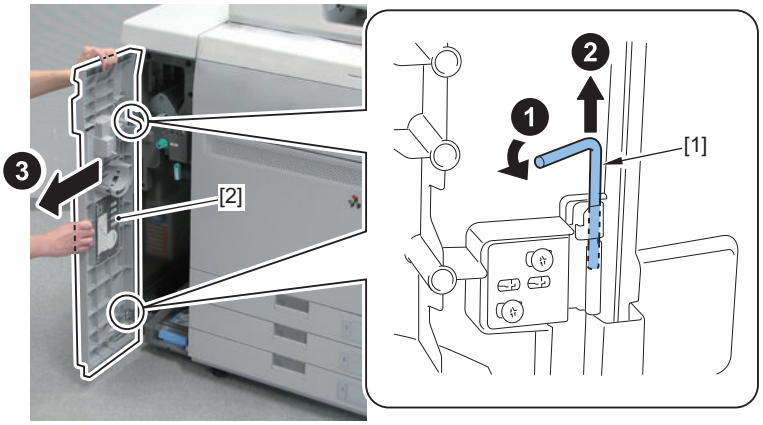
Removing the Front Left Cover

■ Procedure

1. **Open the Front Left Cover [1], remove the Stepped Screw [2], and then store the link [3].**



2. **Remove the 2 Hinge Shafts [1] and the Front Left Cover [2].**



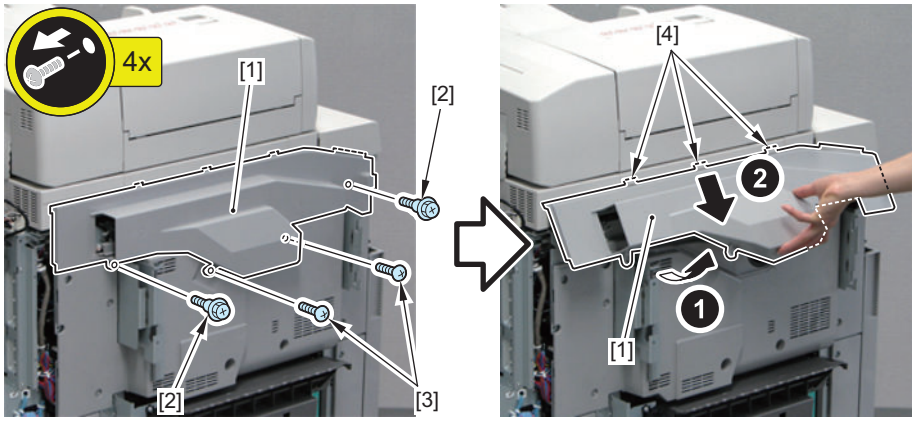
Removing the Left Upper Cover

■ Preparation

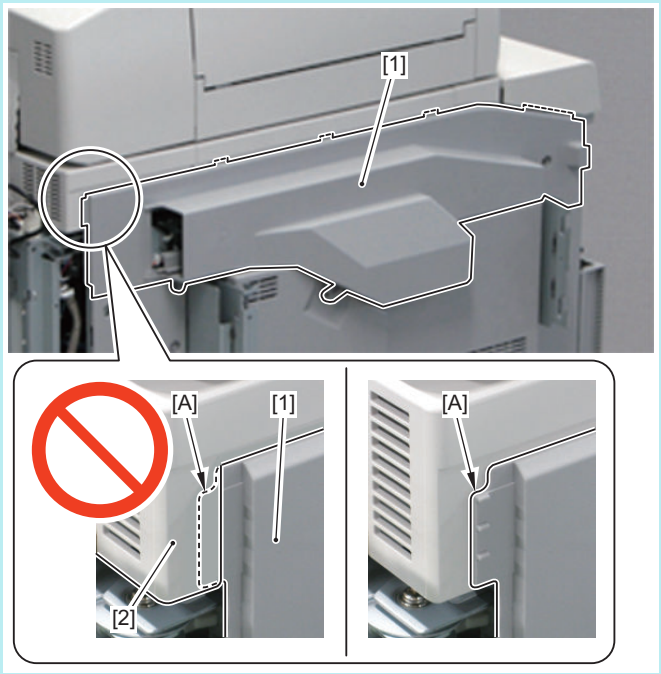
1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**
2. **Removing the Decurler Unit****"Removing the Decurler Unit" on page 910**
3. **Removing the Box Left Cover****"Removing the Box Left Cover" on page 947**

■ Procedure

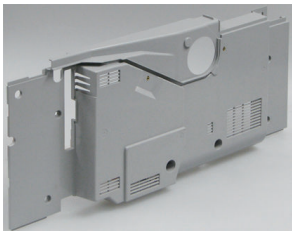
1. **Remove the Left Upper Cover [1].**
   - 2 Stepped Screws [2]
   - 2 Screws (Binding) [3]
   - 3 Hooks [4]



NOTE:
How to install the Left Upper Cover
Install the Left Upper Cover [1] so that its [A] part comes on the upper side of the Reader Cover [2].



Removing the Left Middle Cover

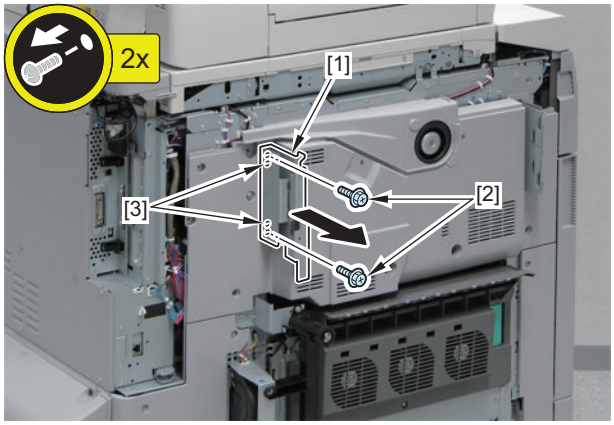


■ Preparation

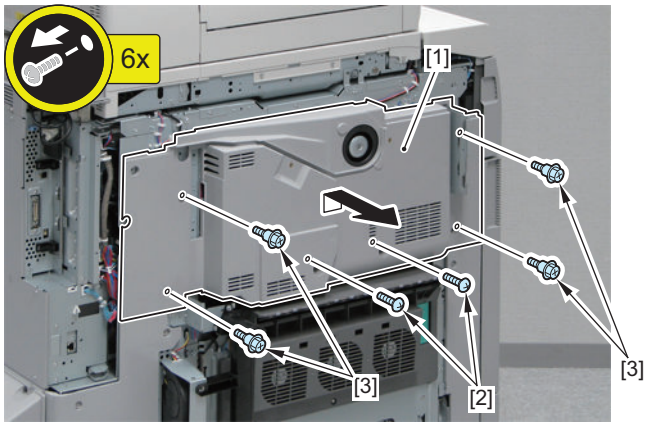
1. **Removing the Front Left Cover**"Removing the Front Left Cover" on page 949
2. **Removing the Decurler Unit**"Removing the Decurler Unit" on page 910
3. **Removing the Box Left Cover**"Removing the Box Left Cover" on page 947
4. **Removing the Upper Left Cover**"Removing the Left Upper Cover" on page 950

■ Procedure

1. **Remove the Decurler Mounting Plate (Rear) [1].**
   - 2 Screws [2]
   - 2 Bosses [3]



2. **Remove the Left Middle Cover [1].**
   - 2 Screws [2]
   - 4 Stepped Screws [3]



Removing the Left Lower Rear Cover

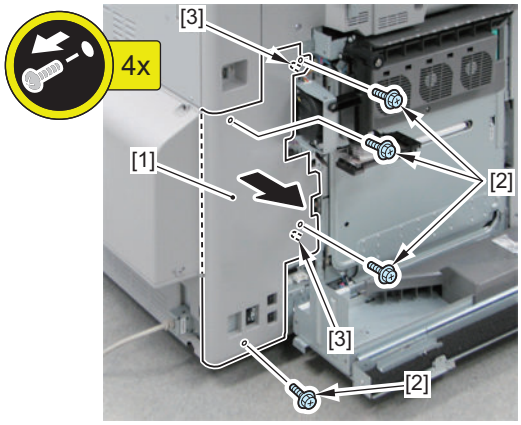
■ Preparation

1. **Removing the Front Left Cover**"Removing the Front Left Cover" on page 949

2. **Removing the Decurler Unit**"Removing the Decurler Unit" on page 910

■ Procedure

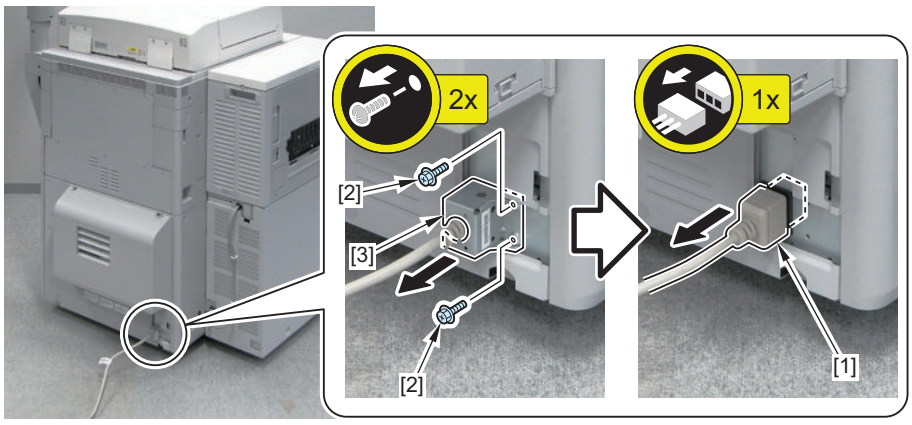
1. **Remove the Left Lower Rear Cover [1].**
   - 4 Screws [2]
   - 2 Bosses [3]



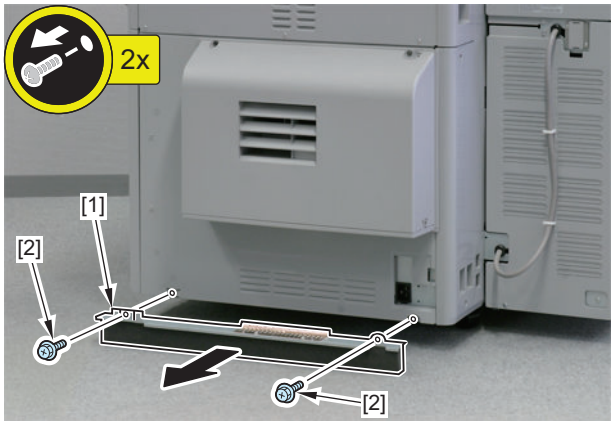
Removing the Rear Lower Cover

■ Procedure

1. **Disconnect the Power Supply Connector [1].**
   - 2 Screws [2]
   - Power Supply Connector Cover [3]

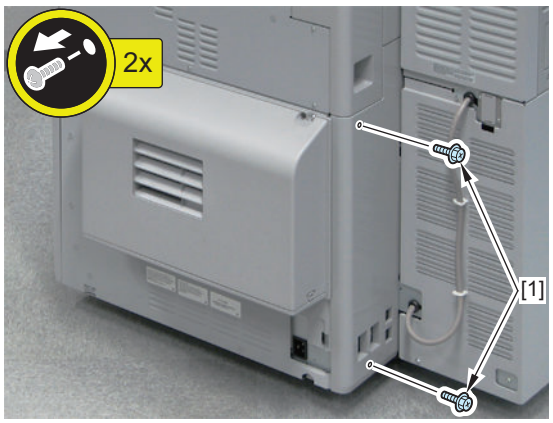


2. **Remove the Rear Curtain Unit [1].**
   - 2 Screws [2]

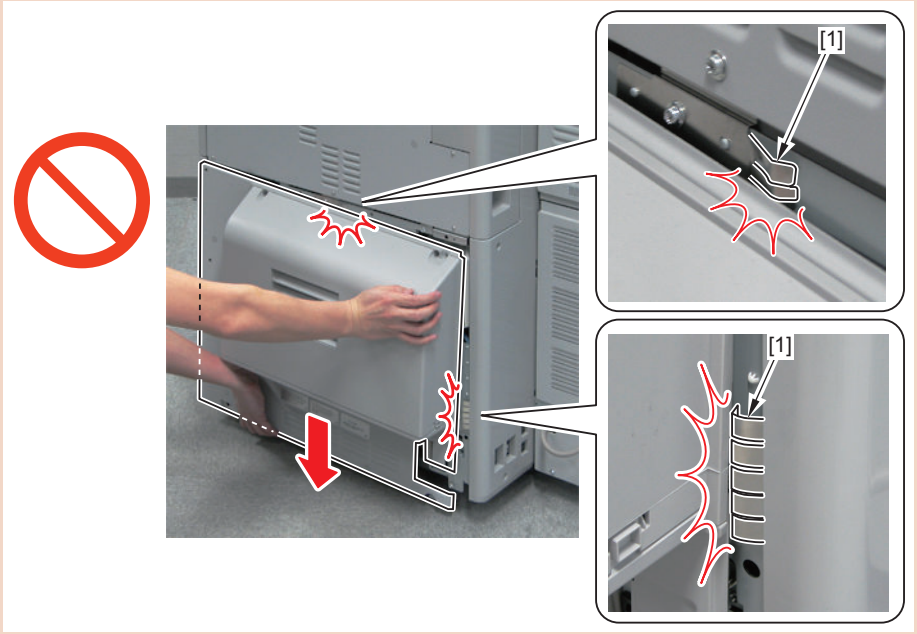


CAUTION:
Do not move the machine over a long distance while the Rear Curtain Unit [1] is installed. Otherwise, the Rear Curtain Unit [1] may be damaged.

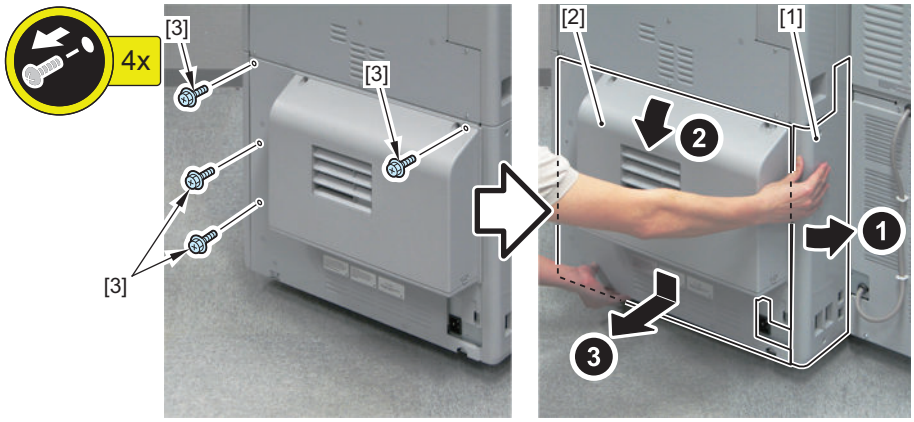
3. **Remove the 2 screws [1] of the Left Lower Rear Cover.**



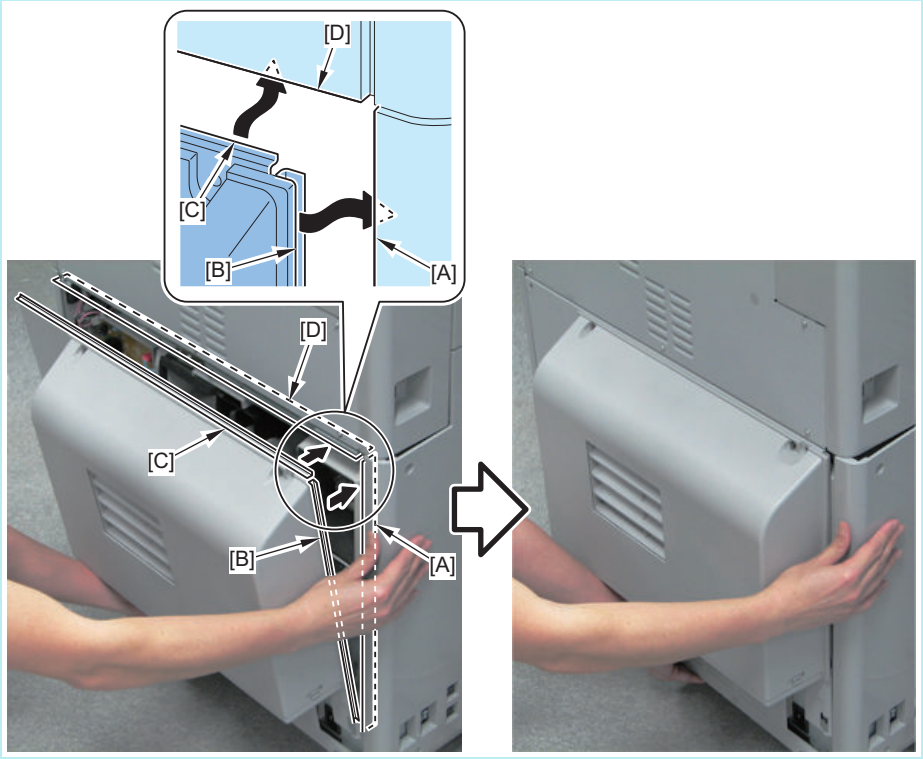
CAUTION:
When disassembling/assembling, do not deform the Grounding Plate [1].



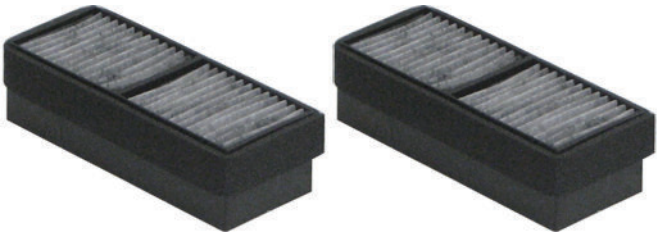
4. **While opening the Left Lower Rear Cover [1], remove the Rear Lower Cover [2].**
   - 4 Screws [3]



NOTE:
- When assembling, be sure to insert the edge [A] of the Left Lower Rear Cover in the groove [B] of the Rear Lower Cover.
- When assembling, be sure to put the [C] part of the Rear Lower Cover inside the [D] part of the Rear Upper Cover.

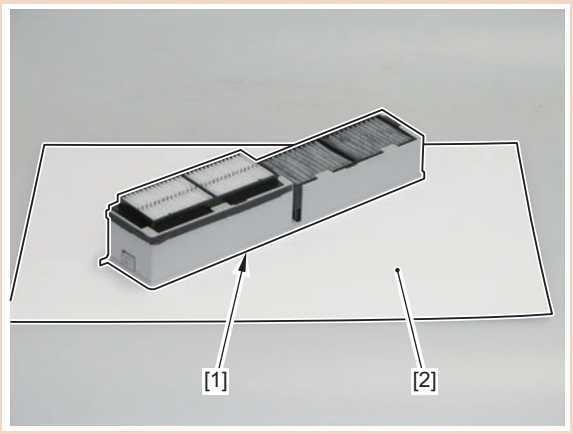


Removing the Fixing Dustproof Filter and the Ozone Filter

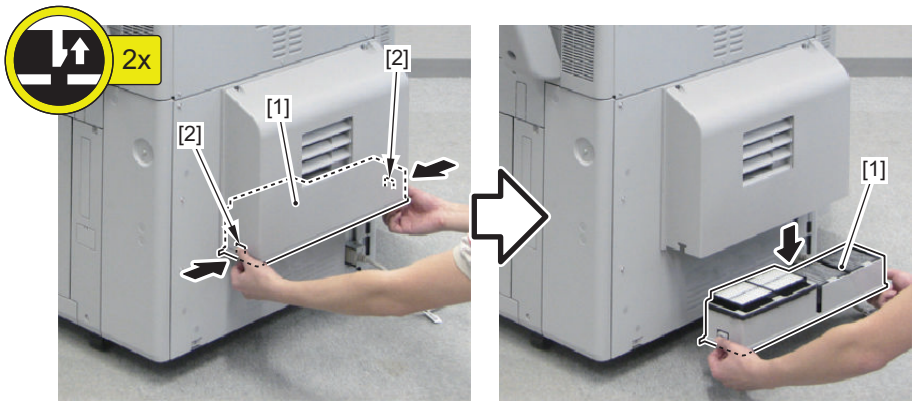


■ Procedure

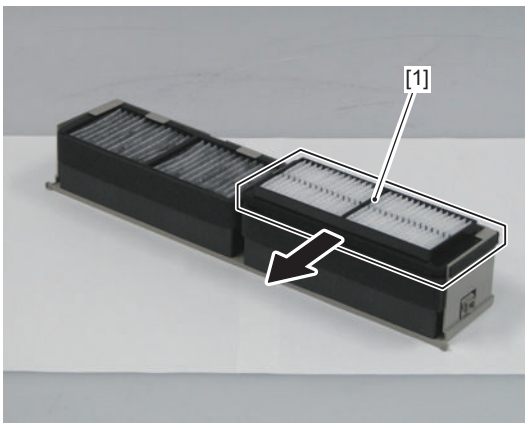
CAUTION:
Be sure to place the Noise Reduction Duct Filter Unit [1] on a sheet of paper [2] because toner is attached on the unit.



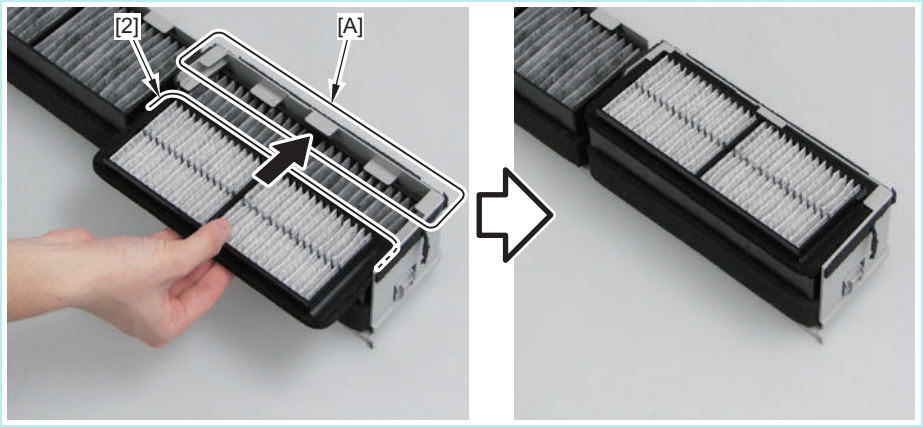
1. **Remove the Noise Reduction Duct Filter Unit [1].**
   - 2 Claws [2]



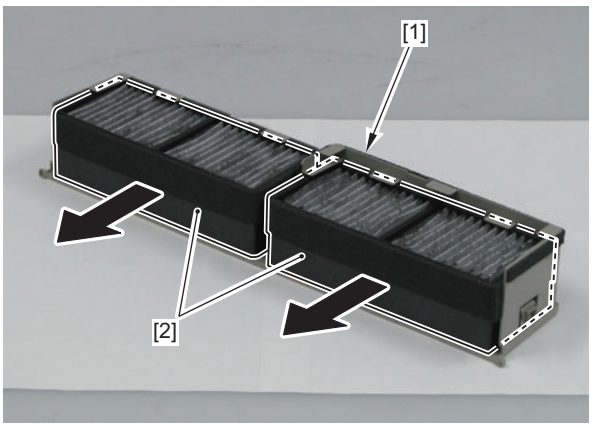
2. Remove the Fixing Dustproof Filter [1].



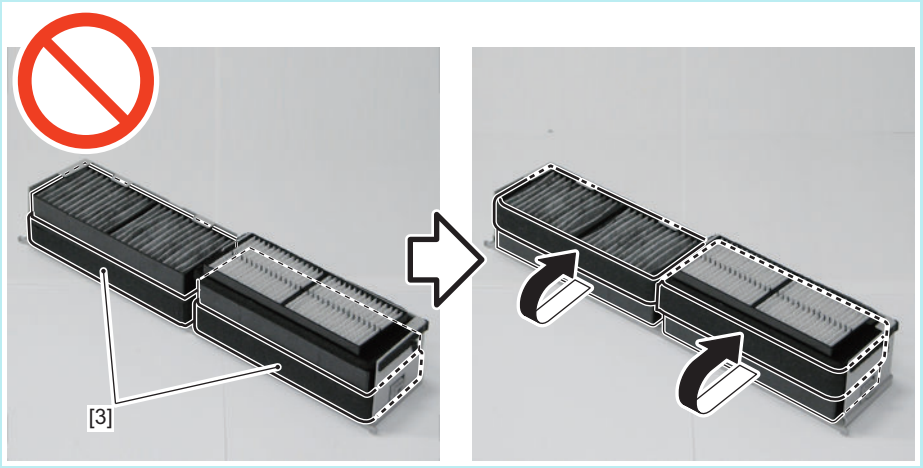
NOTE:
How to install the Fixing Dustproof Filter
Be sure to align the rib [2] of the Fixing Dustproof Filter with the guide [A] when installing the filter.



3. **Remove the 2 Ozone Filters [2] from the Filter Case [1].**



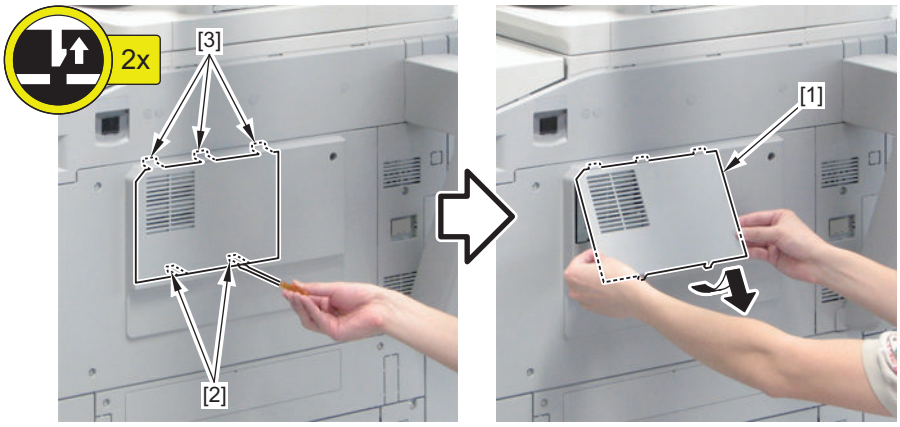
NOTE:
How to install the Ozone Filter
Be sure to install the Ozone Filter with its sponge [3] on the upper side.



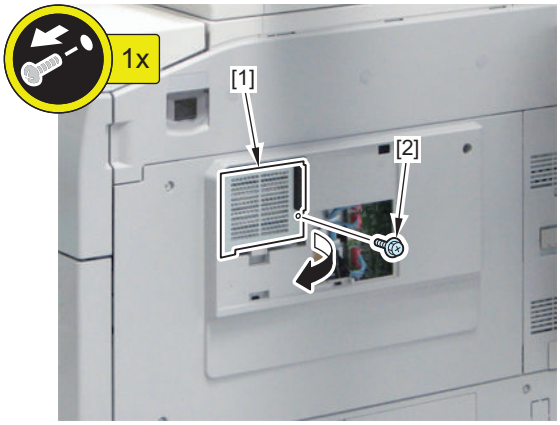
Removing the Primary Charging Dustproof Filter

■ Procedure

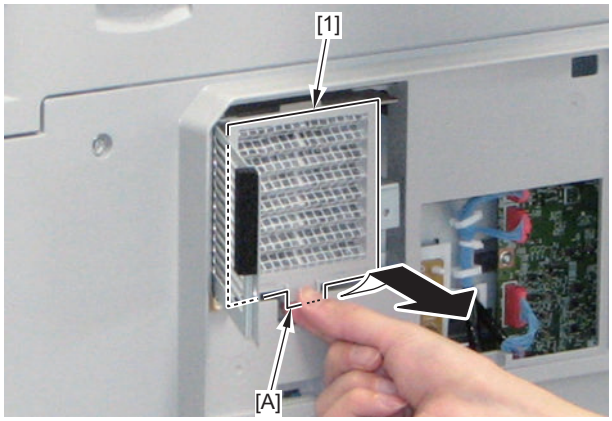
1. **Remove the Right Middle Front Cover 2 [1].**
   - 2 Claws [2]
   - 3 Hooks [3]



2. **Open the Filter Cover [1].**
   - 1 Screw [2]



3. **Hold the tab [A] to remove the Primary Charging Dustproof Filter [1].**



Options

Removing the DADF Unit + Reader Unit

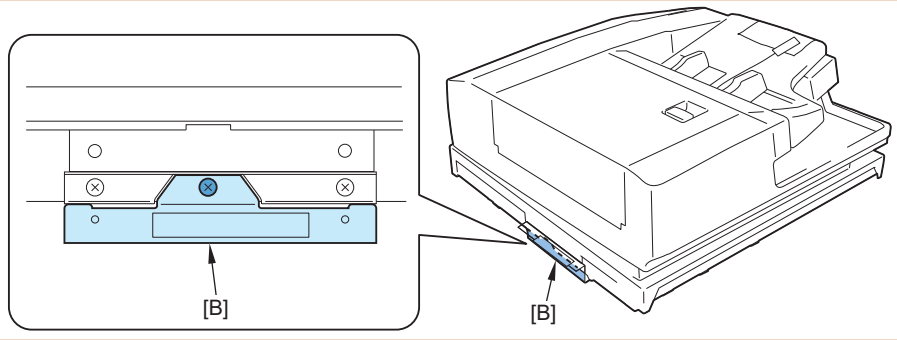
■ Preparation

NOTE:
When pickup system options are installed, be sure to disconnect them from the host machine as needed.

1. **Removing the Front Left Cover****"Removing the Front Left Cover" on page 949**
2. **Removing the Decurler Unit****"Removing the Decurler Unit" on page 910**
3. **Removing the Box Right Cover****"Removing the Box Right Cover" on page 946**
4. **Removing the Box Left Cover****"Removing the Box Left Cover" on page 947**
5. **Removing the Left Upper Cover****"Removing the Left Upper Cover" on page 950**
6. **Removing the Box Upper Cover****"Removing the Box Upper Cover" on page 948**
7. **Be sure to refer to the correct step according to the following instruction since the step differs depending on whether the Multi-purpose Tray Pickup Unit (option) is installed.**
   - If the Multi-purpose Tray Pickup Unit is not installed
   1. Removing the Right Middle Front Cover 1"Removing the Right Middle Front Cover 1" on page 944
   - If the Multi-purpose Tray Pickup Unit is installed
   1. Open the Multi-purpose Tray Pickup Unit.
8. **Removing the Right Upper Front Cover****"Removing the Right Upper Front Cover" on page 945**
9. **Close the Multi-purpose Tray Pickup Unit. (If the Multi-purpose Tray Pickup Unit is installed)**

■ Procedure

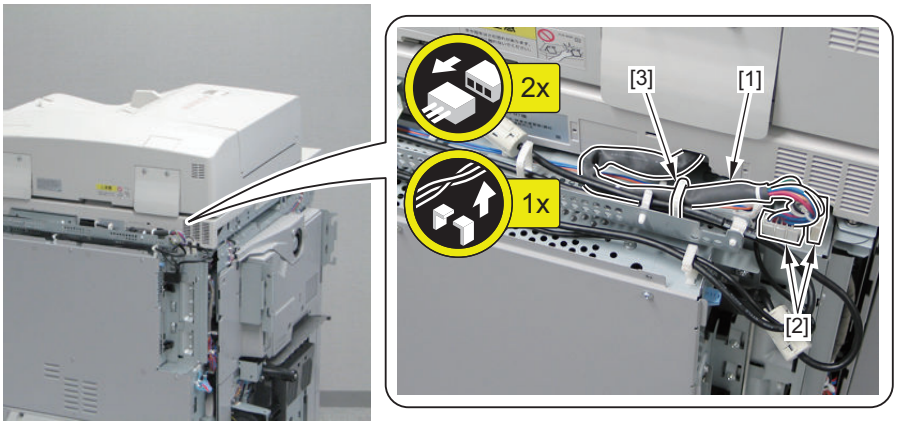
⚠ CAUTION:
- Because the weight of the equipment is approx. 40 kg, be sure to work with 2 or more people when lifting it up/down. Also, be sure to lift the equipment horizontally.
- To prevent deformation of the bottom of the Reader Unit, be sure that the Reader Support Plate [B] is installed when placing it on the floor.



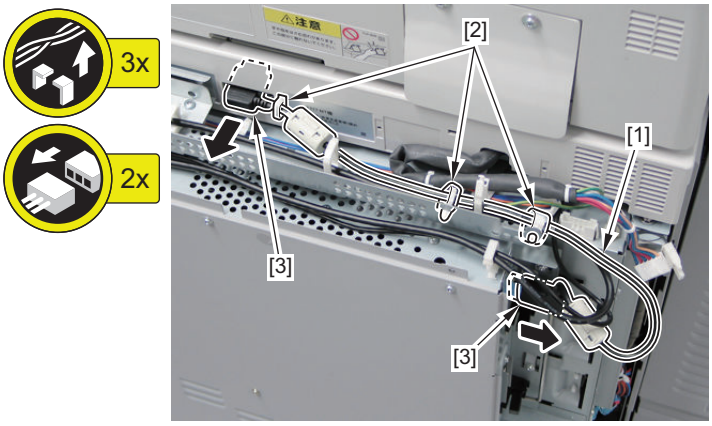
1. **Move the Reader Scanner Unit to the fixing position by executing the following service mode.**
   Service Mode (Level 2) > COPIER > FNCTION > MISC-R > RD-SHPOS

CAUTION:
Be sure to move the Scanner Unit to the fixing position and secure it in place when moving the Reader after installation. Otherwise, the Scanner Unit may get damage

2. **Disconnect the Reader Power Supply Cable [1].**
   - 2 Connectors [2]
   - 1 Wire Saddle [3]

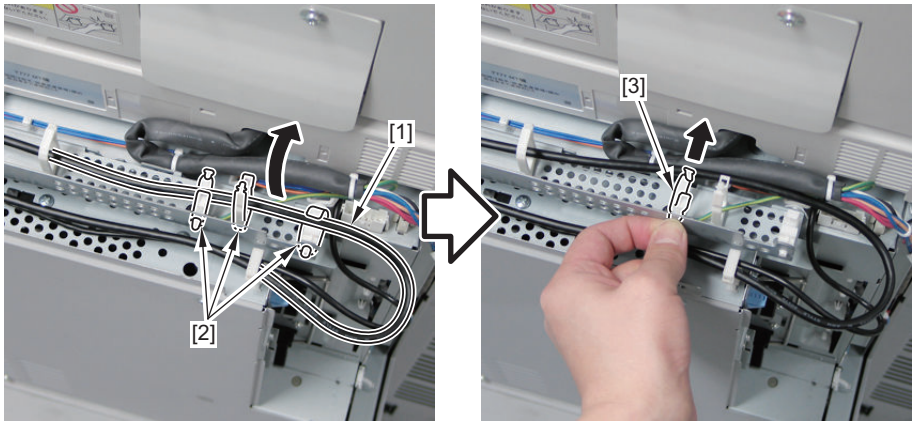


3. **Disconnect the Reader Communication Cable [1].**
   - 3 Wire Saddles [2]
   - 2 Connectors [3]



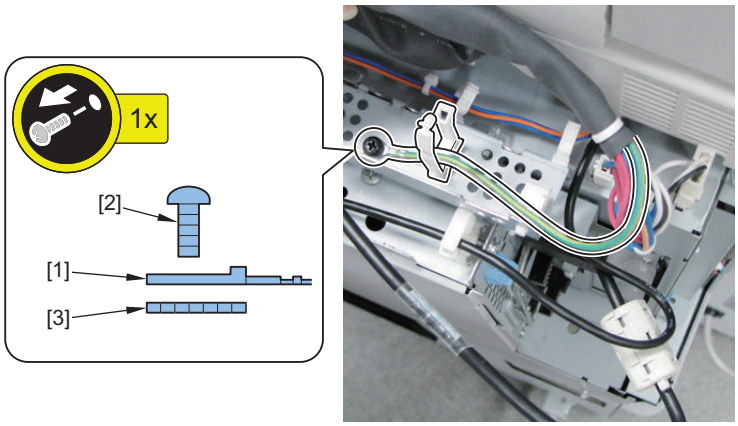
4. **Free the Control Panel Cable [1] from the 3 Wire Saddles [2].**

5. **Remove the Wire Saddle [3].**

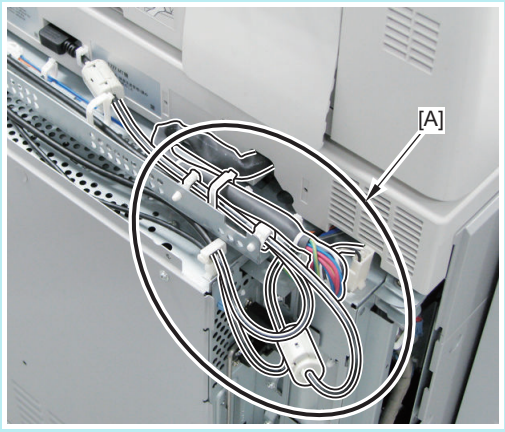


6. Disconnect the round shape terminal [1] of the Grounding Wire.

- 1 Screw [2]
- 1 Toothed Washer [3]

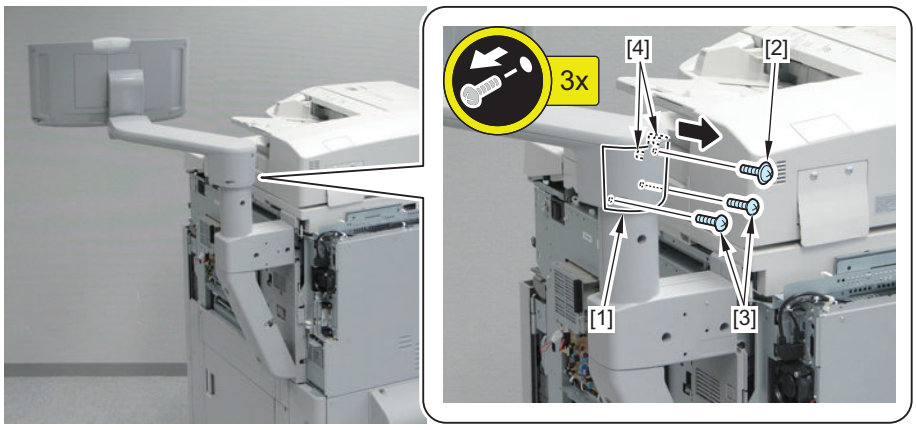


NOTE:
Be sure to allow extra slack of the cables at the [A] part for opening and closing the Controller Box.



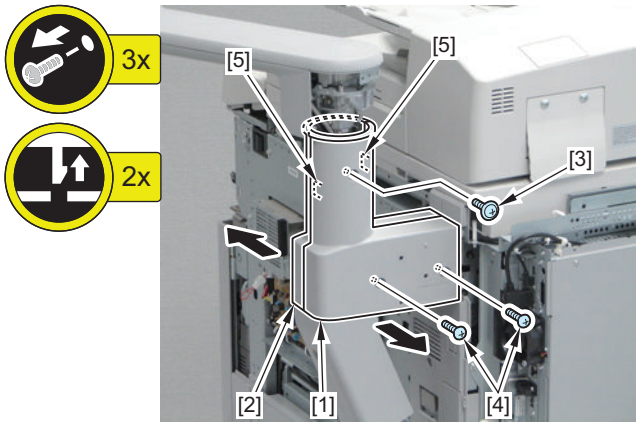
7. Remove the Arm Rear Cover [1].

- 1 Screw (TP) [2]
- 2 Screws (Tapping) [3]
- 2 Bosses [4]

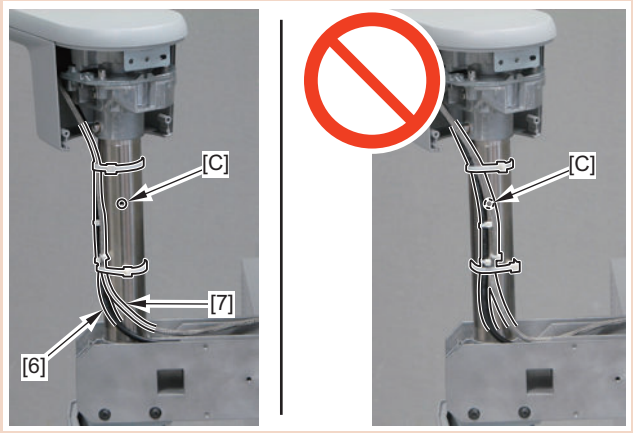


8. Remove the Base Rear Cover [1] an the Base Front Cover [2].

- 1 Screw (TP) [3]
- 2 Screws (Tapping) [4]
- 2 Claws [5]

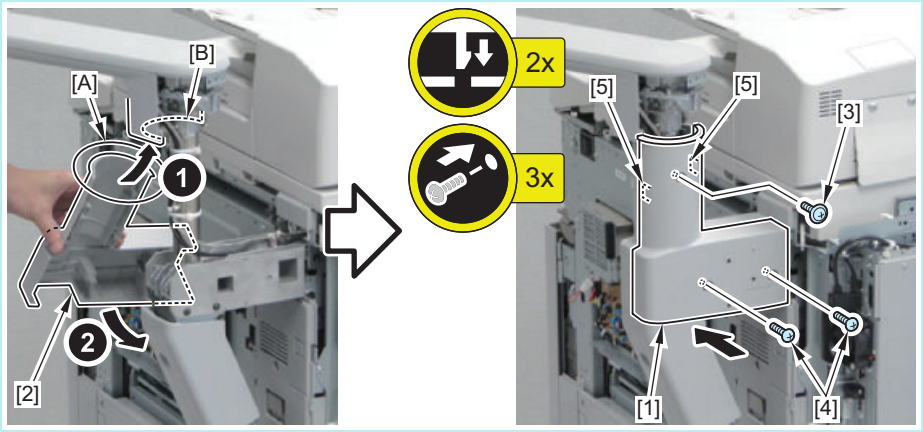


CAUTION:
Be sure that the Control Panel Cable [1] and the Power Supply Cable [2] do not cover the screw hole [A].

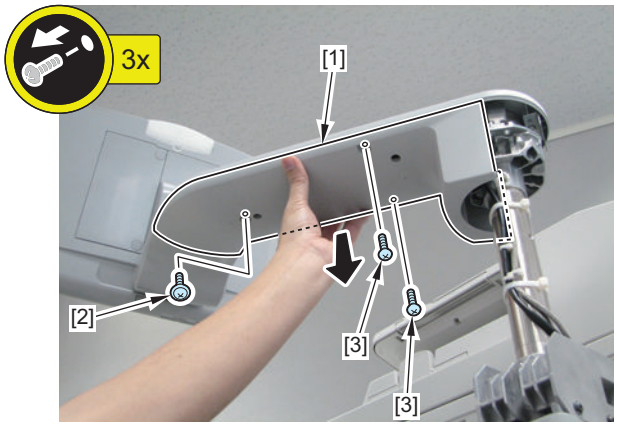


NOTE:
How to install the Base Rear Cover [1] and the Base Front Cover [2]

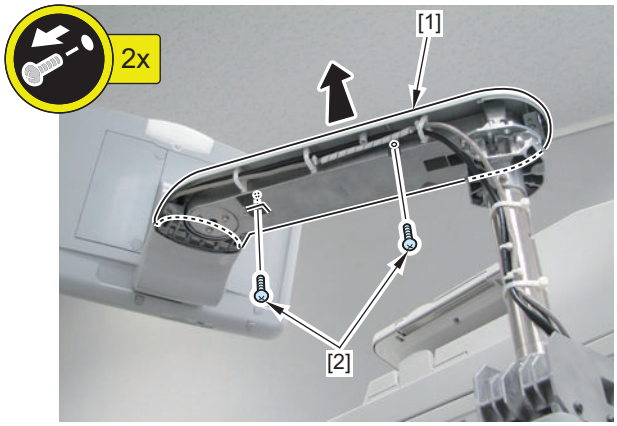
1. Put the [A] part of the Base Front Cover [2] in the [B] part which is inside the Arm Lower Cover.
2. Install the Base Rear Cover [1].
   - 2 Claws [5]
   - 1 Screw (TP) [3]
   - 2 Screws (Tapping) [4]



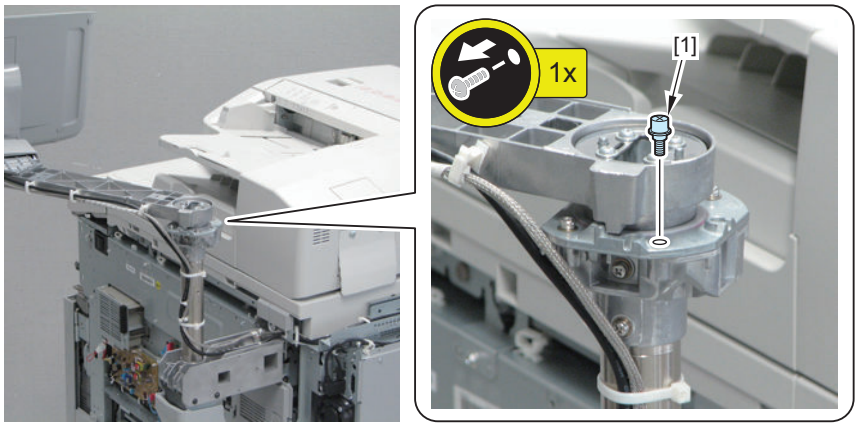
9. **Remove the Arm Lower Cover [1].**
   - 1 Screw (TP) [2]
   - 2 Screws (Tapping) [3]



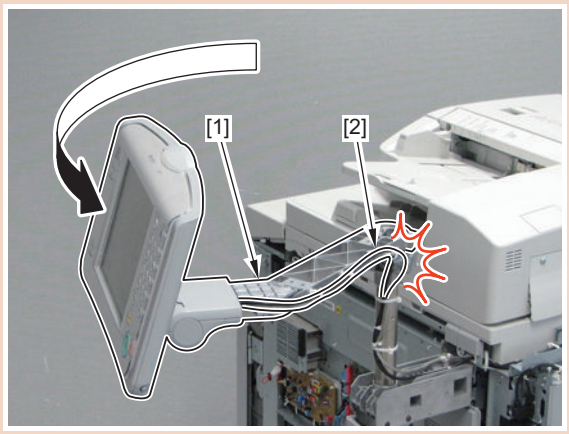
10. **Remove the Arm Upper Cover [1].**
   - 2 Screws (Tapping) [2]



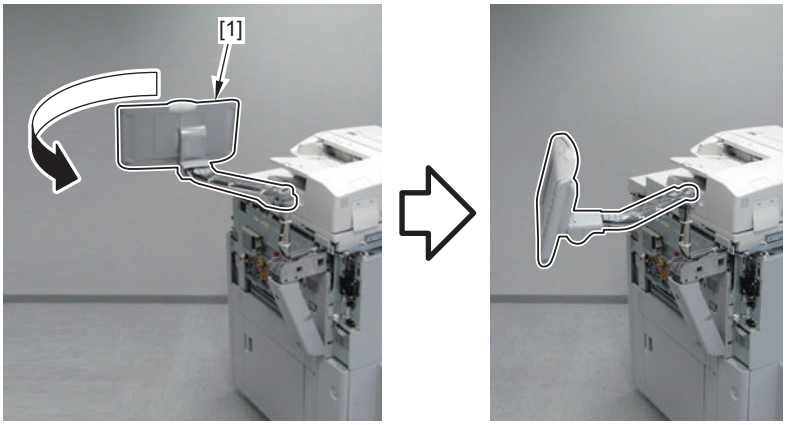
11. Remove the Stopper Stepped Screw [1].



CAUTION:
When rotating the Upright Control Panel [1], do not break the 2 Control Panel Cables [2].

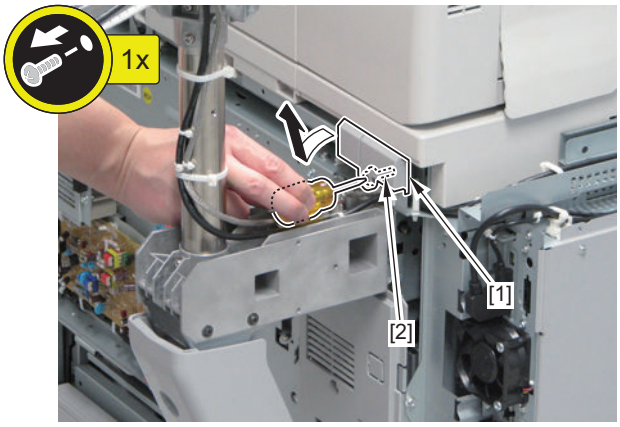


12. Rotate the Upright Control Panel [1].



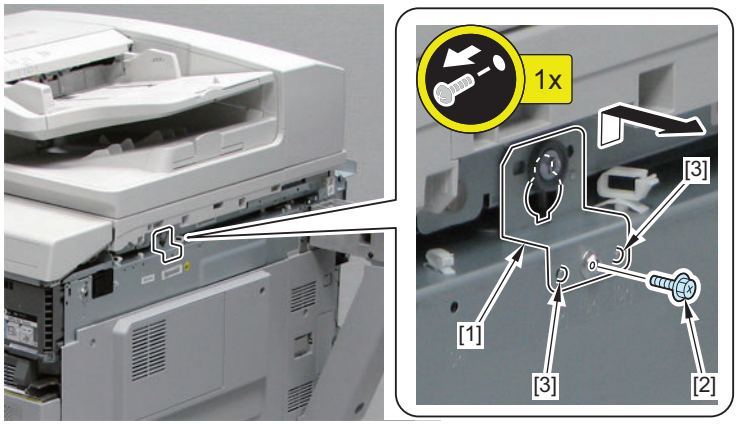
13. Remove the Right Upper Rear Cover [1].

- 1 Screw [2]



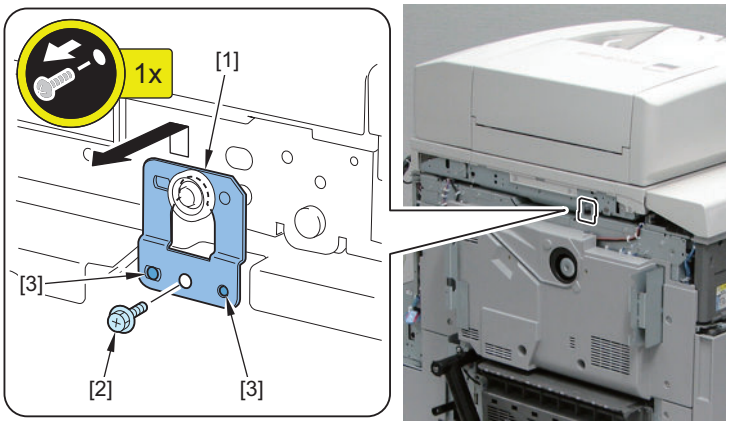
14. Remove the Reader Fixation Plate (R) [1].

- 1 Screw [2]
- 2 Bosses [3]



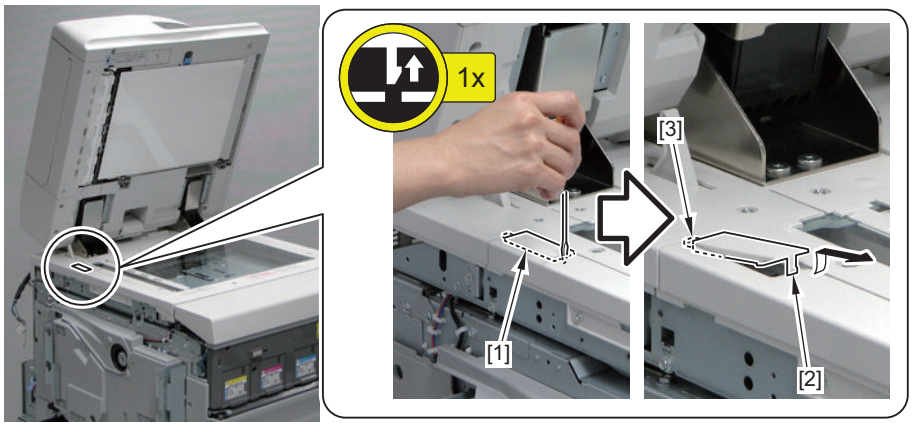
15. Remove the Reader Fixation Plate (L) [1].

- 1 Screw [2]
- 2 Bosses [3]

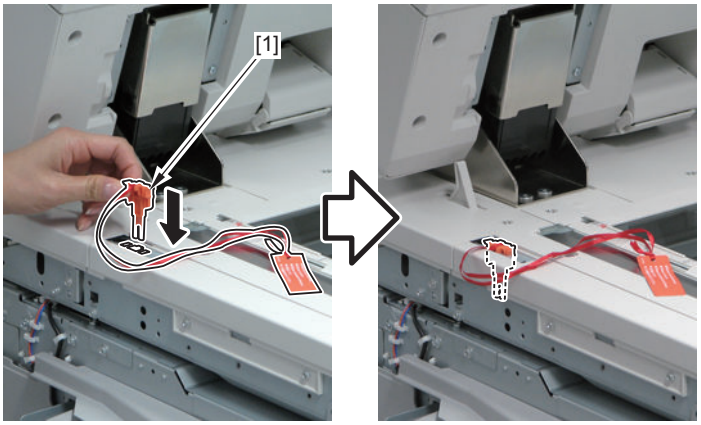


16. Open the DADF, and remove the Left Upper Small Cover [1].

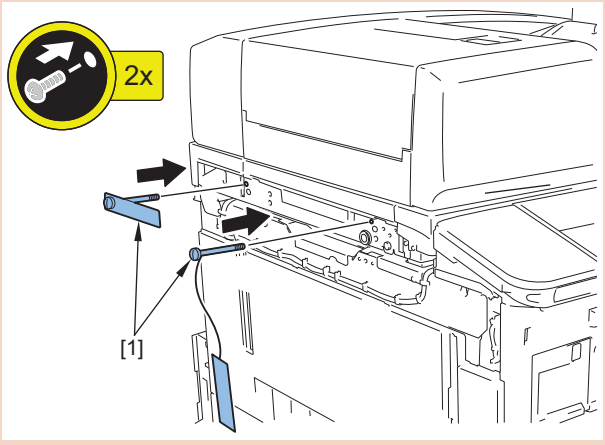
- 1 Claw [2]
- 1 Hook [3]



17. Install the Scanner Fixation Tool [1] that has been kept in a safe place since installation.



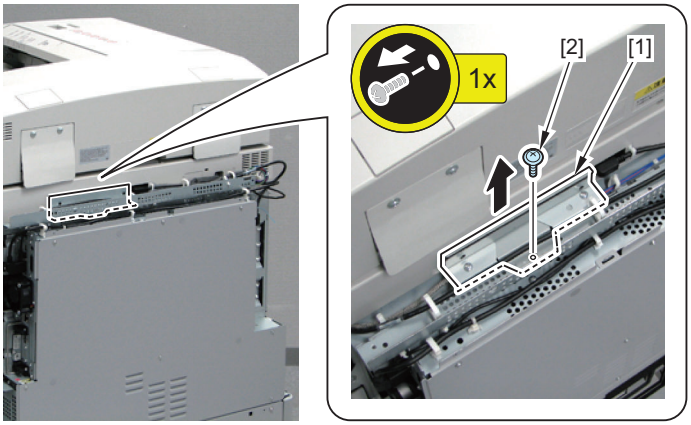
CAUTION:
Fixation by the Scanner Fixation Tool assumes shipping of the reader placed on the host machine.
When shipping only the DADF + Reader Unit, be sure to use the 2 Scanner Fixation Screws [1].



18. Close the DADF

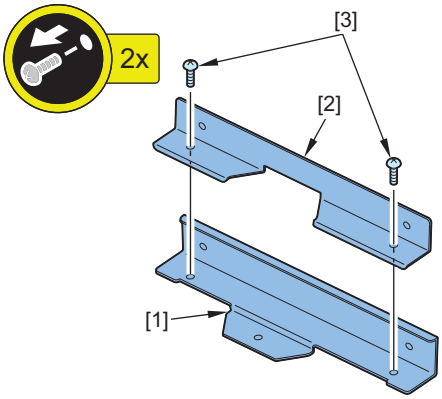
19. Remove the Reader Support Plate [1].

- 1 Screw [2]



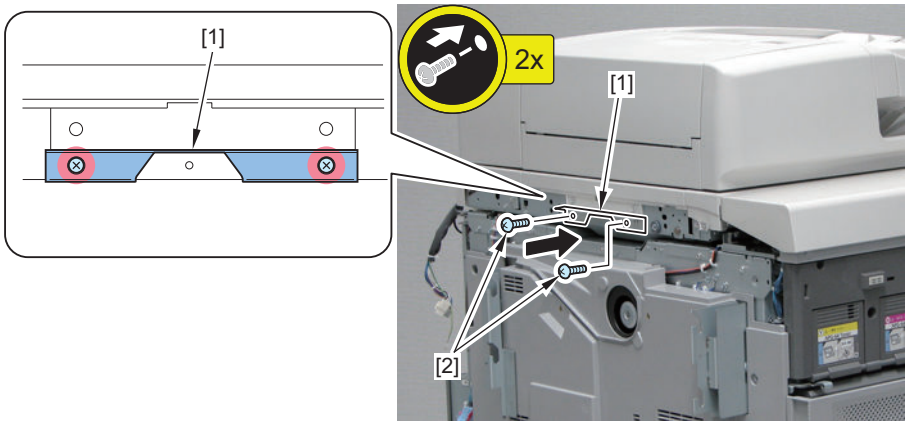
20. Remove the Reader Support Plate A [2] from the Reader Support Plate B [1].

- 2 Screws [3]



21. Install the Reader Support Plate A [1].

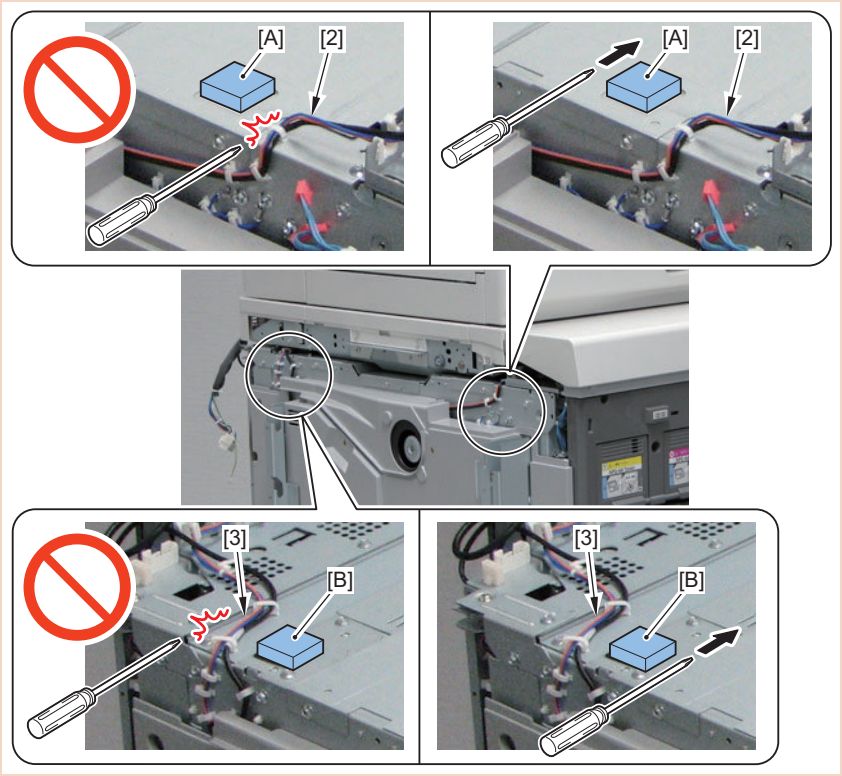
- 2 Screws [2]

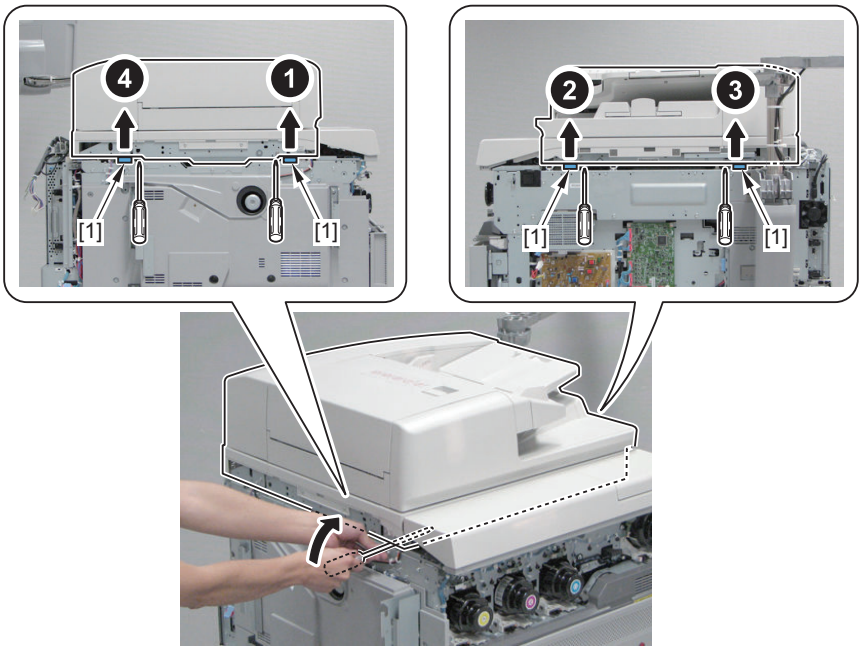


22. Lift up the DADF + Reader Unit slightly with a screwdriver by applying the principle of leverage, and remove the 4 Rubber Plates [1] from the host machine (printer).

⚠ CAUTION:

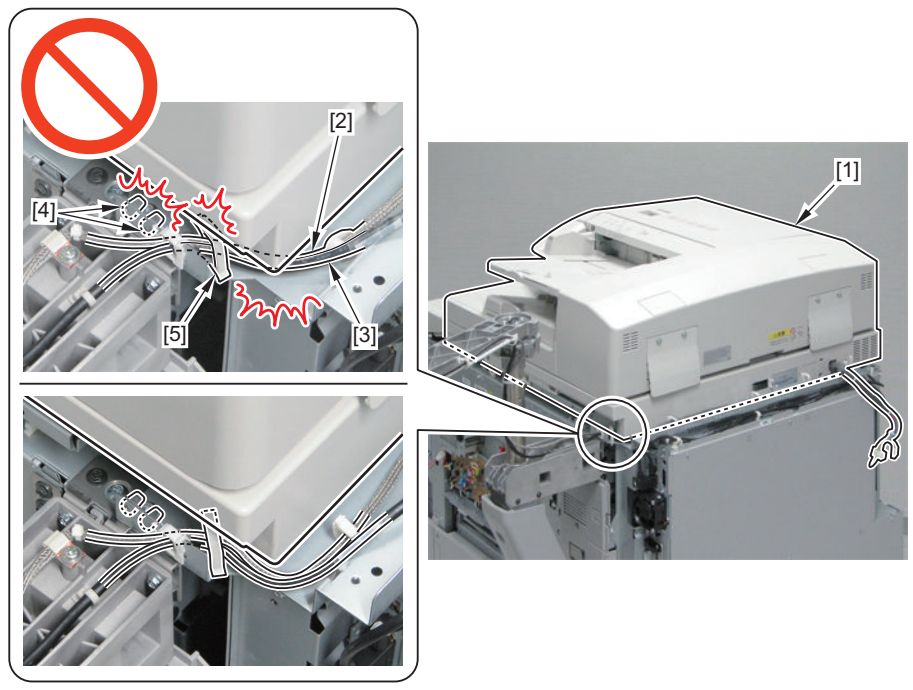
- When attempting to lift up the DADF + Reader Unit fully without first removing the 4 Rubber Plates, force is generated when the Rubber Plates are removed, which may cause the DADF + Reader Unit to fall.
- To make the work easier, remove the Rubber Plates in the front side first.
- Do not use a long screwdriver. Otherwise, it may be bent.
- When removing the Rubber Plate [A] on the front side, do not insert a screwdriver between the front side of the plate and the host machine because harnesses [2] are routed there.
- When removing the Rubber Plate [A] on the rear side, do not insert a screwdriver between the rear side of the plate and the host machine because harnesses [3] are routed there.





CAUTION:
Points to note when installing/removing the DADF + Reader Unit

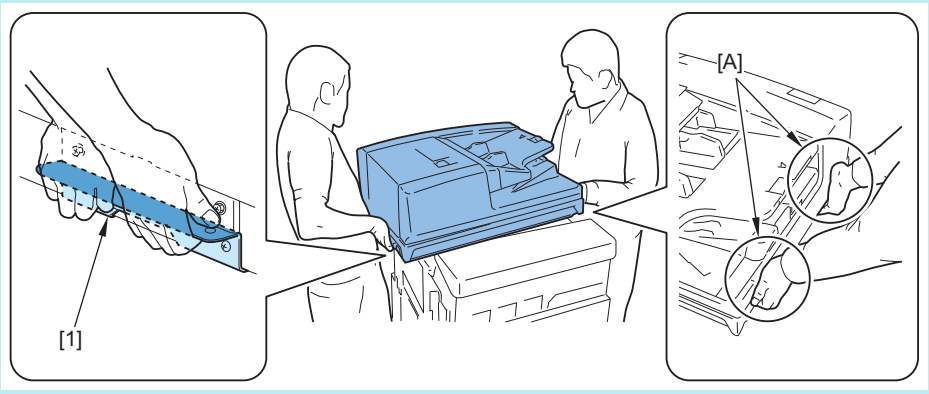
- Do not trap the Reader Power Supply Cable [2] and the Reader Communication Cable [3].
- Be careful not to break the 2 Dust Collection Cups [4].
- Be careful not to break the Wire Saddle [5].



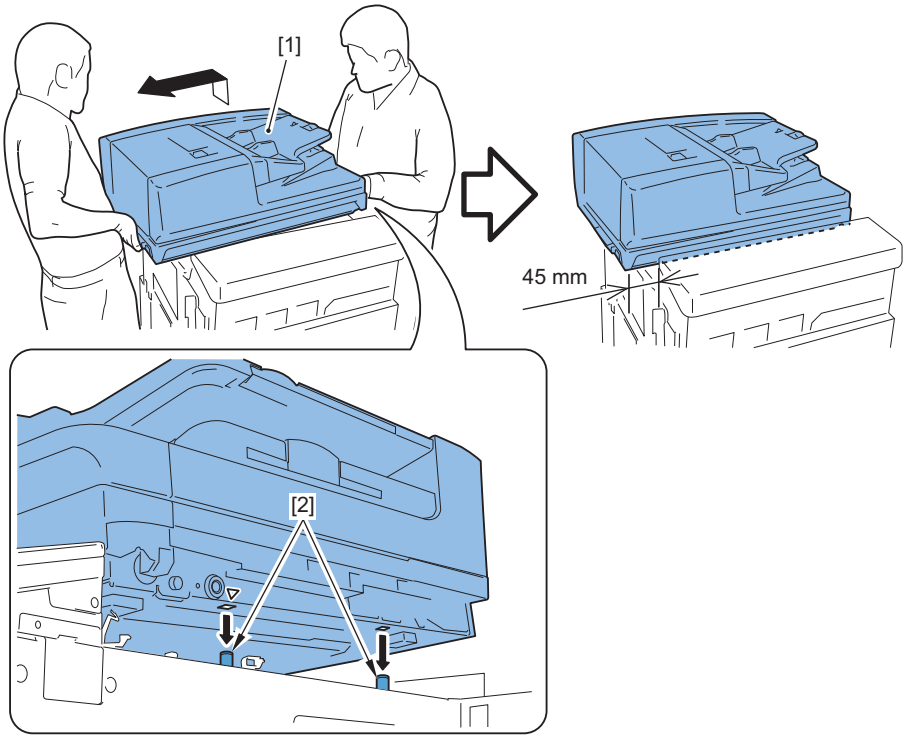
⚠ CAUTION:

- Because the weight of the equipment is approx. 40 kg, be sure to work with 2 or more people when lifting it up/down. Also, be sure to lift the equipment horizontally.
- When lifting up/down the DADF + Reader Unit, be careful not to get the cables and fingers caught.

NOTE:
When lifting up/down the DADF + Reader Unit, be sure to hold the Reader Support Plate A [1] and the 2 positions on the right side of the reader [A].



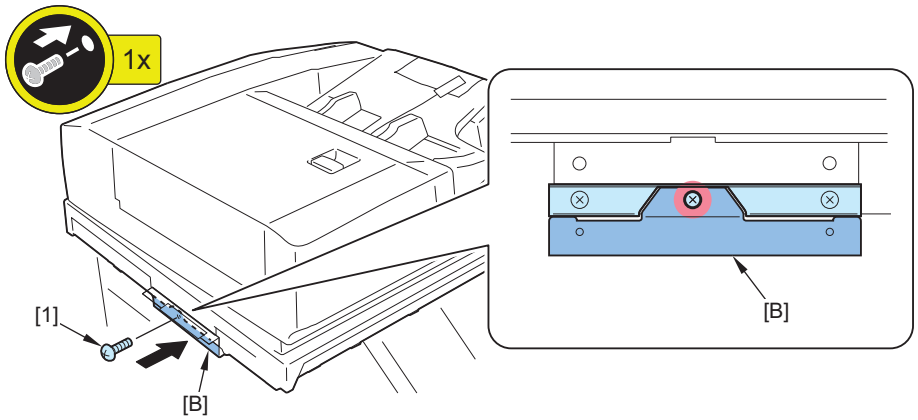
23. **Remove the DADF + Reader Unit [1] from the 2 pins [2] of the host machine, and place it temporarily while being shifted for approx. 45mm toward left side of the host machine.**



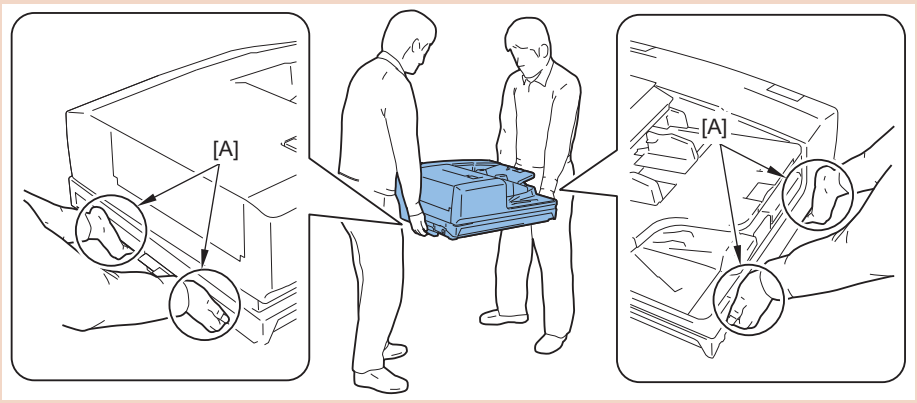
24. Install the Reader Support Plate [B].

- 1 Screw [1]

CAUTION:
When lifting down the DADF + Reader Unit from the host machine, be sure to install the Reader Support Plate [B] to the DADF + Reader Unit before lifting it down. This is to prevent deformation of the bottom of the Reader Unit.

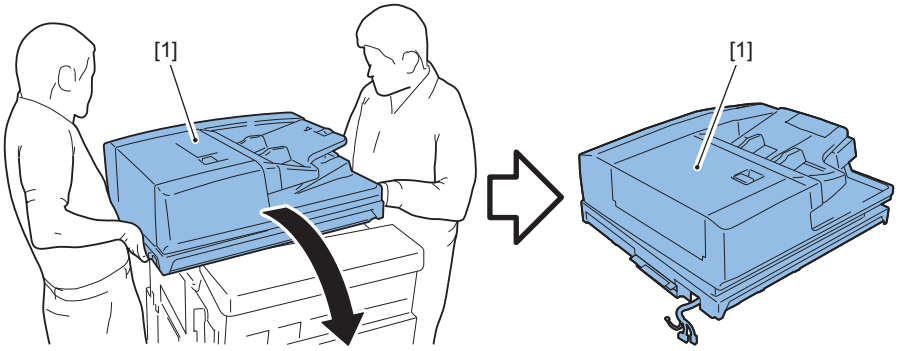


CAUTION:
When lifting up/down the DADF + Reader Unit, be sure to hold the position [A] shown in the figure.



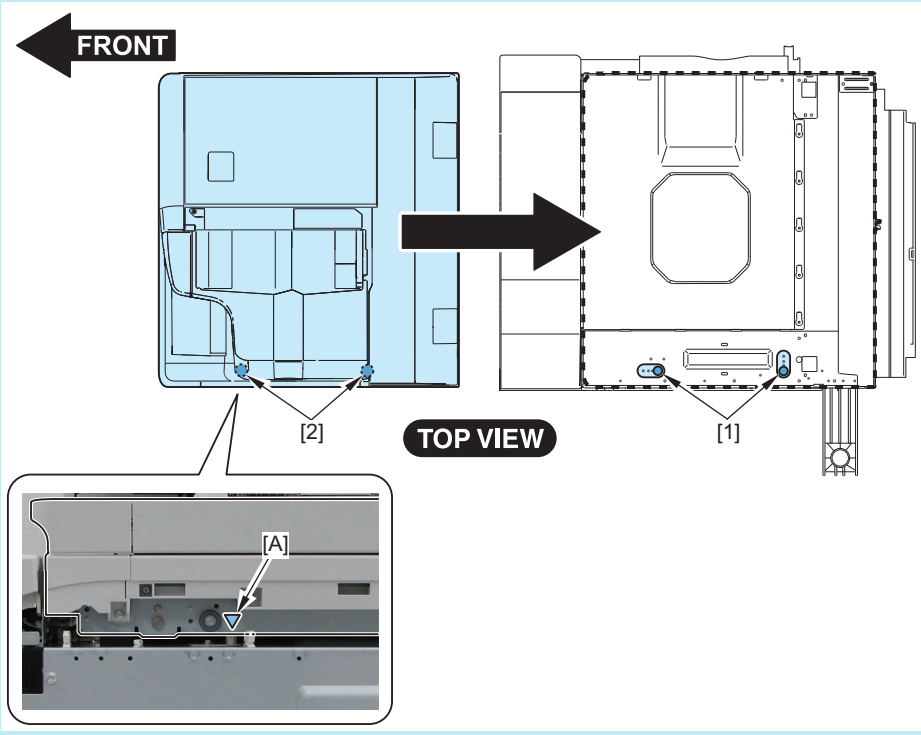
25. Lift the DADF + Reader Unit [1] with 2 or more people, and remove it by passing over the front side of the host machine.

CAUTION:
Because the center of gravity of the equipment is at the rear, be careful not to drop it when lifting it.



NOTE:
Installation to the host machine
Place the DADF + Reader Unit temporarily on the floor in such a way that the 2 pins [1] of the host machine and the 2 holes of the DADF + Reader Unit are facing the same direction. Then, place the DADF + Reader Unit on the host machine from the front side of the machine.

- The triangle mark [A] are shown to indicate the positions of the 2 holes [2] located on the side of the Reader Unit.



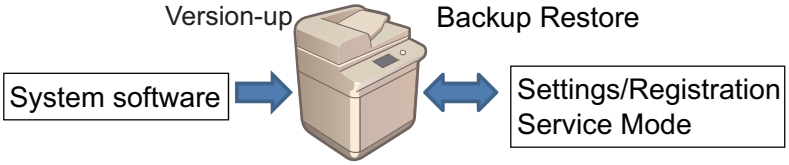
Data to be handled by SRAM(with HDD Encryption Board

The kind of data to handle

Data to operate this machine is largely divided into 2 categories.

System software	Common data among the same model
Data in SRAM and HDD on the boards	Factory settings value for the target machine and the values in Address Book and Settings/Registration, etc. entered by the user.

Upgrading and installation is used as the terms to handle the system software.
Backup and restoration is used as the terms to handle data in SRAM and HDD on the boards.



Be sure to use the latest possible backup data for the SRAM data of each board.
If restoring the SRAM data backed up long time ago, image failure, etc., may occur due to mismatch between the backup data and the parameter for host machine adjustment changed after backup.

■ Handling SRAM data of this machine

With the normal service, the contents of SRAM of the Main Controller PCB 2 can be backed up to HDD in service mode and restored after replacing the board.
If there is an HDD Encryption Board, the encryption key of the HDD Encryption Board recorded on SRAM is lost when replacing the Main Controller PCB 2, and the contents of HDD cannot to be read. Therefore, restoration cannot be done although backup is performed.
When replacing the Main Controller PCB 2, user data needs to be reentered in the same way as when replacing the HDD with a new one.

Part to be replaced	Description	Procedure	When TPM is enabled (ON)
Main Controller 2	SRAM of the Main Controller PCB 2 includes user data and MEAP-related data. If there are any files backed up from RUI by the user, restore them after recovery. Explain the user that the reinstallation of everything related to MEAP is necessary. Reference: If MeapBack.bin.bin is saved using SST, it can be restored after replacing the Main Controller PCB 2. This makes the reinstallation of everything related to MEAP unnecessary.	1. Use SST to backup the "sramimg.bin." 2. Replace the Main Controller PCB. 3. Use SST to restore the "sramimg.bin."	After the system is properly installed, enable TPM to execute a backup of TPM.
New HDD	Install the system software on the new HDD after formatting it by SST. If there are any files backed up from RUI by the user, restore them after recovery. Explain the user that the reinstallation of everything related to MEAP is necessary.	1. Hold down 2 and 8 to start the machine. 2. Use SST to Format ALL. 3. Install the system.	After the system is properly installed, enable TPM to execute a backup of TPM.

Part to be replaced	Description	Procedure	When TPM is enabled (ON)
New HDD	Reference: If MeapBack.bin.bin is saved using SST, it can be restored after replacing the Main Controller PCB 2. This makes the reinstallation of everything related to MEAP unnecessary.	1. Hold down 2 and 8 to start the machine. 2. Use SST to Format ALL. 3. Install the system.	After the system is properly installed, enable TPM to execute a backup of TPM.
System installation when the HDD is properly working.	To upgrade the system version, the Assist Mode of SST is recommended.	1. Enter service mode and select the following: COPIER > FUNCTION > SYSTEM > DOWNLOAD > OK 2. Use SST to install the system software in Assist mode.	No additional work
Backup of Reader Controller PCB	Enter service mode to make a backup of SRAM data into the HDD.	1. Select the following to execute system backup: COPIER > FUNCTION > SYSTEM RSRAMBUP 2. Replace the Reader Controller PCB 3. Select the following to restore the system: COPIER > FUNCTION > SYSTEM RSRAMRES	No additional work
Backup of DC Controller PCB	Enter service mode to make a backup of SRAM data into the HDD.	1. Select the following to execute system backup: COPIER > FUNCTION > SYSTEM DSRAMBUP 2. Replace the DC Controller PCB 3. Select the following to restore the system: COPIER > FUNCTION > SYSTEM DSRAMRES	No additional work
HDD Encryption Board	An encryption key of the HDD Encryption Board is newly made. Install the system software on the HDD after formatting it by SST. If there are any files backed up from RUI by the user, restore them after recovery.	1. Hold down 2 and 8 to start the machine. 2. Use SST to Format ALL. 3. Install the system.	After the system is properly installed, enable TPM to execute a backup of TPM.
TPM Board	When there is a backup of TPM, restore TPM.	1. Use RUI to make a restore.	Follow the description on the left.
	When there is no backup of TPM, select the following: Settings/Registration > Management Settings	1. Use RUI to make a backup. 2. Settings/Registration > Management Settings > Data Management > Initialize All Data/Settings 3. Use RUI to make a restore. 4. Enable TPM to make a backup.	Follow the description on the left.

● Items which needs to be backed up when replacing the Main Controller PCB 2

When replacing the Main Controller PCB 2, the encryption key of the HDD Encryption Board on SRAM is lost and HDD cannot be accessed. For recovery, perform "Items which needs to be backed up by the user when replacing the HDD" as well in addition to the table below to format the HDD.

Items	User	Service	DCM

*1: Detailed parameters cannot be imported by default. Only basic parameters can be imported.
When OFF is set for "Restrict Receiving for Each Function" in “Device Information Delivery Settings" in "Settings/Registration", the detailed parameters can also be imported.
However, import of detailed parameters between different models is not recommended.
The data can be import/export only from/to another host machine of the same model.
*2: "Copy" and "Scan and Store" are not supported.
*3: IIt is possible only when logging in as an administrator user.
*4: Only "favorites of web browser" can be backed improves.
*5: Only when the MEAP applications have a backup function
*6: Data retained independently by the MEAP application is excluded. This includes only data registered as management information data of the MEAP application.
*7: Backup only against TPM PCB failure is possible.
In addition, restoration cannot be done to other machines whose TPM setting is set to "ON".
*8: Backup is possible in Sraming, DSRAMBUP, and RSRAMBUP.
*9: When You set it in COPIER > OPTION > USER > SMD-EXPT > ON, a backup/restore is possible in Service Mode Settings from the Remote UI.
There is a backup button on the TOP page of the service mode. HDD and USB memory can back up Service Mode Settings by backup button.
*10:Audit log that was exported cannot be put back to the device from which the log was exported

● Items with no backup method when replacing the HDD

Regarding the items in the table below, there is no method for the user to back them up. Ask the user to make settings again. Part of the items can be recovered from Meapbac.bin.

Items	User	Service	DCM
Preferences (Except for Paper Type Management Settings)	-	SST (Sramimg)	Remote UI (Import/Export All)
Adjustment/Maintenance	-	SST (Sramimg)	Remote UI (Import/Export All)

Setting items for Main Menu	-	-	Remote UI (Import/Export All)

● Using SST enables the following:

SST has the following functions that are necessary for service work:

- To download system software
- To copy the system software into a USB memory device.
- To backup and restore information of SRAM and MEAP in Main Controller.
- To format HDD
- To collect device log
- To clear the encryption key of HDD Encryption Board

● Upgrading using a USB memory device

Using a USB memory device, the following functions are available to upgrade the system:

- To download system software
- To clear download file
- To format HDD
- To collect device log

Adjustment

Basic Adjustment

Image Position Adjustment <Overview>

■ Checking the paper size

- The image position adjustment is executed based on the following premises: paper sizes of A3 and LDR are 297mm X 420mm and 279mm X 432mm, respectively. Therefore, if the trailing edge margin and right edge margin do not become the reference value 2.5mm after the adjustment, the paper size may not be the regular size so check the paper size being used.
- In leading edge right angle adjustment, it is assumed that the four corners of paper are at a right angle.

■ Paper Type

The recommended paper to use for image margin adjustment is shown below.

- GF-C081 (81.4 gsm)
- OK Top Coat Plus (128 gsm)
- Hammermill Color Copy Digital 28lb (105 gsm)
- CANON-OCE TOP COLOUR 100 gsm

Image position adjustment can also be performed using paper frequently used by the customer. However, be sure not to use recycled paper, textured paper, and vellum paper because variation in feeding performance is more likely to occur with them.

■ Adjustment Flow and Standard

CAUTION:

- The test print used for adjustment must be magenta halftone image.
- In the case of halftone images delivered face-down, the leading edge of the formed image comes to the trailing edge side with respect to the feed direction. Be sure to pay attention to the leading edge and the trailing edge during measurement.

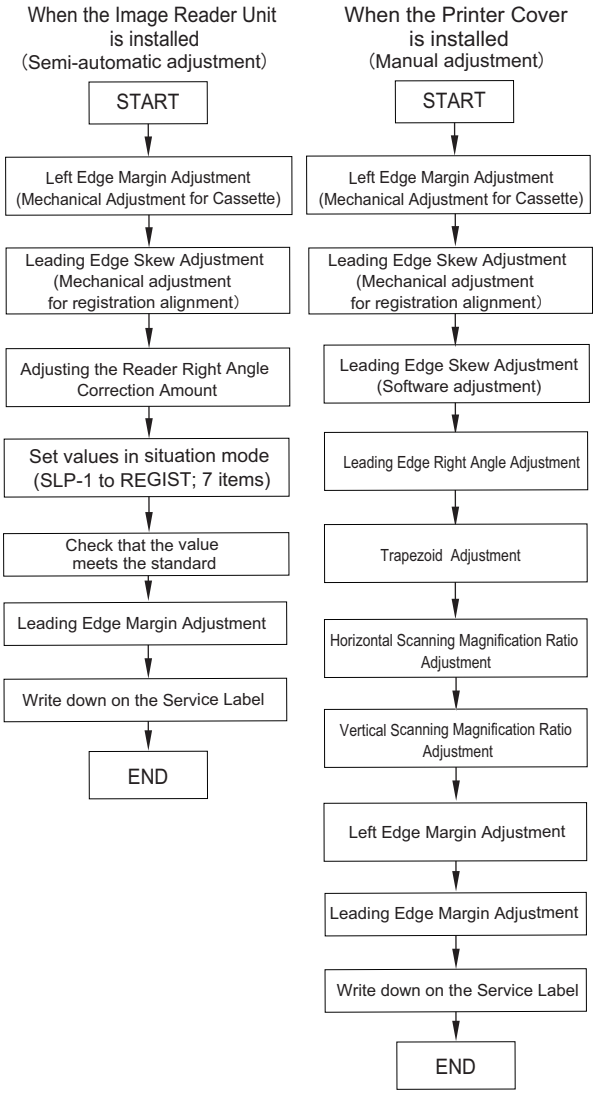
Check that each image position is within the specified range in accordance with "Checking/Adjusting Image Position". If it is out of the specified range, make an adjustment in accordance with "Adjustment method" of each item.

NOTE:

The following adjustment can be performed semi-automatically only when the Image Reader Unit is installed.
Semi-automatic adjustment: When the positions of images on 2-sided prints/copies are not aligned between the front and back sides, you can make adjustments at a time by reading a test page by the reader using a guide sheet.

- When the Image Reader Unit is installed (semi-automatic adjustment): Proceed to “Adjustment using the scanner (semi-automatic adjustment)” on page 983
- When the Printer Cover is installed (manual adjustment): Proceed to “Adjustment without using the scanner (manual adjustment)” on page 1009

< Adjustment flow >



< Adjustment using the scanner (semi-automatic adjustment) >

Left edge margin (Mechanical Adjustment for Cassette, Execute with all paper sources)

- L4 = 2.5 +/-1.0 mm or less

Lading edge skew (Mechanical Adjustment for Registration Alignment)

- -0.5 </= L1 - L2 </= +0.5 mm

Adjusting the Reader Right Angle Correction Amount

- D = (d1 + d2) / 2

Image Position Adjustments

- REG-L-1M (Left Edge Margin): +/- 5 or less
- REGIST1M (Leading Edge Margin): +/- 5 or less
- MAG-H-1M (Horizontal Scanning Magnification Ratio): +/- 20 or less
- MAG-V-1M (Vertical Scanning Magnification Ratio): +/- 20 or less
- SLP-1M (Leading Edge Skew): +/- 5 or less
- ANGLE-1M (Leading Edge Right Angle): +/- 5 or less
- TRPZ-1M (Trapezoid): +/- 5 or less

Leading edge margin

- L3 = 4.0 +/-0.5 mm or less

< Adjustment without using the scanner (manual adjustment) >

Left edge margin (Mechanical Adjustment for Cassette, Execute with all paper sources)

- L4 = 2.5 +/-1.0 mm or less

Lading edge skew (Mechanical Adjustment for Registration Alignment)

- -0.5 </= L1 - L2 </= +0.5 mm

Leading edge skew (Software Adjustment)

- -0.3 </= L1 - L2 </= +0.3 mm

Leading edge right angle (based on an assumption that right angle accuracy of paper is correct)

- -0.5 </= (L4 - L5) x 280/400 </= +0.5 mm

Trapezoid

- -0.5 </= Lx1 - Lx2 </= +0.5 mm

Magnification ratio in horizontal scanning direction

- A3 paper: Ly = 292 +/-0.6 mm or less
- LDR paper: Ly = 274.4 +/-0.5 mm or less

Magnification ratio in vertical scanning direction

- A3 paper: Lx = 412 +/-0.8 mm or less
- LDR paper: Lx = 423.8 +/-0.8 mm or less

Left edge margin (Software Adjustment)

- L4 = 2.5 +/-0.5 mm or less

Leading edge margin

- L3 = 4.0 +/-0.5 mm or less

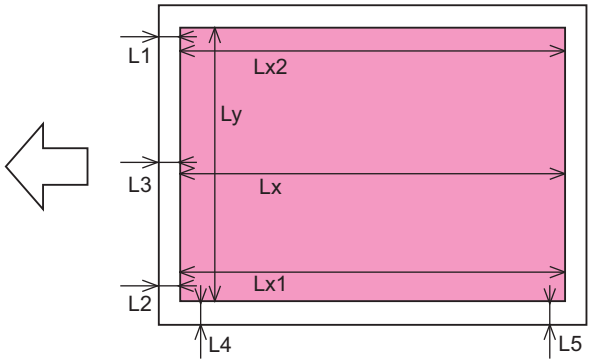


Image Position Adjustment<Checking/Adjusting>

Go through the following procedure for image adjustment.

☐

■ Adjustment using the scanner (semi-automatic adjustment)

● Left Edge Margin Adjustment (Mechanical Adjustment for Cassette Execute with all paper sources)

☐

1. **After setting the service mode (level 1) as follow, press the Start key and output a test print from each cassette.**
   - COPIER > TEST > PG > TYPE = 5
   - COPIER > TEST > PG > COLOR-M = 1
   - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
   - COPIER > TEST > PG > PG-PICK = 1/2/3

2. **In following service mode (Level 1), check that each value is within the range of +/- 10.**
   - COPIER > DISPLAY > CST-STS > REG-L-C1 (Cassette 1)
   - COPIER > DISPLAY > CST-STS > REG-L-C2 (Cassette 2)
   - COPIER > DISPLAY > CST-STS > REG-L-C3 (Cassette 3)

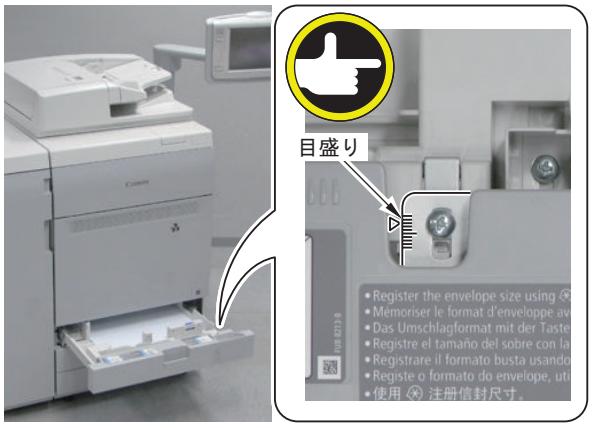
NOTE:
- Display range: -100 to 100 (0.1 mm per increment)
- If the value is "+": The paper is displaced to the front with respect to the feed direction.
- If the value is "-": The paper is displaced to the rear with respect to the feed direction.

3. **If the margin is within the range, proceed to "Adjustment Method step 7".**
   If it is not within the range, execute adjustment by following the procedure below.

< Adjustment Method >

☐

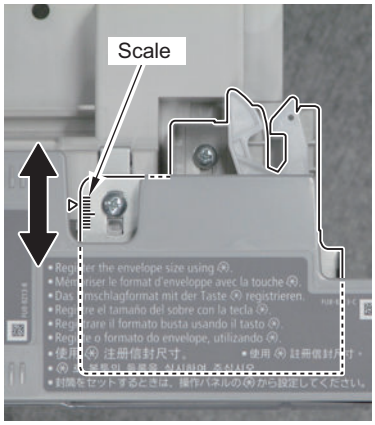
1. **Pull out the Cassette.**
2. **Check the position of the scale of the Cassette Lock Unit.**



3. **Loosen the 2 screws of the Cassette Lock Unit.**

4. **According to the scale in which the position was checked in step 2, adjust the position of the Cassette Lock Unit.**
   - Rough indication: 1.0 mm per increment
   - If the value is "+": Move it toward the front by the amount of "REG-L-xx".
   - If the value is "-": Move it toward the rear by the amount of "REG-L-xx".
     Example: If the value of "REG-L-xx" is "+30", move the Cassette Button Link Unit toward the front by 3 mm.

CAUTION:
Be careful not to move a cassette too much; otherwise, it may not be able to be installed in the host machine.



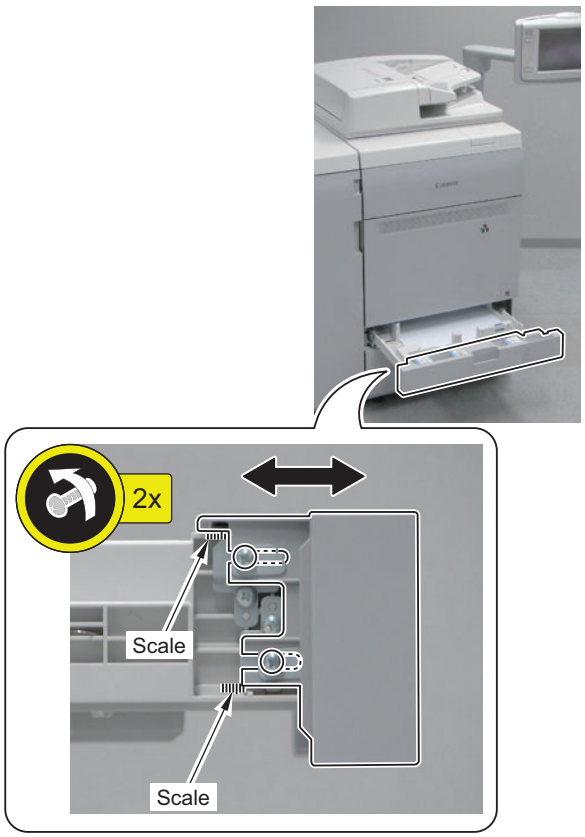
5. **Tighten the 2 screws loosened in step 3.**

6. **Perform printing again from the paper source where adjustment has been made, and check that the value is within the specified range. When the result is out of the specified range, repeat steps 1 to 5.**

NOTE:
If you are concerned with alignment of the Cassette Cover, adjust the right and left sides of the cover as necessary.

7. **Loosen the 2 screws and adjust the position of the Cassette Cover by referring to the scale.**
   When moving the Cassette Lock Unit, adjust the left side of the Cassette Cover by shifting it with the same shifting amount of the unit.

8. **Tighten the 2 screws that were loosened.**



9. **Exit service mode.**

CAUTION:
When "Mechanical Adjustment for Cassette Execute" has been performed, be sure to perform the following "Cassette pull-in Check".

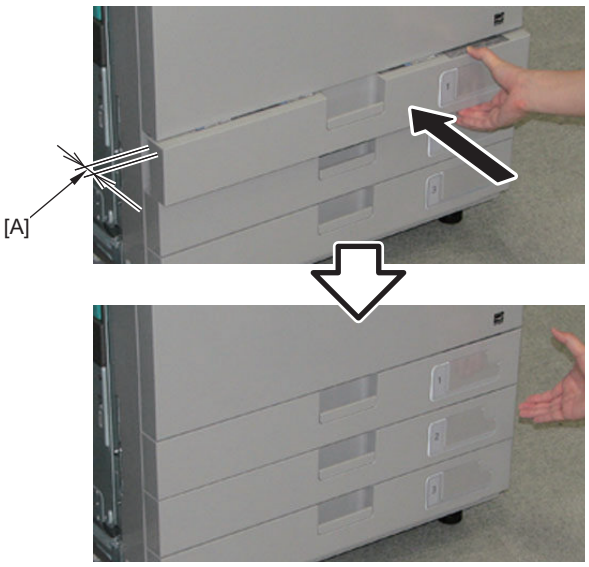
<Cassette pull-in Check>

☐

1. **Open the Left Cover.**
2. **Open the cassette 200 mm or more.**

NOTE:
The pull-in mechanism is activated by opening the cassette 200 mm or more.

3. Push back the cassette until it is 15 mm [A] from the Front Cover of the host machine, and let go of the cassette.



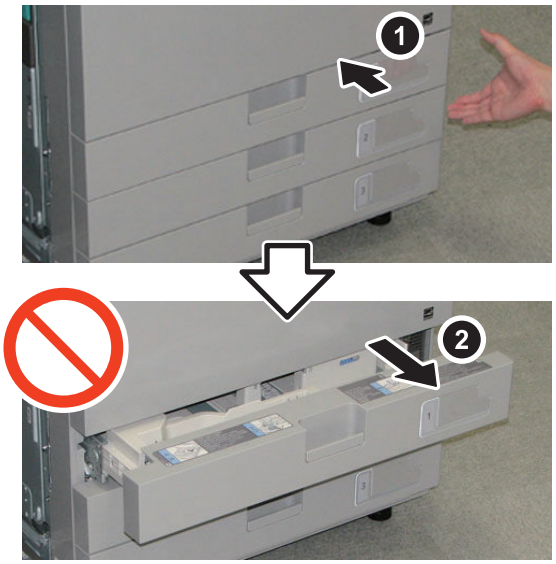
< Appropriate >

The latch is locked, and the level difference between the Cassette Front Cover and other external covers is within the appropriate range when viewed from the left side. Adjustment is not necessary.

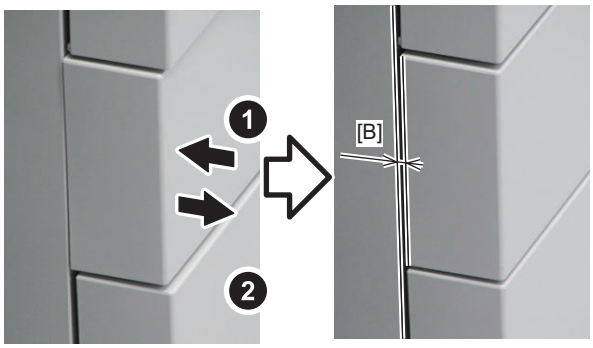
- The level difference [A] between the cassette and other covers (the Front Cover and other Cassette Front Covers) on the front side should be 2 mm or less.
- The gap [B] from the cover on the rear side should be 4 to 5 mm.

< Semi-closed >

The cassette has been excessively pulled in. The gap from other external covers is eliminated by further pushing the cassette in this situation, but adjustment is needed from a functional point of view.



By further pushing the cassette in this situation, a gap [B] is generated between the cassette and the cover on the rear side. Measure and write down the gap [B].



Perform "Adjusting the Cassette Front Cover", and then perform "Adjusting the Pull-in Guide" as needed.

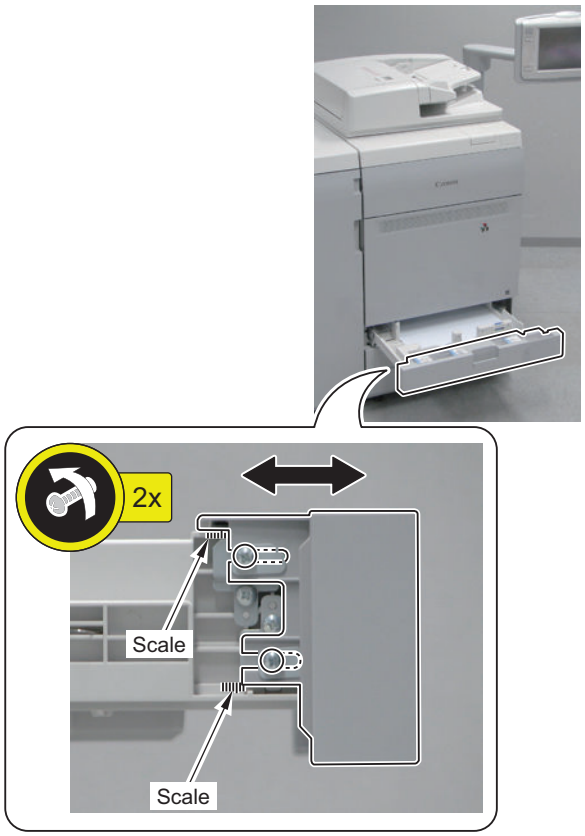
< Latch not locking >

The cassette has not been pulled in enough. The cassette is not latched and comes out. Perform "Adjust the Pull-in Guide".

<Adjusting the Cassette Front Cover>

1. **Pull out the cassette.**
2. **Loosen the 2 adjustment screws on the left side, and move the Cassette Front Cover as needed using the 2 scales as reference until the gap [B] from the cover on the rear side you wrote down in "Checking Method" changes to a value within the appropriate range.**

NOTE:
While the appropriate range of the gap is 4 to 5 mm in normal circumstances, in the case of a semi-closed cassette, adjust the gap to a value within 5 mm.



3. **Tighten the 2 adjustment screws you loosened in step 2.**
4. **Perform the procedure of "Checking Method" again. If the gap is still out of the appropriate range, perform "Adjusting the Pull-in Guide".**

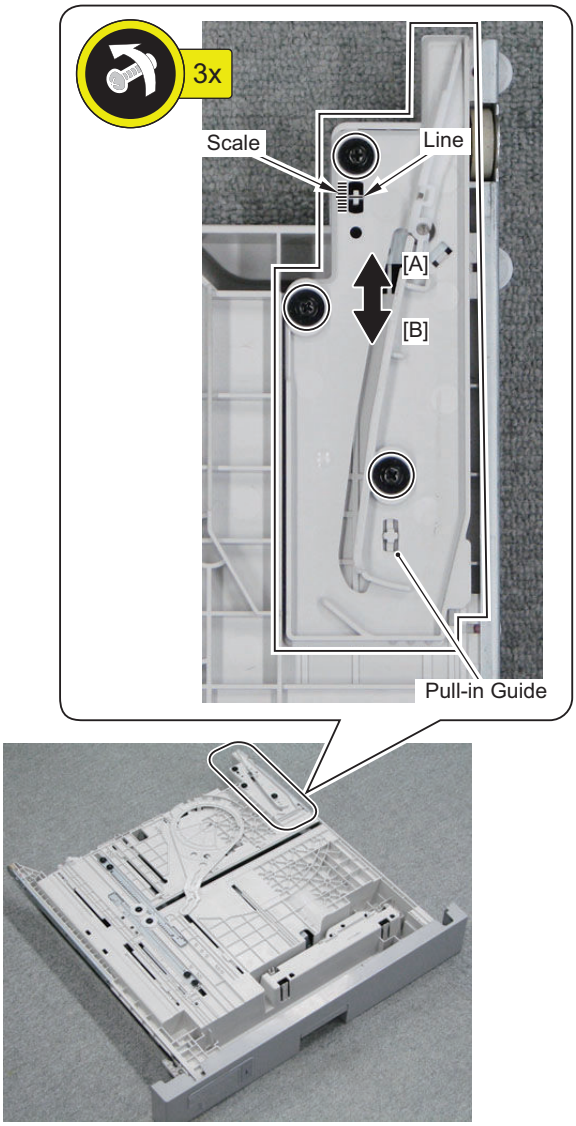
<Adjusting the Pull-in Guide>

1. **Remove the cassette.**

2. **Loosen the 3 adjustment screws on the rear side of the cassette. Using the scale and the boss line as reference, move the position of the Pull-in Guide for 1 division of the scale.**

NOTE:
Check the initial position on the scale (because the position at the time of shipment is not always at the center).

- In the case of a semi-closed cassette: Move the Pull-in Guide for 1 division of the scale upward (toward the rear side [A] of the host machine) so that the amount the cassette is pulled in is reduced.
- In the case of latch not locking: Move the Pull-in Guide for 1 division of the scale downward (toward the front side [B] of the host machine) so that the amount the cassette is pulled in is increased.



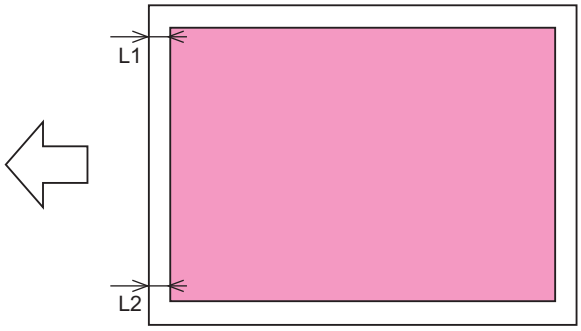
3. **Tighten the 3 adjustment screws you loosened in step 2.**
4. **Perform the procedure of "Checking Method" again, and adjust the gap until it becomes an appropriate value.**

● Leading Edge Skew Adjustment (Mechanical Adjustment for Registration Alignment)

□

1. **After setting the service mode (level 1) as follow, press the Start key and output a test print from the Cassette 1.**
   - COPIER > TEST > PG > TYPE = 5
   - COPIER > TEST > PG > COLOR-M = 1
   - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
   - COPIER > TEST > PG > PG-PICK = 1

2. **Check that the values of the leading edge skew of the image satisfy "-0.5 </= L1 - L2 </= +0.5 mm". When the result is out of the specified range, perform adjustment by following the following procedure.**

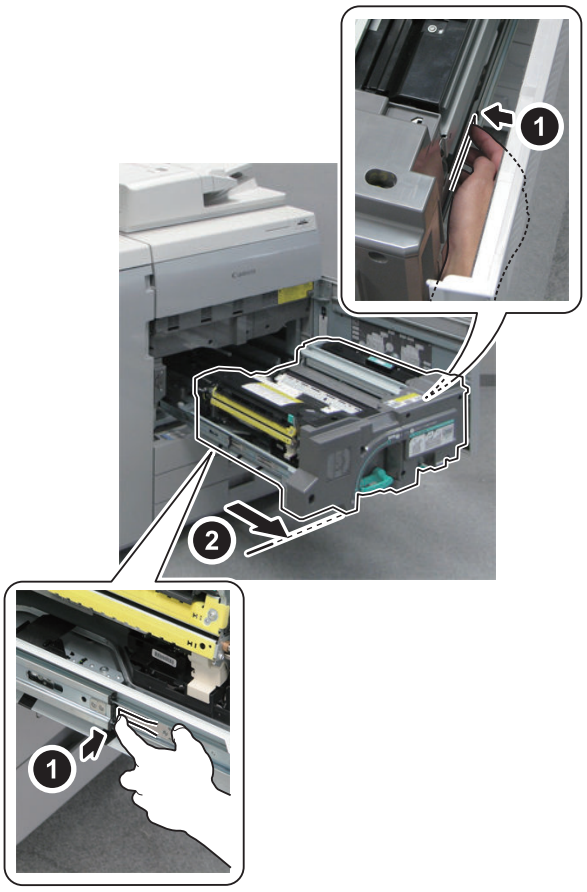


< Adjustment method >

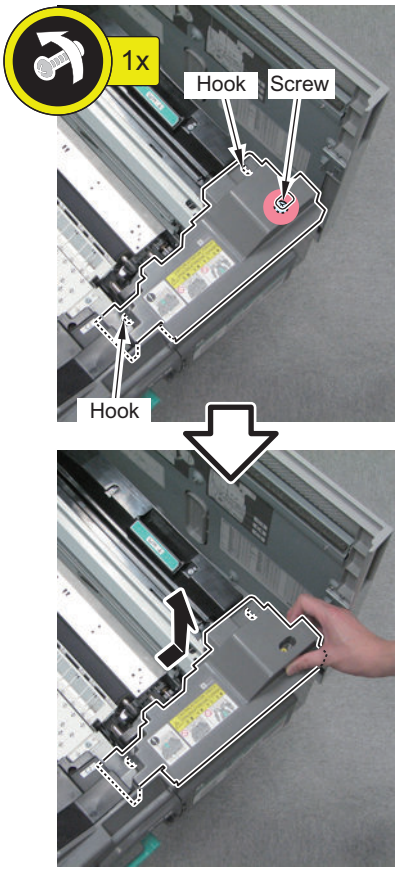
□

1. **Open the Front Cover and pull out the Fixing Feed Unit.**
2. **Push the 2 Lock Springs of the Rails (both sides) to release the lock and further pull out the Fixing Feed Unit until it stops.**

CAUTION:
Do not release the Lock Springs at the rear side of the Rails (both sides); otherwise the Frame of the Fixing Feed Unit can be off.

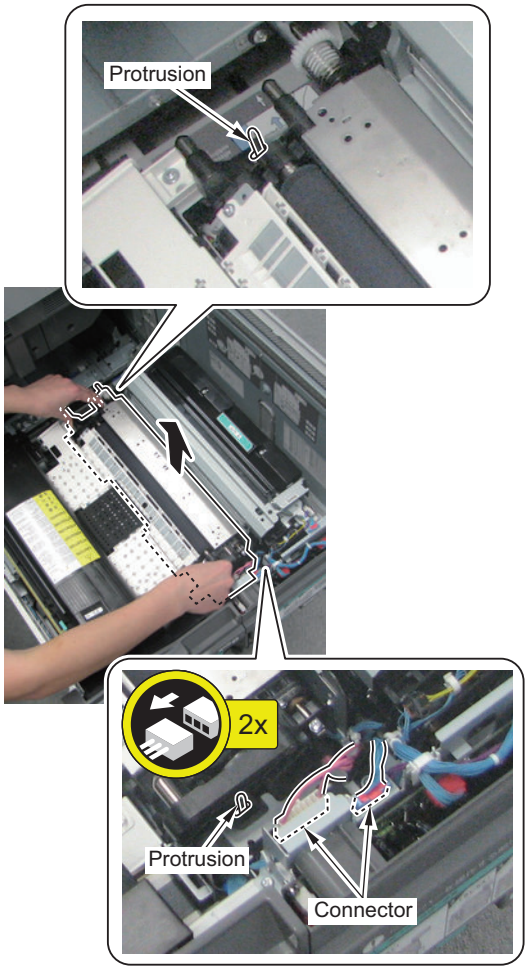


3. **Remove the Fixing Feed Inner Cover.**
   - 1 Screw
   - 2 Hooks

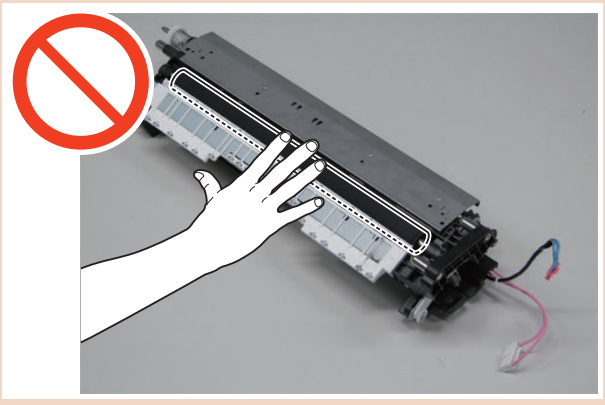


4. Remove the Secondary Transfer Outer Unit.

- 2 Connectors
- 2 Protrusions



CAUTION:
Do not touch the surface of the Secondary Transfer Outer Roller.

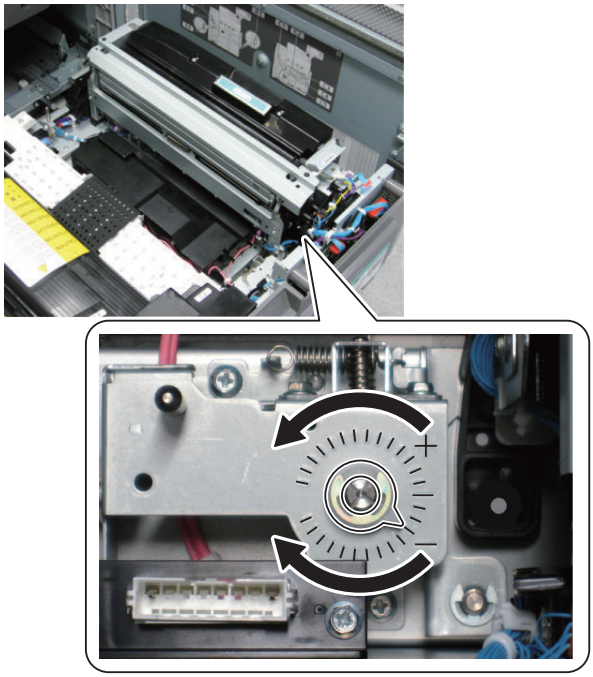


5. Loosen the 4 screws.

6. Adjust the Registration Adjustment Shaft by turning it with a screwdriver.

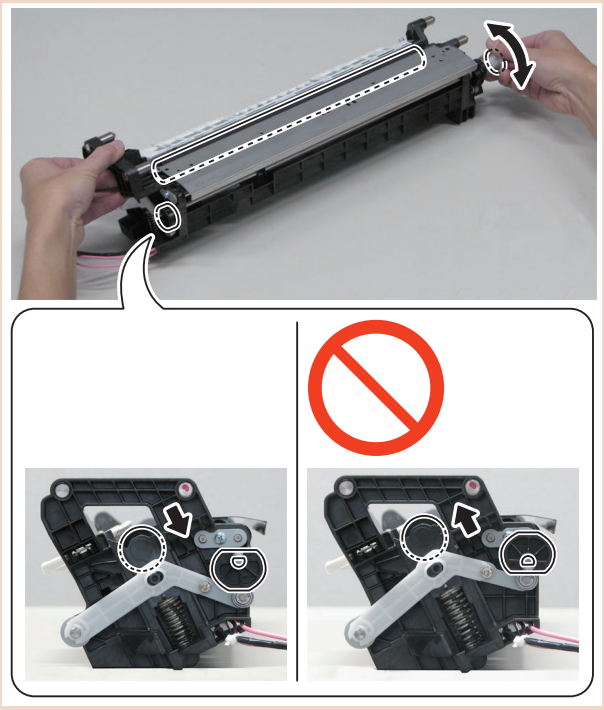
- In case of L1 - L2 > 0.5 mm: Turn to - direction
- In case of L1 - L2 < -0.5 mm: Turn to + direction

  e.g.: In case of L1 - L2 = 0.6, turn the shaft to - direction by 6 scales.
  1 scale mark of the dial: 0.1mm



7. Install the Secondary Transfer Outer Unit (2 Connectors).

CAUTION:
When installing the Secondary Transfer Outer Unit to the Fixing Feed Unit, be sure to do so after releasing the pressure applied on the Secondary Transfer Outer Roller. (Otherwise, the Secondary Transfer Outer Roller may be deformed, or the ITB may be damaged.)
< How to release the pressure applied on the Secondary Transfer Outer Roller >
The pressure on the Secondary Transfer Outer Roller can be released by turning the gear and changing the direction of the cam. Be sure to keep the Secondary Transfer Outer Roller lowered.



8. **Tighten the 4 screws loosened in step 5.**

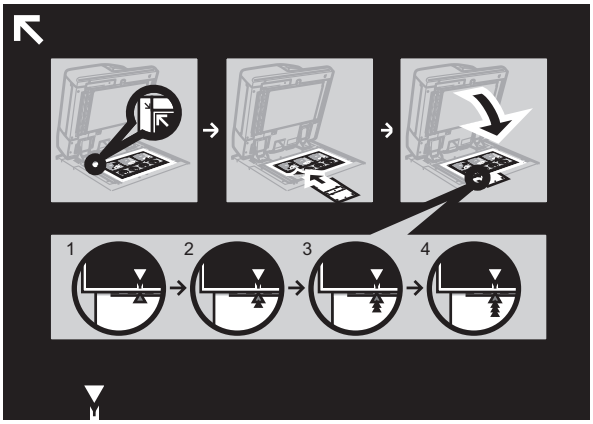
CAUTION:
When tightening the screws, be sure to tighten them in the order from (1) to (2).

9. **Perform printing again from the Cassette 1, and check that the value is within the specified range.**

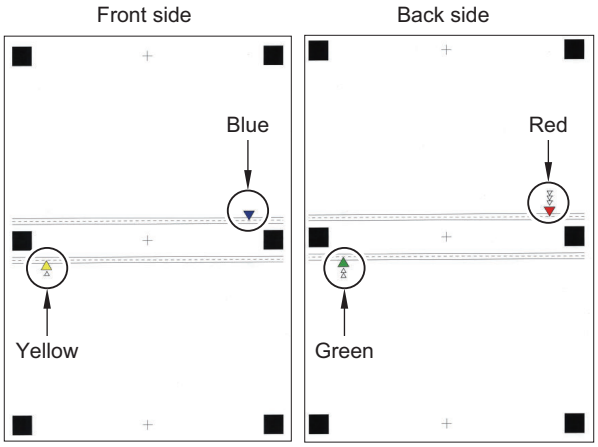
● Adjusting the Reader Right Angle Correction Amount

When the positions of images on 2-sided prints/copies are not aligned between the front and back sides, make adjustments by reading a test page by the reader using a guide sheet.

Guide sheet



Test page (2-sided)



CAUTION:

- Be sure to clean the Copyboard Glass and the back side of the feeder before adjustment.
- Use data for the guide sheet (for A3, for 11x17) provided separately.
- Print the guide sheet under the following conditions: When the guide sheet is not properly printed, accurate adjustment result may not be obtained.
  Use a sheet of paper whose size is the same as the size data of the guide sheet to create a guide sheet.
  Paper that is 200 g/m2 or above is recommended.
  Set the magnification ratio to 100% magnification.

☐

NOTE:
When [System Manager Information Settings] is set, it is required to log in as a system manager in accordance with instructions of the user administrator.

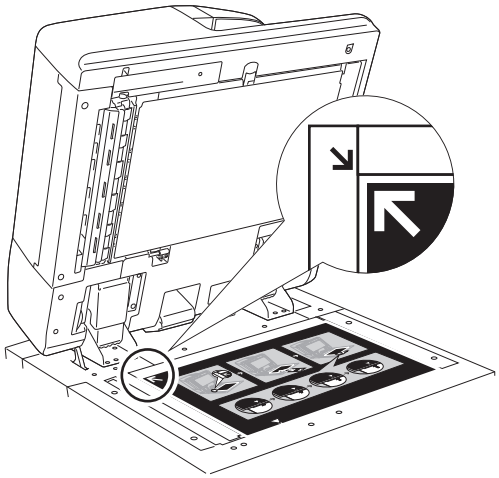
1. **Select [Settings/Registration] > [Preferences] > [Paper Settings] > [Paper Type Management Settings].**
2. **Select paper to use for adjustment, press [Duplicate], and then name and save the paper.**
3. **Make settings of the duplicated paper in [Paper Settings].**

☐

4. **Press [Paper Type Management Settings], select the type of duplicated paper from the list, and then press [Details/Edit].**
5. **Press [Change] of <Adjust Image Position>, and press [Use Scanner].**
6. **Set the number of test page to output to 1, and press [Next].**
7. **Select the paper source where paper used for the adjustment is loaded, and press [Start Printing] (a test page is output).**

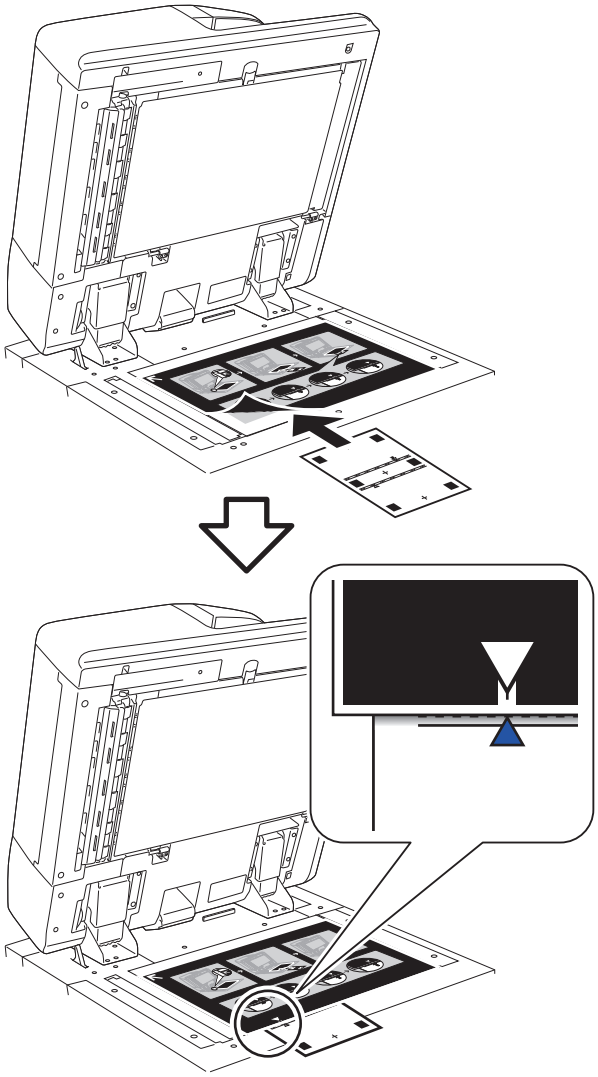
□

8. **Place the guide sheet on the Copyboard Glass, and align the arrow mark of the guide sheet with that of the Copyboard Glass.**



□

9. **Align the triangle mark of the guide sheet with the triangle mark (blue) which is for the first scanning of the test page.**



☐

10. Close the feeder, and press [Start Scanning].

NOTE:
Be careful not to move the guide sheet when closing the feeder.

☐

11. According to the instruction on the screen, scan the test page by setting the yellow, green, and red triangle marks for the second, third, and fourth scanning, respectively.

☐

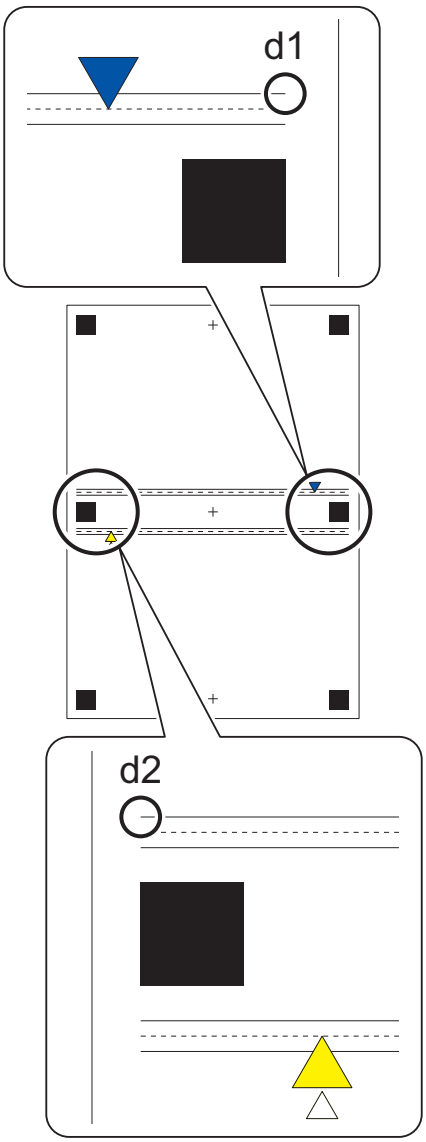
12. When multiple test pages were output, repeat the steps 9 to 11 for the number of test pages output.
The adjustment is finished when all the test pages have been scanned. Scan the test pages in the order they were output.

☐

13. After scanning is finished, perform the steps 5 to 7, and output 1 test page.

☐

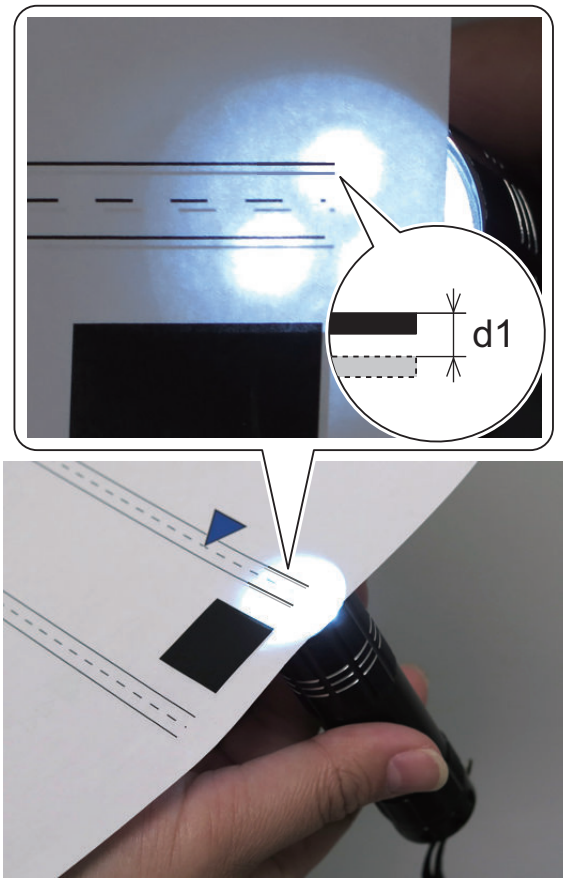
14. Measure the amount of displacement between the front and back sides of d1 (blue side) and d2 (yellow side) of the test page that was output.



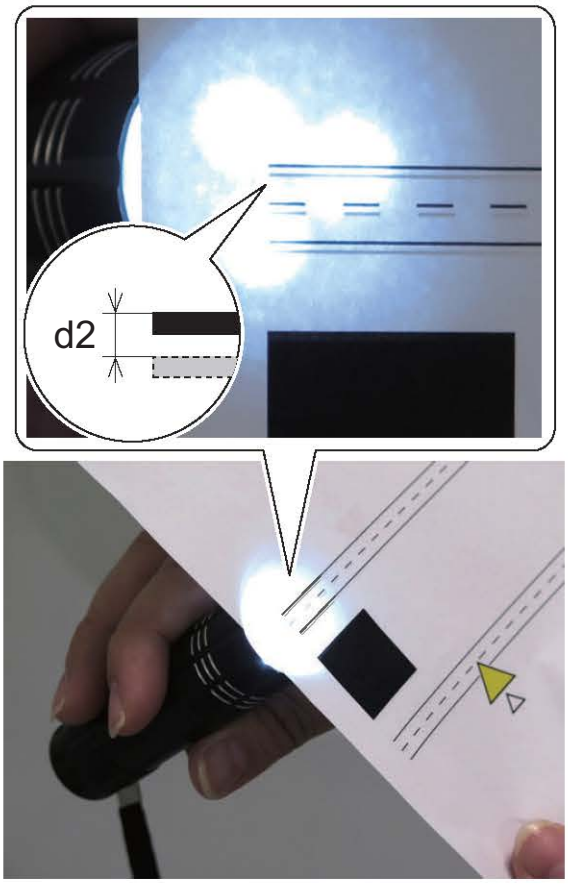
☐
14-1. Expose d1 (blue side) to the light from the back side (red and green side), and measure the amount of displacement between the front and back of d1.

CAUTION:
- Be sure to measure the amount of displacement either between the upper sides of the lines or between the lower sides of the lines.
- Use the lines on the front side (blue and yellow side) as a reference.

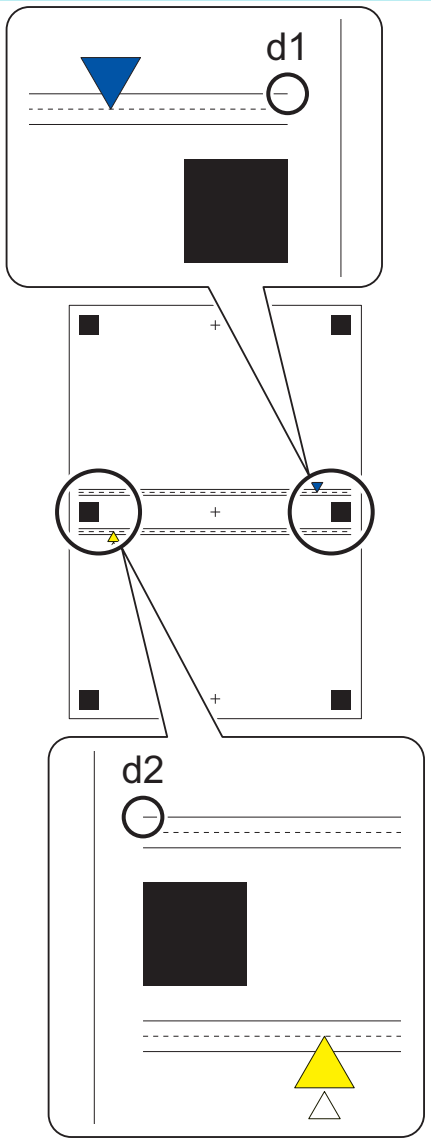
NOTE:
The gray part in dashed lines shows a line printed on the back (red and green side) from which the light is exposed.



□
14-3. Measure d2 (yellow side) in the same way.



NOTE:
Be sure to calculate D (the amount of displacement) in step 14-4 using the values measured in the direction shown in the figure below.



□

14-4. When d1 and d2 are 0.5 mm or less, respectively, end the adjustment. If more than 0.5 mm, calculate D which is the amount of displacement between the front and back as shown below:

- D = (d1 + d2)/2

NOTE:
When improving the accuracy further from 0.5 mm upon user's request, perform the following steps:

< Example of measuring D >

Yellow side / Blue side

Ex.1:

d2 = -0.7 d1 = -0.4

D = ((-0.7) + (-0.4))/2 = -0.55

Ex.2:

d2 = +0.5 d1 = +0.4

D = ((+0.5) + (+0.4))/2 = +0.45

Ex.3:

d2 = -0.7 d1 = +0.4

D = ((-0.7) + (+0.4))/2 = -0.15

Ex.4:

d2 = +0.5 d1 = -0.4

D = ((+0.5) + (-0.4))/2 = +0.05

□

15. Enter the measured D in the following service mode (Level 1). (Unit: 0.01 mm)

Service Mode > COPIER > ADJUST > ADJ-XY > RDR-ANG2

Ex.: Enter "-55" in the case of D = -0.55 mm.

Enter "55" in the case of D = +0.55 mm.

□

16. Perform the steps 4 to 11, and output 1 test page.

□

17. Measure the D (amount of displacement between the front and back) and if the further adjustment is necessary, go back to step 5, output 1 test page, and then perform the adjustment again.

NOTE:
If the adjustment is performed again, adjust by adding to the value displayed for RDR-ANG2 as the reference.

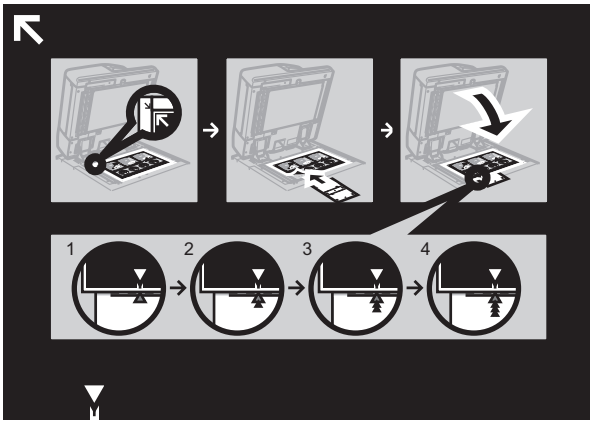
● Image Position Adjustments

Perform the following procedures to adjust the image position.

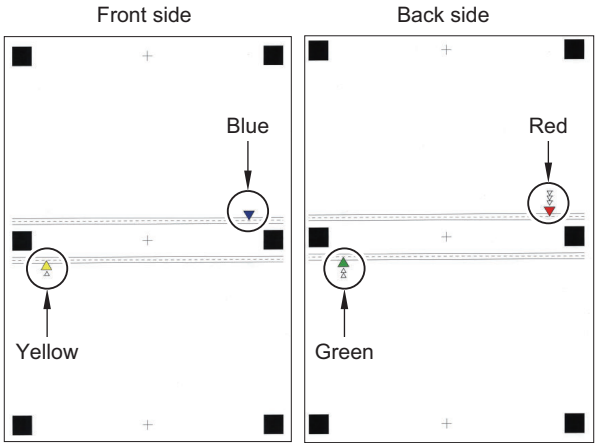
- Leading Edge Skew Adjustment (Software Adjustment)
- Leading Edge Right Angle Adjustment
- Trapezoid Adjustment
- Horizontal Scanning Magnification Ratio Adjustment
- Vertical Scanning Magnification Ratio Adjustment
- Left Edge Margin Adjustment
- Leading Edge Margin Adjustment

When the positions of images on 2-sided prints/copies are not aligned between the front and back sides, make adjustments by reading a test page by the reader using a guide sheet.

Guide sheet



Test page (2-sided)



CAUTION:

- Be sure to clean the Copyboard Glass and the back side of the feeder before adjustment.
- Use data for the guide sheet (for A3, for 11x17) provided separately.
- Before performing the adjustment, be sure to print the guide sheet under the following conditions: When the guide sheet is not properly printed, accurate adjustment result may not be obtained.
  Use a sheet of paper whose size is the same as the size data of the guide sheet to create a guide sheet.
  Paper that is 200 g/m2 or above is recommended.
  Set the magnification ratio to 100% magnification.

NOTE:
- **If "Adjusting the Reader Right Angle Correction Amount" has been performed just before this adjustment, the values scanned in the procedure can be used, and the output of the first test page (steps 1 to 11) can be omitted.**
- **In the case of performing "Adjusting the Reader Right Angle Correction Amount" and this adjustment separately, it is necessary to duplicate 2 types of paper "for adjustment" and "for checking" and output the test page 2 times.**

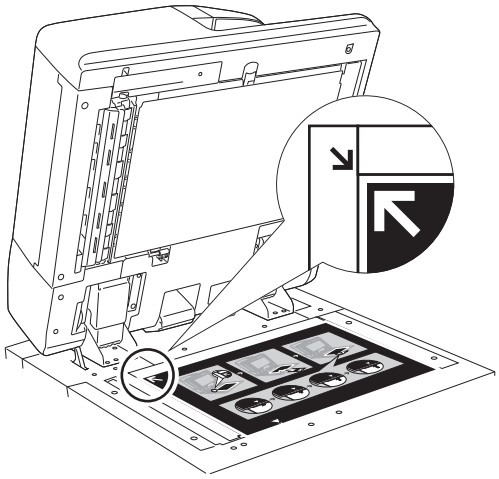
□

NOTE:
When [System Manager Information Settings] is set, it is required to log in as a system manager in accordance with instructions of the user administrator.

1. **Select [Settings/Registration] > [Preferences] > [Paper Settings] > [Paper Type Management Settings].**
2. **Select paper to use for adjustment, press [Duplicate], and then save the paper under a new name (for adjustment).**
3. **Make settings of the duplicated paper (for adjustment) in [Paper Settings].**
4. **Press [Paper Type Management Settings], select the type of duplicated paper (for adjustment) from the list, and then press [Details/Edit].**
5. **Press [Change] of <Adjust Image Position>, and press [Use Scanner].**
6. **Set the number of test pages to output to 1, and press [Next].**
7. **Select the paper source where paper used for the adjustment is loaded, and press [Start Printing] (a test page is output).**

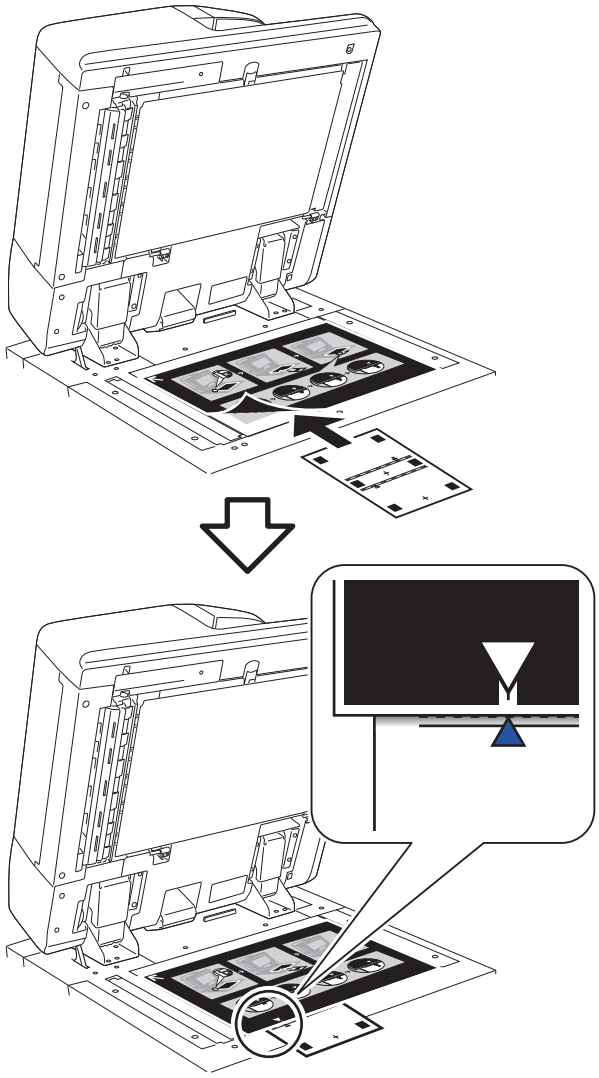
□

8. **Place the guide sheet on the Copyboard Glass, and align the arrow mark of the guide sheet with that of the Copyboard Glass.**



☐

9. **Align the triangle mark of the guide sheet with the triangle mark (blue) which is for the first scanning of the test page.**



☐

10. **Close the feeder, and press [Start Scanning].**

NOTE:
Be careful not to move the guide sheet when closing the feeder.

☐

11. **According to the instruction on the screen, scan the test page by setting the yellow, green, and red triangle marks for the second, third, and fourth scanning, respectively.**

CAUTION:
Do not change the paper settings scanned in [Paper Settings] (or the scan results will be overwritten).
If settings of another paper have been configured before adjusting the image position, start from step 8 to scan the test page again.

☐

12. **Enter service mode > SITUATION > Installation > Semi-automatic image position adjustment.**

13. Add the value shown in the scan result (with "M" at the end) to the setting value.

Example 1: When the left edge margin REG-L-1M = 4, REG-L = 3
4 + 3 = 7, therefore enter "7" for REG-L.
Example 2: When the left edge margin REG-L-1M = 4 = -4, REG-L = -3
(-4) + (-3) = -7, therefore enter "-7" for REG-L.

Adjustment item	Scan result	Setting value
Left edge margin	REG-L-1M	REG-L
Leading edge margin	REGIST1M	REGIST
Horizontal scanning magnification ratio	MAG-H-1M	MAG-H
Vertical scanning magnification ratio	MAG-V-1M	MAG-V
Leading edge skew	SLP-1M	SLP-1
Leading edge right angle	ANGLE-1M	ANGLE-1
Trapezoid	TRPZ-1M	TRPZ-1

□

14. Perform steps 1 to 7 again to duplicate the paper type used as "for checking" aside from the paper type used as "for adjustment", and output a sheet of test page.

15. Perform steps 8 to 11 again to scan the test page.

CAUTION:
Do not change the paper settings scanned in [Paper Settings] (or the scan results will be overwritten).
If settings of another paper have been configured before checking the standard value, scan the test page again.

16. Enter service mode > SITUATION > Installation > Semi-automatic image position adjustment.

17. Check again that the value displayed in the scan result (with "M" at the end) meets the standard.

Scan result	Standard
REG-L-1M	+/-5 or less
REGIST1M	+/-5 or less
MAG-H-1M	+/-20 or less
MAG-V-1M	+/-20 or less
SLP-1M	+/-5 or less
ANGLE-1M	+/-5 or less
TRPZ-1M	+/-5 or less

18. If the value does not meet the standard, repeat steps 13 to 17.

19. After the adjustment, delete all the paper types that have been duplicated.

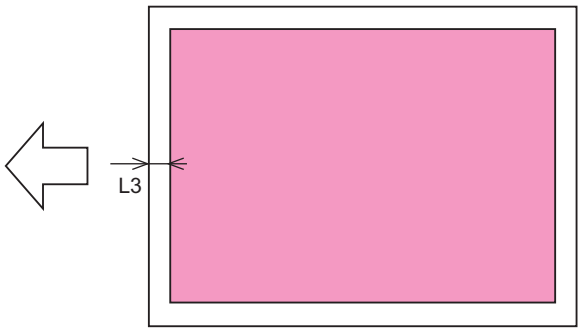
• Leading Edge Margin Adjustment

□

1. After setting the service mode (level 1) as follow, press the Start key and output a test print from the Cassette 1.

- COPIER > TEST > PG > TYPE = 5
- COPIER > TEST > PG > COLOR-M = 1
- COPIER > TEST > PG > COLOR-Y/C/Bk = 0
- COPIER > TEST > PG > PG-PICK = 1

2. **Check that the leading edge margin L3 is within the range indicated below. When the result is out of the specified range, perform adjustment by following the following procedure.**
   - L3: 4.0 +/-0.5 mm



< Adjustment method >

☐

1. **Adjust the value of the following service mode (Level 1): COPIER > ADJUST > FEED-ADJ > REGIST**
   - Setting range: - 100 to 100 (0.1 mm per increment))
   - When the setting value is increased by "1", the leading edge margin is decreased by 0.1 mm.
2. **Perform printing again from the Cassette 1, and check that the value is within the specified range.**
3. **If the values of the following service modes have been changed, write down the new adjustment value in the service label.**
   - REG-L
   - REGIST
   - MAG-H
   - MAG-V
   - SLP-1
   - ANGLE-1
   - TRPZ-1
4. **Exit service mode.**

■ Adjustment without using the scanner (manual adjustment)

● Left Edge Margin Adjustment (Mechanical Adjustment for Cassette Execute with all paper sources)

☐

1. **After setting the service mode (level 1) as follow, press the Start key and output a test print from each cassette.**
   - COPIER > TEST > PG > TYPE = 5
   - COPIER > TEST > PG > COLOR-M = 1
   - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
   - COPIER > TEST > PG > PG-PICK = 1/2/3
2. **In following service mode (Level 1), check that each value is within the range of +/- 10.**
   - COPIER > DISPLAY > CST-STS > REG-L-C1 (Cassette 1)
   - COPIER > DISPLAY > CST-STS > REG-L-C2 (Cassette 2)
   - COPIER > DISPLAY > CST-STS > REG-L-C3 (Cassette 3)

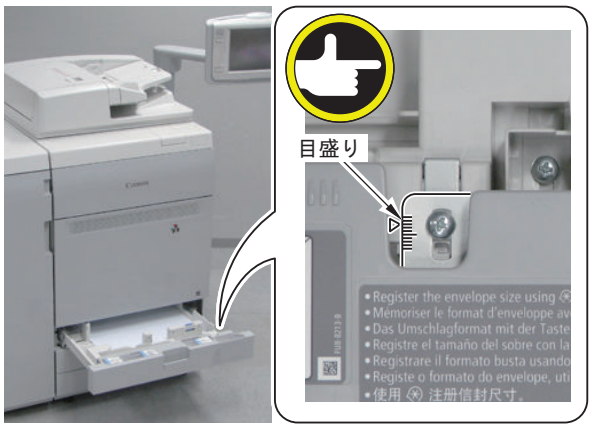
NOTE:
- Display range: -100 to 100 (0.1 mm per increment)
- If the value is "+": The paper is displaced to the front with respect to the feed direction.
- If the value is "-": The paper is displaced to the rear with respect to the feed direction.

3. **If the margin is within the range, proceed to "Adjustment Method step 7".**
   If it is not within the range, execute adjustment by following the procedure below.

< Adjustment Method >

□

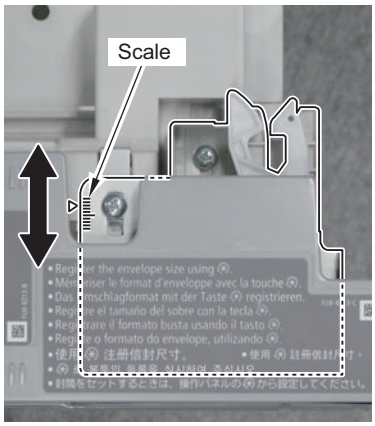
1. **Pull out the Cassette.**
2. **Check the position of the scale of the Cassette Lock Unit.**



3. **Loosen the 2 screws of the Cassette Lock Unit.**

4. **According to the scale in which the position was checked in step 2, adjust the position of the Cassette Lock Unit.**
   - Rough indication: 1.0 mm per increment
   - If the value is "+": Move it toward the front by the amount of "REG-L-xx".
   - If the value is "-": Move it toward the rear by the amount of "REG-L-xx".
     Example: If the value of "REG-L-xx" is "+30", move the Cassette Button Link Unit toward the front by 3 mm.

CAUTION:
Be careful not to move a cassette too much; otherwise, it may not be able to be installed in the host machine.

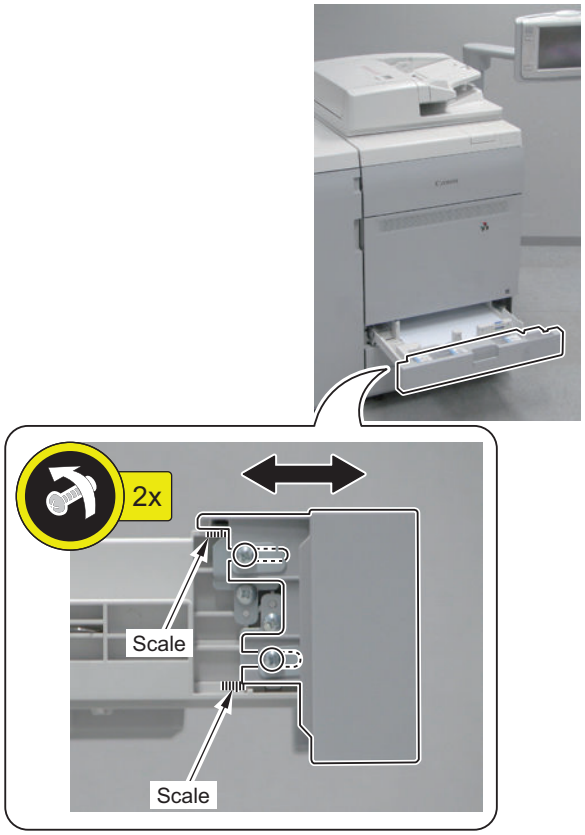


5. **Tighten the 2 screws loosened in step 3.**

6. **Perform printing again from the paper source where adjustment has been made, and check that the value is within the specified range. When the result is out of the specified range, repeat steps 1 to 5.**

NOTE:
If you are concerned with alignment of the Cassette Cover, adjust the right and left sides of the cover as necessary.

7. **Loosen the 2 screws and adjust the position of the Cassette Cover by referring to the scale.**
   When moving the Cassette Lock Unit, adjust the left side of the Cassette Cover by shifting it with the same shifting amount of the unit.
8. **Tighten the 2 screws that were loosened.**



9. **Exit service mode.**

CAUTION:
When "Mechanical Adjustment for Cassette Execute" has been performed, be sure to perform the following "Cassette pull-in Check".

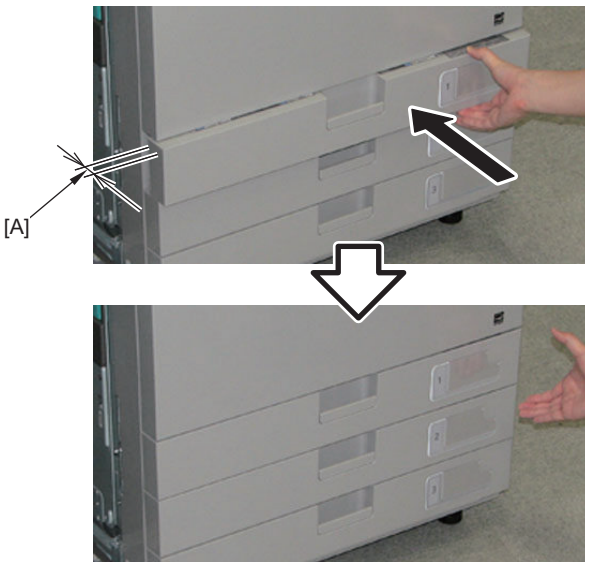
<Cassette pull-in Check>

☐

1. **Open the Left Cover.**
2. **Open the cassette 200 mm or more.**

NOTE:
The pull-in mechanism is activated by opening the cassette 200 mm or more.

3. Push back the cassette until it is 15 mm [A] from the Front Cover of the host machine, and let go of the cassette.



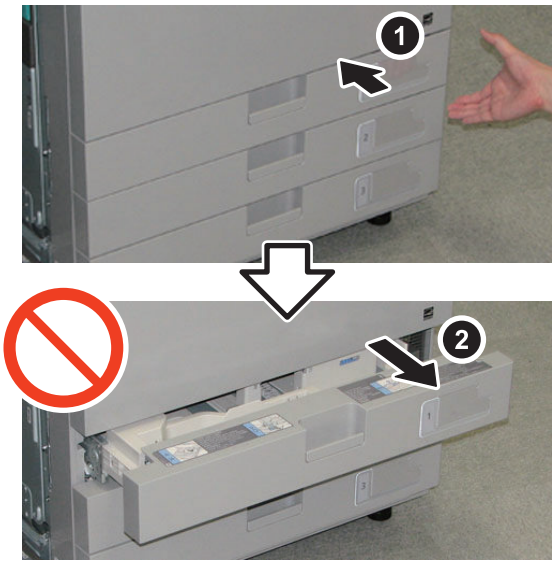
< Appropriate >

The latch is locked, and the level difference between the Cassette Front Cover and other external covers is within the appropriate range when viewed from the left side. Adjustment is not necessary.

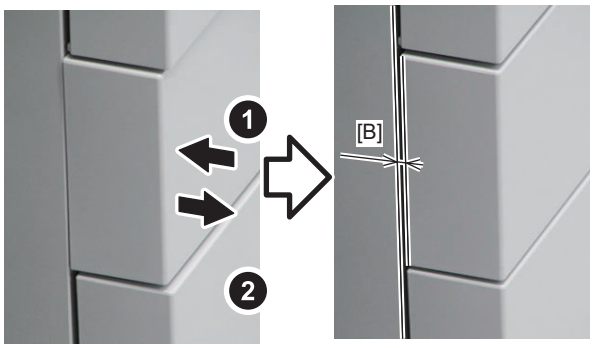
- The level difference [A] between the cassette and other covers (the Front Cover and other Cassette Front Covers) on the front side should be 2 mm or less.
- The gap [B] from the cover on the rear side should be 4 to 5 mm.

< Semi-closed >

The cassette has been excessively pulled in. The gap from other external covers is eliminated by further pushing the cassette in this situation, but adjustment is needed from a functional point of view.



By further pushing the cassette in this situation, a gap [B] is generated between the cassette and the cover on the rear side. Measure and write down the gap [B].



Perform "Adjusting the Cassette Front Cover", and then perform "Adjusting the Pull-in Guide" as needed.

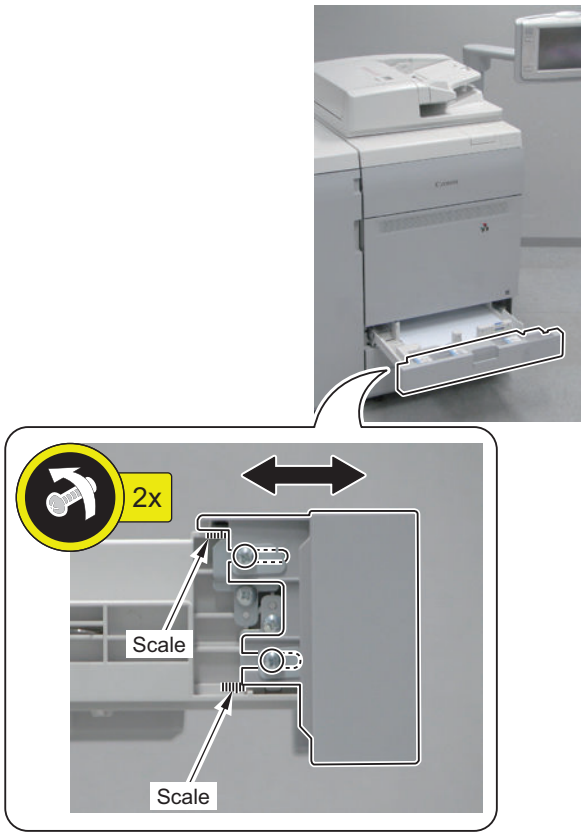
< Latch not locking >

The cassette has not been pulled in enough. The cassette is not latched and comes out. Perform "Adjust the Pull-in Guide".

<Adjusting the Cassette Front Cover>

1. **Pull out the cassette.**
2. **Loosen the 2 adjustment screws on the left side, and move the Cassette Front Cover as needed using the 2 scales as reference until the gap [B] from the cover on the rear side you wrote down in "Checking Method" changes to a value within the appropriate range.**

NOTE:
While the appropriate range of the gap is 4 to 5 mm in normal circumstances, in the case of a semi-closed cassette, adjust the gap to a value within 5 mm.



3. **Tighten the 2 adjustment screws you loosened in step 2.**
4. **Perform the procedure of "Checking Method" again. If the gap is still out of the appropriate range, perform "Adjusting the Pull-in Guide".**

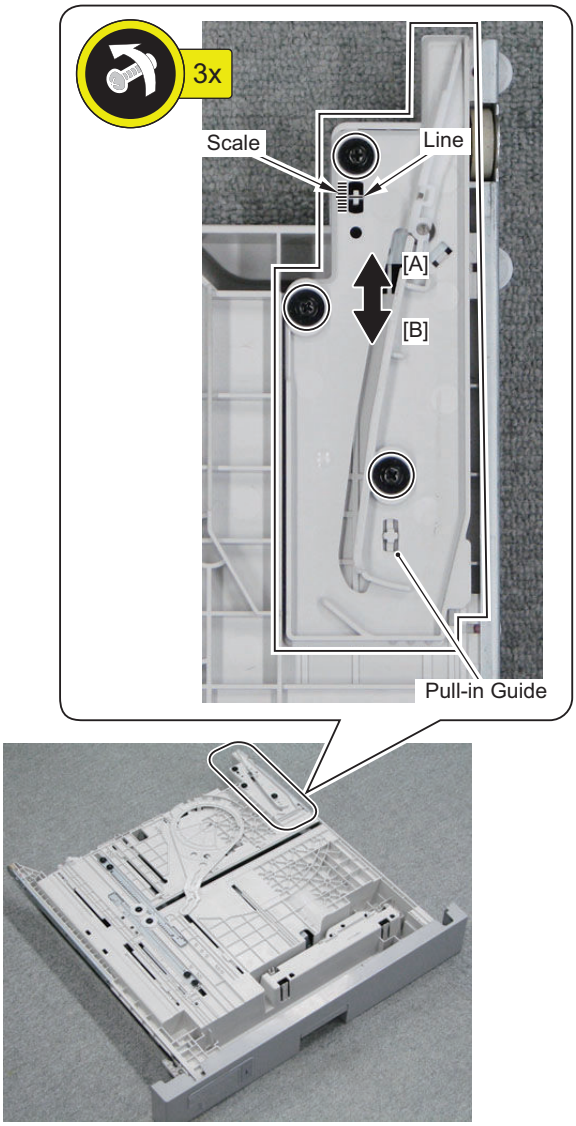
<Adjusting the Pull-in Guide>

1. **Remove the cassette.**

2. **Loosen the 3 adjustment screws on the rear side of the cassette. Using the scale and the boss line as reference, move the position of the Pull-in Guide for 1 division of the scale.**

NOTE:
Check the initial position on the scale (because the position at the time of shipment is not always at the center).

- In the case of a semi-closed cassette: Move the Pull-in Guide for 1 division of the scale upward (toward the rear side [A] of the host machine) so that the amount the cassette is pulled in is reduced.
- In the case of latch not locking: Move the Pull-in Guide for 1 division of the scale downward (toward the front side [B] of the host machine) so that the amount the cassette is pulled in is increased.



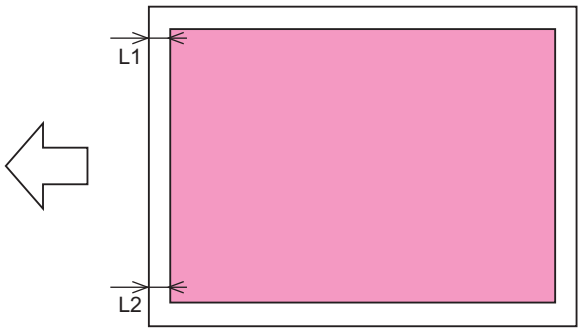
3. **Tighten the 3 adjustment screws you loosened in step 2.**
4. **Perform the procedure of "Checking Method" again, and adjust the gap until it becomes an appropriate value.**

● Leading Edge Skew Adjustment

□

1. **After setting the service mode (level 1) as follow, press the Start key and output a test print from the Cassette 1.**
   - COPIER > TEST > PG > TYPE = 5
   - COPIER > TEST > PG > COLOR-M = 1
   - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
   - COPIER > TEST > PG > PG-PICK = 1

2. **Check that the leading edge skew on the image is as follow. When the result is out of the specified range, perform adjustment by following the following procedure.**
   - If the result is -0.5 ≦ L1 - L2 ≦ +0.5 mm: Go to mechanical adjustment for registration alignment
   - If the result is as follow -0.3 ≦ L1 - L2 ≦ +0.3 mm: Go to software adjustment

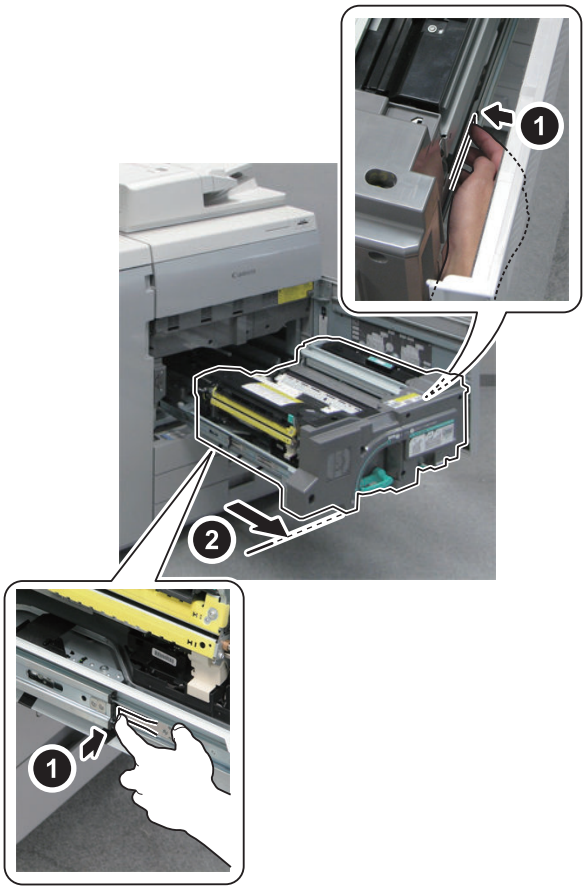


<Adjustment method (mechanical adjustment for registration alignment)>

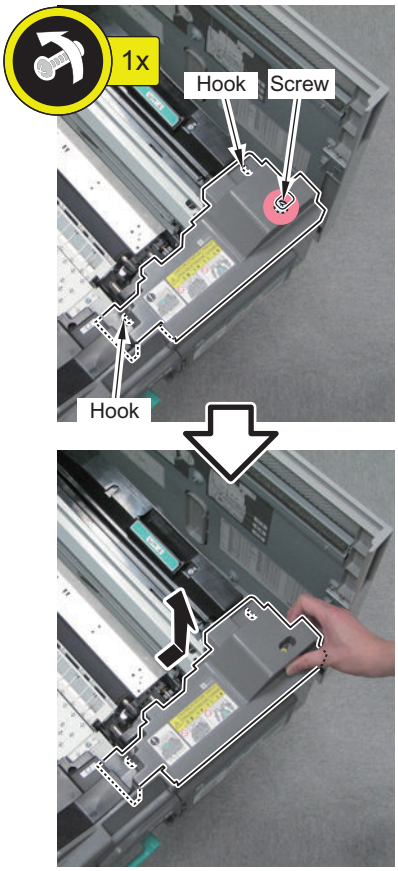
□

1. **Open the Front Cover and pull out the Fixing Feed Unit.**
2. **Push the 2 Lock Springs of the Rails (both sides) to release the lock and further pull out the Fixing Feed Unit until it stops.**

CAUTION:
Do not release the Lock Springs at the rear side of the Rails (both sides); otherwise the Frame of the Fixing Feed Unit can be off.

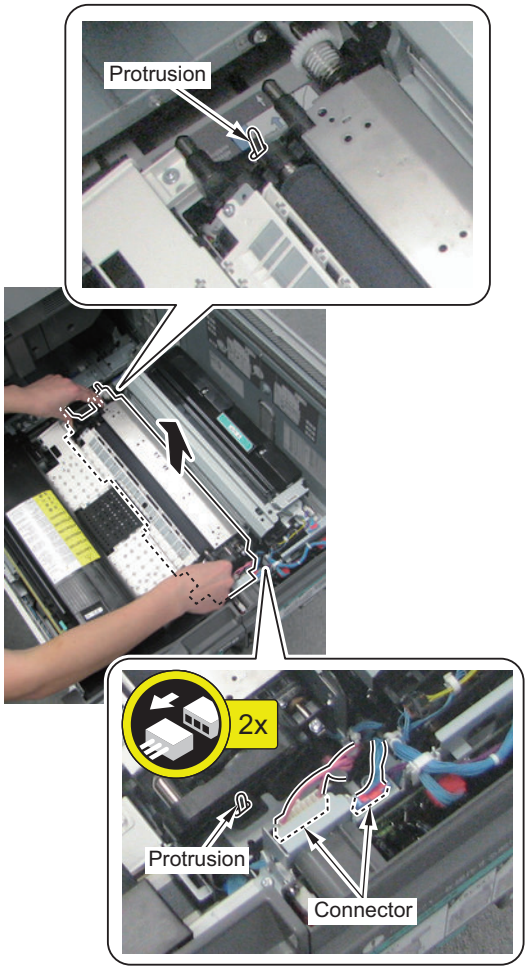


3. **Remove the Fixing Feed Inner Cover.**
   - 1 Screw
   - 2 Hooks

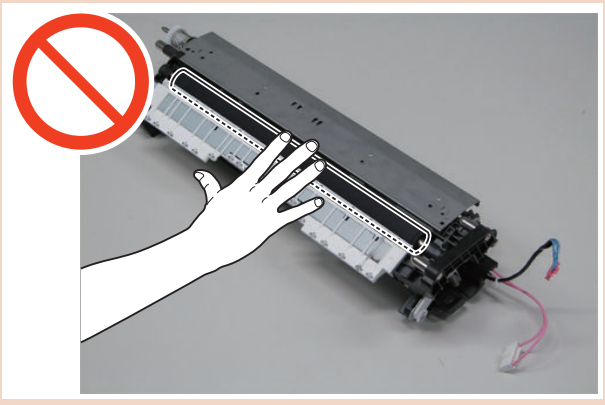


4. Remove the Secondary Transfer Outer Unit.

- 2 Connectors
- 2 Protrusions



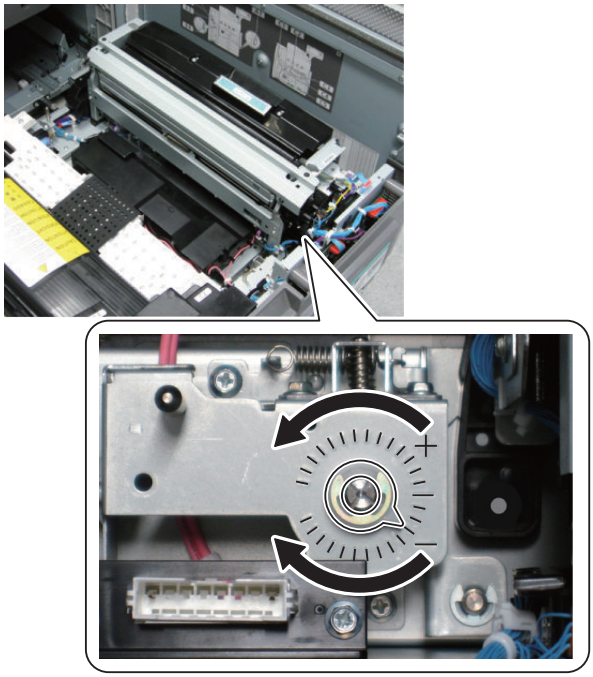
CAUTION:
Do not touch the surface of the Secondary Transfer Outer Roller.



5. Loosen the 4 screws.

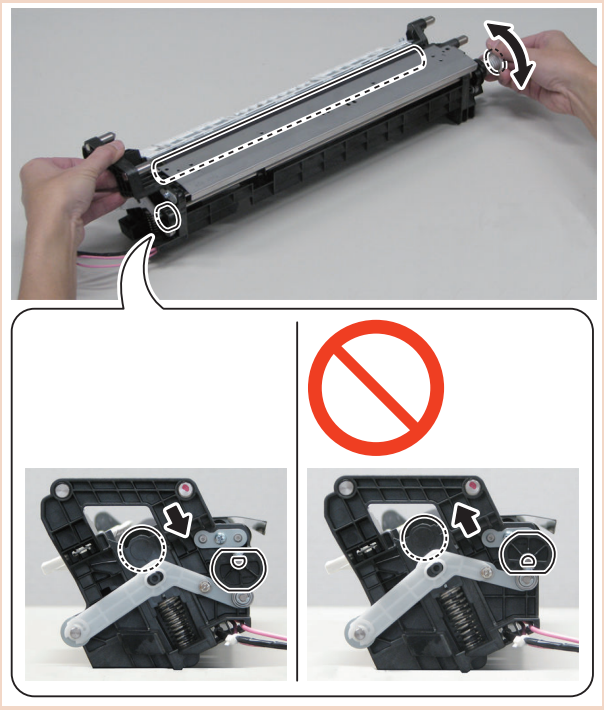
6. Adjust the Registration Adjustment Shaft by turning it with a screwdriver.

- In case of L1 - L2 > 0.5 mm: Turn to - direction
- In case of L1 - L2 < - 0.5 mm: Turn to + direction
  e.g.: In case of L1 – L2 = 0.6, turn the shaft to - direction by 6 scales.
  1 scale mark of the dial: 0.1mm



7. Install the Secondary Transfer Outer Unit (2 Connectors).

CAUTION:
When installing the Secondary Transfer Outer Unit to the Fixing Feed Unit, be sure to do so after releasing the pressure applied on the Secondary Transfer Outer Roller. (Otherwise, the Secondary Transfer Outer Roller may be deformed, or the ITB may be damaged.)
< How to release the pressure applied on the Secondary Transfer Outer Roller >
The pressure on the Secondary Transfer Outer Roller can be released by turning the gear and changing the direction of the cam. Be sure to keep the Secondary Transfer Outer Roller lowered.



8. **Tighten the 4 screws loosened in step 5.**

CAUTION:
When tightening the screws, be sure to tighten them in the order from (1) to (2).

9. **Perform printing again from the Cassette 1, and check that the value is within the specified range.**
   - If - 0.5 ≦ L1 – L2 ≦ + 0.5 mm: Go to software adjustment
   - If -0.3mm </= L1 - L2 </= +0.3mm or less: Go to leading edge right angle adjustment

< Adjustment method (Software Adjustment) >

☐

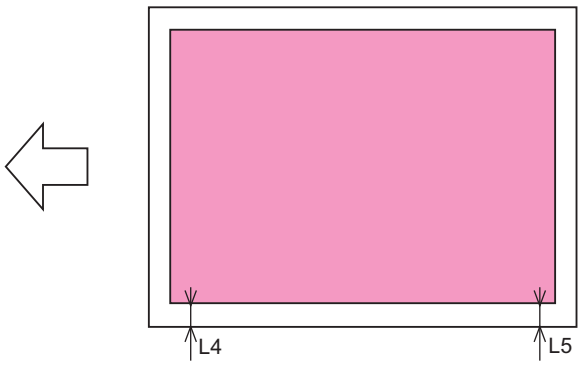
1. **Adjust the value of the following service mode (Level 1): COPIER > ADJUST > IMG-REG > SLP-1**
   - Setting range: -10 to 10 (0.1 mm per increment)
   - When the value is increased by "1", the leading edge skew (L1 - L2) is increased by 0.1 mm.
2. **Perform printing again from the Cassette 1, and check that the value is within the specified range.**
3. **Write down the new adjustment value in the service label.**
   - SLP-1

NOTE:
The same test print image can be used to check the image of the following image adjustments.

● Leading Edge Right Angle Adjustment (based on an assumption that right angle accuracy of paper is correct)

□

1. **After setting the service mode (level 1) as follow, press the Start key and output a test print from the cassette 1.**
   - COPIER > TEST > PG > TYPE = 5
   - COPIER > TEST > PG > COLOR-M = 1
   - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
   - COPIER > TEST > PG > PG-PICK = 1
2. **Check that the leading edge right angle on the image is - 0.5 ≦ (L4 - L5) x 280/400 ≦ + 0.5 mm. When the result is out of the specified range, perform adjustment by following the following procedure.**



< Adjustment method >

□

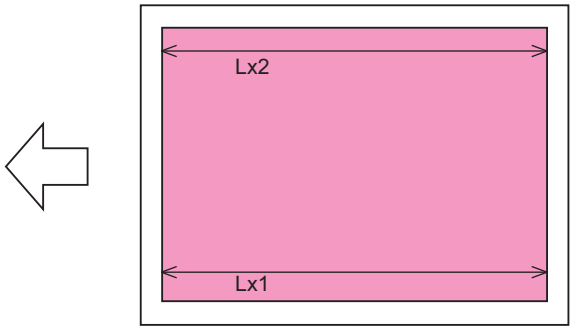
1. **Measure the leading edge right angle ((L4 – L5) × 280/400).**
2. **Adjust the value of the following service mode (Level 1): COPIER > ADJUST > IMG-REG > ANGLE-1**
   - Setting range: -10 to 10 (0.1 mm per increment)
   - When the value is increased by "1", the leading edge right angle ((L4 – L5) × 280/400) is increased by 0.1 mm.
     E.g. (in the case of A3 paper): When L4 = 2.5 and L5 = 1.5, (2.5 - 1.5) x 280/400 = 0.7; therefore, the value to enter is "-7".
3. **Perform printing again from the Cassette 1, and check that the value is within the specified range.**
4. **Write down the new adjustment value in the service label.**
   - ANGLE-1

● Trapezoid Adjustment

□

1. **After setting the service mode (level 1) as follow, press the Start key and output a test print from the cassette 1.**
   - COPIER > TEST > PG > TYPE = 5
   - COPIER > TEST > PG > COLOR-M = 1
   - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
   - COPIER > TEST > PG > PG-PICK = 1

2. **Check that trapezoid of the image is - 0.5 </= Lx1 - Lx2 </= + 0.5 mm. When the result is out of the specified range, perform adjustment by following the following procedure.**



< Adjustment method >

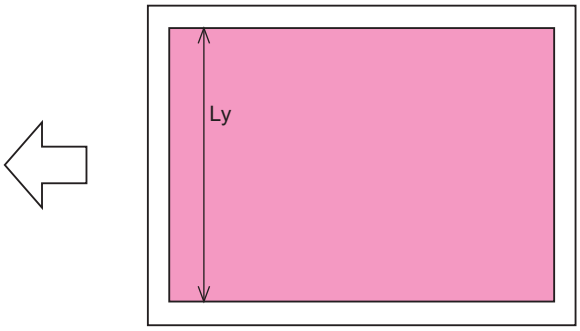
☐

1. **Measure trapezoid (Lx1 - Lx2).**
2. **Adjust the value of the following service mode (Level 1): COPIER > ADJUST > IMG-REG > TRPZ-1**
   - Setting range: -10 to 10 (0.1 mm per increment)
   - When the value is increased by "1", the trapezoid (Lx1 - Lx2) is increased by 0.1 mm.
     E.g. (in the case of A3 paper): When Lx1=412 and Lx2 = 411.4, 412-411.4 = 0.6; therefore, the value to enter is "-6".
3. **Perform printing again from the Cassette 1, and check that the value is within the specified range.**
4. **Write down the new adjustment value in the service label.**
   - TRPZ-1

● Horizontal Scanning Magnification Ratio Adjustment

☐

1. **After setting the service mode (level 1) as follow, press the Start key and output a test print from the Cassette 1.**
   - COPIER > TEST > PG > TYPE = 5
   - COPIER > TEST > PG > COLOR-M = 1
   - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
   - COPIER > TEST > PG > PG-PICK = 1
2. **Check that the horizontal scanning magnification ratio is within the specified range. When the result is out of the specified range, perform adjustment by following the following procedure.**
   - A3 paper: Ly = 292 +/- 0.6 mm
   - LDR paper: Ly = 274.4 +/- 0.5 mm



< Adjustment method >

☐

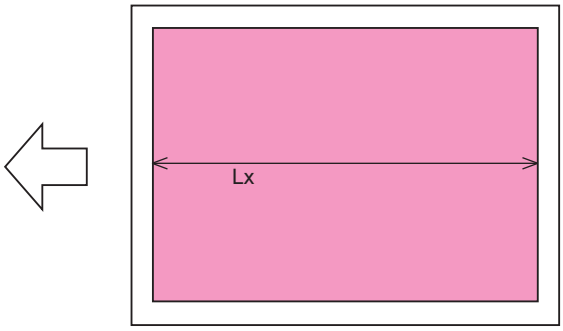
1. **Measure the horizontal scanning magnification ratio.**
   - In case of A3 paper: (Ly/292 - 1) x 100 (%)
   - In case of LDR paper: (Ly/274.4 - 1) x 100 (%)

2. **Adjust the value of the following service mode (Level 1): COPIER > ADJUST > IMG-REG > MAG-H**
   - Setting range: -100 to 100 (0.01% per increment)
   - When the value is increased by "1", the horizontal scanning magnification ratio is increased by 0.01%
     E.g. (in the case of A3 paper): When Ly = 291, (291/292 - 1) x 100 = -0.342... (The value is rounded off to two decimal places)
     When the actually measured value is smaller than the nominal value (292 mm), the value of the ratio becomes "-(negative)"; therefore, the value to enter is "+34".
3. **Perform printing again from the Cassette 1, and check that the value is within the specified range.**
4. **Write down the new adjustment value in the service label.**
   - MAG-H

● Vertical Scanning Magnification Ratio Adjustment

□

1. **After setting the service mode (level 1) as follow, press the Start key and output a test print from the cassette 1.**
   - COPIER > TEST > PG > TYPE = 5
   - COPIER > TEST > PG > COLOR-M = 1
   - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
   - COPIER > TEST > PG > PG-PICK = 1
2. **Check that the vertical scanning magnification ratio is within the specified range. When the result is out of the specified range, perform adjustment by following the following procedure.**
   - A3 paper: Lx = 412 +/- 0.8 mm
   - LDR paper: Lx = 423.8 +/- 0.8 mm



< Adjustment method >

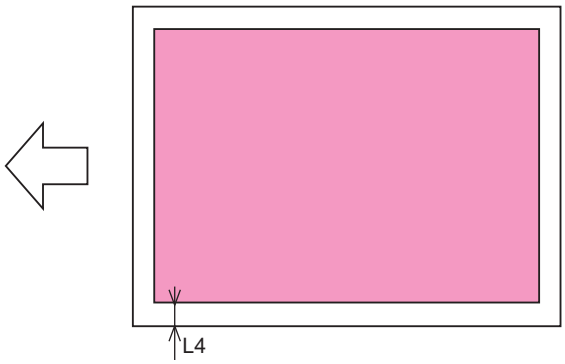
□

1. **Measure the vertical scanning magnification ratio.**
   - A3 paper: (Lx/412 - 1) x 100 (%)
   - LDR paper: (Lx/423.8 - 1) x 100 (%)
2. **Adjust the value of the following service mode (Level 1): COPIER > ADJUST > IMG-REG > MAG-V**
   - Setting range: -100 to 100 (0.01 % per increment)
   - When the value is increased by "1", the vertical scanning magnification ratio is increased by 0.01 %.
     E.g. (in the case of A3 paper): When Ly = 411, (411/412-1) x 100 = - 0.242... (The value is rounded off to two decimal places)
     When the actually measured value is smaller than the nominal value (412 mm), the value of the ratio becomes "-(negative)"; therefore, the value to enter is "+ 24".
3. **Perform printing again from the Cassette 1, and check that the value is within the specified range.**
4. **Write down the new adjustment value in the service label.**
   - MAG-V

● Left Edge Margin Adjustment (Software Adjustment)

□

1. **After setting the service mode (level 1) as follow, press the Start key and output a test print from the Cassette 1.**
   - COPIER > TEST > PG > TYPE = 5
   - COPIER > TEST > PG > COLOR-M = 1
   - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
   - COPIER > TEST > PG > PG-PICK = 1
2. **Check that the left edge margin is within the range indicated below. When the result is out of the specified range, perform adjustment by following the following procedure.**
   - L4: 2.5 +/- 0.5 mm



< Adjustment Method >

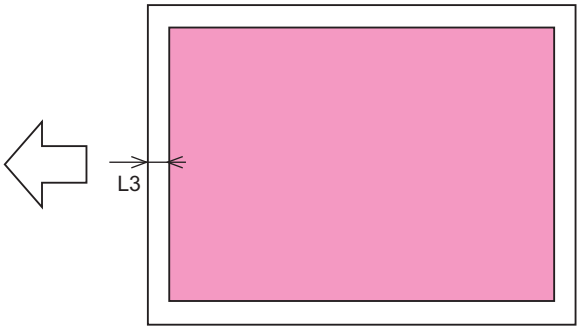
□

1. **Adjust the value of the following service mode (Level 1): COIPIER > ADJUST > FEED-ADJ > REG-L**
   - Setting range: -100 to 100 (0.1 mm per increment)
   - As the value is incremented by "1", the left edge margin is increased by 0.1 mm.
2. **Perform printing again from the Cassette 1, and check that the value is within the specified range.**
3. **Write down the new adjustment value in the service label.**
   - REG-L

● Leading Edge Margin Adjustment

□

1. **After setting the service mode (level 1) as follow, press the Start key and output a test print from the Cassette 1.**
   - COPIER > TEST > PG > TYPE = 5
   - COPIER > TEST > PG > COLOR-M = 1
   - COPIER > TEST > PG > COLOR-Y/C/Bk = 0
   - COPIER > TEST > PG > PG-PICK = 1
2. **Check that the leading edge margin L3 is within the range indicated below. When the result is out of the specified range, perform adjustment by following the following procedure.**
   - L3: 4.0 +/-0.5 mm



< Adjustment Method >

□

1. **Adjust the value of the following service mode (Level 1): COPIER > ADJUST > FEED-ADJ > REGIST**
   - Setting range: -100 to 100 (0.1 mm per increment)
   - When the setting value is increased by "1", the leading edge margin is decreased by 0.1 mm.
2. **Perform printing again from the Cassette 1, and check that the value is within the specified range.**
3. **Write down the new adjustment value in the service label.**
   - REGIST
4. **Exit service mode.**

When replacing parts

Overview

In this chapter, measures of adjustment when replacing parts in servicing operation are mentioned. Parts to be replaced are categorized into 5 blocks based on their related technology as shown below.

Category	Parts Replacement	Refarence
Main Controller System	HDD	“HDD” on page 1028
	Main Controller PCB 1	“Main Controller PCB 1” on page 1031
	Main Controller PCB 2	“Main Controller PCB 2” on page 1031
	DC Controller PCB	“DC Controller PCB” on page 1033
	TPM PCB	“TPM PCB” on page 1034
	Reader Controller PCB	“Reader Controller PCB” on page 1034
Laser Exposure System	Laser Scanner Unit	“Laser Scanner Unit” on page 1045
Image Formation System	Primary Charging Wire	“Primary Charging Wire” on page 1046
	Grid Plate	“Grid Plate” on page 1048
	Primary Charging Assembly	“Primary Charging Assembly” on page 1050
	Pre-Primary Transfer Charging Wire	“Pre-transfer Charging Wire” on page 1052
	Pre-Primary Transfer Charging Assembly	“Pre-transfer Charging Assembly” on page 1053
	Drum Unit	“Drum Unit” on page 1053
	Drum Patch Sensor Unit (Bk)	“Drum Patch Sensor Unit (Bk)” on page 1054
	Developing Assembly	“Developing Assembly” on page 1054
	Potential Sensor	“Potential Sensor” on page 1055
	ITB	“ITB” on page 1056
	ITB Inner Scraper	“ITB Inner Scraper” on page 1056
	Secondary Transfer Inner Roller	“Secondary Transfer Inner Roller” on page 1056
	Transfer Cleaning Unit	“Transfer Cleaning Unit” on page 1057
	Actions when releasing the pressure from the ITB	“Actions when releasing the pressure from the ITB” on page 1057
	Primary Transfer Roller	“Primary Transfer Roller” on page 1057
	Patch Sensor Unit	“Registration Patch Sensor Unit” on page 1058
Fixing System	Fixing assembly	“Fixing Assembly” on page 1058
	Fixing Belt Unit	“Fixing Belt Unit” on page 1059
	Pressure Belt Unit	“Pressure Belt Unit” on page 1061
Pickup Feed System	Registration Unit	“Registration Unit” on page 1064

Main Controller

■ HDD

When replacing the HDD, perform the following work.

1. Actions before parts replacement (reference: “Before Replacement” on page 1028)
2. Parts replacement (reference: “Removing the HDD” on page 497)
3. Actions after parts replacement (reference: “After Replacement” on page 1030)

● Before Replacement

1. Data Backup

Remote UI
Settings/Registration > Management Settings > Data Management > Back Up
Target Data:
- Box
- System Box
- Fax Box
- Image composition forms
  * When an optional HDD (1 TB) is used, only the HDD connected by USB can be backed up.

2. **Export the settings.**
   Remote UI
   Settings/Registration > Management Settings > Data Management > Export
   Target Data:
   - Settings/Registration Basic information
   - Paper Type Management Settings
   - Forwarding Settings
   - Box Settings
   - Department ID Management Settings
   - Main Menu Settings
   - Web Access Settings
   - Favorite Settings
   - Address Book
   - Quick Menu Settings
   - MEAP Application Setting Information
   - User Setting Information (USER-PRT also possible)
   - iW Function Flow Settings
   - Service Mode Settings (P-PRINT also possible)
     * Service mode settings can be exported by setting Copier > Option > USER > SMD-EXPT > 1. SMD-EXPT is not applicable for export so it needs to be set each time the HDD is replaced.

3. **Export the settings.**
   Remote UI
   Settings/Registration > Management Settings > Data Management > Import/Export Individually
   Target Data:
   - Address Book
   - Device settings (forwarding settings, address book, and favorite settings for sending)
   - Printer Settings
   - Paper Information

4. **Audit log collection***
   Remote UI
   Settings/Registration > Management Settings > Device Management > Collect audit logs
   * After acquiring the audit log, give the data to the user.

5. **Backup the MEAP.**
   SST (Meapback)
   Target Data:
   - Application license files (SMS)
   - SSO-H local device authentication information (SSO-H)
     * Meapback.bin can be restored after HDD replacement and HDD initialization.
     [Caution]
     If the following service modes are executed, Meapback.bin becomes unable to be restored.
     - COPIER > FUNCTION > SYSTEM > CHK-TYPE > 7
     - COPIER > FUNCTION > SYSTEM > HD-CLEAR

6. **TPM**
   Target Data:
   Check the TPM key backed up by the user.

● After Replacement

1. **Format the HDD**
    1. Start the machine in safe mode (turn ON the Main Power Switch while pressing the numeric keys 2 and 8).
    2. Format all partitions using SST.
2. **Downloading System Software**
    1. Using SST, download the system software (SYSTEM/LANG/RUI, etc.).
3. **Initialize the key/certificate/CA certificate.**
   (Lv.2) COPIER > FUNCTION > CLEAR > CA-KEY
4. **Turn OFF and then ON the power.**
5. **Restore the backup data.**
    - Manually input the report data.
    - Restore using the remote UI.
6. **When an encryption key/certificate/CA certificate has been generated or added by the user, ask the user to execute regeneration.**
7. **Execute auto adjust gradation (Full Adjust).**
   Related Settings/Registration mode: Adjustment/Maintenance > Adjust Image Quality > Auto Adjust Gradation

● When Using the Card Reader and imageWARE Accounting Manager

Because the card ID used for imageWARE Accounting Manager is stored in HDD, collection of the card information by NSA is not available immediately after replacement of the HDD.
After performing "After Replacing the HDD", reinstall the card ID from imageWARE Accounting Manager by the following procedures.

1. **Go to COPIER > FUNCTION > INSTALL > CARD and enter the numerical value of the leading card which is used for Department ID. Then, press "OK" button. (e.g.: If No. 1 to No. 1000 cards are used for Department ID, enter "1" of the leading card.)**
2. **After turning OFF and then ON the main power switch, perform the following operations in Settings/Registration mode.**
    - In Management Settings > User Management > Department ID Management > Page Totals, be sure that "ID00000001" to "ID00001000" are created.
    - Set the following: Preferences > Network > TCP/IP Settings > IPv4 Settings > IP Address Settings > IP Address, Gateway Address, Subnet Mask.
    - In Management Settings > User Management > System Manager Information Settings > System Manager ID and System PIN, register any number for them. Then, turn OFF and ON the main power switch.

   If "System Manager ID" and "System PIN" are not registered, "card registration to device" cannot be executed for the imageWARE Accounting Manager setting operation.
3. **Download the card ID from imageWARE Accounting Manager to the Main Body again.**
4. **After downloading is completed, go to Management Settings > User Management > Department ID Management > Page Totals. Be sure that only the downloaded card ID is displayed.**
5. **Print using the user card registered from imageWARE Accounting Manager. Be sure that the card information used for the target devices of imageWARE Accounting Manager is collected.**

● Points to Note when Using HDD with System Software Already Installed

When a HDD with the system software of another machine (machine that has a different serial number) installed is used for troubleshooting, it will be able to be used if both models are the iR-ADV C5255 series or later.
However, be sure to format it and install the firmware after installation.
Operation cannot be guaranteed if it is used as is.
Installing a HDD that has been installed in another machine is not recommended because it must be formatted when installed.
If it must be done, make sure that the user understands that the user data and other data will be deleted before doing so.
Furthermore, a HDD that has been used with the iR-ADV C5255 series cannot be accessed from a PC as a result of security enhancements.

■ Main Controller PCB 1

1. Actions before parts replacement (reference: “Before Replacement” on page 1031)
2. Parts replacement (reference: “Removing the Main Controller PCB 1” on page 501)
3. Actions at parts replacement (reference: “Actions at Replacement” on page 1031)
4. Actions after parts replacement (reference: “After Replacement” on page 1031)

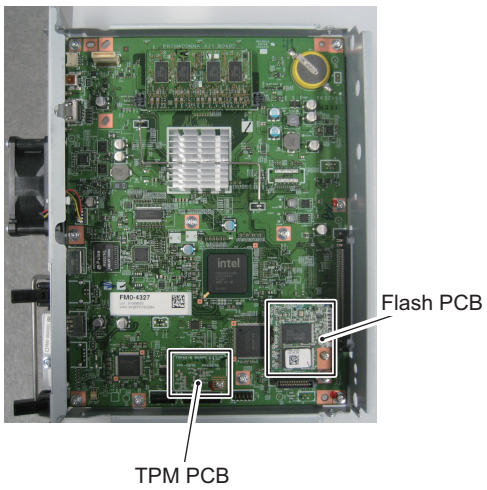
● Before Replacement

1. **Export the settings.**

   Remote UI
   Settings/Registration > Management Settings > Data Management > Import/Export Individually
   Target Data:
   - Address Book
   - Device settings (forwarding settings, address book, and favorite settings for sending)

● Actions at Replacement

1. **Replace the part from the old PCB to the new PCB.**
   - Flash PCB
   - TPM PCB



● After Replacement

1. **Set and register the data again.**

   Remote UI
   Settings/Registration > Management Settings > Data Management > Import/Export Individually

■ Main Controller PCB 2

1. Actions before parts replacement (reference: “Before Replacement” on page 1032)
2. Parts replacement (reference: “Removing the Main Controller PCB 2” on page 504)
3. Actions at parts replacement (reference: “When Replacing” on page 1032)
4. Actions after parts replacement (reference: “After Replacement” on page 1033)

Points to Note

Recommend to the customer to make a backup of the Mail Box documents with the remote UI.

Prohibition Items

Do not transfer the following parts to another machine (a machine with a different serial number).
The machine will not start up normally, and may become unrecoverable in some cases.
- Main Controller PCB 2 (with the Memory PCB unremoved)
- Memory PCB

● Before Replacement

1. **Export the settings.**

   Remote UI
   Settings/Registration > Management Settings > Data Management > Export
   Target Data:
   - Settings/Registration Basic information
   - Paper Type Management Settings
   - Forwarding Settings
   - Box Settings
   - Department ID Management Settings
   - Main Menu Settings
   - Web Access Settings
   - Favorite Settings
   - Address Book
   - Quick Menu Settings
   - MEAP Application Setting Information
   - User Setting Information (USER-PRT also possible)
   - iW Function Flow Settings
   - Service Mode Settings (P-PRINT also possible)

     * Service mode settings can be exported by setting Copier > Option > USER > SMD-EXPT > 1. SMD-EXPT is not applicable for export so it needs to be set each time the HDD is replaced.

2. **Export the settings.**

   Remote UI
   Settings/Registration > Management Settings > Data Management > Import/Export Individually
   Target Data:
   - Address Book
   - Device settings (forwarding settings, address book, and favorite settings for sending)
   - Printer Settings
   - Paper Information

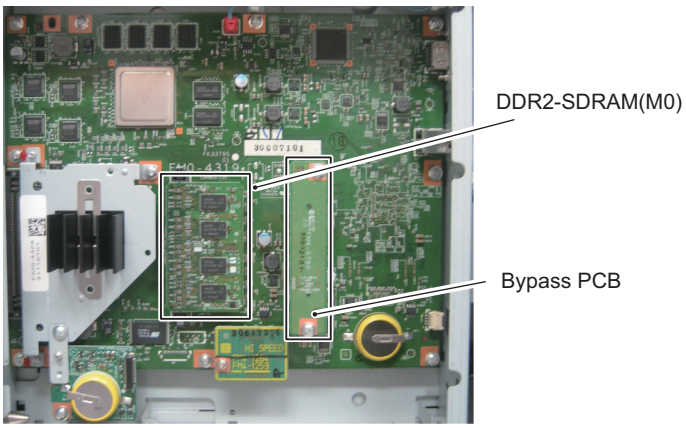
3. **Back up the SRAM. (If the machine has the HDD Encryption Board)**

   SST (Sramimg)
   Target Data:
   - Encryption key for HDD Encryption Board

     [NOTE]
     When there is a HDD encryption key, if the Main Controller PCB 2 is replaced, the contents of the HDD will become unable to be read because the encryption key for the HDD Encryption Board stored in SRAM will be lost. Consequently, restoration is not possible even if a backup to the HDD is made.

● When Replacing

1. **Move the parts from the old PCB to the new PCB.**
   - DDR2-SDRAM x1
   - Bypass PCB
   - Memory PCB



● After Replacement

1. **Set and register the data again.**
   Remote UI
   - Settings/Registration > Management Settings > Data Management > Import
   - Settings/Registration > Management Settings > Data Management > Import/Export Individually
2. **Restore the SRAM. (If the machine has the HDD Encryption Board)**
   SST (Sramimg)
3. **When an encryption key/certificate/CA certificate has been generated or added by the user, ask the user to execute reinstallation.**
4. **Executing “Auto Adjust Gradation (Full Adjust)”.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation]
5. **Execute "Auto Correct Color Mismatch".**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

■ DC Controller PCB

How to Replace the Parts:“Removing the DC Controller PCB” on page 509

CAUTION:
After replacing the DC Controller PCB, E101-0001 may occur due to a wrong combination of versions.
After replacing the DC Controller, update it to an appropriate version if necessary in accordance with the versions of other PCBs.

Prohibition Items

When replacing the DC Controller PCB, be sure to use a new one. Do not use the DC Controller PCB which was used with another machine.

● Before Replacement

1. **Backup of DC Controller PCB SRAM**
   COPIER > FUNCTION > SYSTEM > DSRAMBUP (LEVEL2)
   "ACTIVE" is displayed and then "OK!" is displayed about 2 minutes later.

⚠ CAUTION:
Even if the result of DSRAMBUP is "OK!", the backup data cannot be saved to the HDD.
In order to back up the data without fail, wait for 10 minutes after occurrence of an event log (exceptional operation, error code, or reboot) and start of automatic creation and saving of a debug log without performing any operation, and then execute DSRAMBUP.
Condition which results in failure in the backup:
DSRAMBUP was executed when an event log (exceptional operation, error code, or reboot) has occurred and a debug log is automatically being created and saved.
Cause:
If DSRAMBUP is executed while a debug log is being created and saved, "OK!" is displayed without a backup file of the DC Controller being created. Even if a backup file that was created before exists in the HDD, after the backup file is deleted, a file that cannot be restored is written to the HDD. When restoration is executed, "NG!" is displayed because there is no backup file that can be restored. Therefore restoration ends in failure.
Remedy:
Execute DSRAMBUP after completion of creation/saving of the debug log.

Turn OFF the main power when the above work is complete.
* Execute the service mode (Lv.1) COPIER > FUNCTION > MSISC-P> P-PRINT so that the settings can be specified manually again if required (just in case).

● After Replacement

1. **Restoration of DC Controller PCB SRAM**
   COPIER > FUNCTION > SYSTEM > DSRAMRES (LEVEL2)
   "ACTIVE" is displayed at execution and then "OK!" is displayed about 2 minutes later. Restoration is complete.
   * When backup data cannot be uploaded before replacement due to reasons such as damage of the DC Controller PCB, enter the value of each service mode item described on the service label or P-PRINT.
2. **Execute service mode.**
   COPIER > ADJUST > P-PASCAL
   Enter the value shown on the service label affixed to the location that was hidden beneath the removed Front Cover of the Fixing Feed Unit.
   “Service Mode Backup” on page 1701

■ TPM PCB

How to Replace the Parts:“Security Function (Encryption Key, Certificate and Protection of Password)” on page 50
* Be sure to perform the installation work by referring to the procedure above.

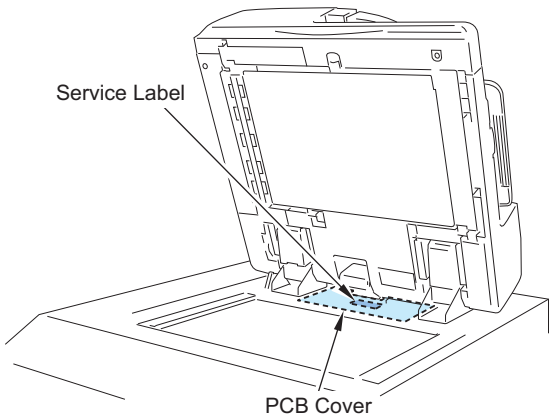
■ Control Panel CPU PCB / LCD Panel

After replacement, adjust the coordinate position on the Touch Panel of the Control Panel in service mode (COPIER> FUNCTION> PANEL> TOUCHCHK).

■ Reader Controller PCB

● Service mode backup

The machine is adjusted one by one at the factory shipment and the adjustment values are written on the service label.
When the adjustment is carried out at a field and the service mode values are changed, be sure to write the changed values on the service label.
If there is no corresponding items on the service label, write the value to a blank field.



● Measurement during Reader Controller PCB Replacement and After RAM Clear

CAUTION:
Before replacing Reader Controller PCB, be sure to make an output of the newest P-PRINT.
Service Mode > COPIER > FUNCTION > MISC-P > P-PRINT

1. **Using SST, download the newest system software (R-CON).**
2. **Perform RAM clear.**
   Service Mode > COPIER > FUNCTION > CLEAR > R-CON
3. **Turn the connecting equipment OFF/ON.**

4. Perform the input or adjustment for MTF value.

1. Input the MTF value of P-PRINT outputted before replacement.
   Service Mode > COPIER > ADJUST > CCD > MTF2-M1

MTF value (front side) (Service Mode)			
MTF2-M1	MTF2-M7	MTF2-S1	MTF2-S7
MTF2-M2	MTF2-M8	MTF2-S2	MTF2-S8
MTF2-M3	MTF2-M9	MTF2-S3	MTF2-S9
MTF2-M4	MTF2-M10	MTF2-S4	MTF2-S10
MTF2-M5	MTF2-M11	MTF2-S5	MTF2-S11
MTF2-M6	MTF2-M12	MTF2-S6	MTF2-S12

2. Input the MTF value of P-PRINT outputted before replacement.
   Service Mode > COPIER > ADJUST > CCD > MTF-M1

MTF value (back side) (Service Mode)			
MTF-M1	MTF-M7	MTF-S1	MTF-S7
MTF-M2	MTF-M8	MTF-S2	MTF-S8
MTF-M3	MTF-M9	MTF-S3	MTF-S9
MTF-M4	MTF-M10	MTF-S4	MTF-S10
MTF-M5	MTF-M11	MTF-S5	MTF-S11
MTF-M6	MTF-M12	MTF-S6	MTF-S12

3. Perform the MTF filter coefficient computation.
   Service Mode > COPIER > FUNCTION > CCD > MTF-CLC

5. Input the value written the service label (the inside of PCB cover) (Total: 42 items).

Service Mode > COPIER > ADJUST > ADJ-XY > ADJ-X

The value written the service label (the inside of PCB cover) (Service Mode)			
ADJ-X	ADJ-Y-DF	ADJ-X-MG	ADJY-DF2
ADJ-Y	STRD-POS	-	-

Service Mode > COPIER > ADJUST > CCD > W-PLT-X

The value written the service label (the inside of PCB cover) (Service Mode)			
W-PLT-X	DFTBK-R	DFCH2G2	DFCH-B10
W-PLT-Y	DFTBK-G	DFCH2G10	DFCH-G2
W-PLT-Z	DFTBK-B	DFCH2K2	DFCH-G10
SH-TRGT	DFTBK-BW	DFCH2K10	DFCH-K2
DFTAR-R	DFCH2R2	DFCH-R2	DFCH-K10
DFTAR-G	DFCH2R10	DFCH-R10	100-RG
DFTAR-B	DFCH2B2	DFCH-B2	100-GB
DFTAR-BW	DFCH2B10	-	-

Service Mode > COPIER > ADJUST > CCD > 100DF2RG

The value written the service label (the inside of PCB cover) (Service Mode : Lv2)			
100DF2RG	100DF2GB	-	-

Service Mode > COPIER > ADJUST > PASCAL > OFST-PK2

The value written the service label (the inside of PCB cover) (Service Mode)			
OFST-PK2	OFST-PY2	OFST-PM2	OFST-P2C

NOTE:
When the value of the following item in the service label is negative, it may not be possible to enter in the service mode screen.
Service Mode > COPIER > ADJUST > ADJ-XY > STRD-POS
Only if the value cannot be entered, there is no need to enter "STRD-POS". However, it is necessary to perform the stream reading adjustment.
“Stream Reading Adjustment” on page 1037

6. **Perform computation for front & back linearity matching.**
   Service Mode > COPIER > FUNCTION > CCD > DF-LNR
7. **Input the value written in the service label (inside PCB cover).**
   Service Mode > FEEDER > ADJUST > DOCST
   Service Mode > FEEDER > ADJUST > LA-SPEED
   Service Mode > FEEDER > ADJUST > DOCST2
   Service Mode > FEEDER > ADJUST > LA-SPD2
8. **Perform output adjustment of the sensor.**

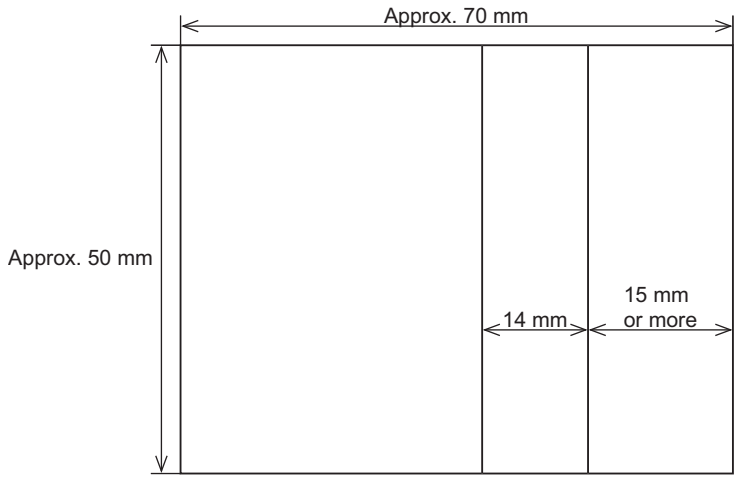
CAUTION:
Be sure that there is no paper inside the DADF.

1. Perform service mode item.
   Service Mode > FEEDER > FUNCTION > SENS-INT

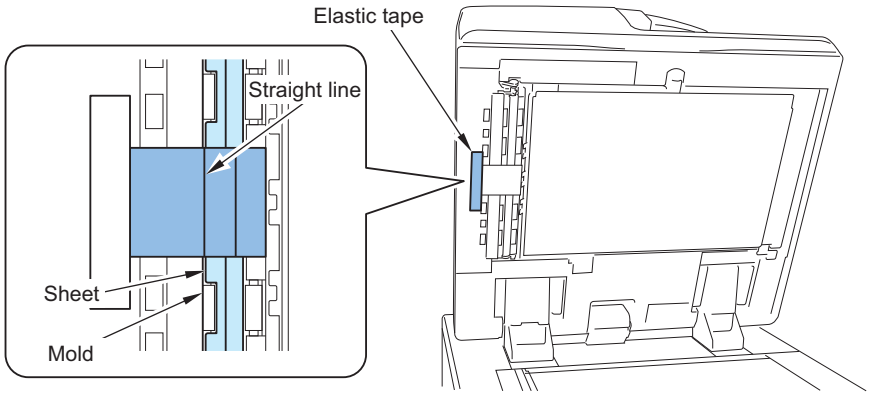
9. **Adjust tray width. Perform either AB system or Inch system.**
   - a. AB system adjustment.
     1. Select the item in the service mode.
        Service Mode > FEEDER > FUNCTION > TRY-A4
     2. Adjust the slide guide to the index "A4/A3".
     3. Press OK, and register the A4 width.
     4. Select the item in the service mode.
        Service Mode > FEEDER > FUNCTION > TRY-A5R
     5. Adjust the slide guide to the index "A5R".
     6. Press OK, and register the A5R width.
   - b. Inch system adjustment.
     1. Select the item in the service mode.
        Service Mode > FEEDER > FUNCTION > TRY-LTR
     2. Adjust the slide guide to the index "LTR/ 11x17".
     3. Press OK, and register the letter width.
     4. Select the item in the service mode.
        Service Mode > FEEDER > FUNCTION > TRY-LTRR
     5. Adjust the slide guide to the index "STMT/ LTRR/ LGL".
     6. Press OK, and register the LTRR width.
10. **After turning OFF/ON the power, make a copy and check the copied image.**
    If moire appeared on the copied image, perform the sharpness adjustment in service mode.
    1. Reader
       Service Mode > COPIER > ADJUST > MISC > SH-ADJ
    2. DADF
       Service Mode > COPIER > ADJUST > MISC > SH-ADJ2
11. **Make an output of P-PRINT.**
    Service Mode > COPIER > FUNCTION > MISC-P > P-PRINT
12. **Store the outputted P-PRINT into the service book.**

● Stream Reading Adjustment

1. Create a read position adjustment paper with the paper that is used by customer (white paper).
   1-1) Prepare the paper with 70 mm or more in width and 50 mm or more in height.
   Tolerance of width 14 mm: -/+ 0.3
   1-2) Draw a straight line 15 mm or more away from the right edge on the paper created in step 1-1) with a pencil (black).
   Right angle accuracy of paper with line: unnecessary (right angle does not affect the adjustment accuracy).
   1-3) Draw a straight line 14 mm left from the line in step 1-2) (tolerance: -/+ 0.3) with a pencil (black).



2. Align the straight line with the clearance between the sheet and the mold, and fix the read position adjustment paper with a piece of elastic tape.
   Position accuracy of read position adjustment paper: -/+0.3 mm

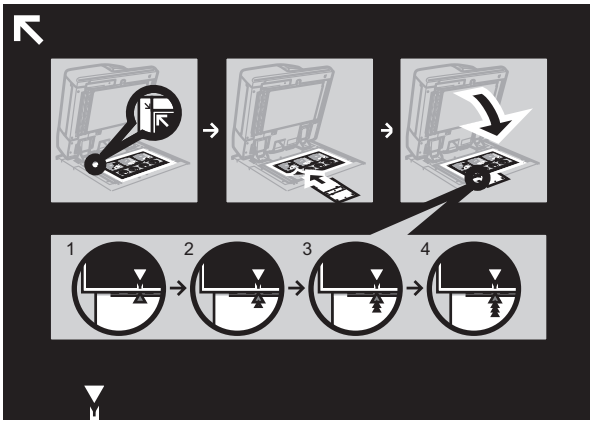


3. Execute the following service mode item.
   Service Mode > COPIER > FUNCTION > INSTALL > STRD-POS

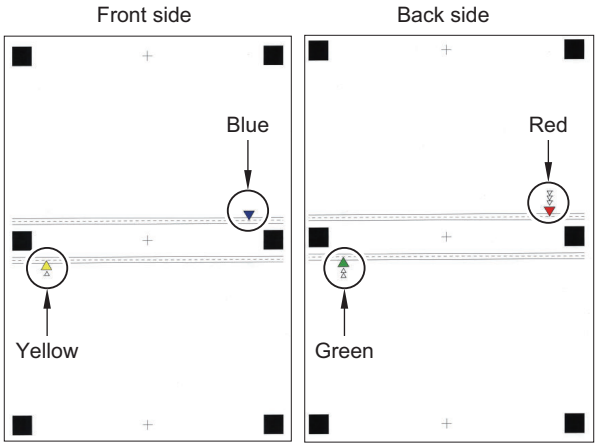
● Adjusting the Reader Right Angle Correction Amount

When the positions of images on 2-sided prints/copies are not aligned between the front and back sides, make adjustments by reading a test page by the reader using a guide sheet.

Guide sheet



Test page (2-sided)



CAUTION:

- Be sure to clean the Copyboard Glass and the back side of the feeder before adjustment.
- Use a guide sheet (for A3, for 11x17) provided in PDF format.
- Print the guide sheet under the following conditions: When the guide sheet is not properly printed, accurate adjustment result may not be obtained.
  Use a sheet of paper whose size is the same as the size data of the guide sheet to create a guide sheet.
  Paper that is 200 g/m2 or above is recommended.
  Set the magnification ratio to 100% magnification.

□

NOTE:
When [System Manager Information Settings] is set, it is required to log in as a system manager in accordance with instructions of the user administrator.

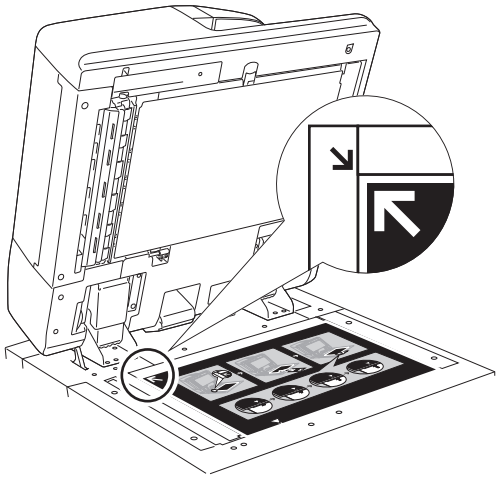
1. **Select [Settings/Registration] > [Preferences] > [Paper Settings] > [Paper Type Management Settings].**
2. **Select paper to use for adjustment, press [Duplicate], and then name and save the paper.**
3. **Make settings of the duplicated paper in [Paper Settings].**

□

4. **Press [Paper Type Management Settings], select the type of duplicated paper from the list, and then press [Details/Edit].**
5. **Press [Change] of <Adjust Image Position>, and press [Use Scanner].**
6. **Set the number of test page to output to 1, and press [Next].**
7. **Select the paper source where paper used for the adjustment is loaded, and press [Start Printing] (a test page is output).**

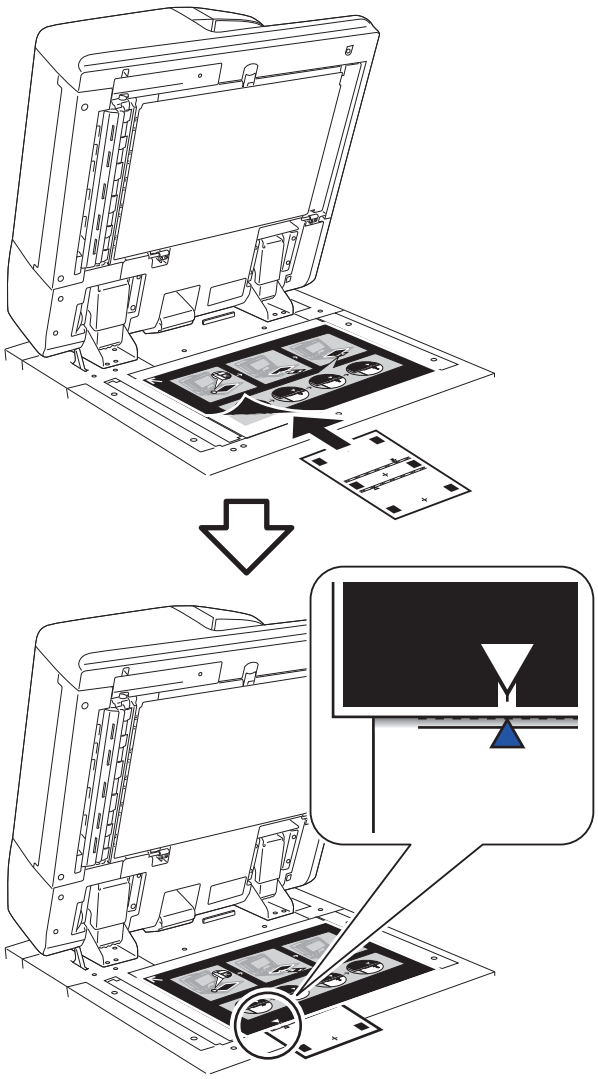
□

8. **Place the guide sheet on the Copyboard Glass, and align the arrow mark of the guide sheet with that of the Copyboard Glass.**



□

9. **Align the triangle mark of the guide sheet with the triangle mark (blue) which is for the first scanning of the test page.**



☐

10. Close the feeder, and press [Start Scanning].

NOTE:
Be careful not to move the guide sheet when closing the feeder.

☐

11. According to the instruction on the screen, scan the test page by setting the yellow, green, and red triangle marks for the second, third, and fourth scanning, respectively.

☐

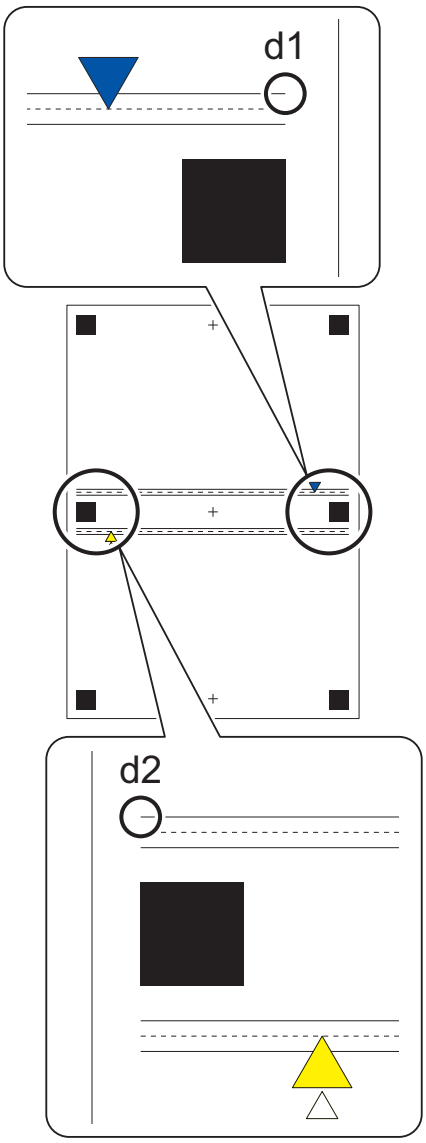
12. When multiple test pages were output, repeat the steps 9 to 11 for the number of test pages output.
The adjustment is finished when all the test pages have been scanned. Scan the test pages in the order they were output.

☐

13. After scanning is finished, perform the steps 5 to 7, and output 1 test page.

☐

14. Measure the amount of displacement between the front and back sides of d1 (blue side) and d2 (yellow side) of the test page that was output.



□

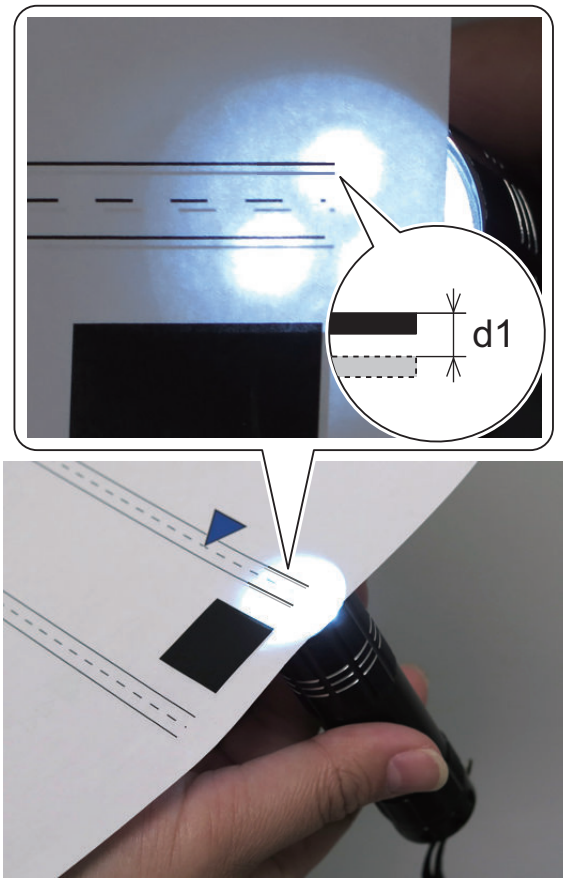
14-1. Expose d1 (blue side) to the light from the back side (red and green side), and measure the amount of displacement between the front and back of d1.

CAUTION:

- Be sure to measure the amount of displacement either between the upper sides of the lines or between the lower sides of the lines.
- Use the lines on the front side (blue and yellow side) as a reference.

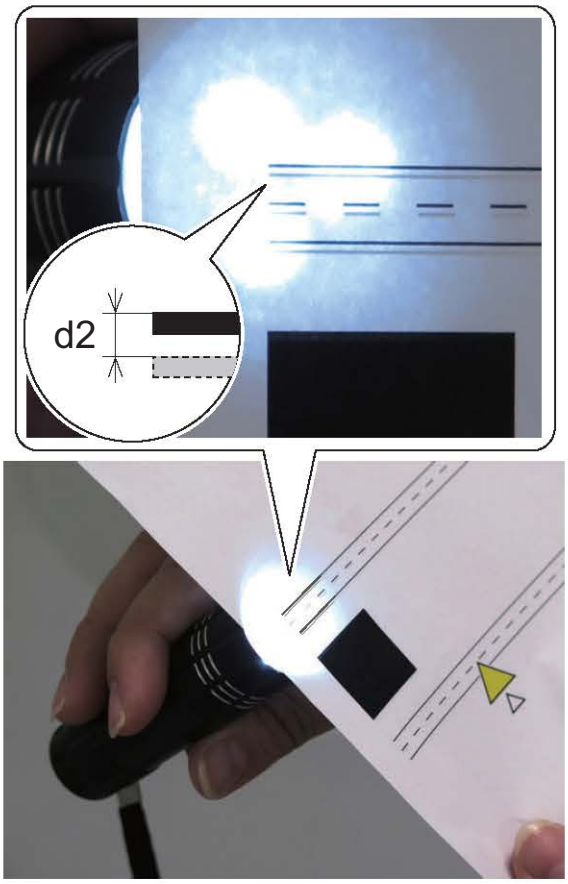
NOTE:

The gray part in dashed lines shows a line printed on the back (red and green side) from which the light is exposed.

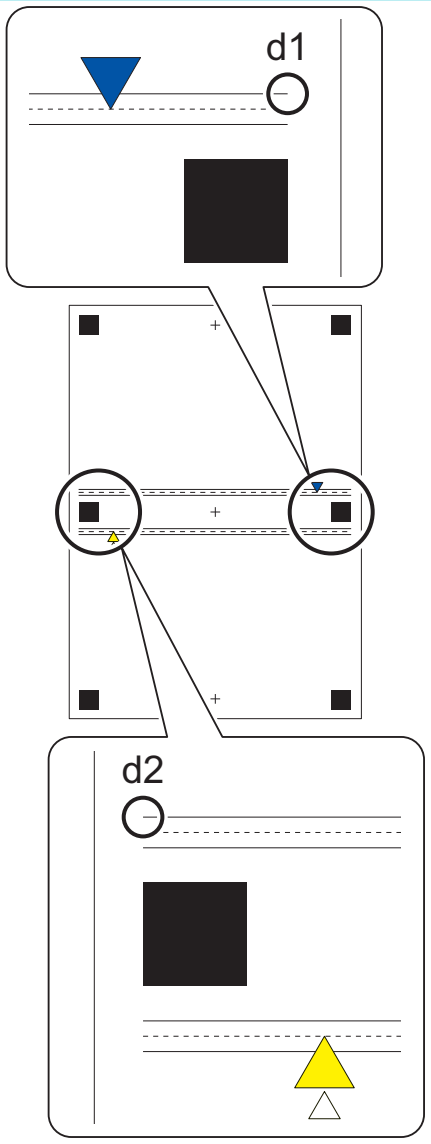


□

14-3. Measure d2 (yellow side) in the same way.



NOTE:
Be sure to calculate D (the amount of displacement) in step 14-4 using the values measured in the direction shown in the figure below.



□

14-4. When d1 and d2 are 0.5 mm or less, respectively, end the adjustment. If more than 0.5 mm, calculate D which is the amount of displacement between the front and back as shown below:

- D = (d1 + d2)/2

NOTE:
When improving the accuracy further from 0.5 mm upon user's request, perform the following steps:

< Example of measuring D >

Yellow side / Blue side

Ex.1:

d2 = -0.7 d1 = -0.4

D = ((-0.7) + (-0.4))/2 = -0.55

Ex.2:

d2 = +0.5 d1 = +0.4

D = ((+0.5) + (+0.4))/2 = +0.45

Ex.3:

d2 = -0.7 d1 = +0.4

D = ((-0.7) + (+0.4))/2 = -0.15

Ex.4:

d2 = +0.5 d1 = -0.4

D = ((+0.5) + (-0.4))/2 = +0.05

□

15. Enter the measured D in the following service mode (Level 1). (Unit: 0.01 mm)

Service Mode > COPIER > ADJUST > ADJ-XY > RDR-ANG2

Ex.: Enter "-55" in the case of D = -0.55 mm.

Enter "55" in the case of D = +0.55 mm.

□

16. Perform the steps 4 to 11, and output 1 test page.

□

17. Measure the D (amount of displacement between the front and back) and if the further adjustment is necessary, go back to step 5, output 1 test page, and then perform the adjustment again.

NOTE:
If the adjustment is performed again, adjust by adding to the value displayed for RDR-ANG2 as the reference.

Laser Exposure System

■ Laser Scanner Unit

How to Replace the Parts:“Removing the Laser Scanner Unit” on page 530

● Adjustment procedure

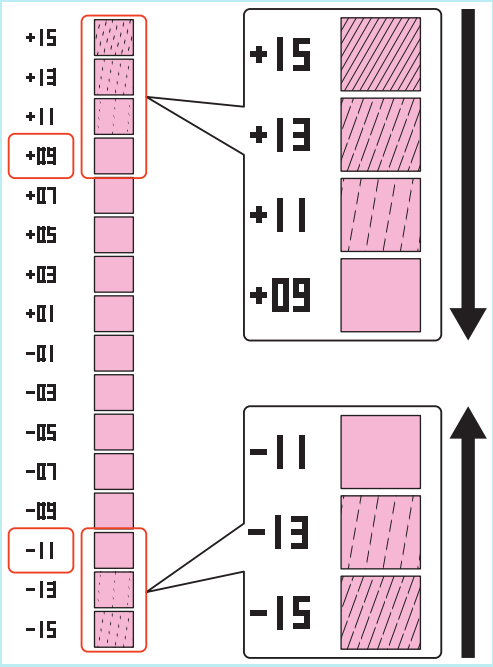
1. **Initialization of the adjustment value**
   Enter "0" for the service mode corresponding to the colors of the replaced Laser Scanner Unit.
   COPIER > ADJUST > LASER > M-ADJ-Y,M,C,K: 0
   COPIER > ADJUST > LASER > M-ADJ2-Y,M,C,K: 0
2. **Auto gradation adjustment**
   Settings/Registration > Adjustment/Maintenance > Adjust Image Quality > Full Adjust
3. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

The following moiré adjustment is for colors M, C and K. Since moiré is not visible in the color Y, there is no need for adjustment.

4. **Scanner Phase Adjustment**
   Output a PG for phase adjustment (PG 23 outputs the total three sheets of test chart of M, C, and K). *Output by color is not available.
   COPIER > TEST> PG > TYPE: 23
   COPIER > TEST> PG > PG-PICK: Select the paper source where A3 or LGL size paper is loaded
   In the service mode that corresponds to the color, enter the median of the values of the areas where moiré has not occurred in the output chart.
   COPIER > ADJUST > LASER > LSADJ1-M,C,K

NOTE:
How to see the chart for moire adjustment
Check the following for each of the 2 columns of the chart:

1. Starting from +15, look for the location where moire disappears.
2. Starting from -15, look for the location where moire disappears.
3. Take note of the numeric value obtained by adding the two numbers and then dividing it by two.
4. Check the other side (column) in the same manner, and take note of the numeric value.
5. The value to be entered in service mode is the one obtained by adding the two numbers and then dividing it by two.



5. **Scanner Magnification Ratio Adjustment**
   Output a PG for magnification ratio adjustment (PG24 outputs the total three sheets of test chart of M, C, and K). *Output by color is not available.
   COPIER > TEST> PG > TYPE: 24
   COPIER > TEST> PG > PG-PICK: Select the paper source where A3 or LGL size paper is loaded
   In the service mode that corresponds to the color, enter the median of the values of the areas where moiré has not occurred in the output chart.
   COPIER > ADJUST > LASER > LSADJ2-M,C,K

6. **Write the value after the adjustment on the Service Label of the host machine.**
   - M-ADJ-Y,M,C,K
   - M-ADJ2-Y,M,C,K

   Write down the above on the Service Label of the host machine.

Image Formation System

■ Primary Charging Wire

How to Replace the Parts:“Replacing the Primary Charging Wire Unit / Cleaning the Primary Charging Assembly” on page 643

● Adjustment procedure

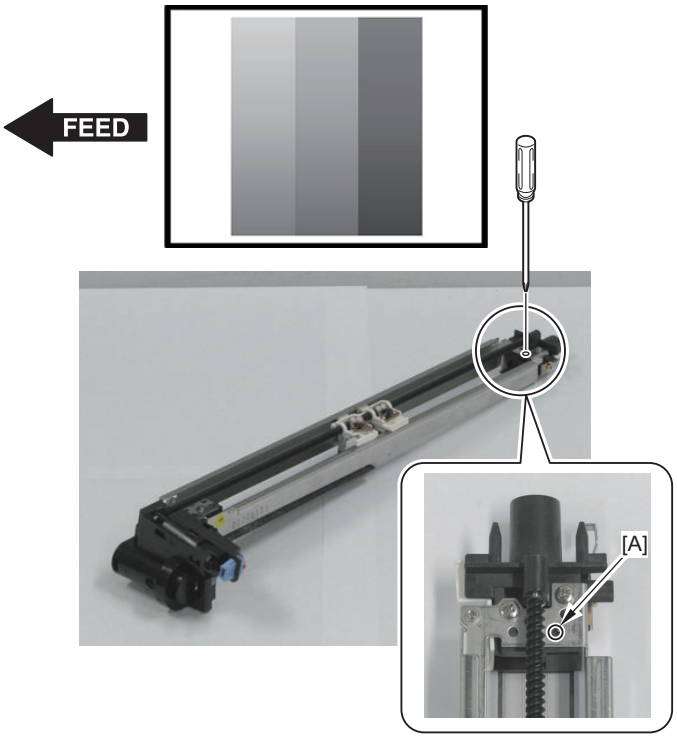
1. **Reset the parts counters.**
   COPIER > COUNTER > PRDC-1 > PRM-WIRE
2. **Clean the Charging Wire.**
   COPIER > FUNCTION > CLEANING > WIRE-EX
3. **Execute potential control.**
   COPIER > FUNCTION > DPC > DPC
4. **Output the image for wire height adjustment.**
   COPIER > FUNCTION > MISC-P > GRID-ADJ

NOTE:
Full-bleed A3 329.0 mm x 483.0 mm (13" x 19") is recommended.
PG can be output only under the following conditions.
- Paper type: Plain paper 1/2
- Paper size: Full-bleed A3 329.0 mm x 483.0 mm (13" x 19") / A3 / SRA3 / Ledger 279.4 mm x 431.8 mm (11" x 17")* / Full-bleed A3 305.0 mm x 457.0 mm (12" x 18")
- Paper source: Cassette 1

In cases other than the above, "NG" appears and blank paper is output.
* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 and later.

5. **If there is density difference between the front and the rear side of the test print image, refer to step 6 to adjust if the front side is dark, or refer to step 7 if the rear side is dark. If the density is even, execute step 8 and later.**
6. **Adjust the Primary Charging Assembly (if the front side of the test print image is dark).**

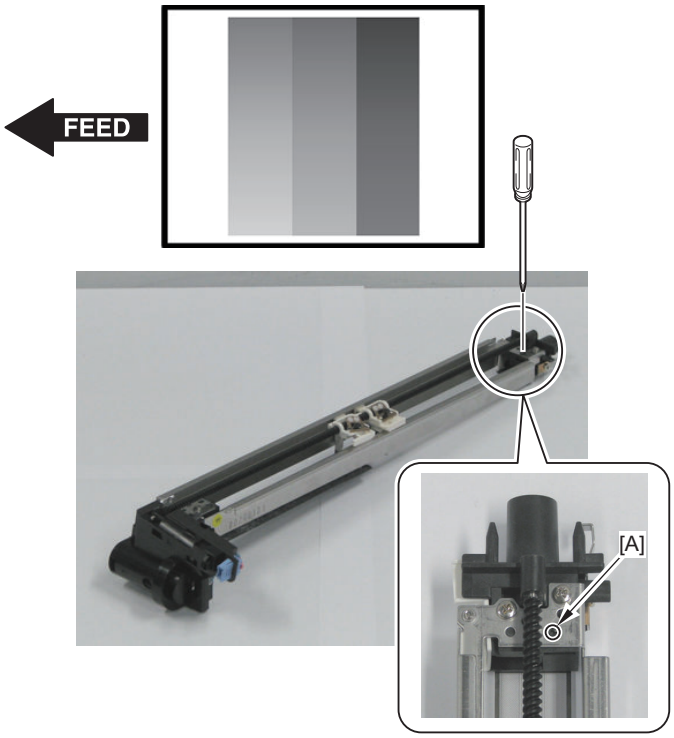
NOTE:
- If the front side of the test print image is dark [1], execute steps from 6-1 to 6-3 as shown below until the density becomes even. When the density becomes even, execute step 8 and later.



1. Rotate the Resin Screw [A] a full turn clockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
2. If the front side of the test print image is still dark, further rotate the Resin Screw [A] a full turn clockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
3. If the front side of the test print image is still dark, rotate the Resin Screw [A] a half turn clockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.

7. Adjust the Primary Charging Assembly (if the rear side of the test print image is dark).

NOTE:
- If the rear side of the test print image is dark [2], execute steps from 7-1 to 7-3 as shown below until the density becomes even. When the density becomes even, execute steps 8 and later.



1. Rotate the Resin Screw [A] a full turn counterclockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
2. If the rear side of the test print image is still dark, further rotate the Resin Screw [A] a full turn counterclockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
3. If the rear side of the test print image is still dark, rotate the Resin Screw [A] a half turn counterclockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.

8. **Execute ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
9. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
10. **Color displacement correction**
    [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
11. **Execute uneven density correction.**
    [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Grid Plate

How to Replace the Parts:“Removing the Grid Plate” on page 634

● Adjustment procedure

1. **Reset the parts counters.**
   COPIER > COUNTER > PRDC-1 > PRM-GRID
2. **Clean the Charging Wire.**
   COPIER > FUNCTION > CLEANING > WIRE-EX
3. **Execute potential control.**
   COPIER > FUNCTION > DPC > DPC

4. **Output the image for wire height adjustment.**
   COPIER > FUNCTION > MISC-P > GRID-ADJ

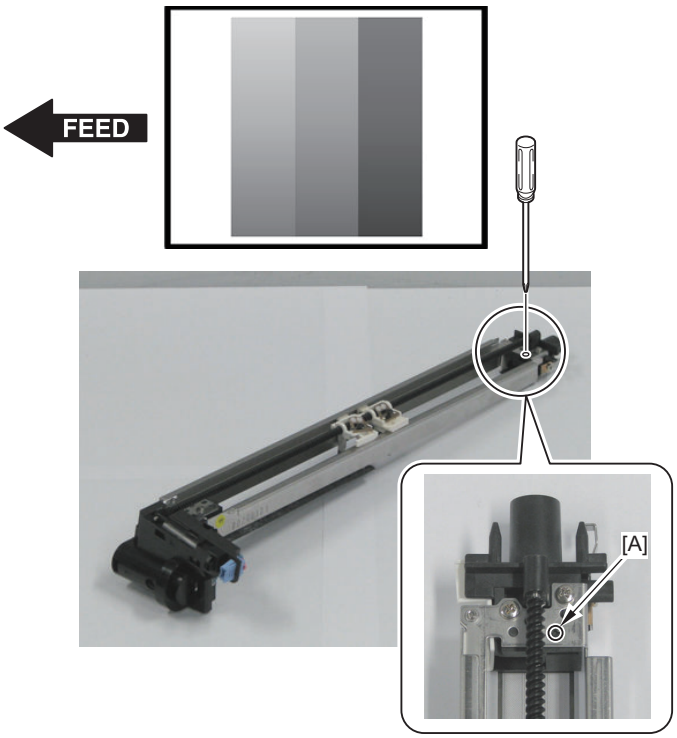
NOTE:
Full-bleed A3 329.0 mm x 483.0 mm (13" x 19") is recommended.
PG can be output only under the following conditions.
- Paper type: Plain paper 1/2
- Paper size: Full-bleed A3 329.0 mm x 483.0 mm (13" x 19") / A3 / SRA3 / Ledger 279.4 mm x 431.8 mm (11" x 17")* / Full-bleed A3 305.0 mm x 457.0 mm (12" x 18")
- Paper source: Cassette 1

In cases other than the above, "NG" appears and blank paper is output.
* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 and later.

5. **If there is density difference between the front and the rear side of the test print image, refer to step 6 to adjust if the front side is dark, or refer to step 7 if the rear side is dark. If the density is even, execute step 8 and later.**

6. **Adjust the Primary Charging Assembly (if the front side of the test print image is dark).**

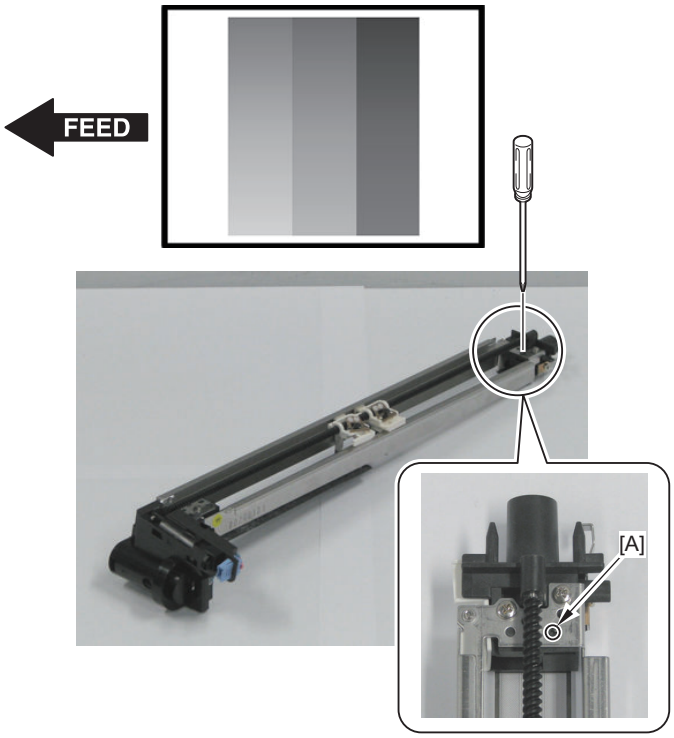
NOTE:
- If the front side of the test print image is dark [1], execute steps from 6-1 to 6-3 as shown below until the density becomes even. When the density becomes even, execute step 8 and later.



1. Rotate the Resin Screw [A] a full turn clockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
2. If the front side of the test print image is still dark, further rotate the Resin Screw [A] a full turn clockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
3. If the front side of the test print image is still dark, rotate the Resin Screw [A] a half turn clockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.

7. **Adjust the Primary Charging Assembly (if the rear side of the test print image is dark).**

NOTE:
- If the rear side of the test print image is dark [2], execute steps from 7-1 to 7-3 as shown below until the density becomes even. When the density becomes even, execute steps 8 and later.



1. Rotate the Resin Screw [A] a full turn counterclockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
2. If the rear side of the test print image is still dark, further rotate the Resin Screw [A] a full turn counterclockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
3. If the rear side of the test print image is still dark, rotate the Resin Screw [A] a half turn counterclockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.

8. **Execute ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
9. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
10. **Color displacement correction**
    [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
11. **Execute uneven density correction.**
    [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Primary Charging Assembly

How to Replace the Parts:“Removing the Primary Charging Assembly” on page 627

● Adjustment procedure

1. **Reset the parts counters.**
   COPIER > COUNTER > PRDC-1 > PRM-UNIT
2. **Clean the Charging Wire.**
   COPIER > FUNCTION > CLEANING > WIRE-EX
3. **Execute potential control.**
   COPIER > FUNCTION > DPC > DPC

4. **Output the image for wire height adjustment.**
   COPIER > FUNCTION > MISC-P > GRID-ADJ

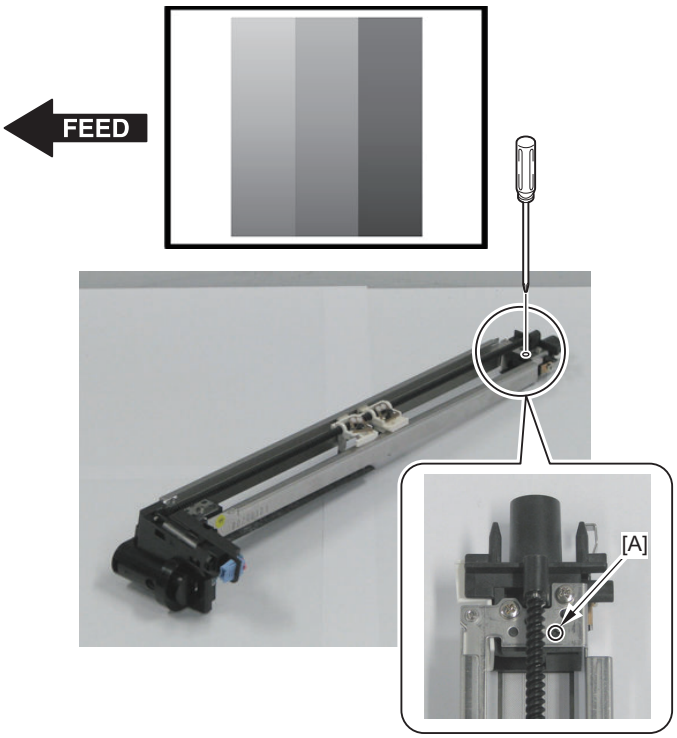
NOTE:
Full-bleed A3 329.0 mm x 483.0 mm (13" x 19") is recommended.
PG can be output only under the following conditions.
- Paper type: Plain paper 1/2
- Paper size: Full-bleed A3 329.0 mm x 483.0 mm (13" x 19") / A3 / SRA3 / Ledger 279.4 mm x 431.8 mm (11" x 17")* / Full-bleed A3 305.0 mm x 457.0 mm (12" x 18")
- Paper source: Cassette 1

In cases other than the above, "NG" appears and blank paper is output.
* Ledger 279.4 mm x 431.8 mm (11" x 17") is supported with DCON Ver. 4.01 and later.

5. **If there is density difference between the front and the rear side of the test print image, refer to step 6 to adjust if the front side is dark, or refer to step 7 if the rear side is dark. If the density is even, execute step 8 and later.**

6. **Adjust the Primary Charging Assembly (if the front side of the test print image is dark).**

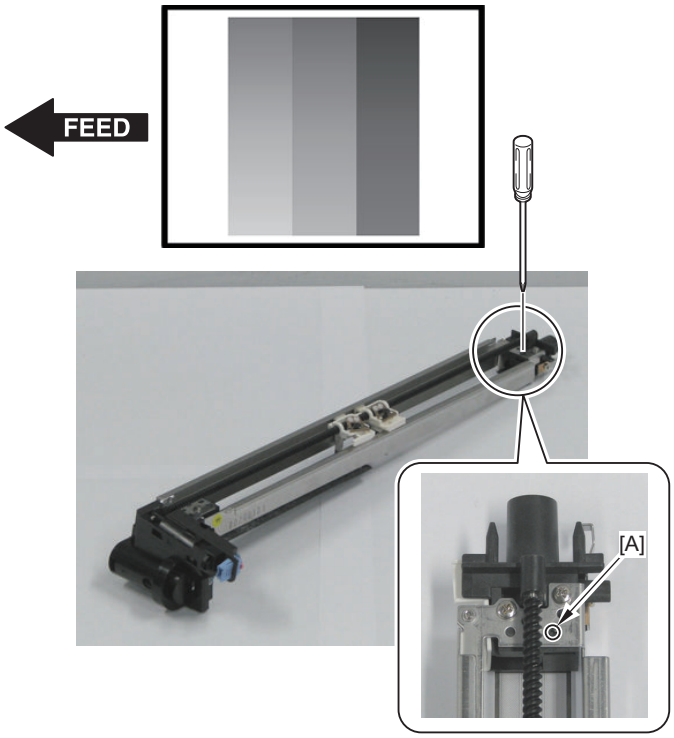
NOTE:
- If the front side of the test print image is dark [1], execute steps from 6-1 to 6-3 as shown below until the density becomes even. When the density becomes even, execute step 8 and later.



1. Rotate the Resin Screw [A] a full turn clockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
2. If the front side of the test print image is still dark, further rotate the Resin Screw [A] a full turn clockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
3. If the front side of the test print image is still dark, rotate the Resin Screw [A] a half turn clockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.

7. **Adjust the Primary Charging Assembly (if the rear side of the test print image is dark).**

NOTE:
- If the rear side of the test print image is dark [2], execute steps from 7-1 to 7-3 as shown below until the density becomes even. When the density becomes even, execute steps 8 and later.



1. Rotate the Resin Screw [A] a full turn counterclockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
2. If the rear side of the test print image is still dark, further rotate the Resin Screw [A] a full turn counterclockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.
3. If the rear side of the test print image is still dark, rotate the Resin Screw [A] a half turn counterclockwise. While referring to the replacement procedure of the Primary Charging Assembly, install it to the host machine, output a test print and check the image.

8. **Execute ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
9. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
10. **Color displacement correction**
    [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
11. **Execute uneven density correction.**
    [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Pre-transfer Charging Wire

How to Replace the Parts:“Replacing the Pre-transfer Charging Wire Unit/Cleaning the Pre-transfer Charging Assembly” on page 659

● Adjustment procedure

1. **Reset the parts counters.**
   COPIER > COUNTER > PRDC-1 > PO-WIRE
2. **Clean the Charging Wire.**
   COPIER > FUNCTION > CLEANING > WIRE-EX
3. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
4. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]

5. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Pre-transfer Charging Assembly

How to Replace the Parts:“Removing the Pre-transfer Charging Assembly” on page 649

● Adjustment procedure

1. **Reset the parts counters.**
   COPIER > COUNTER > PRDC-1 > PO-UNIT
2. **Clean the Charging Wire.**
   COPIER > FUNCTION > CLEANING > WIRE-EX
3. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
4. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Drum Unit

How to Replace the Parts:“Removing the Drum Unit (Bk)” on page 662“Separating the Developing Assembly (Y)/(M)/(C) from the Drum Unit (Y)/(M)/(C)” on page 716

● Adjustment procedure

[Work before Drum Replacement]

1. **Turn OFF the warm-up rotation control.**
   COPIER > FUNCTION > INSTALL > AINR-OFF = 1
2. **Turn OFF the main power (replace the Drum Unit).**
   It is recommended to replace the Drum Cleaning Blade with a new one at the same time as replacing the Drum.
   When reusing the Drum Cleaning Blade, clean the edge of the Drum Cleaning Blade and apply lubricant (Tospearl) to the edge.

[Work after Drum Replacement]

3. **Turn ON the main power.**
4. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
5. **Execute drum reset mode.**
   Select COPIER > FUNCTION > INSTALL > CLR-SET, and set the target color to "1".
   COPIER > FUNCTION > INSTALL > DRMRESET
6. **Turn ON the warm-up rotation control.**
   COPIER > FUNCTION > INSTALL > AINR-OFF = 0
7. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
8. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

9. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Drum Patch Sensor Unit (Bk)

How to Replace the Parts:“Removing the Drum Patch Sensor Unit (Bk)” on page 678

● Adjustment procedure

1. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
2. **Enter the alpha value of the Patch Sensor.**
   COPIER > ADJUST > DENS > ALF-C
   (Enter the 4-digit number at the bottom of the barcode sticker affixed to the Patch Sensor Unit.)

3. **Adjustment of Patch Sensor light intensity**
   COPIER > FUNCTION >MISC-P > PT-LPADJ
4. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Developing Assembly

How to Replace the Parts:“Removing the Developing Assembly (Bk)” on page 701“Separating the Developing Assembly (Y)/(M)/(C) from the Drum Unit (Y)/(M)/(C)” on page 716

● Adjustment procedure

[Work before Developing Assembly Replacement]

1. **Turn OFF the warm-up rotation control.**
   COPIER > FUNCTION > INSTALL > AINR-OFF = 1
2. **Turn OFF the main power (replace the Developing Assembly).**

[Work after Developing Assembly Replacement]

3. **Turn ON the main power.**
4. **Execute the initial installation mode of the Developing Assembly.**
   Select COPIER > FUNCTION > INSTALL > CLR-SET, and set the target color to "1".
   COPIER > FUNCTION > INSTALL > INISET
5. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
6. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
7. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
8. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Potential Sensor

How to Replace the Parts:“Removing the Potential Sensor PCB Unit (including Potential Sensor and Potential Control PCB)” on page 607

● Adjustment procedure

1. **Install the Primary Charging Rail with the Potential Sensor removed to the host machine.**
   - 1 Screw
2. **Install the ITB Unit to the host machine.**
3. **Connect a new cable to the connector of a new Potential Sensor.**
4. **Install the Potential Sensor to the 2 pin electrodes for checking the Potential Sensor.**
   - 1 Connector
   - 1 Screw
5. **Install a new Potential Control PCB.**
   - 1 Connector
   - 1 Screw
   - 5 PCB Supports
6. **Pass the Primary Charging Rail and the 2 harnesses of the electrode for checking the Potential Sensor through the Edge Saddle of the Right Side Plate of the host machine, and secure them with the 7 Wire Saddles and the Reuse Band and connect the 2 connectors.**
7. **Place the electrode for checking the Potential Sensor on the Process Unit Inner Cover, and use the Electrode Clip to pinch the plate of the hinge to ground.**
8. **Use a dedicated tool to deactivate the Front Door Switch.**
9. **Turn ON the main power switch.**
   For the detailed procedures of steps 1 to 9 above, refer to the actions to be taken when replacing the Potential Sensor PCB Unit (“When Replacing the Potential Sensor PCB Unit” on page 610).
10. **Immediately after turning ON the main power switch, turn OFF the warm-up rotation control.**
    COPIER > FUNCTION > INSTALL > AINR-OFF = 1
11. **Execute the Potential Sensor adjustment.**
    COPIER > FUNCTION > DPC > OFST
12. **Turn ON the warm-up rotation control.**
    COPIER > FUNCTION > INSTALL > AINR-OFF = 0
13. **Turn OFF the main power switch.**
    For the detailed procedures of steps 14 to 17 below, refer to the actions to be taken when replacing the Potential Sensor PCB Unit (“When Replacing the Potential Sensor PCB Unit” on page 610).

14. **Install a new Potential Sensor to the Primary Charging Rail.**
15. **Install a new Potential Sensor Protection Sheet.**
16. **Install the Primary Charging Rail to the host machine.**
17. **Install the removed parts in reverse order.**

■ ITB

How to Replace the Parts:“Removing the ITB” on page 570

● Adjustment procedure

1. **Reset the parts counters.**
   COPIER > COUNTER > DRBL-1 > TR-BLT
2. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
3. **Execute the primary transfer ATVC.**
   COPIER > FUNCTION > MISC-P > 1ATVC-EX
4. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ ITB Inner Scraper

How to Replace the Parts:“Removing the ITB Inner Scraper Holder” on page 592

● Adjustment procedure

1. **Reset the parts counters.**
   COPIER > COUNTER > DRBL-1 > ITB-SCRP
2. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
3. **Execute the primary transfer ATVC.**
   COPIER > FUNCTION > MISC-P > 1ATVC-EX
4. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Secondary Transfer Inner Roller

How to Replace the Parts:“Removing the Secondary Transfer Inner Roller” on page 590

● Adjustment procedure

1. **Reset the parts counters.**
   COPIER > COUNTER > DRBL-1 > 2TR-INRL
2. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB

3. **Execute the primary transfer ATVC.**
   COPIER > FUNCTION > MISC-P > 1ATVC-EX
4. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Transfer Cleaning Unit

How to Replace the Parts:“Removing the Transfer Cleaning Unit” on page 564

● Adjustment procedure

1. **Reset the parts counters.**
   COPIER > COUNTER > DRBL-1 > ITBCLN-U
2. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
3. **Execute the primary transfer ATVC.**
   COPIER > FUNCTION > MISC-P > 1ATVC-EX
4. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Actions when releasing the pressure from the ITB

How to Replace the Parts:“Actions when releasing the pressure from the ITB” on page 548

● Adjustment procedure

Be sure to perform the actions for when releasing the pressure from the ITB for the removal/installation of the ITB Unit (when the ITB Pressure Release Lever is turned).

1. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
2. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]

■ Primary Transfer Roller

How to Replace the Parts:“Removing the Primary Transfer Roller” on page 586

● Adjustment procedure

1. **Reset the parts counters.**
   COPIER > COUNTER > DRBL-1 > 1TR-RL-Y/M/C/K
2. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
3. **Execute the primary transfer ATVC.**
   COPIER > FUNCTION > MISC-P > 1ATVC-EX

4. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
5. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
6. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

■ Registration Patch Sensor Unit

How to Replace the Parts:“Removing the Registration Patch Sensor Unit” on page 597

● Adjustment procedure

1. **Execute the ITB neutral position adjustment.**
   COPIER > FUNCTION > INSTALL > INIT-ITB
2. **Adjustment of Patch Sensor light intensity**
   COPIER > FUNCTION >MISC-P > PT-LPADJ
3. **Auto gradation adjustment**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Adjust Gradation] > [Full Adjust]
4. **Color displacement correction**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Auto Correct Color Mismatch]
5. **Execute uneven density correction.**
   [Settings/Registration] > [Adjustment/Maintenance] > [Adjust Image Quality] > [Correct Shading]

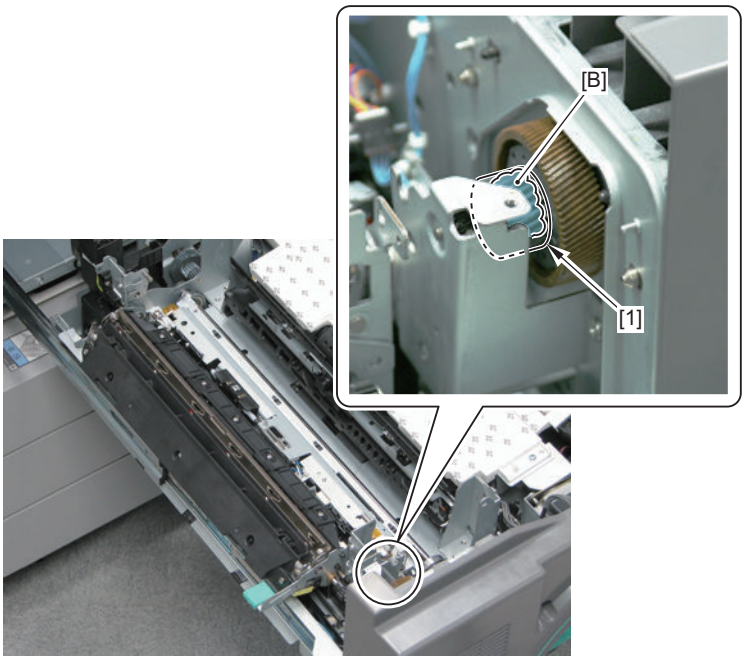
Fixing System

■ Fixing Assembly

How to Replace the Parts:“Removing the Fixing Assembly” on page 843

● Adjustment procedure

1. **Apply grease (SE1107) to the tooth surface [B] of the gear [1] of the Fixing Drive Unit.**
   - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface



2. **Install the removed parts in reverse order.**

3. **Clear the counters.**
   COPIER > COUNTER > FIXING > FX-CNT
   COPIER > COUNTER > DRBL-1> FX-BLT-U / FX-BLT-L

NOTE:
The following items are cleared when the above counter is cleared.
- COPIER > DISPLAY > FIXING > FX-U-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-L-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-U-STR
- COPIER > DISPLAY > FIXING > FX-MTR2 to 5
- COPIER > DISPLAY > FIXING > FX-R-TM
- COPIER > COUNTER > FIXING > FX-RF-RL
- COPIER > COUNTER > CLEANING > FX1-RFRL
- COPIER > COUNTER > PRDC-1 > FXLW-TH1/2

4. **Clear the error. (If an error occurred)**
   COPIER > FUNCTION > CLEAR > ERR

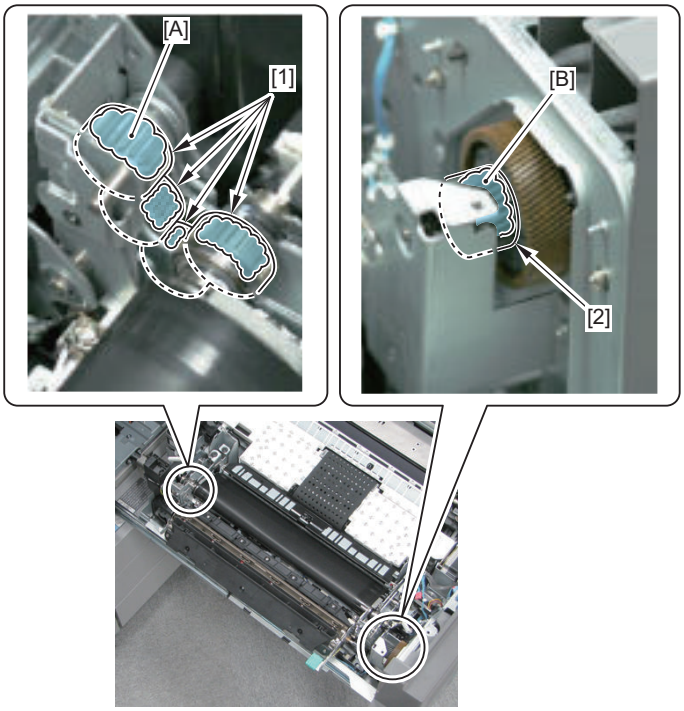
■ Fixing Belt Unit

How to Replace the Parts:“Opening the Fixing Belt Unit” on page 798

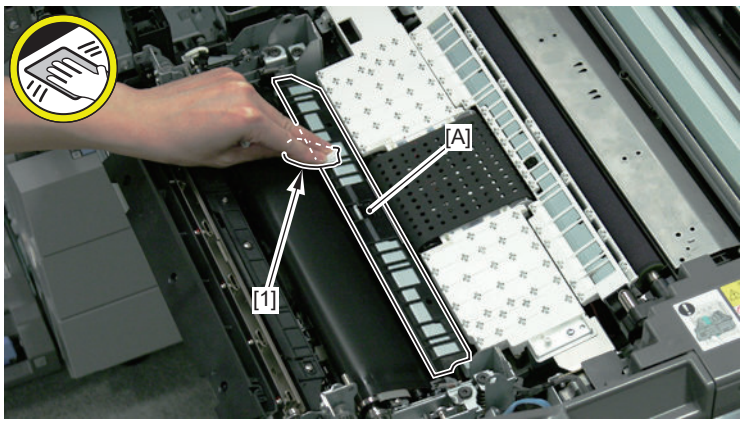
● Adjustment procedure

1. **Apply grease (SE1107) to the tooth surfaces [A] of the 4 gears of the Pressure Belt Unit.**
   - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface

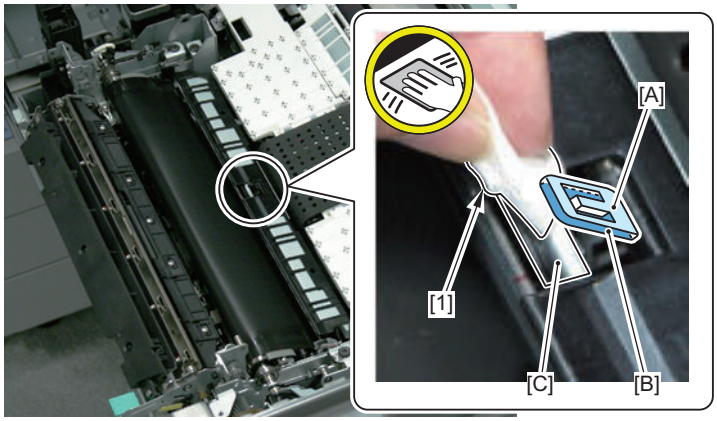
2. **Apply grease (SE1107) to the tooth surface [B] of the gear [2] of the Fixing Drive Unit.**
   - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface



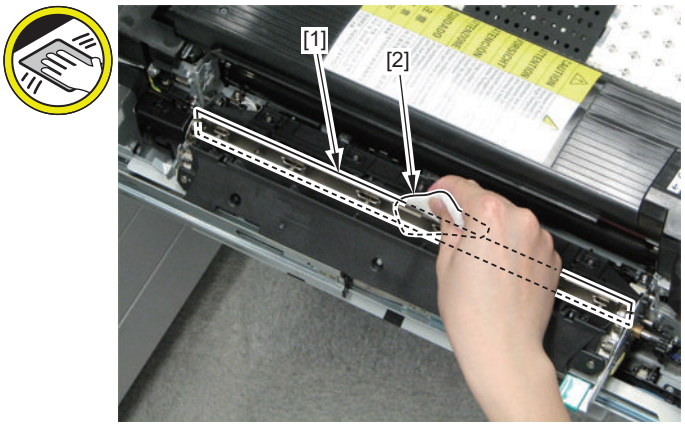
3. **Clean the surface [A] of the Fixing Inlet Guide with lint-free paper [1] moistened with alcohol.**



4. **Using lint-free paper [1] moistened with alcohol, clean the Sensor Flag's surface side [A], back side [B], and the [C] part which comes in contact with the Fixing Inlet Guide.**



5. **Clean the Separation Plate [1] of the Inner Delivery Unit with lint-free paper [2] moistened with alcohol.**



6. **Install the removed parts in reverse order.**

7. **Clear the counters.**
   COPIER > COUNTER > DRBL-1 > FX-BLT-U

NOTE:
The following items are cleared when the above counter is cleared.
- COPIER > DISPLAY > FIXING > FX-U-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-U-STR
- COPIER > DISPLAY > FIXING > FX-R-TM
- COPIER > COUNTER > FIXING > FX-RF-RL
- COPIER > COUNTER > CLEANING > FX1-RFRL

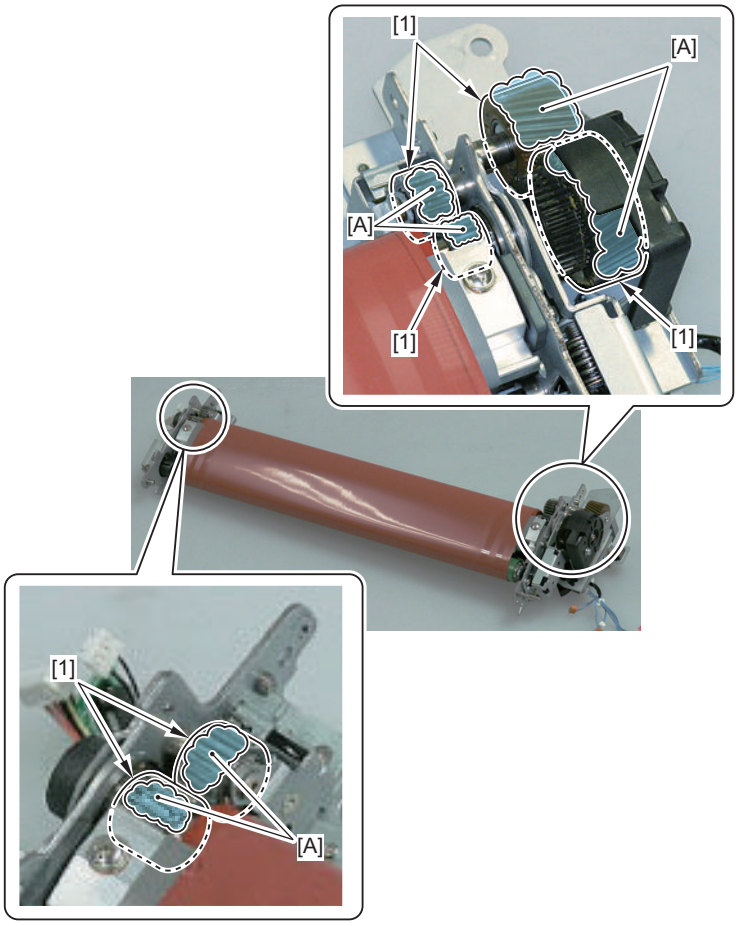
8. **Clear the error. (If an error occurred)**
   COPIER > FUNCTION > CLEAR > ERR

■ Pressure Belt Unit

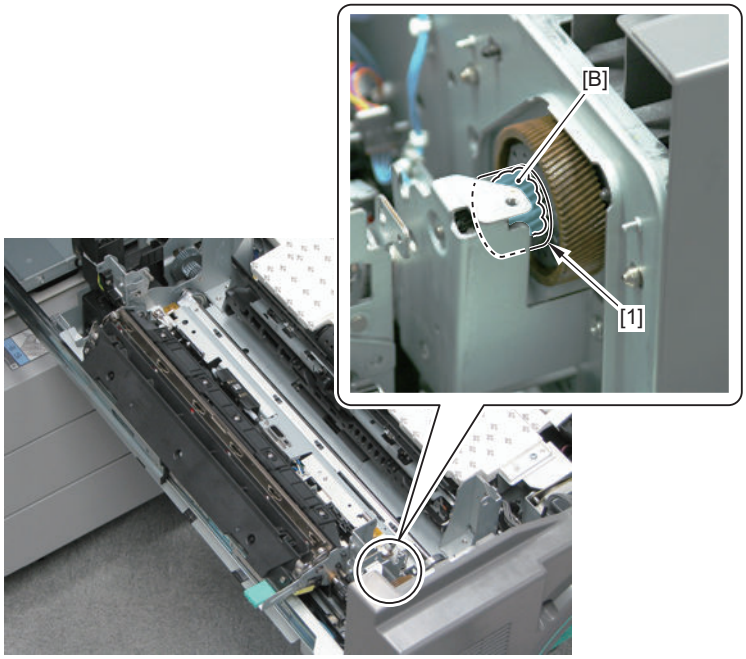
How to Replace the Parts:“Separating the Pressure Belt Unit and the Pressure Heater” on page 828

● Adjustment procedure

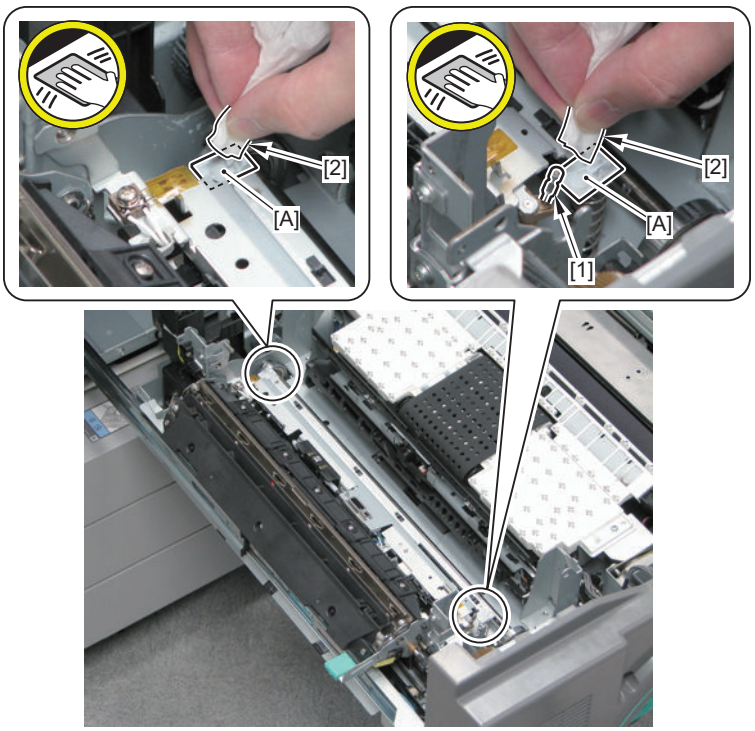
1. **Apply grease (SE1107) to the tooth surfaces [A] of the 6 gears of the Fixing Belt Unit.**
   - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface



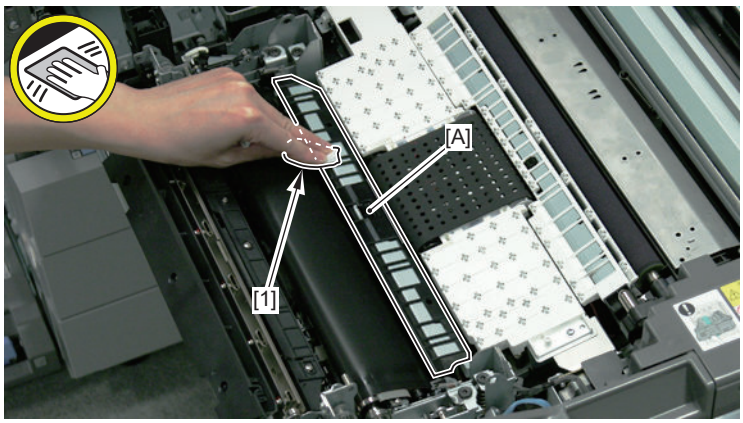
2. **Apply grease (SE1107) to the tooth surface [B] of the gear [1] of the Fixing Drive Unit.**
   - Range/amount of grease to be applied: The amount of grease which covers grease-applicable area on the gear teeth surface



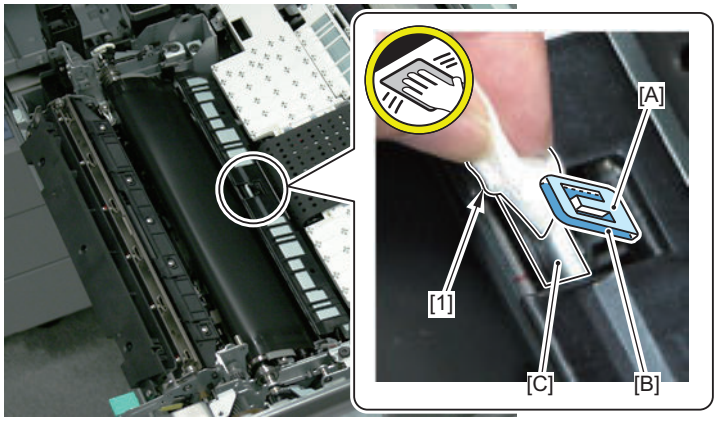
3. **Clean the soiling of the Contact Roller [1] on the Pressure Belt Position Sensor and the oil dripped from the Pressure Belt to the bottom side [A] of the Fixing Lower Unit with lint-free paper [2].**



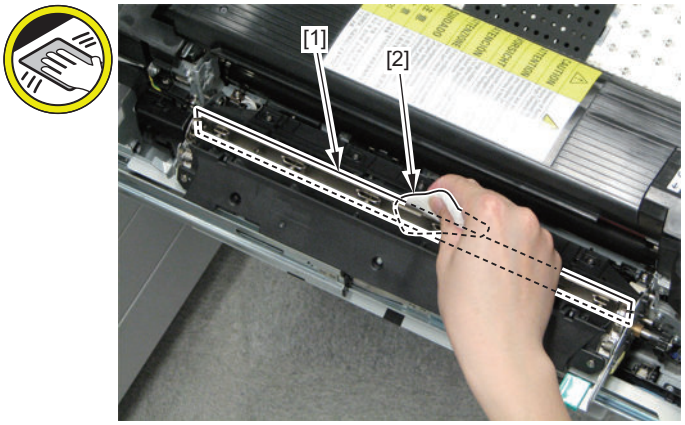
4. **Clean the surface [A] of the Fixing Inlet Guide with lint-free paper [1] moistened with alcohol.**



5. **Using lint-free paper [1] moistened with alcohol, clean the Sensor Flag's surface side [A], back side [B], and the [C] part which comes in contact with the Fixing Inlet Guide.**



6. **Clean the Separation Plate [1] of the Inner Delivery Unit with lint-free paper [2] moistened with alcohol.**



7. **Install the removed parts in reverse order.**

8. **Clear the counters.**
   COPIER > COUNTER > DRBL-1 > FX-BLT-L

NOTE:
The following items are cleared when the above counter is cleared.
- COPIER > DISPLAY > FIXING > FX-L-TM1 to 5
- COPIER > DISPLAY > FIXING > FX-MTR2 to 5

9. **Clear the error. (If an error occurred)**
   COPIER > FUNCTION > CLEAR > ERR

Pickup Feed System

■ Registration Unit

How to Replace the Parts:“Removing the Registration Unit” on page 892

● Adjustment procedure

NOTE:
Perform this adjustment also when removing/installing the unit only.

1. **Execute image position adjustment.****“Image Position Adjustment <Overview>” on page 981**

When clearing RAM

DC controller PCB

How to Replace the Parts	“Removing the DC Controller PCB” on page 509
Before Replacing	Backup of DC Controller PCB SRAM COPIER > FUNCTION > SYSTEM > DSRAMBUP (LEVEL2) “ACTIVE” is displayed and then “OK!” is displayed about 2 minutes later. Turn OFF the main power when the above work is complete.
Aftter Replacing	Restoration of DC Controller PCB SRAM COPIER > FUNCTION > SYSTEM > DSRAMRES (LEVEL2) “ACTIVE” is displayed at execution and then “OK!” is displayed about 2 minutes later. Restoration is complete.
Prohibited Operation	• When replacing the DC Controller PCB, be sure to use a new one. Do not use the DC Controller PCB which was used with another machine.

6 Troubleshooting

Making Initial Checks

List of Initial Check Items

Item	No.	Check Items	Check
Installation Environment	1	The value of power voltage is +/- 10% of the specified voltage.	
	2	The machine is installed away from heat and moisture (near a faucet, water heater, or humidifier), cold place, source of fire or in an area exposed to dust.	
	3	The machine is not in a place that generates ammonia gas.	
	4	The machine is not in a place of direct sunlight.	
	5	The machine is installed in a well-ventilated place where the machine stands horizontally.	
	6	The power plug of the machine is connected to the output.	
Checking the paper	7	The Canon-recommended paper is used.	
	8	Paper does not absorb moisture or dry out. Set paper by taking it out from a new package to output.	
Checking the paper setting	9	Paper that is within the specified volume is correctly set in the Cassette, Deck and Multi-purpose Tray.	
	10	When using transparency, the transparency is set in the correct direction.	
Checking the consumable parts	11	Check the list of estimated life of consumable parts and replace parts that have reached the estimated life.	
Checking the periodically replaced parts	12	Replace parts that have reached the estimated life in accordance with the list of periodical services and the table of periodically replaced parts.	

Test Print

Overview

This machine has several test print types shown in the table below. A circle in each image check item shows the availability to check the different type of image faults. If the faulty image shown in the output does not appear in the appropriate test print type, the cause may lie in PDL input or the reader

PG TYPE	TYPE Pattern	Items										Origi-nator
		Grada-tion	Fog-ging	Trans-fer Fault	Black line	White line	Uneven Density	Uneven Density at the Front / Rear	Color dis-place-ment	Right Angle	Straight Lines	
0	Normal copy / print											----
1 to 3	(For R&D)											----
4	16-Gra-dation	Yes	Yes			Yes		Yes				Main control-ler PCB
5	Full Area Half Tone			Yes	Yes	Yes	Yes					Main control-ler PCB
6	Grid									Yes	Yes	Main control-ler PCB
10	MCYBk Horizon-tal Line					Yes		Yes				Main control-ler PCB
12	64-Gra-dation	Yes										Main control-ler PCB
14	Full Col-or 16-grada-tion	Yes	Yes									Main control-ler PCB

Selecting Test Print TYPE

1. **Set the copy count, paper size, and pickup mode (single-sided or double-sided).**
2. **Select the following service mode.**
   Service Mode_COPIER > TEST > PG
3. **Enter the appropriate TYPE No. using the keypad, and press the OK key.**
4. **Set the density in the following service mode (valid only if TYPE=5).**
   Service Mode_COPIER > TEST > PG > DENS-Y
   - DENS-Y, DENS-M, DENS-C, DENS-K
5. **Set the image mode in the following service mode.**
   Service Mode_COPIER > TEST > PG > TXPH
6. **Press the start key.**

How to check test print

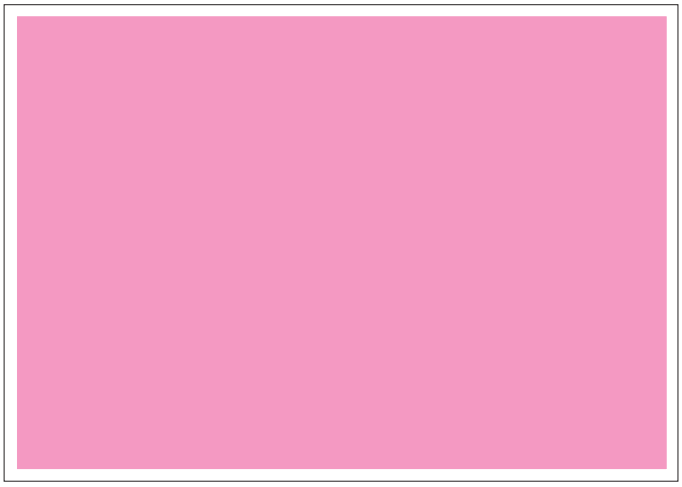
■ 16-Gradation (TYPE=4)

This test print can mainly check gradation performance, image fogging, white line, and density unevenness at the rear/front.

1. Gradation
   If there is no 16-step density gradation, it may be caused by fault of drum unit or laser scanning system.
2. Foggy image
   If there is foggy image only at the white area as shown in the figure below, it may be caused by fault of drum unit or laser scanning system.
3. Vertical white/black line
   If white or black lines occur with a particular color, the possible cause is an error in the Drum Unit of the color, an error in the Developing Assembly, or soiling on the laser light path.
   If white or black lines occur at the same position with all the colors, the possible cause is deterioration of the Intermediate Transfer Unit or Fixing Assembly.
4. Density unevenness at the rear/front
   If there is density unevenness at the rear/front, it may be caused by fault of drum unit, laser scanning system or transfer unit.

■ Full Area Half Tone (TYPE=5)

This test print can mainly check transfer failure, black line, white line, and pitch unevenness.



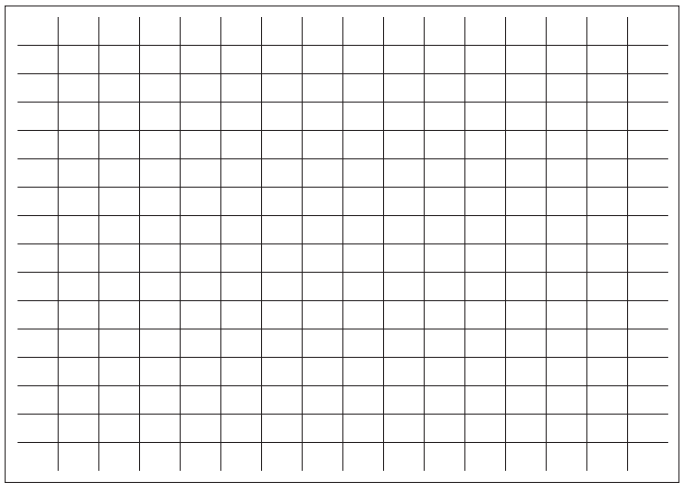
COLOR-M=1, COLOR-Y/C/K=0

NOTE:
- Output by every developing color is available by specifying the developing color (COLOR-Y/COLOR-M/COLOR-C/COLOR-K) in the following service mode:
  Service Mode_COPIER > TEST > PG > COLOR-Y
- In the case of changing density of the test print, execute followings in service mode for density setting:
  Service Mode_COPIER > TEST > PG > DENS-Y
  - DENS-Y, DENS-M, DENS-C, DENS-K

1. Transfer failure
   If there is transfer failure, it may be caused by fault of transfer (intermediate transfer/secondary transfer) unit.
2. Horizontal unevenness
   If there is horizontal unevenness, it may be caused by fault of photosensitive drum drive unit, drum ITB motor, or drum unit.
3. Vertical unevenness
   If there is vertical unevenness, it may be caused by soiled LDE lens, fault of drum unit, or deterioration of intermediate transfer belt.

■ Grid (TYPE=6)

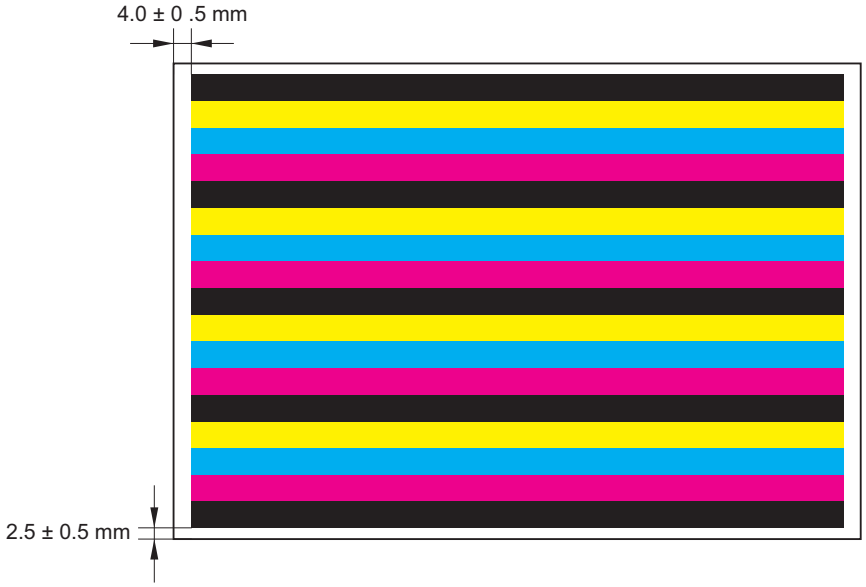
This test print can mainly check color displacement, right angle accuracy and linearity.



1. Color displacement
   If there is color displacement, it may be caused by fault of each laser scanning system, transfer (intermediate transfer/secondary transfer) unit or photosensitive drum drive unit.
2. Right angle accuracy and linearity
   If there is fault of right angle accuracy or linearity, it may be caused by fault of laser scanning system, or defective shape of registration (upper/lower) roller or the secondary transfer outer roller.

■ MCYBk Horizontal Line (TYPE=10)

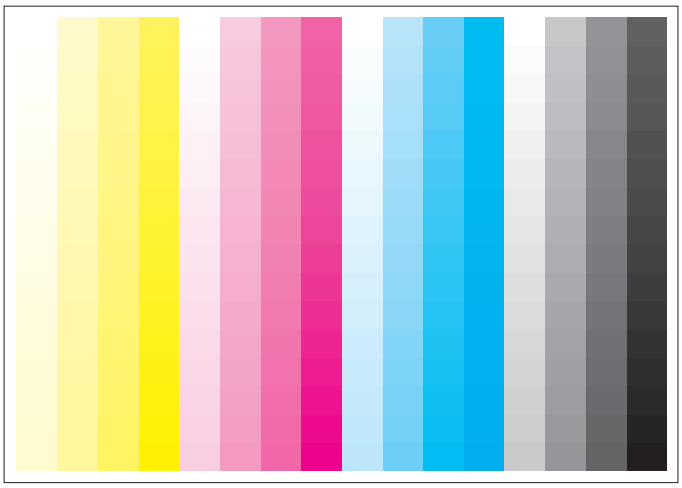
This test print can mainly check the dark area density of each color, balance among each color and white line by developing.



1. Solid density of each color and balance among each color.
   - Density is not extremely light.
   - In the case of light density with a certain color, it may be caused by the developer of the color in question, or fault of primary transfer roller, laser scanning system or high voltage system.
2. White/black line
   If white or black lines occur with a particular color, the possible cause is an error in the Drum Unit of the color, an error in the Developing Assembly, or soiling on the laser light path.
   If white or black lines occur at the same position with all the colors, the possible cause is deterioration of the Intermediate Transfer Unit or Fixing Assembly.
3. Density unevenness at the rear/front
   If there is density unevenness with a certain color, it may be caused by fault of drum unit, laser scanning system or transfer (intermediate transfer/secondary transfer) unit.
   If there is density unevenness with all colors, it may be caused by deterioration of intermediate transfer unit.

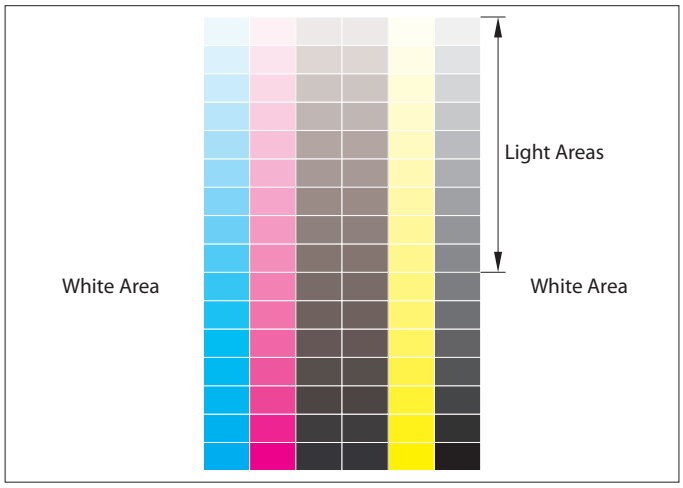
■ 64-Gradation (TYPE=12)

YMCBk64 gradation test print can mainly check gradation performance of each color (YMBCk) at one time.



■ Full Color 16-gradation (TYPE=14)

Full color 16-gradation test print can mainly check gray balance, gradation performance of each color (YMCBk) and foggy image.



1. Gray balance
   Check to see if the output comes with even density of each color at gray scale area.
2. Gradation performance
   Check gradation performance and density difference of each color (YMCBk)
3. Foggy image
   If there is foggy image at the white area, it may be caused by fault of developing system or photosensitive drum, or correction fault of laser scanning system.

Image Faults

Development stain

[Location]

Developing Assembly

[Cause]

When the toner charging amount (tribo-charging) shifts at relatively low levels, toner scatters inside the Developing Assembly and in the space between the lid of the Developing Assembly and the sleeve, and the accumulated toner turns into a development stain.

[Condition]

End of the life of developer In a high humidity environment
It is likely to occur with Bk or M.

[Field Remedy]

Reduce the TD ratio in the Developing Assembly by service mode to resolve this symptom.

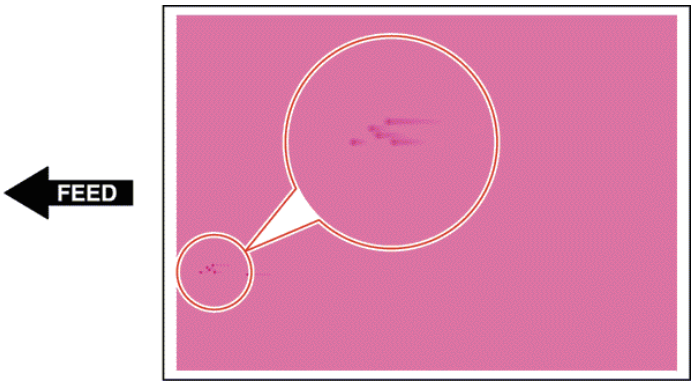
1. **Adjust the Toner Density Sensor density correction upper limit of the color with which this symptom occurs.**
   Set the value of the target color to "+1" in the following service mode (HLMT-PTY / HLMT-PTM / HLMT-PTC / HLMT-PTK). (Default: 0)
   COPIER > ADJUST > DENS > HLMT-PTY
   COPIER > ADJUST > DENS > HLMT-PTM
   COPIER > ADJUST > DENS > HLMT-PTC
   COPIER > ADJUST > DENS > HLMT-PTK
2. **Print 50 sheets of image at 10% image ratio 4 times.**
   1. Set "16" for the service mode (TYPE).
      COPIER > TEST > PG > TYPE
   2. Set the value of the target color to "1" in service mode (COLOR-Y / COLOR-M / COLOR-C / COLOR-K). Set "0" for colors other than the target one.
      COPIER > TEST > PG > COLOR-Y
      COPIER > TEST > PG > COLOR-M
      COPIER > TEST > PG > COLOR-C
      COPIER > TEST > PG > COLOR-K
   3. Set "50" for the service mode (PG-QTY).
      COPIER > TEST > PG > PG-QTY
3. **Print the original with which this symptom occurred, and check if the symptom has disappeared.**
   - If it has disappeared, execute full adjustment.
     - Settings/Registration > Adjustment/Maintenance > Adjust Image Quality > Auto Adjust Gradation > Full Adjust
   - If it has not disappeared, set the value of the target color to "+2" in service mode (HLMT-PTY / HLMT-PTM / HLMT-PTC / HLMT-PTK) and perform steps 2 and 3. If that does not work, perform step 4.

4. **Set the value of service mode of the target color (HLMT-PTY / HLMT-PTM / HLMT-PTC / HLMT-PTK) back to the default value "0", and clean the Developing Assembly and Drum Unit.**

NOTE:
Step 2 is required because toner needs to be consumed to make T/D ratio in the Developing Assembly to be the specified value.

CAUTION:
Increasing the setting value of service mode (HLMT-PTY / HLMT-PTM / HLMT-PTC / HLMT-PTK) will be disadvantageous for carrier adhesion (a symptom that carrier is developed).

[Image Sample]



Transfer Failure on Trailing Edge of Coated Paper

[Location]

Secondary Transfer Unit

[Cause]

Gap voltage occurs between the ITB and paper in the secondary transfer nip area as a result of the upward curl of the paper's trailing edge.

[Condition]

At printing of coated paper
[Field Remedy]

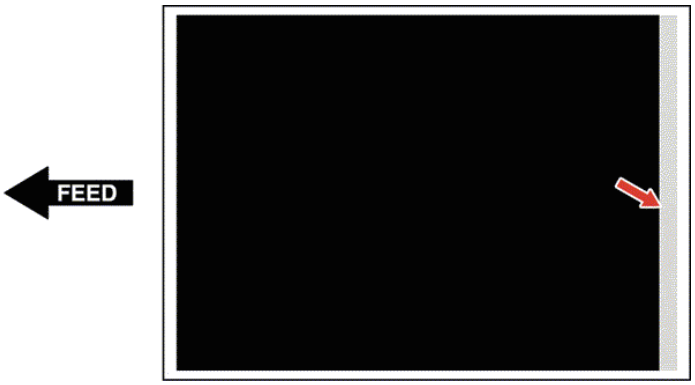
1. **Instruct the user to use papers to which "curl straightening" has been performed. (Bend paper in opposite direction to straighten curling.)**
   Be sure to straighten the curled papers before using them. (Degree of curl: 10 mm or less for plain paper; 5 mm or less for heavy paper)
   Paper may not be fed depending on the paper type.
   If it persists, execute the following.
2. **Adjust the secondary transfer bias in Settings/Registration > Correct Tail End Toner Application.**
   1. Set "1" for the service mode (IMGC-ADJ).
      COPIER > OPTION > DSPLY-SW > IMGC-ADJ
   2. Select the paper with which this symptom occurred.
      - Settings/Registration > Preferences > Paper Settings > Paper Type Management Settings > Applicable paper

NOTE:
It is necessary to log in to "System Management Mode" to select "Paper Type Management Settings".

3. Select Details/Edit > Correct Tail End Toner Application > Front Side or Back Side.
   Correction level: Gradually increase the value until white spots disappear.
   Correction amount: Enter the range of white spots (distance from trailing edge: mm).

NOTE:
1. "Correct Tail End Toner Application" can be changed only for paper that has been duplicated and registered.
2. In "Correct Tail End Toner Application", adjustment of the secondary transfer bias is performed.
   Adjust correction level in + direction: Weaken secondary transfer bias
   Adjust correction level in - direction: Strengthen secondary transfer bias

[Image Sample]



Calibration for Color Difference on Front and Back Sides

This makes adjustments when a significant color difference occurs between images scanned by the Scanner Unit (for front side) and the Scanner Unit (for back side).

NOTE:
This adjustment is only enabled for models equipped with 2 Scanner Units (inside the Reader and inside the DADF).

1. **Check that A4 (LTR) size paper (plain paper) is set in the deck or cassette.**
2. **Output the adjustment chart.**
   1. Set "1" for the service mode (TXPH: low screen ruling).
      COPIER > TEST > PG > TXPH
   2. Set "0" for the service mode (THRU: for Pascalγ).
      COPIER > TEST > PG > THRU
   3. Set "58" for the service mode (TYPE: low screen ruling).
      COPIER > TEST > PG > TYPE

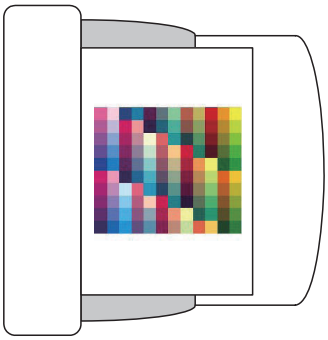
NOTE:
Immediately after turning ON the power, printing approximately 30 sheets of blank paper before outputting the adjustment chart is recommended to stabilize engine operations.

3. **Set the reference plane in service mode (1PCLBSETDADF: setting of duplex color difference correction reference plane).**
   COPIER > FUNCTION > MISC-R > 1PCLBSETDADF
   <Setting value>
   - 0: None (Default)
   - 1: Align the back side with the front side
   - 2: Align the front side with the back side

NOTE:
- Adjustment cannot be made while the setting of service mode (1PCLBSETDADF) is "0".
- Be sure to set this item to "0" when not making an adjustment.
- Ensure that the adjustment chart in steps 4 and 5 is orientated as shown in the figures.
- If it is orientated incorrectly, "NG!" will be displayed in the service mode and need to perform the work again.

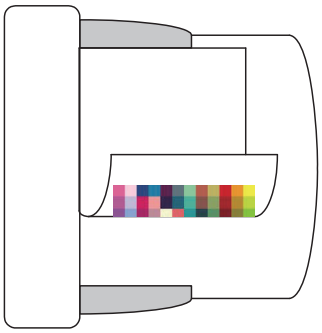
NOTE:
In steps 4 and 5, "NG!" may be displayed even when the adjustment chart is set correctly.
In such cases, the document may be placed at an angle or the output chart itself may be skewed.
Reprint the chart if "NG" is displayed even after resetting the document.

4. **Place the output adjustment chart face-up on the Document Pickup Tray, and select service mode (1PSCLB_A: execute DADF duplex color difference correction (front)). Then press the [OK] key.**
   COPIER > FUNCTION > MISC-R > 1PSCLB_A
   Place the output adjustment chart with document side up, and set the blue patch in the corner so that it comes in left front side.



NOTE:
The reading value is cleared when exiting the MISC-R screen while reading.

5. **Place the output adjustment chart face-down on the Document Pickup Tray, and select Service Mode (1PSCLB_B: execute DADF duplex color difference correction (back)). Then press the [OK] key.**
   COPIER > FUNCTION > MISC-R > 1PSCLB_B
   Place the output adjustment chart with document side down, and set the blue patch in the corner so that it comes in left rear side.



NOTE:
The reading value is cleared and processing stops when exiting the MISC-R screen while reading.

6. **Check that "OK" is displayed in service mode "1PSCLB_A" and "1PSCLB_B", and turn OFF and then ON the main power switch.**

7. **Execute steps a to c in response to the correction results if necessary.**
   - a. In the case of resetting the correction results:
     Set "0" for the following service mode (1PCLBSET: setting of DADF duplex color difference correction reference plane) and turn OFF and then ON the main power switch.
     COPIER > FUNCTION > MISC-R > 1PCLBSET
   - b. If you are concerned with the displacement of color that occurred after adjustment:
     Set "1" for the following service mode (1PCLBUDR: setting of DADF duplex color difference correction lower limit) and repeat from step 3.
     COPIER > FUNCTION > MISC-R > 1PCLBUDR
     <Setting value>
     0: OFF (default); 1: ON
   - c. If color is extremely displaced after correction:
     Set "1" or "2" for the following service mode (1PCLBOVR: setting of DADF duplex color difference correction upper limit) and repeat from step 3.
     <Setting value>
     0: Control level off (default); 1: Weak control level; 2: Strong control level

Scratch on Fixing Belt Caused by Paper Edge

[Location]

Fixing Belt

[Cause]

Continuous feeding of the same size paper roughs the surface of the Fixing Belt where the paper edge passes through and glossy lines will then appear on the image on large size paper.

[Condition]

When fixing refresh sequence is performed at certain intervals to reduce symptoms (it will not completely disappear), sufficient effect may not be obtained if the execution frequency is insufficient or soiling on the surface of the Refresh Roller gets worse.

[Field Remedy]

Identify the cause whether it is due to insufficient execution frequency or soiling on the surface of the Refresh Roller, and take appropriate actions.

1. **Check the image before taking action.**
   Recommended image (Cy gradation image): Set the following service modes.
   - TYPE = 16
     COPIER > TEST > PG > TYPE
   - COLOR-C = 1
     COPIER > TEST> PG > COLOR-C
   - COLOR-Y = 0
     COPIER > TEST> PG > COLOR-Y
   - COLOR-M = 0
     COPIER > TEST> PG > COLOR-M
   - COLOR-K = 0
     COPIER > TEST> PG > COLOR-K

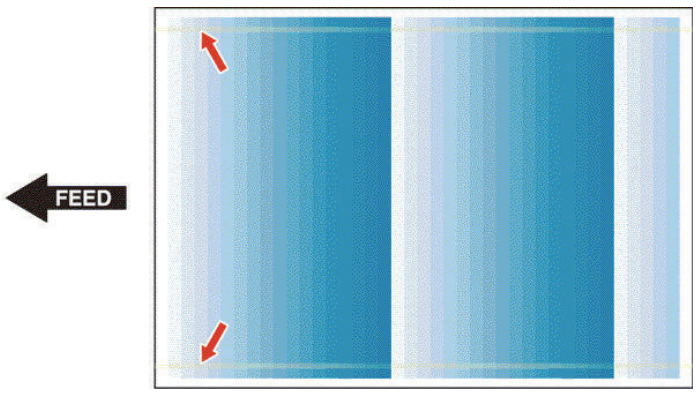
2. **Execute the manual refresh mode in the following service mode (FXD-CL-E).**
   COPIER > FUNCTION > CLEANING > FXD-CL-E

3. **Check the image again if effect has been obtained (if the symptom is alleviated).**
   Recommended image (Cy gradation image): Set the following service modes.
   - TYPE = 16
     COPIER > TEST > PG > TYPE
   - COLOR-C = 1
     COPIER > TEST> PG > COLOR-C
   - COLOR-Y = 0
     COPIER > TEST> PG > COLOR-Y
   - COLOR-M = 0
     COPIER > TEST> PG > COLOR-M
   - COLOR-K = 0
     COPIER > TEST> PG > COLOR-K

4. **Check step a. or b. below.**
   - a. If there is effect of alleviating glossy lines
     Since there is a possibility that the execution frequency of the fixing refresh sequence may be insufficient, make an adjustment by the following method to increase the frequency, and then observe for a while.
     - Settings/Registration > Adjustment/Maintenance > Maintenance > Fixing Roller Auto Refresh Level
   - b. If there is no effect of alleviating glossy lines that appear at the part where the paper edge passes through
     Execute the following service mode (FX-BLT-U: Fixing Belt Unit feed counter) and check the Fixing Belt Unit feed counter. Then decide whether cleaning or replacement of the unit would be preferable.
     COPIER > COUNTER > DRBL-1 > FX-BLT-U
     - If the life of the Fixing Belt Unit (feed counter) is advanced: Replace the Fixing Belt Unit to remove glossy lines on images.
     - If the life of the Fixing Belt Unit (feed counter) is not advanced: There is a possibility that the surface of the Refresh Roller may be soiled, so clean the surface of the Refresh Roller by referring to the Service Manual.
       Execute step 5 after cleaning the surface.

5. **If cleaning of the Refresh Roller has been performed, check the image again.**
   Recommended image (Cy gradation image): Set the following service modes.
   - TYPE = 16
     COPIER > TEST > PG > TYPE
   - COLOR-C = 1
     COPIER > TEST> PG > COLOR-C
   - COLOR-Y = 0
     COPIER > TEST> PG > COLOR-Y
   - COLOR-M = 0
     COPIER > TEST> PG > COLOR-M
   - COLOR-K = 0
     COPIER > TEST> PG > COLOR-K

   Replace the Fixing Belt Unit if there is no effect of alleviating uneven gloss.
   [Image Sample]



Instructing Users at Times of Image Failure due to Long Length Paper

If an image failure occurs when using long length paper, it is possible to perform a remedy for the failure in "Settings/Registration" in the user screen.

Specific remedies must be instructed to users by referring to "Long Length Paper Adjustment/Maintenance Guide" provided for users.

Malfunction

Operation Failure of the ITB Pressure Release Lever

If any of the symptoms shown below occurs when the ITB Pressure Release Lever is turned, perform the cleaning described in this section.

- The ITB Pressure Release Lever is hard to turn.
- The ITB Pressure Release Lever is hard to raise, and the ITB Front Middle Cover (to be secured with a screw) cannot be installed.

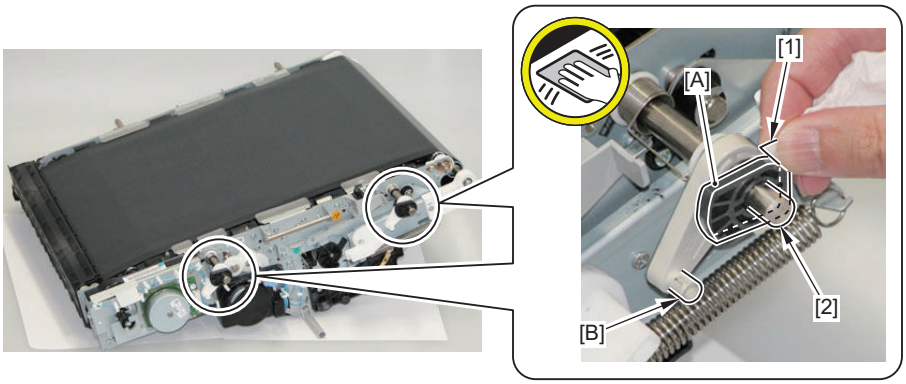
■ Preparation

1. **Open the Front Cover.**
2. **Pull out the Fixing Feed Unit.****"Pulling out the Fixing Feed Unit" on page 859**
3. **Pulling out the ITB Unit****"Pulling out the ITB Unit" on page 550**
4. **Removing the ITB Unit****"Removing the ITB Unit" on page 553**

■ Procedure

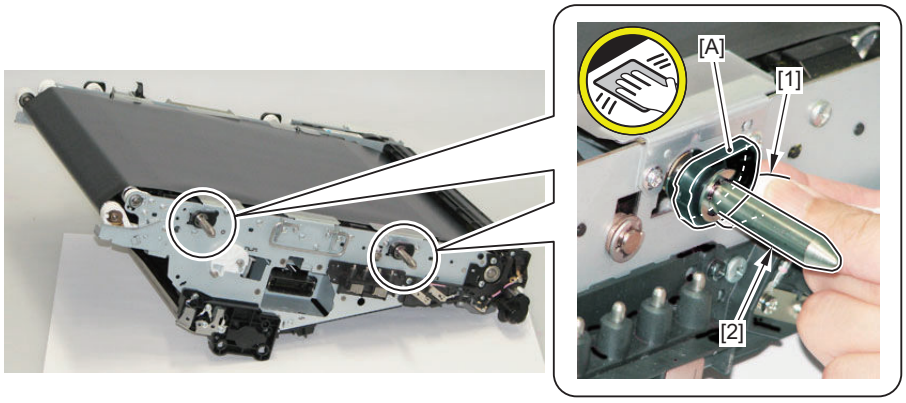
1. **Clean the following areas on the front side of the ITB Unit with lint-free paper [1] moistened with alcohol.**
   - The whole circumference of the surface [A] of the 2 cams
   - The whole circumference of the surface [B] of the shaft of the 2 ITB Pressure Arms

CAUTION:
When cleaning, do not rotate the shaft [2] by moving the cam and the ITB Pressure Arm. Doing so may change the direction of the cam and cause ITB pressure failure.

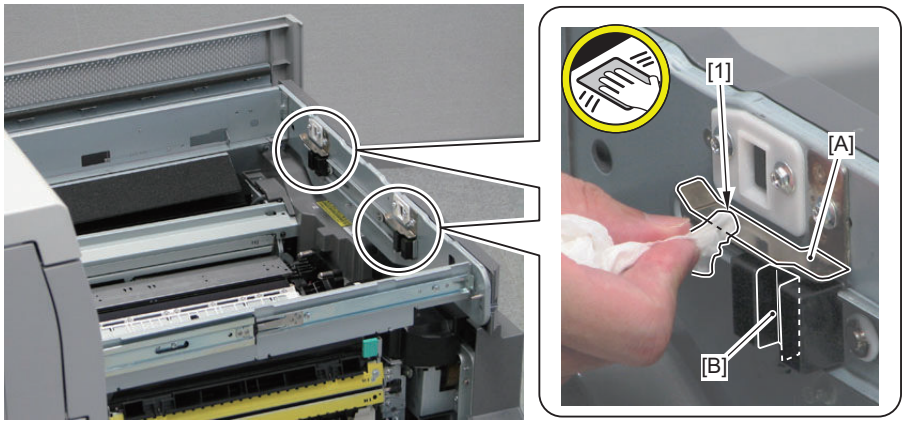


2. **Clean the following areas on the rear side of the ITB Unit with lint-free paper [1] moistened with alcohol.**
   - The whole circumference of the surface [A] of the 2 cams

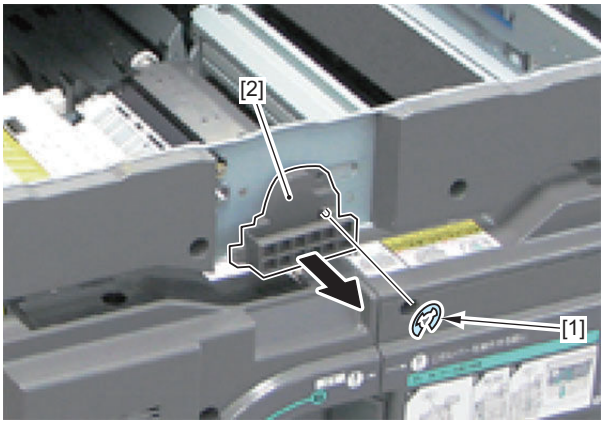
CAUTION:
When cleaning, do not rotate the shaft [2] by moving the cam. Doing so may change the direction of the cam and cause ITB pressure failure.



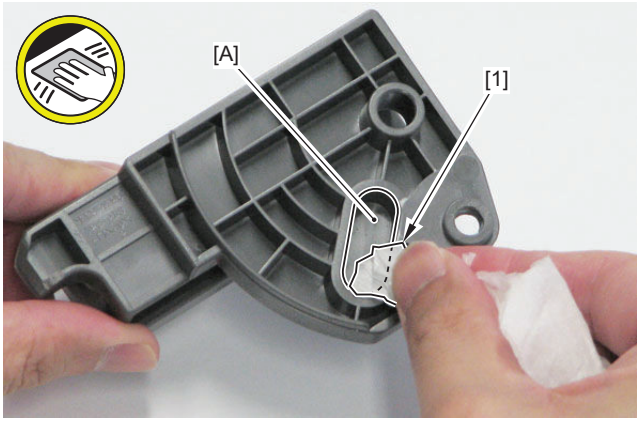
3. **Clean the surface [A] of the 2 Cam Guide Plates and the groove [B] of the 2 ITB Pressure Arm Guides in the ITB Frame with lint-free paper [1] moistened with alcohol.**



4. **Remove the ITB Engagement/Disengagement Lever [1].**
   - 1 E-ring [2]



5. **Clean the groove [A] on the back of the ITB Engagement/Disengagement Lever roller lint-free paper [1] moistened with alcohol.**



Cassette pull-in adjustment

If any of the symptoms shown below occurs when the cassette is closed, perform the adjustment described in this section.

- The cassette bounces back and comes out.
- The cassette is excessively pulled into the host machine.
- The Cassette Front Cover is not aligned with other external covers.

NOTE:
The adjustment position of the Pull-in Guide is related to the position of the cassette's side registration adjustment (the position of the Cassette Lock Unit has been adjusted and the position of the Cassette Front Cover has been changed).
The position of the cassette in the host machine is determined by side registration adjustment of the cassette.
Since the appropriate position to which the Pull-in Guide should be adjusted is determined by the position of the cassette, cassette pull-in adjustment is required when the position of the cassette has been changed.

Side registration adjustment of the cassette

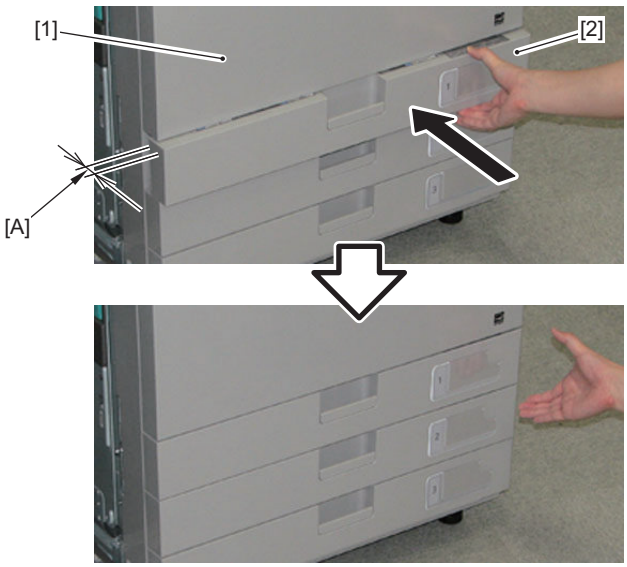
Chapter 9: Installation > Installation of the Host Machine > Image Position Adjustment <Check/Adjustment Procedures>
1. Left Edge Margin Adjustment (Mechanical Adjustment for Cassette Execute with all paper sources)
See side registration adjustment of the cassette (mechanical adjustment for cassette)

■ Checking Method

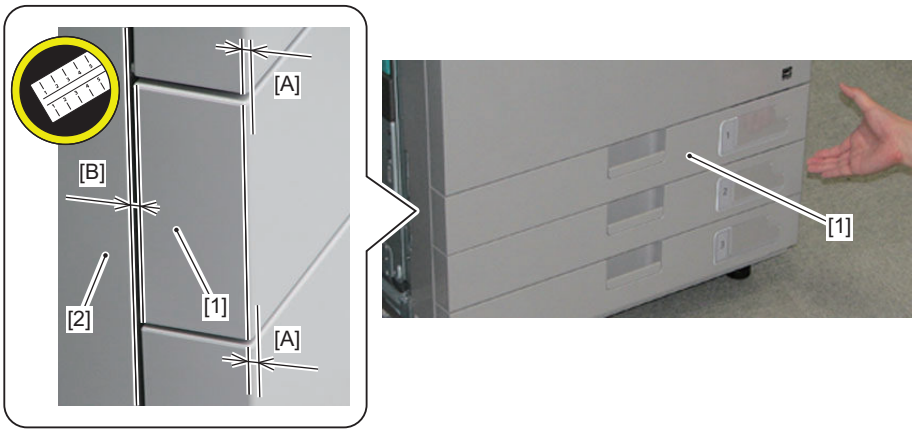
1. **Open the Left Cover.**
2. **Pull out the cassette 200 mm or more.**

NOTE:
The pull-in mechanism is activated by opening the cassette 200 mm or more.

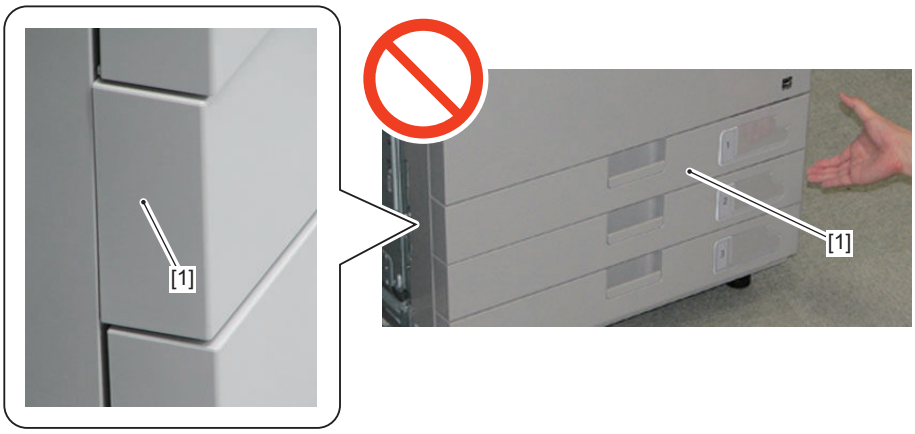
3. **Push back the cassette [2] until it is 15 mm [A] from the Front Cover [1] of the host machine, and let go of the cassette.**



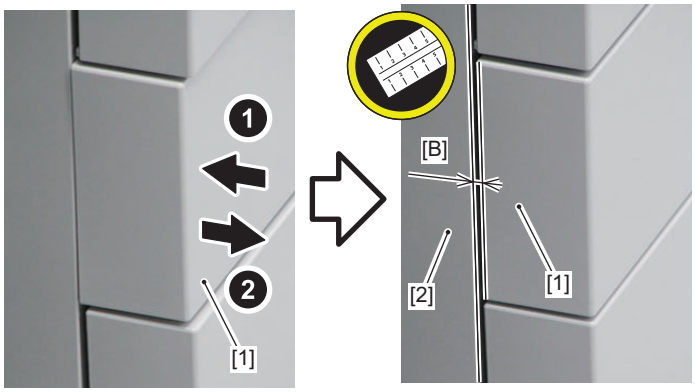
- Appropriate
  The latch is locked, and the level difference between the Cassette Front Cover [1] and other external covers is within the appropriate range when viewed from the left side. Adjustment is not necessary.
  - The level difference [A] between the cassette and other covers (the Front Cover and other Cassette Front Covers) on the front side should be 2 mm or less.
  - The gap [B] from the cover [2] on the rear side should be 3 +/- 1 mm.



- Semi-closed
  The cassette [1] has been excessively pulled in. The gap from other external covers is eliminated by further pushing the cassette in this situation, but adjustment is needed from a functional point of view.

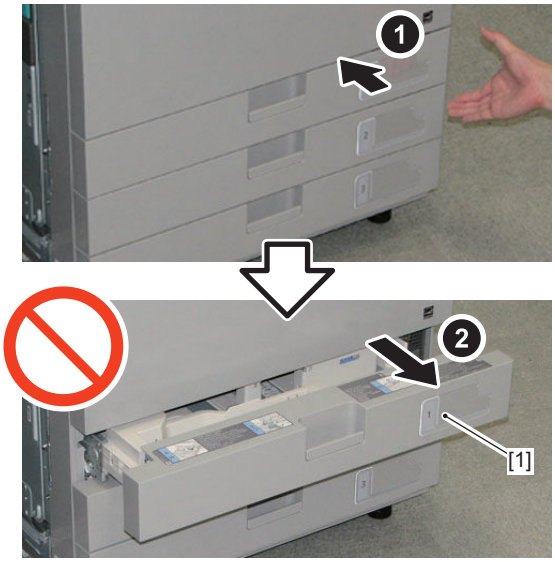


By further pushing the cassette [1] in this situation, a gap [B] is generated between the cassette [1] and the cover [2] on the rear side. Measure and write down the gap [B].



Perform "[1] Adjusting the Cassette Front Cover", and then perform "[2] Adjusting the Pull-in Guide" as needed.

- Latch not locking
  The cassette has not been pulled in enough. The cassette [1] is not latched and comes out. Adjustment is needed.
  Perform "[2] Adjusting the Pull-in Guide".



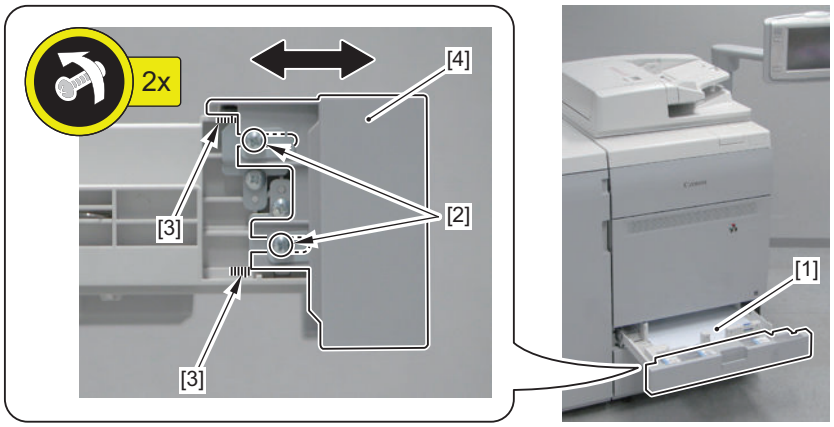
■ Adjustment Method

[1] Adjusting the Cassette Front Cover

1. **Pull out the cassette [1].**

2. **Loosen the 2 adjustment screws [2] on the left side, and move the Cassette Front Cover [4] as needed using the 2 scales [3] as reference until the gap [B] from the cover on the rear side you wrote down in "Checking Method" changes to a value within the appropriate range.**

NOTE:
The appropriate range of the gap is normally 3 +/- 1 mm, but if the cover does not close properly, adjust the gap to 3 to 4 mm in case the cover is halfway closed.



3. **Tighten the 2 adjustment screws you loosened in step 2.**
4. **Perform the "Checking Method" procedure again. If the gap is still out of the appropriate range, perform "[2] Adjusting the Pull-in Guide" from step 5 onwards.**

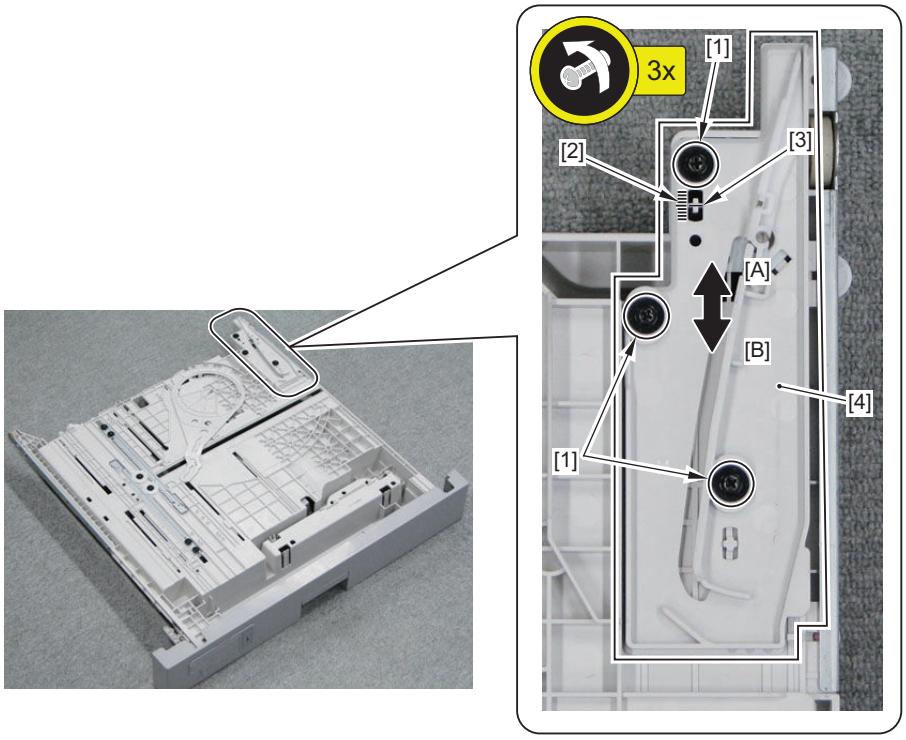
[2] Adjusting the Pull-in Guide

5. **Remove the cassette.**

6. **Loosen the 3 adjustment screws [1] on the rear side of the cassette. Using the scale [2] and the boss line [3] as reference, move the position of the Pull-in Guide [4] for 1 division of the scale.**

NOTE:
Check the initial position on the scale (because the position at the time of shipment is not always at the center).

- In the case of a semi-closed cassette: Move the Pull-in Guide [4] for 1 division of the scale upward (toward the rear side [A] of the host machine) so that the amount the cassette is pulled in is reduced.
- In the case of latch not locking: Move the Pull-in Guide [4] for 1 division of the scale downward (toward the front side [B] of the host machine) so that the amount the cassette is pulled in is increased.



7. **Tighten the 3 adjustment screws you loosened in step 6.**
8. **Perform the "Checking Method" procedure again, and adjust the gap until it reaches an appropriate value.**

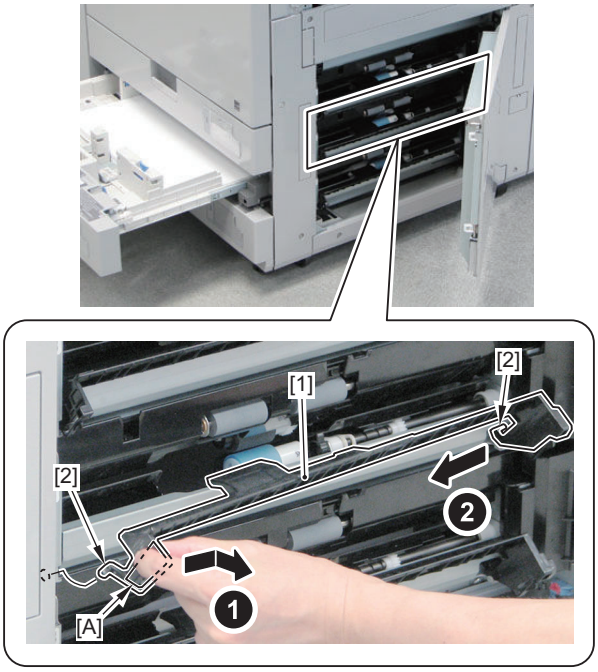
Double feed or pickup failure when paper is picked up from the cassette

In the event of double feed or pickup failure when paper is picked up from the cassette, perform the adjustment in this section to adjust the separation pressure of the cassette pickup.

■ Procedure

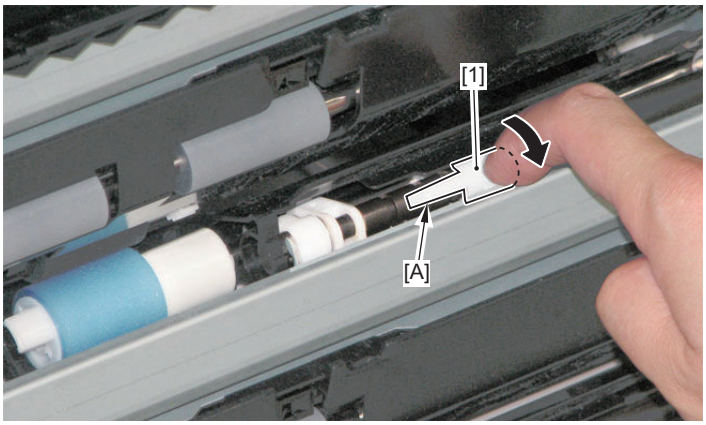
1. **Open the Vertical Path Cover.**
2. **Pull out the cassette.**

3. **Remove the Paper Guide [1] while bending the side [A].**
   - 2 Bosses [2]

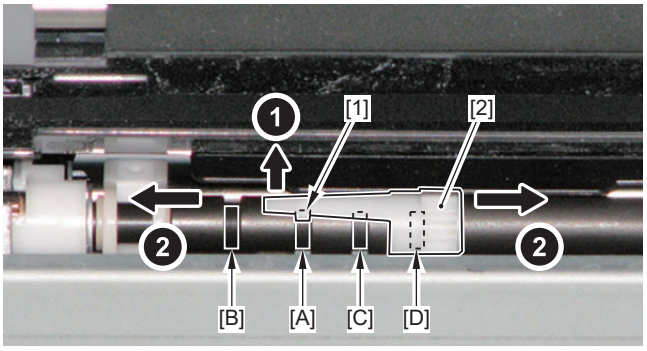


4. **Rotate the Separation Pressure Adjustment Gear [1] so that the protrusion [A] can be seen.**

NOTE:
Be sure to rotate it clockwise when viewed from the front side of the machine.



5. **Lift the Positioning Boss [1] to release it from the initial positioning groove [A], and align it with either of the 3 grooves [B], [C], and [D] to adjust the position of the Separation Pressure Adjustment Gear [2].**
   - When pickup failure occurs: Move the Positioning Boss [1] toward the groove [B] on the front side of the machine (to increase the separation pressure).
   - When double feed occurs: Move the Positioning Boss [1] toward the groove [C] on the rear side of the machine (to reduce the separation pressure). If double feed still occurs, move it further to [D].



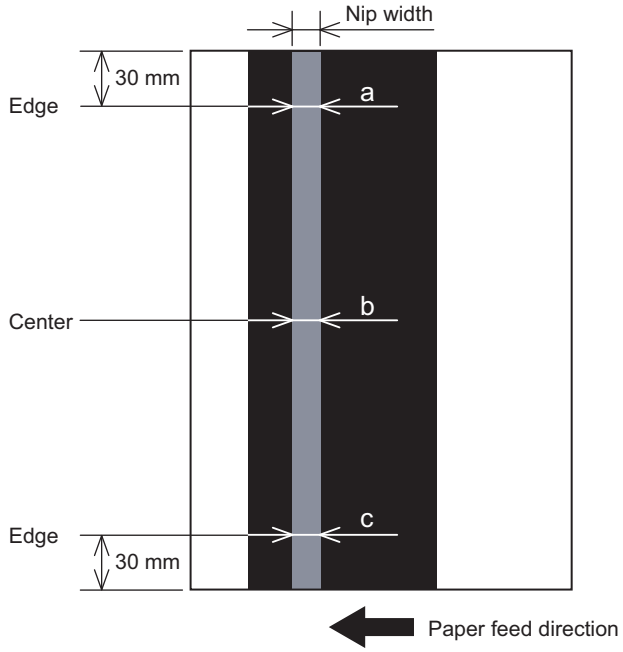
Other

Checking of nip width

If the paper wrinkle or fixing failure occurs, check whether the fixing nip width is within the reference range.
However, fixing nip width of this machine cannot be checked in the field.

1. **Output a PG for checking the nip.**
   Plain 1, A4 or LTR, PG5, Y: 0/M: 0/C: 0/BK: 255 (solid black)
2. **Load the output PG in the cassette.**
3. **Execute the fixing nip paper output in service mode.**
4. **Measure the nip width of output paper and check whether it is within the reference range.**
   < Reference value >
   - Center: 15.5 +/- 1.0 mm
   - Edge: 17.5 +/- 1.0 mm (at 15 mm from the edge)

   If the nip width is not within the range, replace the Fixing Assembly.



Troubleshooting by Forcible Stop of Paper Feed

[Function overview]

Forcibly stop the paper at a specified position.
Next time a job occurs, the paper is forcibly stopped at the stop position (leading edge) shown in the figure for troubleshooting.

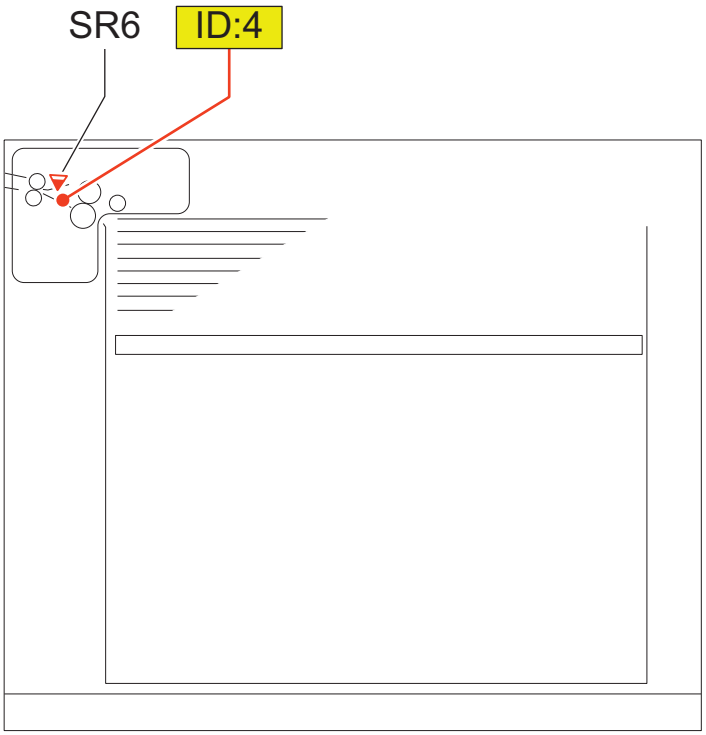
S202
ID:6
S005
S302
ID:7



[Use case]

- When bent paper, skew, or wrinkles occur
- When jams occur frequently
- When you want to check the image on the ITB

[Points to note when using]

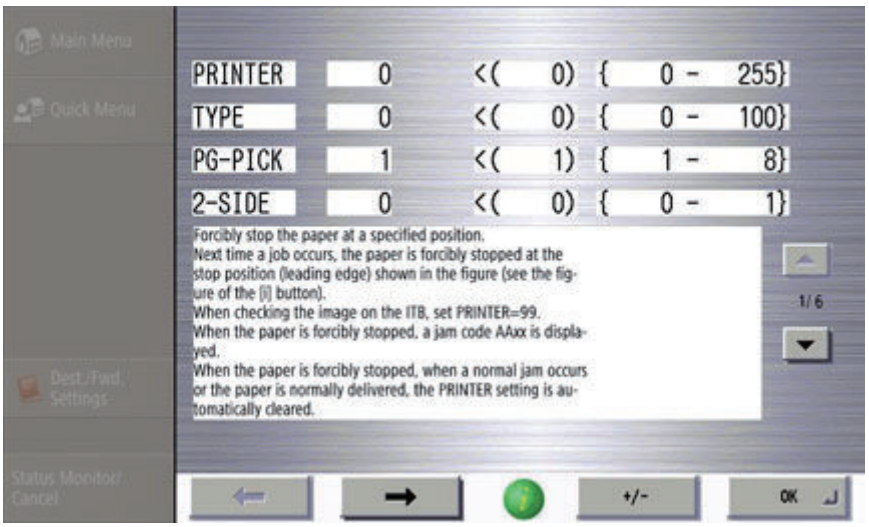
- Remove the stopped paper by the normal jam removal procedure. After the paper is removed, the job will be automatically recovered.
- If a normal jam cord is displayed, the paper is jammed at a position other than the specified position.
- When a job in which the paper does not pass the specified stop position is executed, the setting to forcibly stop the paper becomes disabled.
- Unfixed toner may be attached depending on the stop position. Handle it carefully.

[How to use]

Use this function from SITUATION mode.
Service mode top screen > SITUATION > Troubleshooting > Forcible Stop of Paper Feed
The following service modes can be operated from this SITUATION mode:

- COPIER > TEST > P-STOP > PRINTER (Enter the "stop position number" for the position you want to stop the paper. See the illustration above for specific positions and numbers.)
- COPIER > TEST > PG > TYPE
- COPIER > TEST > PG > PG-PICK
- COPIER > TEST > PG > 2-SIDE
- COPIER > TEST > PG > COLOR-Y
- COPIER > TEST > PG > COLOR-M
- COPIER > TEST > PG > COLOR-C
- COPIER > TEST > PG > COLOR-K
- COPIER > TEST > PG > DENS-Y
- COPIER > TEST > PG > DENS-M
- COPIER > TEST > PG > DENS-C
- COPIER > TEST > PG > DENS-K

- COPIER > TEST > PG > F/M-SW



[Stop positions and check items]

Items that can be checked differ depending on the position where paper stops.
Check for fold/skew/crease/operation check/jam/checking of image on ITB with reference to the table below.

Stop position		Bent	Skew	Wrinkle	Operation check/Jam	Checking of the image on the ITB
0	Not forcibly stopped	-	-	-	-	-
1	Cassette 1 pickup position	Yes	Yes	-	Yes	-
2	Cassette 2 pickup position	Yes	Yes	-	Yes	-
3	Cassette 3 pickup position	Yes	Yes	-	Yes	-
4	POD Deck Lite pickup position	Yes	Yes	-	Yes	-

80	Multi-purpose Tray pickup position	Yes	Yes	-	Yes	-
99	Pre-fixing (1st side, when checking the image)	-	-	-	-	Yes

*1: Paper is stopped when a duplex job is executed (paper is stopped after being reversed)

Controller Self Diagnosis

Controller Self Diagnosis

■ Introduction

Operation of the (2 types of) error diagnosis tools added to the main body and remedy for errors are described. These tools can reduce time to determine cause of errors occurred in field and improve the accuracy of specifying error locations.
This manual can be applied when the main body is placed in the following conditions.

- An error is suspected to have occurred in the Main Controller PCB 1/2 and other related PCBs (child PCBs such as SDRAM or TPM mounted in the Main Controller PCB 1/2).
- Startup takes too long (the progress bar seems to stop halfway), or the Touch Panel of the Control Panel is slow to respond. (<S.M.A.R.T Check>)

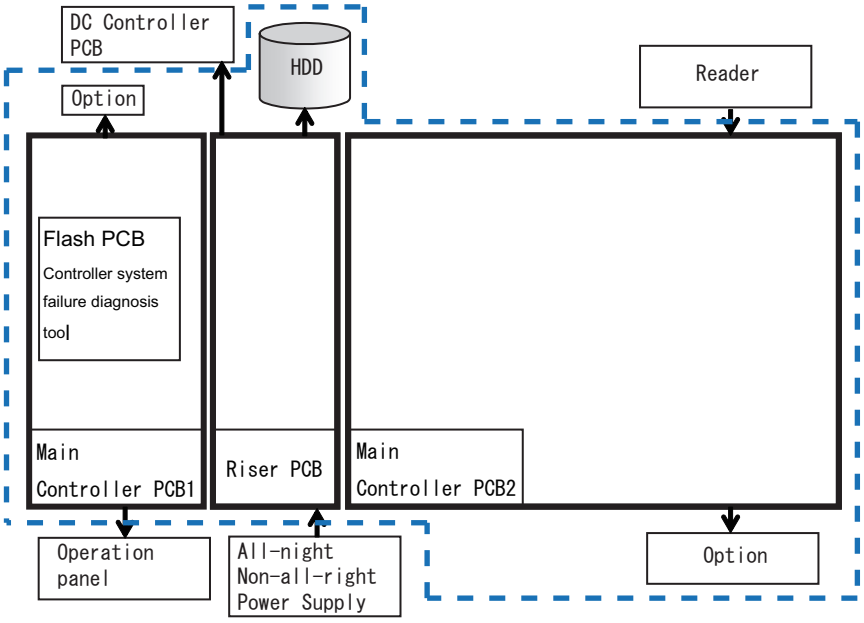
PCBs and units diagnosed by each tool are as follow:

● Controller System Error Diagnosis Tool

- Main Controller PCB 1 side <Main Controller PCB 1, SDRAM, TPM PCB>
- Main Controller PCB 2 side <Main Controller PCB 2, SDRAM (M0, M1), SDRAM (P), SDRAM (S), Memory PCB, Open I/F PCB (option)>
- Rizer PCB / HDD

■ Overview

Error diagnosis tools are installed in this machine, and stored in the locations shown below.



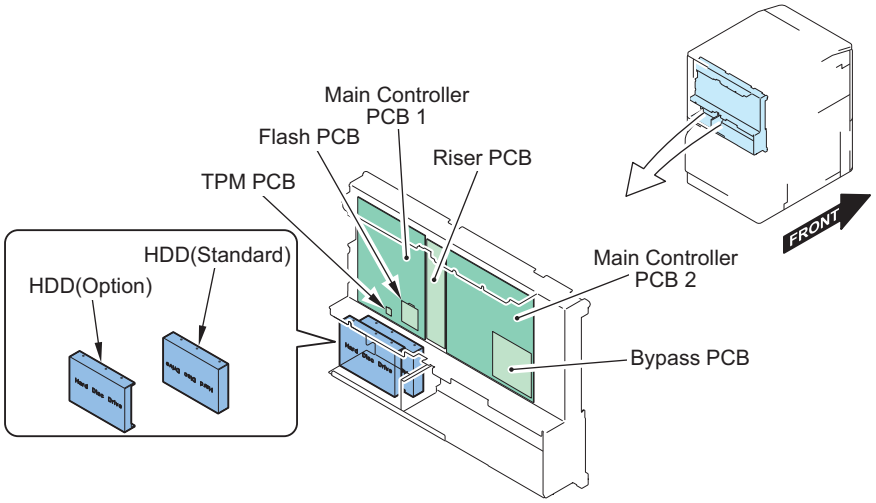
Controller System Error Diagnosis Tool covers the components shown in the blue frame (dotted line).

● Controller System Error Diagnosis Tool

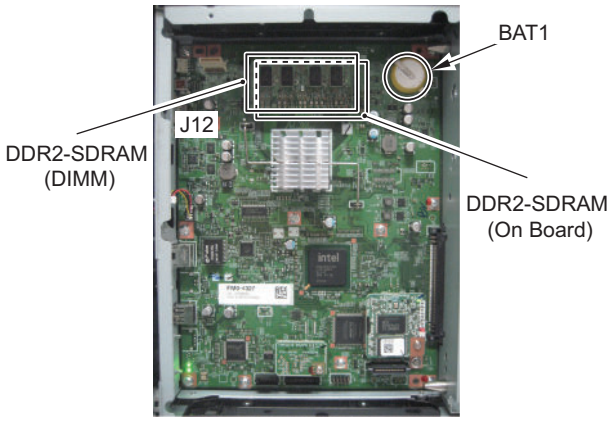
This tool automatically checks the Main Controller PCB 1/2, child PCBs mounted on the Main Controller PCB 1/2, and HDD, and display the result on the Control Panel.

● Layout Drawing

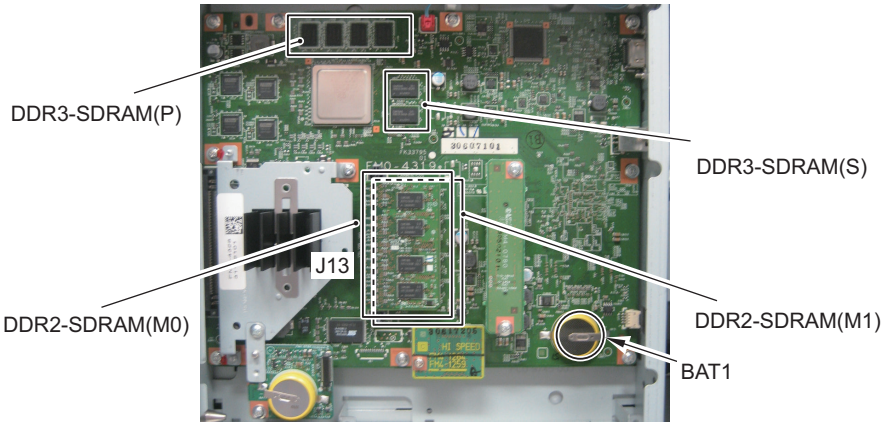
Layout Drawing of PCBs Subject to Diagnosis



Main Controller PCB 1

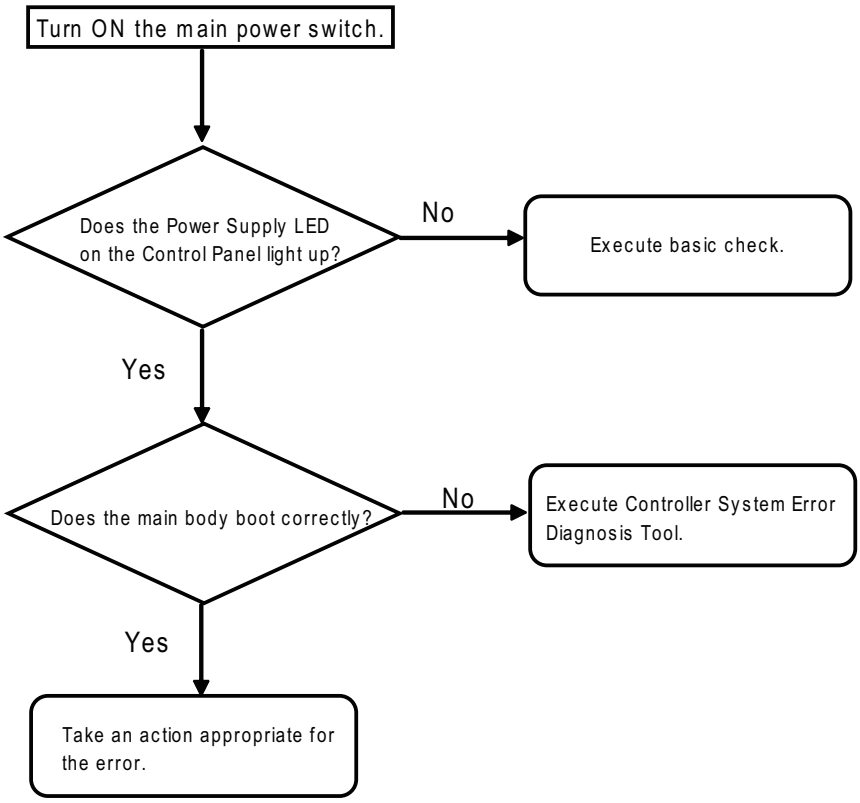


Main Controller PCB 2



■ Basic Flowchart

Basic Check Items
Check all of the items shown below.



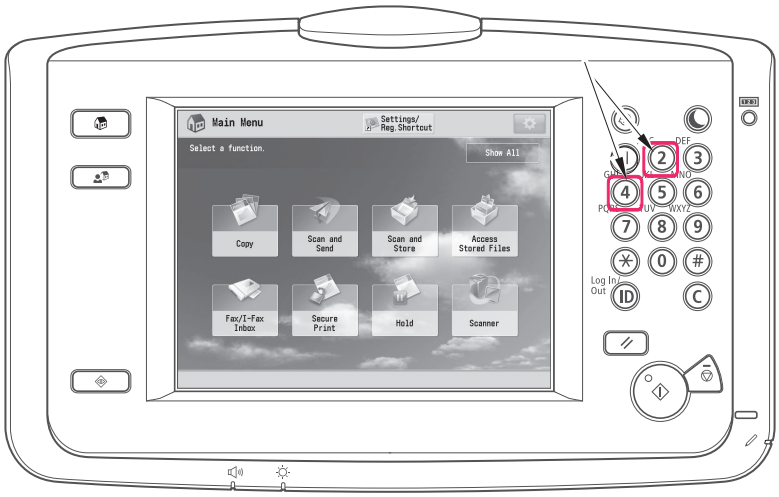
● Basic Check Items

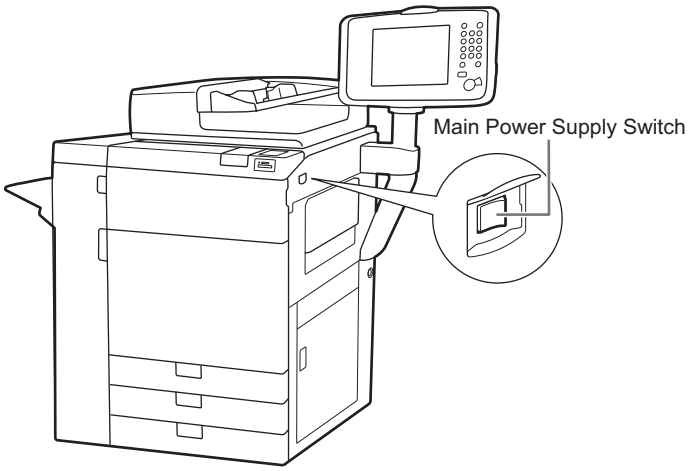
1. **Check if the Leakage Breaker is turned OFF.**
2. **Check if the Power Supply Plug is disconnected.**
3. **Check if the Connection Cable between the Main Controller PCB 1 and Control Panel is disconnected.**
4. **Check if the Connection Main Controller PCB 1 and Main Controller PCB 2 definitely?**
5. **Check if the Connection An All-night Power Supply. Change Non-all-night Power Supply if not recovered.**

■ Controller System Error Diagnosis

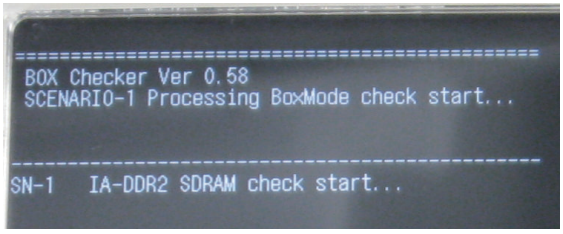
● Startup Method

1. **Turn ON the Main Power Supply Switch while pressing the numeric keys [2] and [4] simultaneously.**





2. **Keep pressing the numeric keys until the following screen appears on the Control Panel. (approx. 20 seconds)**



NOTE:
When this tool is not installed correctly, the regular Startup screen is displayed. (See the figure below)
In this case, perform the following remedy.
Turn OFF the Main Power Switch again, and execute steps 1 and 2 shown above.
If this tool still does not startup, it means that BCT (Box Checker Test) is deleted, so install BCT.
If BCT is not installed correctly, "--.--" is displayed in service mode (BCT) of the host machine.

- COPIER > DISPLAY > VERSION > BCT

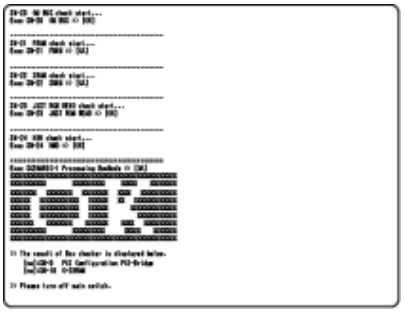
● Diagnosis Time

Diagnosis is completed in approx. 3 minutes.

● Check Result

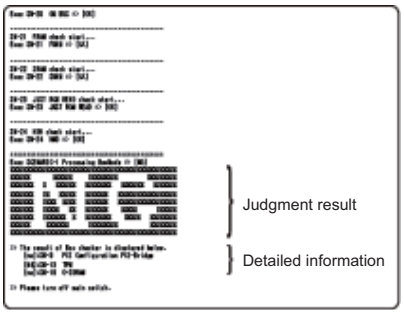
The result is displayed on the Control Panel.

<When the diagnosis result is normal>



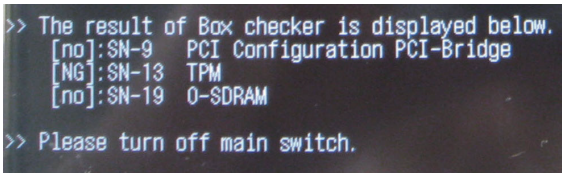
<When an error is detected by diagnosis>

Detailed information is displayed under the judgment result. In detailed information, the name of the test where the error was detected is displayed.



<How to view the error result>

An enlarged view of the detailed information is shown below.



[no] shows that no PCBs that can be installed on the Main Controller by a service technician are installed. If [no] is displayed even though a PCB is installed, a fault has occurred.
[NG] shows that an error has occurred to the PCBs installed as standard.

<Controller System Error Diagnosis Table>

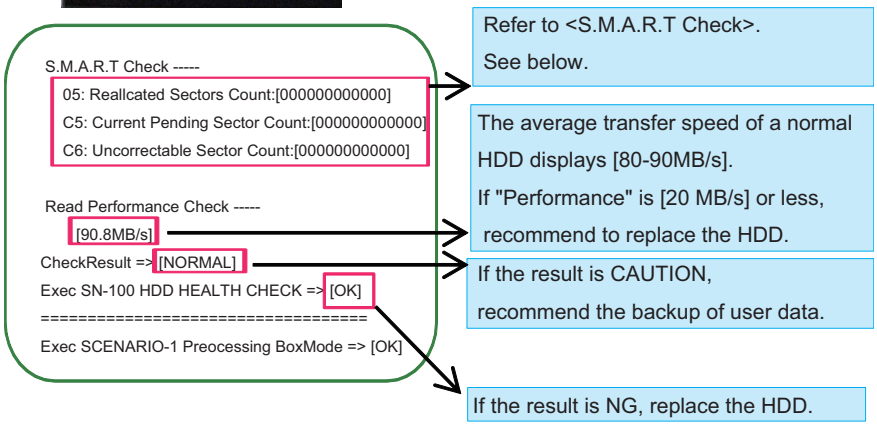
The error locations are identified according to the following table.

Test name	Detailed test name	Possible failure location	Remedy	Relevant error code
SN-1 MN-DDR2 SDRAM	Error check between the Main Controller PCB 1 and SDRAM on the Main Controller PCB 1	• Main Controller PCB 1 • SDRAM on the Main Controller PCB 1	1. Replace the Main Controller PCB 1.	-
SN-2 SM BUS MN DIMM1	Error check of SM bus to the SDRAM (outer) on the Main Controller PCB 1	• Main Controller PCB 1 • SDRAM (outer) on the Main Controller PCB 1	1. Replace the Main Controller PCB 1.	-
SN-3 SM BUS MN DIMM2	Error check of SM bus to the ClockGenerator of the Main Controller PCB 1	• Main Controller PCB 1	1. Replace the Main Controller PCB 1.	-
SN-4 SM BUS MN Clock Gen	Error check of SM bus to the Clock Gen of the Main Controller PCB 1	• Main Controller PCB 1	1. Replace the Main Controller PCB 1.	-
SN-5 SM BUS SOC DIMM2	Error check of SM bus of the Main Controller PCB 1 and SDRAM on the Main Controller PCB 2	• Main Controller PCB 1 • Main Controller PCB 2 • SDRAM on the Main Controller PCB 2	1. Check the connection of the Main Controller PCB 1 and the Main Controller PCB 2. 2. Check the installation of SDRAM on the Main Controller PCB 2. 3. Replace the SDRAM on the Main Controller PCB 2. 4. Replace the Main Controller PCB 2. 5. Replace the Main Controller PCB 1.	-
SN-6 PCI Configuration Maestro	Error check of PCI bus of the Main Controller PCB 1 and the Main Controller PCB 2	• Main Controller PCB 1 • Main Controller PCB 2 • SDRAM on the Main Controller PCB 2	1. Check the connection of the Main Controller PCB 1 and the Main Controller PCB 2. 2. Replace the Main Controller PCB 1. 3. Replace the Main Controller PCB 2.	-

Test name	Detailed test name	Possible failure location	Remedy	Relevant error code
SN-7 PCI Configuration LANC	Error check of LAN chip on the Main Controller PCB 1	• Main Controller PCB 1	1. Replace the Main Controller PCB 1.	-
SN-8 PCI Configuration PCI-Bridge	Check of the Main Controller PCB 1		1. Check the installation of the Main Controller PCB 1. 2. Replace the Main Controller PCB 1.	-
SN-9 CPLD	Check of failure of the CPLD chip of the Main Controller PCB 1	• Main Controller PCB 1	1. Replace the Main Controller PCB 1.	-
SN-10 LANC FLASH	Check of failure of the LANC FLASH of the Main Controller PCB 1	• Main Controller PCB 1	1. Replace the Main Controller PCB 1.	-
SN-11 RTC CHECK	Check of failure of the RTC of the Main Controller PCB 1	• Main Controller PCB 1	1. Replace the Main Controller PCB 1.	-
SN-12 TPM	Check of failure of the TPM PCB on the Main Controller PCB 1 * TPM PCB is not installed in machines for China. Therefore, the diagnosis result will be NG.	• Main Controller PCB 1 • TPM PCB	1. Check the installation of the TPM PCB. 2. Replacement of the TPM PCB 3. Replace the Main Controller PCB 1.	E746
SN-13 M-DDR2 SDRAM	Error check between SDRAMs on the Main Controller PCB 2	• Main Controller PCB 2 • SDRAM (M0) on the Main Controller PCB 2	1. Check the installation of SDRAM (M0) on the Main Controller PCB 2. 2. Replace the SDRAM (M0) on the Main Controller PCB 2. 3. Replace the Main Controller PCB 2.	-
SN-14 FLASH ROM	Check of failure of the CPU ROM (IC60) on the Main Controller PCB 2	• Main Controller PCB 2	1. Replace the Main Controller PCB 2.	-
SN-15 P-DDR3 SDRAM	Error check between the Main Controller PCB 2 and the SDRAM (P) on the Main Controller PCB 2	• Main Controller PCB 2 • SDRAM(P) • Open I/F PCB • Bypass PCB	1. Check the installation of the Bypass PCB/Open I/F PCB. 2. Replace the Main Controller PCB 2.	E747/E748
SN-16 GOR(R)-DDR2 SDRAM	Check of failure of the SDRAM for Rchip on the Main Controller PCB 2	• Main Controller PCB 2 • Open I/F PCB • Bypass PCB	1. Check the installation of the Bypass PCB/Open I/F PCB.	E747/E748
SN-17 S-DDR3 SDRAM	Check of failure of the SDRAM for Schip on the Main Controller PCB 2	• Main Controller PCB 2	1. Replace the Main Controller PCB 2.	E747/E748/E732
SN-18 GOR(O)-DDR2 SDRAM	Check of failure of the SDRAM for Ochip on the Open I/F PCB	• Main Controller PCB 2 • Open I/F PCB	1. Check the installation of the Open I/F PCB. 2. Replace the Open I/F PCB 3. Replace the Main Controller PCB 2. Remarks: The detailed information of the diagnosis result will be [no] when the Open I/F PCB is not installed.	E747/E748

Test name	Detailed test name	Possible failure location	Remedy	Relevant error code
SN-19 GU BUS	Error check of GUBUS in the Main Controller PCB 2	• Main Controller PCB 2 • Open I/F PCB • Bypass PCB	1. Check the installation of the Open I/F PCB or Bypass I/F PCB on the Main Controller PCB 2. 2. Replace the Open I/F PCB or Bypass I/F PCB on the Main Controller PCB 2. 3. Replace the Main Controller PCB 2.	E747/E748
SN-20 FRAM	Check of failure between the between the Main Controller PCB 2 and the Memory PCB	• Main Controller PCB 2 • Memory PCB	1. Check the installation of the Memory PCB on the Main Controller PCB 2. 2. Replace the Memory PCB on the Main Controller PCB 2. 3. Replace the Main Controller PCB 2.	E355
SN-21 SRAM	Check of failure/run out of battery of SRAM of the Main Controller PCB 2	• Main Controller PCB 2	1. Replace the Main Controller PCB 2.	E246/E350/E355
SN-22 HDD	Error check of HDD I/F	• Main Controller PCB 2 • HDD Cable • HDD	1. Check the connection of the HDD Cable. 2. Check the connection of the Main Controller PCB 2 and the Main Controller PCB 1. 3. Replace the HDD.	-
SN-23 FAN	Fan rotation check	• Main Controller PCB 1 • Riser PCB	Check the connection of the Fan Connector (J15) of the IA PCB (Main Controller PCB 1). Check the connection of the Fan Connector (J109/J110) of the Riser PCB.	
SN-100 HDD HEALTH CHECK	HDD S.M.A.R.T information retrieval and performance check (see the display example shown below)	HDD	• If S.M.A.R.T Check displays a numeric value other than [0], it is recommended to back up the customer data. • If [20 MB/s] or less is displayed for Performance, it is recommended to replace the HDD. • If CAUTION is displayed for CheckResult, it is recommended to back up the customer data. • If NG is indicated for Exec SN-100 HDD HEALTH CHECK , replace the HDD.	

HDD S.M.A.R.T Information



<S.M.A.R.T Check>

S.M.A.R.T Check	Description	Remedy
05: Reallcated Sectors Count: [000000000000]	Number of reallocated defective sectors	If any numeric values other than [0000000000000] are displayed, it is recommended to back up the customer data to avoid losing it.
C5: Current Pending Sector Count: [000000000000]	Number of pending sectors (sectors that may be defective)	If any numeric values other than [0000000000000] are displayed, it is recommended to back up the customer data to avoid losing it.
C6: Uncorrectable Sector Count: [0000000000000]	Number of defective sectors (uncorrectable sectors) that cannot be reallocated	If any numeric values other than [0000000000000] are displayed, • it is recommended to back up the customer data to avoid losing it. • Replace the HDD. * Alarm "31-0008" may have occurred in the machine.

NOTE:
Actions to be taken when the HDD Data Encryption/Mirroring Kit is installed to the machine
The details displayed in the SMART information are the Master HDD diagnosis results.
To check which HDD is the master HDD, turn the power OFF and then ON and check whether the green LED on the Mirroring PCB is lit.
The HDD (ChA or ChB) with a green LED light, which flashes first at high speed in conjunction with the HDD access status, will be the Master HDD. On the other hand, the other green LED, which does not light in this status, will be the Backup HDD.

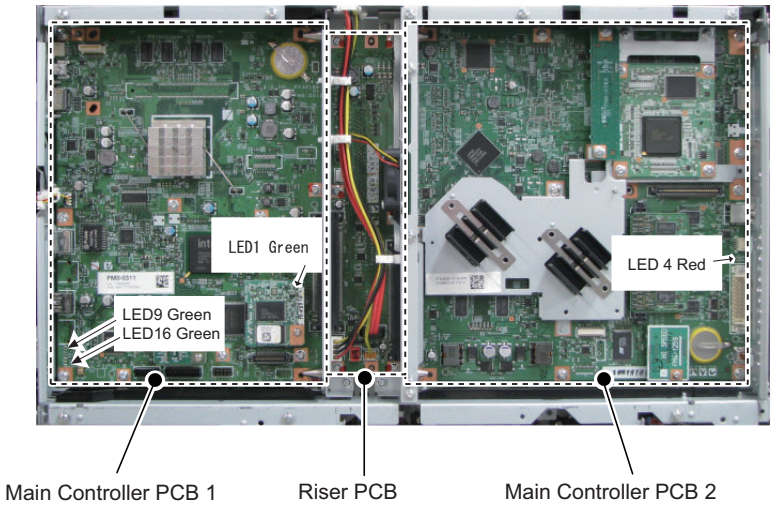
• Limitations

- This diagnosis tool will not start if an error occurs under the test names (SN-1, 2, 7, 15, and 21).
- When no PCBs are installed on the Main Controller PCB 1/2, the following judgment results are displayed.
  Standard PCB: [NG]
  Optional PCB: [OK]
  However, [no] is displayed in the detailed information for optional PCBs.

Operation Check of the Main Controller LEDs

You may be able to determine the remedies against Main Controller-related troubles by checking the lighting status of LEDs on the PCB.

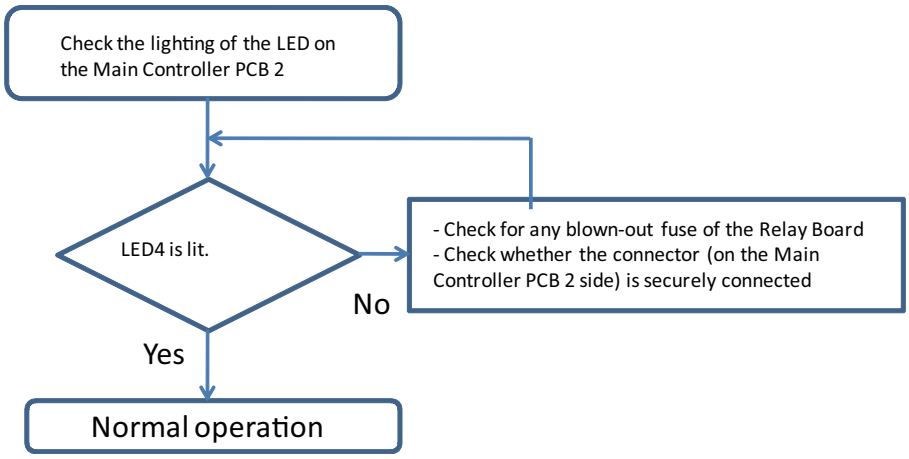
■ Location of LEDs



■ Preconditions

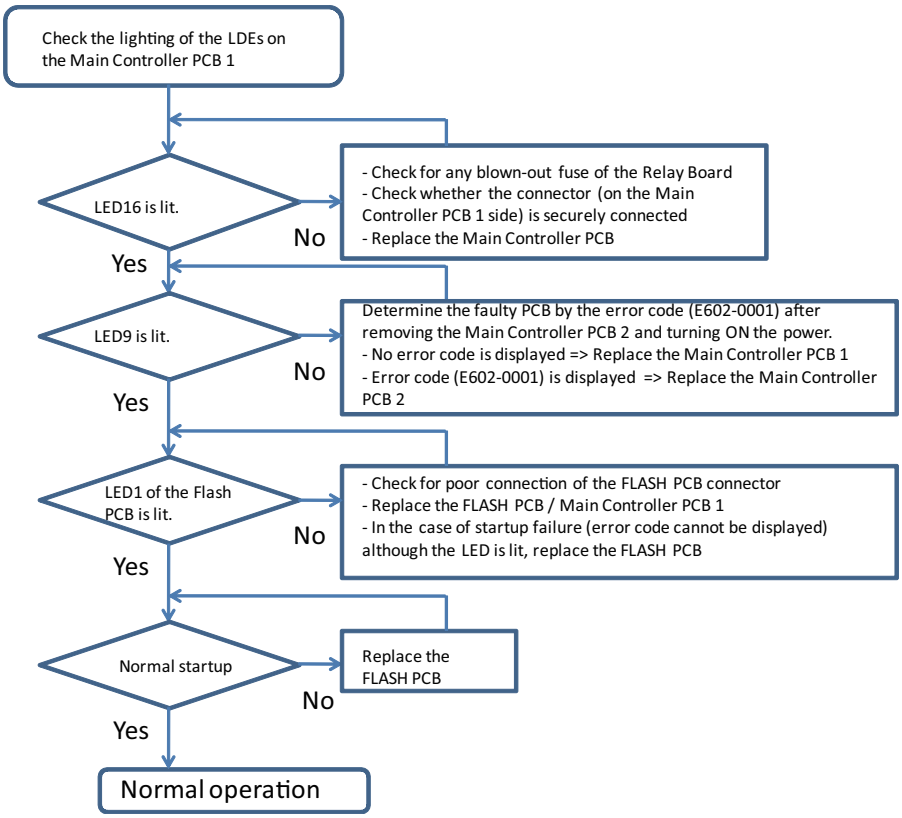
Check whether the Main Controller PCB 1 and the Main Controller PCB 2 are properly inserted.
Check whether the connectors are securely connected. LEDs are not lit when the contaction is poor. (Power-on is not possible)
When the LED of the Control Panel main power is not lit, check the connection of cables (such as UI Cable).

■ Checking the lighting of the LED4 RED on the Main Controller 2



■ Check the lighting of the LDEs on the Main Controller PCB 1

- Main Controller PCB 1 - LED9, LED16
- Flash PCB - LED1



Check the lighting of the LDEs on the Main Controller PCB 1
LED16 is lit.
No
- Check for any blown-out fuse of the Relay Board
- Check whether the connector (on the Main Controller PCB 1 side) is securely connected
- Replace the Main Controller PCB
Yes
LED9 is lit.
No
Determine the faulty PCB by the error code (E602-0001) after removing the Main Controller PCB 2 and turning ON the power.
- No error code is displayed => Replace the Main Controller PCB 1
- Error code (E602-0001) is displayed => Replace the Main Controller PCB 2
Yes
LED1 of the Flash PCB is lit.
No
- Check for poor connection of the FLASH PCB connector
- Replace the FLASH PCB / Main Controller PCB 1
- In the case of startup failure (error code cannot be displayed) although the LED is lit, replace the FLASH PCB
Yes
Normal startup
No
Replace the FLASH PCB
Yes
Normal operation

Debug log

Scope of Application

■ Purpose

When the Canon quality-appointed staff determines the need for an analysis of debug log by the R&D department, we ask the field to collect log for an investigation to determine the cause.

Overview

■ Function Overview

Debug log is an integrated log for failure analysis that gathers logs prepared by the software modules in the device for debug purpose.
In the case of a field failure that is hard to be reproduced, this measure is intended to improve efficiency in failure analysis and reduce the time for failure support by collecting debug log at the user site (which was created immediately after the failure) and sending it to the R&D.
When the Canon quality-appointed staff determines the need for an analysis of firmware debug log by the R&D department, we ask the field to collect log for an investigation to determine the cause.

● Effective Instances of Collecting Debug Log

- The error occurs only at the customer site and cannot be reproduced by the sales company or the Canon staff who is in charge of quality follow-up.
- When the error frequency is low.
- When the error is suspected of links with firmware rather than a mechanical/electrical failure.
  * Collection of Sublog is not necessary when the reproduction procedure is identified and the error can be reproduced by the sales company HQ or the Canon staff who is in charge of quality follow-up.

● Type of Log

There are two types of log: event log and manual log.

Manual log operation procedure

Setting: None

1. Hold down the [Check Counter] button (for 10 seconds or more).
2. Press numeric key [1].
3. Press numeric key [2].
4. Press numeric key [3].

The screen is locked while collecting logs. It takes about 3 minutes for log collection to complete and to be able to operate the screen again.

● Conditions of Log Collection

- Logs can be collected on a PCB-by-PCB basis. (SUBLOG, SUBLOG_RCON, SUBLOG_DCON)

Location	File name	Automatic collection		Manual collection
		Logs generated while the host machine is being operated.	Event log When an event has occurred	Manual log
Main Controller	SUBLOG	Yes	Yes	Yes
Reader Controller	SUBLOG_RCON	No	Yes	Yes
DC Controller	SUBLOG_DCON	No	Yes	Yes

● Collection of Logs

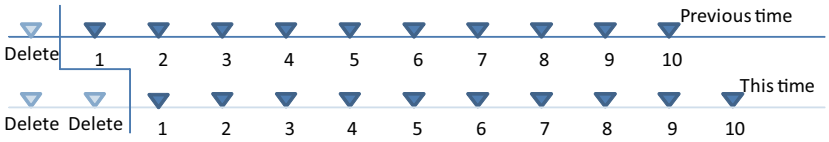
Insert the SST or USB flash drive and press the [OK] key in service mode (DOWNLOAD) to collect the log.

- COPIER > FUNCTION > SYSTEM > DOWNLOAD

● Description of Log to be Collected

When operation from the Control Panel or an event log (exceptional operation, error code, or reboot) occurs, the number of logs increases.
Logs are stored from the latest one, and the latest file is always stored.
Logs earlier than those logs are overwritten and deleted from the oldest log.
When collecting logs from the machine, the log file in the machine is deleted.

NOTE:
The number of files stored differs depending on the model and situation.



Collecting System Information

■ Collection Destination

Use either a USB flash drive or SST (Ver. 4.75 or later) to retrieve debug logs from the device to an external storage.

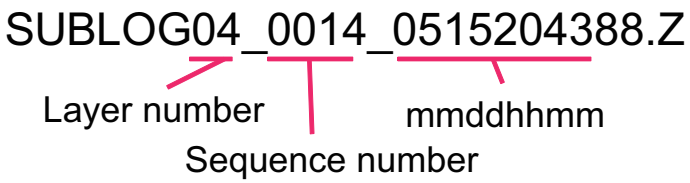
● Collection Method

Retrieve the debug log from the machine by any of the following methods.

- Have the machine recognized the USB flash drive. In the service mode (DOWNLOAD), press [OK].
  COPIER > FUNCTION > SYSTEM > DOWNLOAD
- Forward the debug log by SST on a PC which is connected via a network cable.
- Forward the debug log to a USB flash drive in which system software of the machine is stored.

● File Name of Sublog

Whether the file is new or old can be judged by the year, month, day, hour, and minute.



● Log Collection (USB Flash Drive)

NOTE:
To collect a log, use the USB flash drive in which the system software for this machine has been registered by using SST.

1. **Insert the USB flash drive and press the [OK] key in service mode (DOWNLOAD).**
   - COPIER > FUNCTION > SYSTEM > DOWNLOAD

2. **Select [5] BACKUP.**

```
[[[[[ download Menu (USB) ]]]]]]]]]]
------------------------------------
 [1]: Upgrade (Auto)
 [2]: Upgrade (w Confirmation)
 [3]: Upgrade (Overwrite all)
 [4]: Format HDD
 [5]: Backup
 [7]: Clear downloaded files
 [8]: download Menu 2
 [9]: Other Menu

 /[5] has been selected. Execute?/
 - (OK):0 / (CANCEL):Any other keys -
```

3. **Select [1] Sublog.**

```
[[[[[ Backup Menu (USB) ]]]]]]]]]]
--------------------------------

[1]: Sublog
[4]: ServicePrint
[5]: Netcap
[6]: SRAM(HDD)
[7]: SRAM(USB)

[C]: Return to Main Menu
```

● When the data is sent to the USB memory device

A folder of the year, month, day, hour, and minute is created in the USB memory device. The log file is saved in the folder.
Example: Folder 201205241821

SUBLOGLUT.TXT	64 KB

■ Uploading Data by SST

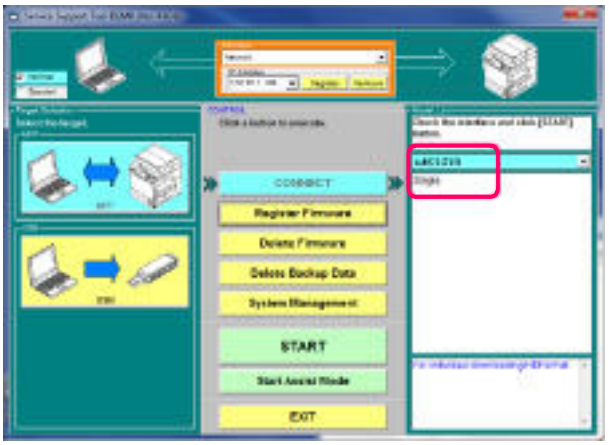
The section describes a method to collect a log by connecting a PC where SST (Ver. 4.75 or later) is running to the machine.

■ Prerequisite:

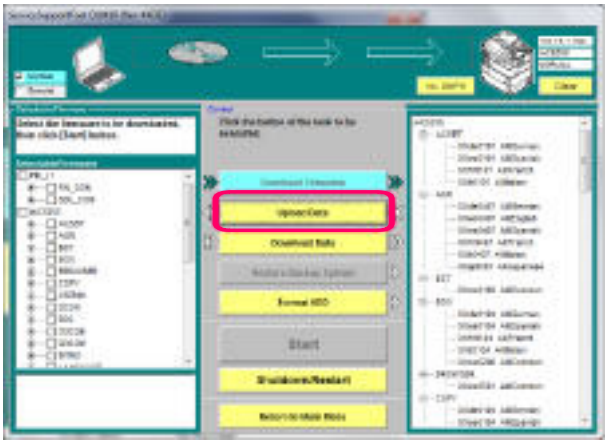
In addition to the continuous log, the manual log (hold down the [Counter Check] key and the [1], [2] and [3] keys) and event log (DEBUG-1) are collected, and the logs are saved in the host machine.
PCs operating with SST are connected to the host machine and that machine is set to download mode status.

NOTE:
The log in the host machine will be deleted when log collection is executed in SST.

1. **Start SST (Ver 4.75 or later) and select the model (e.g. iPRCxxx) from the Model List. Press the [Start] button.**



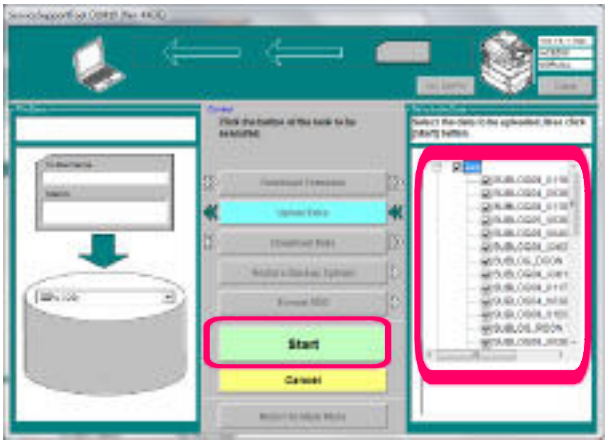
2. **Click the [Upload Data] button.**



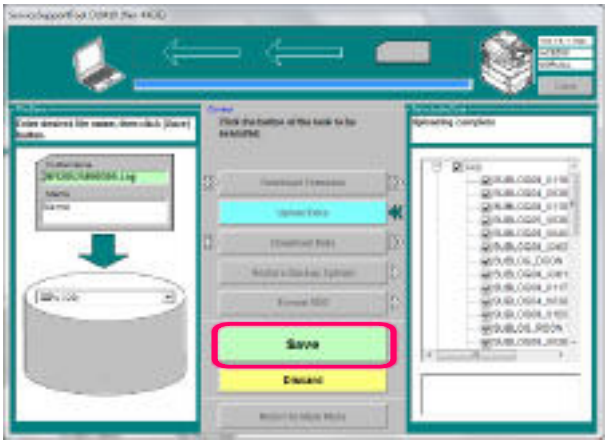
3. **Select the data to be uploaded and click the [Start] button.**

   If the file name is longer than the frame, the fact that it is a log will be displayed in the comment field directly underneath. "log" is displayed in the figure below.

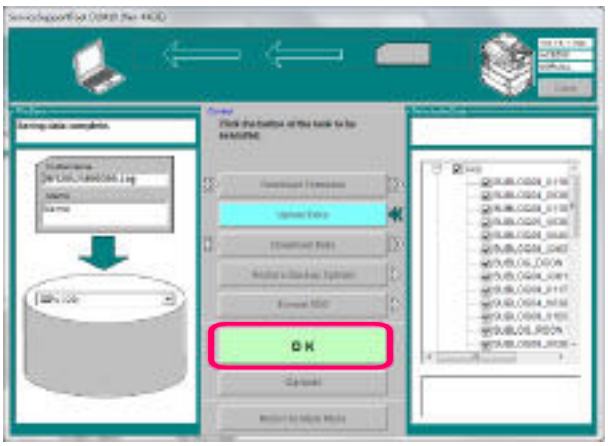
NOTE:
The log is not saved when canceling before pressing the Start button.
It will also be deleted from the host machine.



4. **Press [Store].**

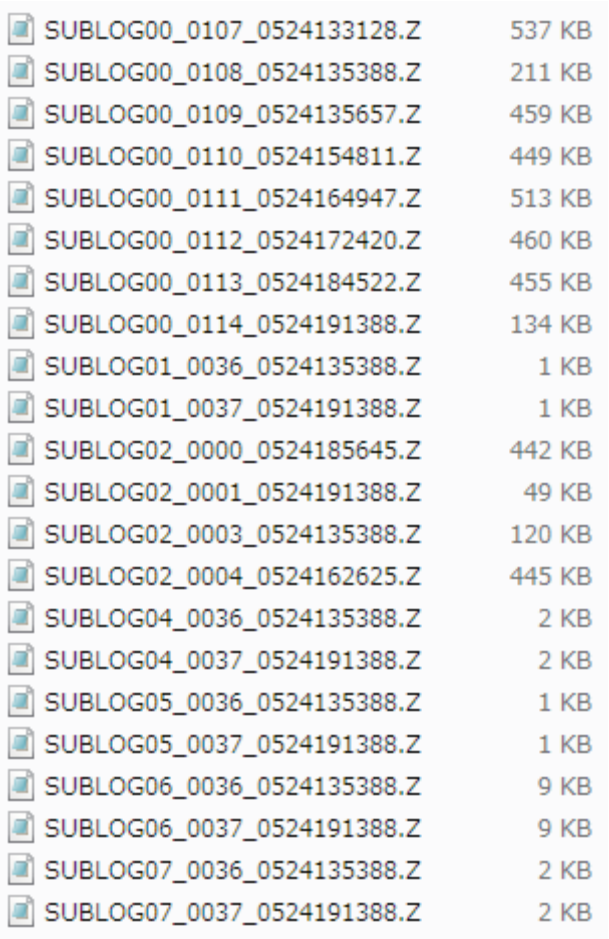


5. **Check that data storage is complete, and press the [OK] button.**



6. **Check that the log is stored in the specified location in the PC.**

   The initial setting is:
   Windows(C:) > ServData > (model name*) > Serial number of the machine (e.g. JWH00003)\ Year Month Day Hour Minute-Log



* The model name specified in step 1

Log Collection Timing

The procedures assumed to be necessary to collect logs are detailed as follows.

■ Preconditions

When the Canon staff who is in charge of quality follow-up determines the need for an analysis of debug log by the R&D department, log collection is requested via sales company HQ. Logs are used to determine the cause.

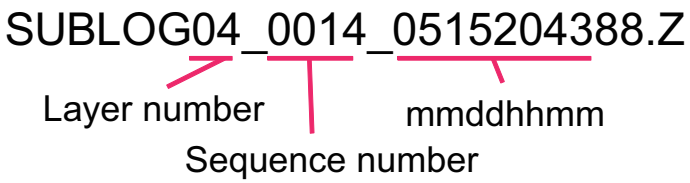
■ Expected Log Collection Procedure

1. **Contact the user to identify the occurrence date and time of the error to be analyzed. (It will be used to judge whether the collected logs contain the log at occurrence of the error based on the date and time of the collected log files. Be sure to inform the occurrence date and time together with the collected log. This will be necessary to shorten the analysis time. If multiple errors have occurred, the dates and times of those errors must be informed. The date and time of occurrence do not always need to be accurate.)**
2. **Visit the user site, and enter download mode to collect the log.**
3. **Check whether the files before and after the specified date and time are contained in the log.**
4. **Reproduce the symptom if possible.**
5. **Collect the log by pressing [Counter Check] key and [1], [2] and [3] keys.**
6. **Retrieve all the collected logs.**

NOTE:
- Prepare a USB flash drive with a memory capacity of at least 2GB to collect logs. It is necessary in order to secure enough capacity when logs are obtained multiple times.
- In order that the USB flash drive is recognized in download mode, it is recommended to store the system software of the host machine. When collecting logs, send all things moved to the USB flash drive.
- Logs are directly saved in the HDD. It is assumed that log files can be saved for about 1 day when performing a variety of operations in succession or for about 30 days when used normally. As long as it is within the assumed range, it is very unusual for logs to be overwritten and have to be collected again.

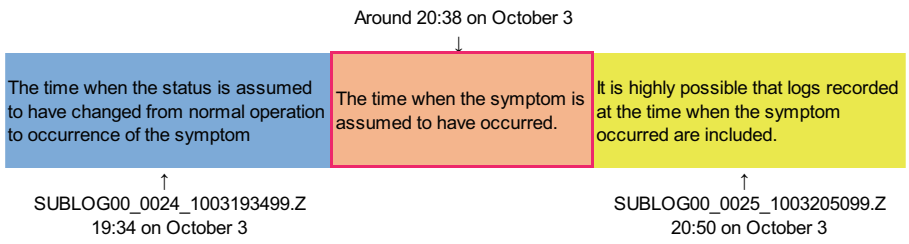
■ Checking the Date of Log Files

This checks the date of files that start with "SUBLOG00_00". It is highly probable that files around the date the symptom occurred will contain information at occurrence of the problem.



Example of collecting logs when the occurrence date is identified

- Example of a problem occurring around 8.38 p.m. on October 3rd



NOTE:
- If "SHT" is added to the file name of the collected log, this will be the log for when shutdown occurred.
  Example:
  SUBLOG00_0001_0918140788SHT.TXT
  If turning OFF the power is included as a behavior when performing an operation, the "SHT" in the file name can help users identify the date and time when verifying occurrence data.
  In the case of 99 in the number of seconds + 3-digit number, it indicates the cause of the log collection such as the E[3-digit number] of error code.
  Example:
  When the error code E747 occurs:
  SUBLOG00_0001_0918140799747.TXT
  When an error code occurs, the E[3-digit number] in the file name can help users identify the date and time when verifying occurrence data.

Network Packet Capture

■ Overview

The network capture function is a function embedded in this machine. Network data received and sent by this machine can be captured without the need for special equipment.
In previous models, when there is a network-related problem that cannot be solved at the first call-initiated visit, packet is collected at the next service visit to solve the problem.
Providing this function allows investigating the cause of the problem before the next service visit and take measures. Even for network-related problems, it allows service technician to reproduce the symptom, and at the same time, collect and bring back the network packet data.
SST or USB flash drive is used to collect network packets.
When it comes to equipment, it used to be necessary to prepare specialized equipment (PC, HUB, cable, packet capture software, etc.), but this is no longer required.
The following effects are anticipated by embedding this function.

- It will now be possible to collect packets of customers' environment remotely.
- Continuous collection of packets is possible in cases where the problem could not be reproduced during a visit.
- Two-way packet collection will be easier for network problems relating to iR-ADV linkage (function enabling network communication between machines).

CAUTION:
In the case of a heavy-load network environment, some of the network packets may be left uncollected.
The machine's network capture function tends to leave packets uncollected more than a PC.
When packets are collected due to print data problems, there may be times when you cannot determine whether it is caused by a print data fault or uncollected packets.
In order to verify whether the machine's network capture function is leaving packets uncollected, you may have to collect packets also with your PC.

● Overall flow

1. **Enable network capture**
2. **Start the network capture function**
3. **Overwrite function**
4. **Encryption function**
5. **Start/stop network capture**
6. **Stop the network capture function**
7. **Disable network capture**

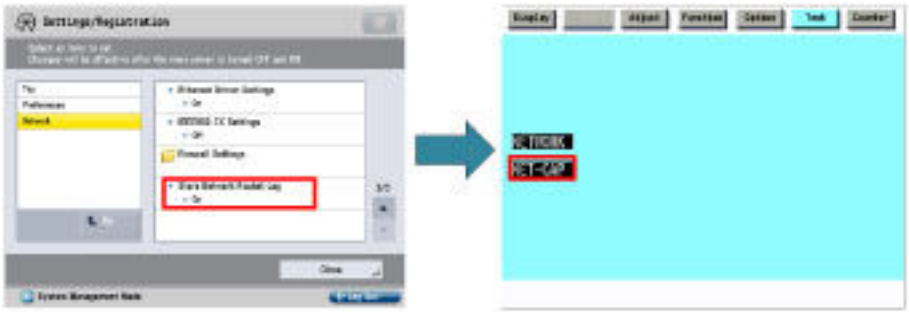
■ Embedded Network Packet Capture Collection

● Enable network capture

To enable this function, the following 2 steps need to be executed.

- Enabling the license of network capture
- Enabling user mode > Network > Store Network Packet Log

Because this function is able to acquire the customer information such as print data, it is not standard function.You make it valid as free license option after obtaining permission from the customer.Then it displays "OFF/ON" in the user mode, you obtain permission from the customer again and let the customer change it to ON.

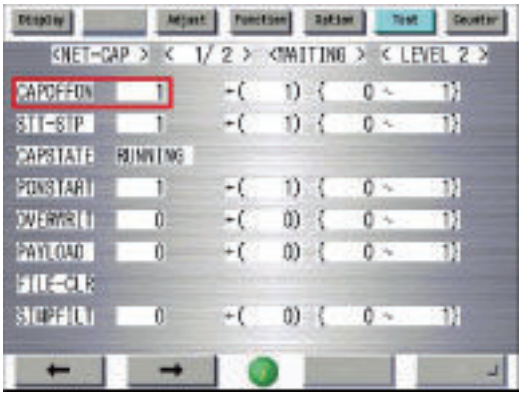


Changing it to "ON" in user mode, it is displayed in Service Mode.

● Starting Network Capture Function

Set "1" in the following service mode (Lv.2).

- COPIER > TEST > NET-CAP > CAPOFFON



This will enable the capture function.

● Overwrite Function

Set "1" for the following service mode (Lv.2).

- COPIER > TEST > NET-CAP > OVERWRIT

NOTE:
When starting capture but the HDD space becomes full, it will be necessary to set "1: Overwrite" in advance in order to delete old files and keep saving captured data.

The behavior when the HDD reaches the limit is as follows.

When overwrite setting is ON

- The oldest packet file is deleted. The oldest file is not decided by the date they were added to the file, but rather by the last time the file was updated.

- Even if the maximum capacity was reached during packet collection, old files are deleted and the process is continued by collecting packets in the file being saved
- The CAPSTATE of the capture remains as "RUNNING".

When overwrite setting is OFF

- Capture is stopped.
- The CAPSTATE of the capture will be "HDDFULL". However, STT-STP will remain as Start (1) status. Capture will start again when STT-STP(0) becomes STT-STP(1).
- Capture will only start again if HDDFULL is cleared.
- The CAPSTATE of the capture will be "RUNNING".
- If HDDFULL is not cleared, the capture start results will show an error.
- The CAPSTATE of the capture will remain as "HDDFULL".
- If capture stop is instructed while in "HDDFULL" status, the CAPSTATE of the capture will remain as "STOP".

● Encryption Function

Set "2" for the following service mode (Lv.2):

- COPIER > TEST > NET-CAP > ENCDATA
  0: Encrypted when data is extracted (factory default setting).
  1: Not encrypted when data is extracted.
  2: Two files are extracted, one encrypted and one clear text.

NOTE:
When collecting data by SST, both encrypted/clear text data are always collected without reflecting the above service mode setting.

The extension of extracted packet data will be "XXX.can" when encryption settings are enabled.
The extension of extracted packet data will be "XXX.cap" when encryption settings are disabled.
This setting only applies when extracting data by the USB flash drive.
When collecting data by SST, both encrypted/clear text data are extracted, so this setting is ignored.

● Starting/Stopping of Network Packet Capture

1. **Set "1" for the following service mode (Lv.2) and start to collect (capture) network packet data.**
   - COPIER > TEST > NET-CAP > STT-STP

2. **Set "0" for this item to stop capture.**

"RUNNING" is displayed in the CAPSTATE item while capturing packets.
"STOP" is displayed at the time of shipment or at completion of packet capturing. "HDDFULL" is displayed when the packet capturing upper limit of 1GB has been captured.

● Stopping the Network Capture Function

Set "0" for the following service mode (Lv.2).

- COPIER > TEST > NET-CAP > CAPOFFON

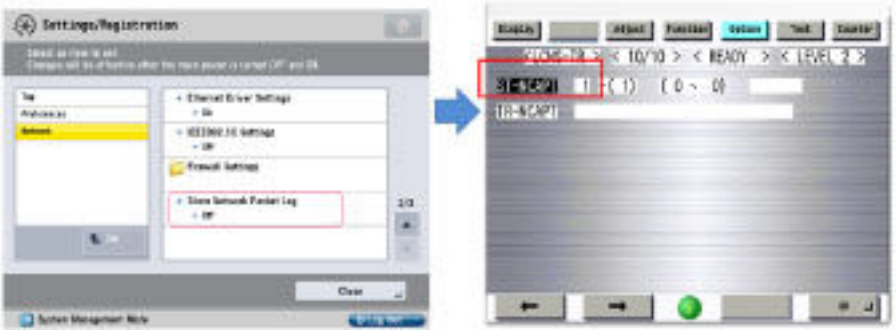
CAUTION:
Stop the network capture function after collecting network packet capture data.

- 0: OFF (disabled)
  When capture function is not operating. At the time of shipment
- 1: ON (enabled)
  When capture function is available.

● Disabling the Network Capture Function

1. **Select "OFF" for the "Store Network Packet Log" setting.**
   - Settings/Registration > Network > Store Network Packet Log

2. **Enter "0" in the following service mode (Lv.2) below and click [OK].**
   - COPIER > OPTION > LCNS-TR > ST-NCAPT



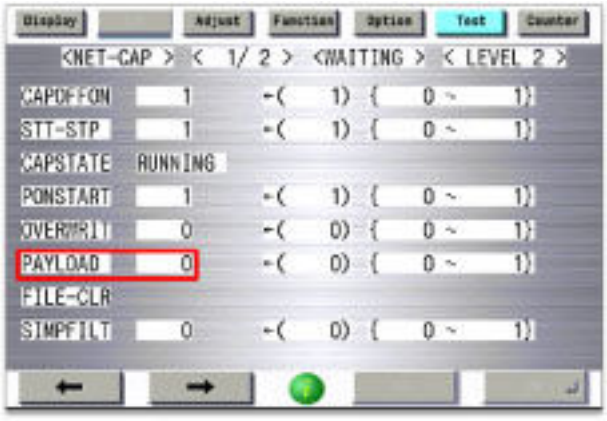
CAUTION:
When the network problem analysis is completed, be sure to disable the network capture function. A disabled license is therefore forwarded, but the LMS license for that destination does not have to be forwarded.

■ Other functions

● Payload Drop Function

Payload = customer data Network packets are acquired including the payload in the default settings. Network packets can be acquired while payload is dropped to prevent the leakage of customer information or the enlargement of network packets.
Service mode (Lv.2)

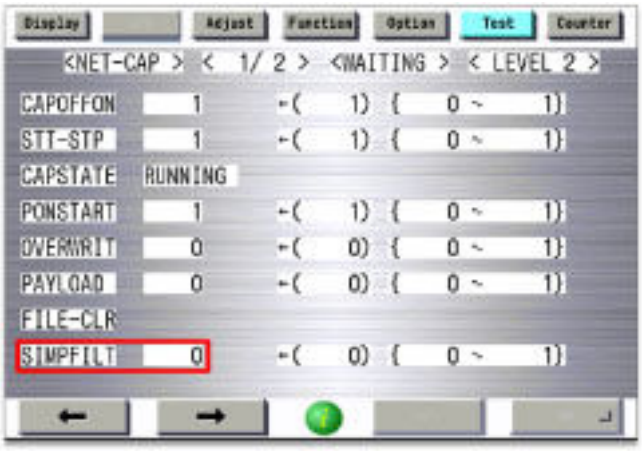
- COPIER > TEST > NET-CAP > PAYLOAD
  0: Not drop the payload (factory default settings)
  1: Drop the payload



● Filter Function

This allows users to make filtering settings.
Service mode (Lv.2)

- COPIER > TEST > NET-CAP > SIMPFILT
  0: Not filtered Collects all data (factory default setting)
  1: Only captures packets where the local MAC address is included in the destination address or sender address of the Ether header.



● Startup Collection Function

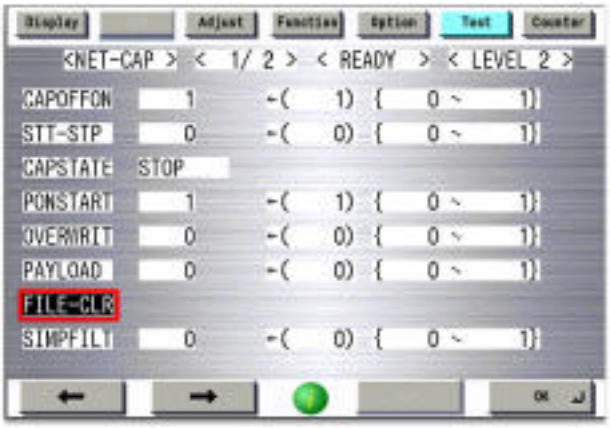
Setting this service mode automatically starts the collection of packet data if network capture operating conditions are fulfilled when the main power is turned ON. Finishing the collection of packet data must be done manually.
Service mode (Lv.2)

- COPIER > TEST > NET-CAP > PONSTART
  0: Not automatically collect at startup (factory default setting)
  1: Automatically collects at startup

● Deletion of Files

This deletes all network capture data stored in the HDD.
Select the following service mode (Lv.2) and click the [OK] button.

- COPIER > TEST > NET-CAP > FILE-CLR



■ SST Network Packet File Collection

● Overview

- Network capture data already saved in the host machine can be collected by using SST.

- To analyze the data in-house, clear text files can be analyzed by using free software such as Wireshark. Only CINC can analyze encrypted files. If it cannot be solved, send CINC an encrypted file.
- When collecting from SST, changed encryption function settings (Service Mode (Lv.2) : ENCDATA) will be disabled and data can be collected at any time in clear text/encryption format.
  - COPIER > TEST > NET-CAP > ENCDATA

● Preparation

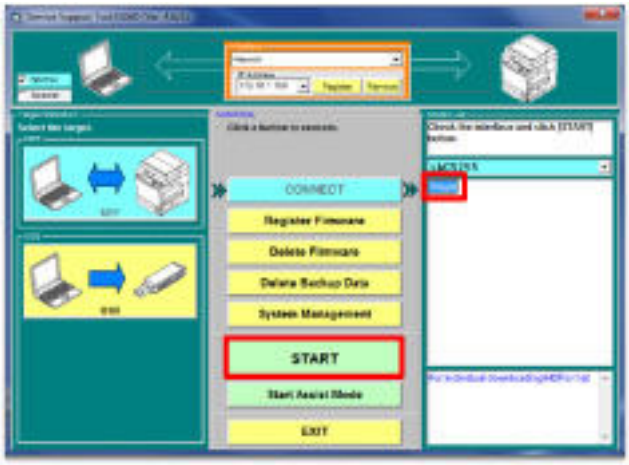
PC with SST (V4.62 or later) registered
(The system software of the corresponding model must have been registered with SST.)

● Overflow

1. **Connect the machine to SST**
2. **Upload data**
3. **Collect the network capture data**

● Starting the Machine and SST

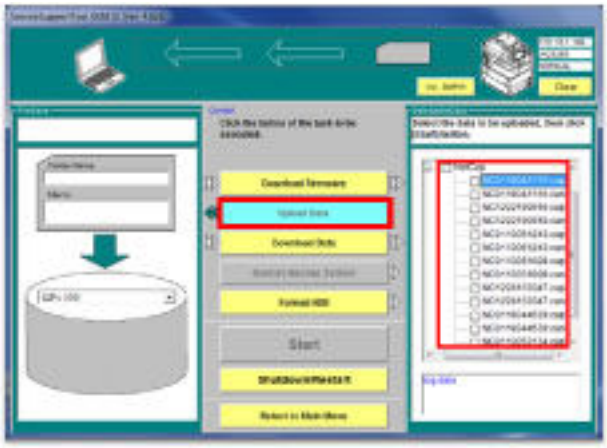
1. **Start the machine using the 2 and 8 keys, and connect SST in Single mode.**
2. **Click the "Start" button.**
3. **Select a model to connect and "Single", check the network settings, and then click the "Start" button.**



● Upload data

1. **Click the [Upload Data] button on SST.**

2. **When a list of packet files stored in the device appears, select target data files to upload.**



NOTE:
When using SST to collect data, you can select both files in encrypted format and clear text format.

● Collecting Network Capture Data

1. **For the SST default installation destination, from your PC, click C-Drive -> ServData -> Target model (e.g. iPRCxxx) -> The machine's Serial No. Holder.**
2. **The following three types of files are collected: clear text (xxx.cap), encrypted (xxx.can), and a list of captured network file being collected.**

3. **The captured network packet data collected as clear text (xxx.cap) is analyzed by using free software.**

NOTE:
If it cannot be analyzed, send CINC the encrypted file (xxx.can).

■ USB Network Packet File Collection

● Overview

- Collect the network capture data that has been stored in the machine using a USB memory.
- It is possible to use files in clear text format for in-house analysis by using free software, such as Wireshark. Note that only Canon Inc. can analyze encrypted files. In the case of failure in solving problems, send encrypted files to Canon Inc.

● Preparation

USB memory
Store in advance the system software of the machine to connect to.
For the system software, it is fine to store just one of the system software of the machine (LANG, etc). There is no need to store the full set.

• Overall flow

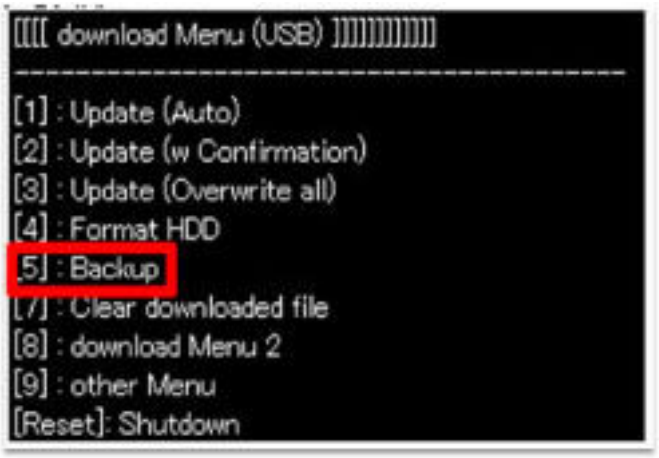
1. **Enter download mode**
2. **Select Backup**
3. **Transfer the network capture data**
4. **Collect the network capture data**

• Entering Download Mode

1. **Connect the USB flash drive to the USB port.**
2. **Select the following service mode, and press [OK].**
   - COPIER > FUNCTION > SYSTEM > DOWNLOAD
3. **When the machine recognizes the USB flash drive, the download Menu (USB) is displayed on the Control Panel.**

• Select Backup

1. **When Download Menu (USB) appears, select [5]: Backup.**



2. **Select - (OK): 0.**

3. **When Backup Menu (USB) appears, select [5]: Netcap.**

4. **Select - (OK): 0.**

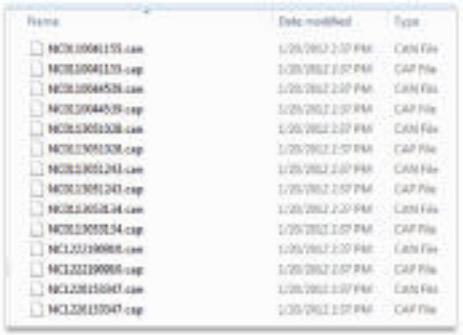
● Transfer the network capture data

1. **Store all the network capture data stored in the machine on the USB memory.**

2. **When "---Please hit any key---" appears, press any key.**
3. **Press the [C] key to return to the download Menu (HDD).**
4. **Press the [Reset] key to shut down the machine.**

● Collect the network capture data

1. **Check that the network capture files are stored on the USB memory.**
2. **Two types of files are collected; a file in clear text format (xxx.cap) and a file in encrypted format (xxx.can).**



3. **Use free software to analyze the collected network packet capture data in clear text format (xxx.cap).**

NOTE:
When the analysis work fails, send the file in encrypted format (xxx.can) to Canon Inc.

Version upgrade

Overview

For PRISMAsync model, refer to PRISMAsync service manual.

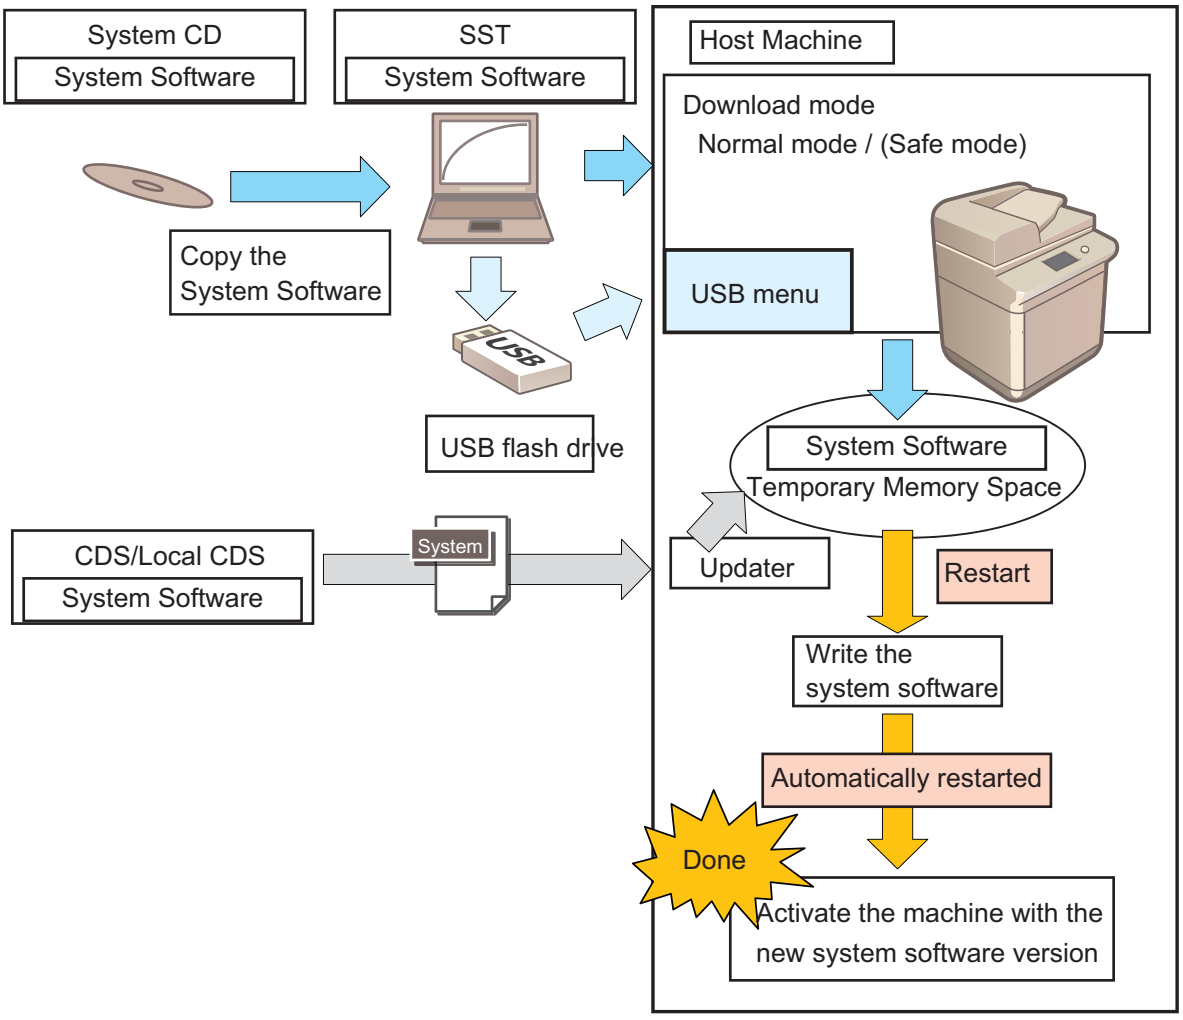
■ Overview of Version Upgrade

The system software version is upgraded in 2 steps, downloading and writing the new version of the system software.

● Downloading System Software

This machine supports the following 3 downloading methods.

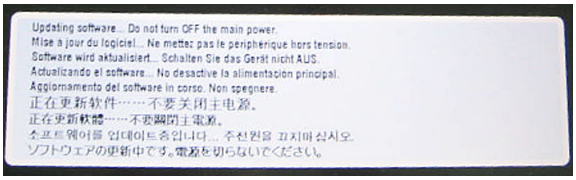
1. **Download via the service support tool (hereinafter referred to as "SST")**
   Connect the machine to the PC by the crossover cable to download the system software using SST installed in the PC.
2. **Download using the USB flash drive**
   Insert the USB flash drive to the slot of the machine, and download the system software stored in the USB flash drive.
3. **Download via Contents Delivery System (hereinafter referred to as "CDS") or Local CDS**
   Download the system software directly to the machine from networks.



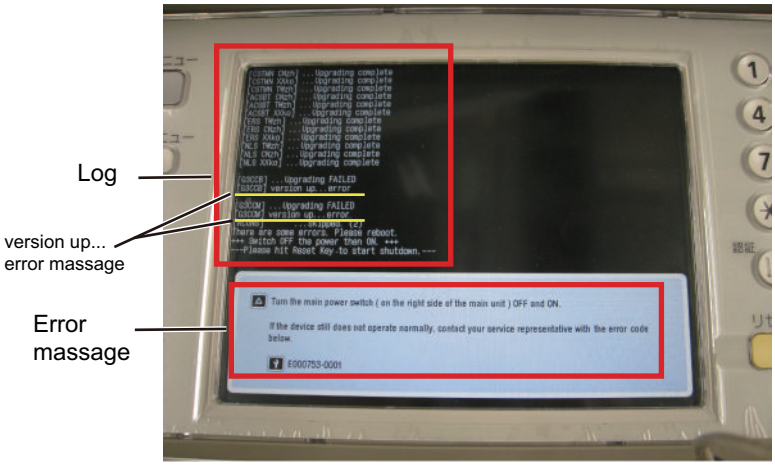
■ Writing System Software

The system software downloaded in either of the above-mentioned methods is stored in the temporary memory space.
After the system software is successfully downloaded, restart the machine to write the software in the machine.
In case the main power switch is turned OFF during the writing process, the machine may not be started.

This machine supports the remote version upgrade via CDS. When upgrading the system software via CDS, the warning message is shown on the control panel to alert the user not to turn OFF the power switch.



When the system software is successfully written, the machine is automatically restarted to activate the downloaded system software.
If any error occurs during the writing process, the error code, E753-0001, is shown.
The name of the system software component is shown to the left of the error log message, “version up…..error”. Check the name if the software is for the option not attached to the machine. If so, turn OFF / ON the machine to recover the error (see Troubleshooting for details).



■ Download Mode

When the version is upgraded via SST or with the USB memory storage device storage device, start the machine in Download mode. This machine has the following 2 Download modes similarly with other iR-series models.

● Normal mode (Recommended)

- Start from the following service mode.
  COPIER > FUNCTION > SYSTEM > DOWNLOAD
- With the existing models, the power switch of the machine is turned on while pressing the numeric keys [1] and [7], but the above operation makes this machine to be in static IP address automatically and enables downloading as in the existing models.
- Version information can be obtained, avoiding unnecessary downloads and errors.

NOTE:
When entering download mode, enter service mode after the main menu is completely displayed.
System software version information is loaded at startup, so you will have to start download mode after obtaining the version information.

● Safe mode:

- Press 2 and 8 keys simultaneously on the numeric keypad when turning on the power.
  * Be sure to use "Single mode" when using SST. SST "Assist mode" cannot be used in safe mode. Any mode can be used when using USB.

■ Points to Note when Downloading

Prohibition of turning OFF the power during the download/writing process

Do not turn OFF the power while downloading/writing the system software. The machine may not startup even after turning ON the power.

When the machine fails to be started after turning ON the power, be sure to start in safe mode (by pressing 2 and 8 keys simultaneously on the numeric keypad).
If the machine can be started up in safe mode, execute HDD formatting (BOOTDEV) and then download the system software again.

It is recommended to use normal mode when using download mode.

Be sure to use normal mode when using download mode except in a case where it is not possible to start this machine and enter service mode.
In safe mode, version information of SYSTEM, MEAPCONT, LANGUAGE, RUI, and SDICT can be obtained, but version information of other system software such as DCON and RCON cannot be obtained. Therefore the following points to note are required when downloading in safe mode.
[RCON]
The version is not upgraded except in a case where Single mode of SST is used or when "Overwrite all" of USB download menu is used.
[DCON and others]
The following symptoms occur when SST (Single mode) or USB download menu (Auto) is used.

- The time for download/write becomes longer because the software is overwritten even when system software of the same version is being written.
- A confirmation message is not displayed when a lower version is going to be downloaded.

Error code E753-0001

When an error occurs during writing process of the system software downloaded using SST or USB flash drive, error code E753-0001 is displayed.
Check if the target option is properly installed and see if the software to download is for the correct target option, and then execute downloading again.

Version Upgrade via SST

■ Overview

The system software can be downloaded either of the two modes below via SST.

- Assist mode (recommended)
- Single mode

Assist mode provides the following features.

- Attached option types are automatically recognized.
- The new versions of the system software for attached option types are automatically searched.
- The set of system software with interactive behavior confirmed is automatically downloaded.
- The accessories attached to the host machine are automatically recognized to download the system software for each accessory.

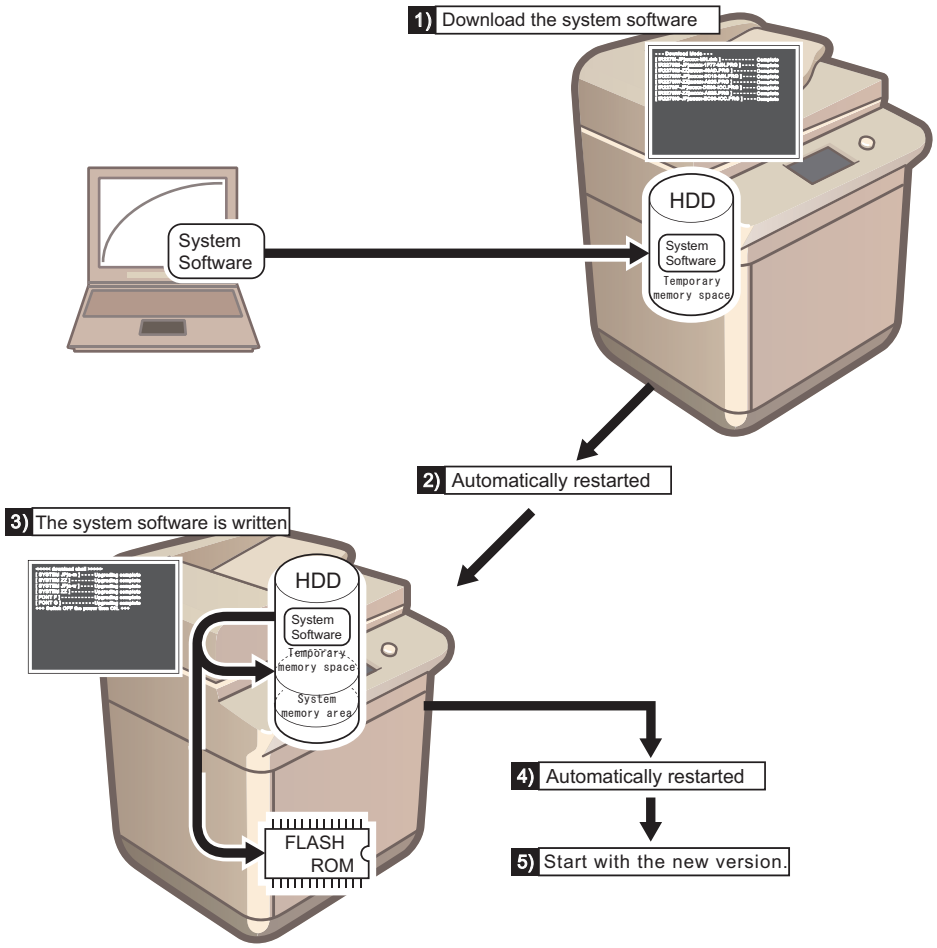
This machine holds a number of system software components that mutually interacts during operation. Behaviors of such system software should be confirmed when these are downloaded as the set. Thus, Assist mode is basically recommended to download the system software for this machine.

NOTE:
Use Single mode only when any of the following conditions is met.

- When downloading some the system software components, i.e. DCON, RCON or options.
- When reloading the system software after HDD is formatted.

● Downloading System Software

The system software is stored in the temporary storage space of the HDD immediately after downloading from the PC. When the machine is restarted after downloading the system software, it will be written to the system area and flash ROM.
When the system software is successfully written, the machine is automatically restarted with the new version of the system software.



■ Copying System Software

● System CD to SST

Register the system software stored in the system CD to SST.

NOTE:
If the system software size exceeds the CD capacity, the system software will be recorded in the system CD in a compressed file format.
In that case, decompress the compressed file and then register to SST.

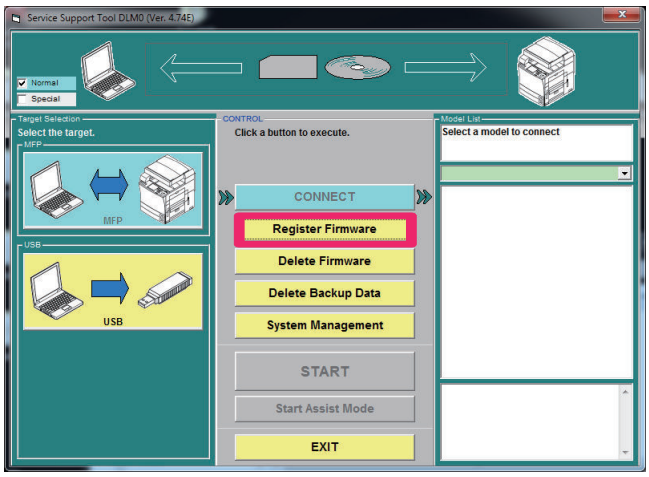
Preparation
What to Prepare:

- PC with SST Ver.4.75 or later installed
- System CD for this machine

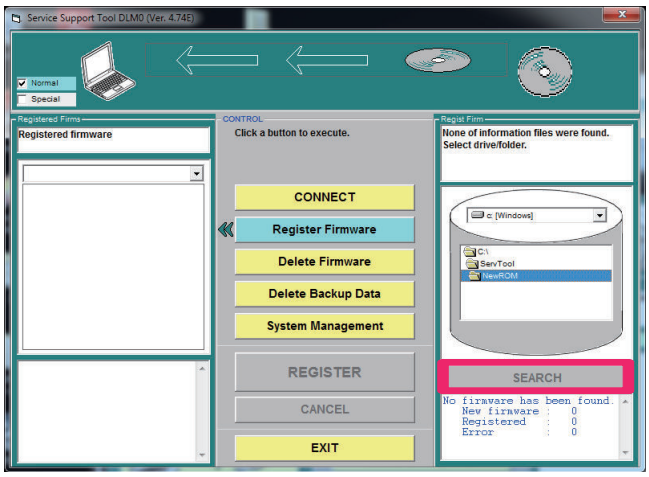
Steps to register the system software

1. **Start the PC.**
2. **Insert the system CD into the PC.**
3. **Start the SST.**

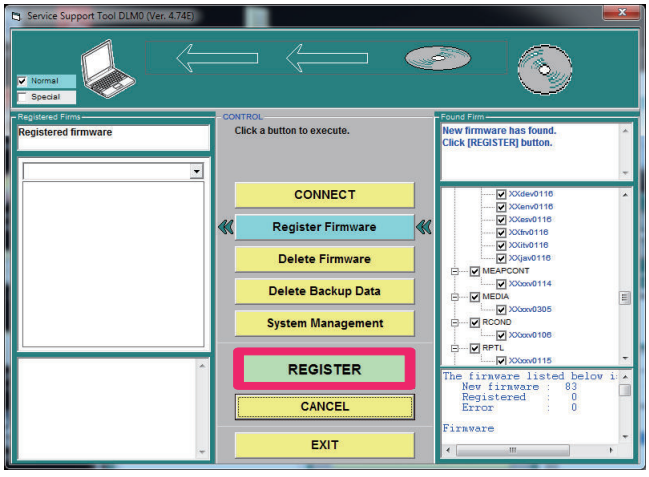
4. **Click the "Register Firmware" button.**



5. **Select the drive where the system CD has been inserted, and click the "SEARCH" button.**

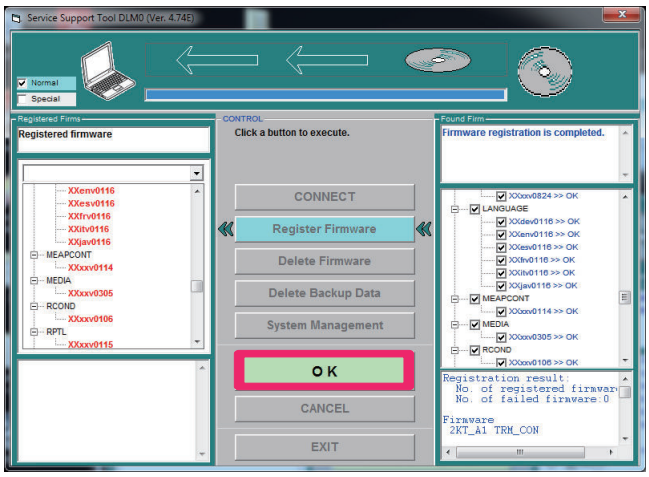


6. **A list of system software in the system CD is displayed.**
   Deselect the checkbox of unnecessary folder(s) and/or system software and click the "REGISTER" button.



NOTE:
"XXXX" in the figure describes the version of system software.

7. **A message indicating completion of system software registration will appear. Click the "OK" button.**



■ Connection

The following IP address is automatically set for this machine at start-up in Download mode.

- IP address:172.16.1.100
- Subnet mask:255.255.255.0

When the PC with SST installed is connected to this machine, change the PC network address to the following.

- IP address:172.16.1.xxx (except 172.16.1.100)
- Subnet mask:255.255.255.0
- Default gateway: arbitrary

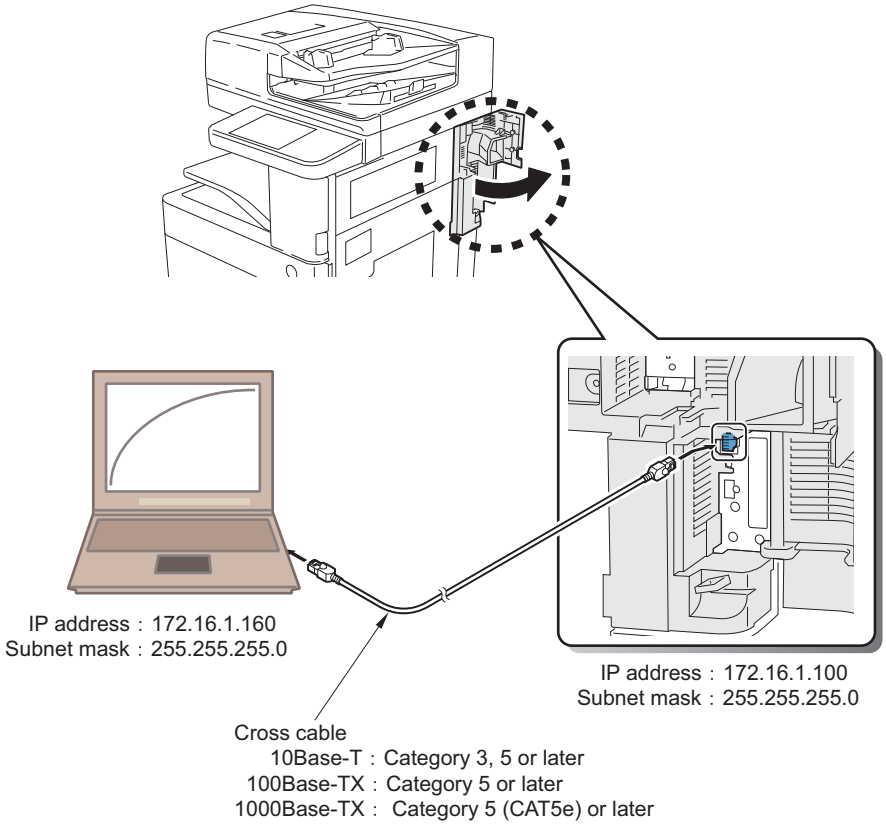
CAUTION:
If the PC has the connection to the network, the settings changed to the above-mentioned may cause network failures due to redundant IP addresses, etc. Ensure that the PC is disconnected from the network when you change the PC network settings. Alternatively use the cross cable to connect the PC to this machine.

● Preparation

What to Prepare

- PC with SST Ver.4.75 or later is installed and the system software for this machine is registered.
- Crossover cable
  10Base-T: Category 3 or 5
  100Base-T: Category 5
  1000Base-T: Enhanced Category 5 (CAT5e) or later

CAUTION:
Disconnect a USB flash drive if connected.
This machine disables the communication to SST if any USB flash drive is recognized, so SST and the USB flash drive cannot be used concurrently.



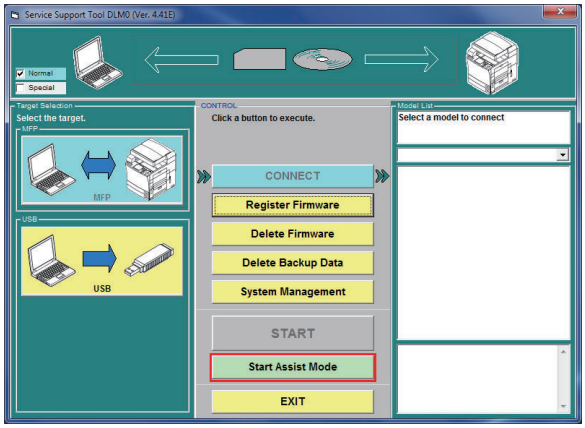
● Procedure

1. **Connect this machine and the PC with SST installed with the crossover cable.**
2. **Turn ON the main power switch of the host machine.**
3. **Start download mode from the following service mode.**
   Select the following service mode, and then press [OK].
   - COPIER > FUNCTION > SYSTEM > DOWNLOAD

■ Downloading System Software (Assist Mode)

1. **Start this machine and enter download mode.**
   - COPIER > FUNCTION > SYSTEM > DOWNLOAD
2. **Connect the PC to this machine and start SST.**

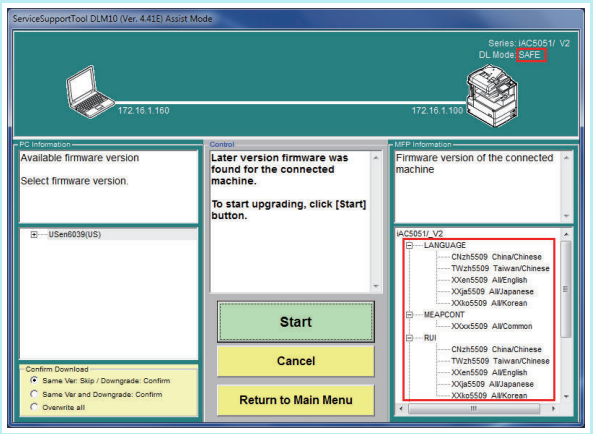
3. **Click the “Start Assist Mode” button.**
   Skip this step when starting SST in assist mode.



If newer combination of the system software is stored in SST, the new combination is automatically selected.

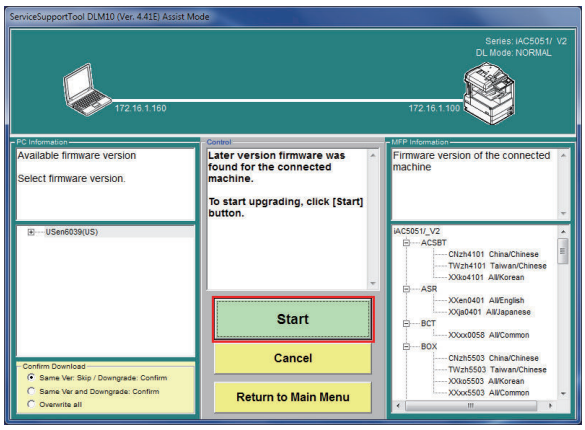
NOTE:
If only the existing system software combination is stored, none of them is selected. Any versions of the existing system software can be downloaded by manual selection.

NOTE:
<When assist mode is used to connect to the machine in safe mode>



Version information can be obtained for only the system software of SYSTEM, LANGUAGE, RUI, MEAPCONT and SDICT.

4. **Click the “Start” button.**



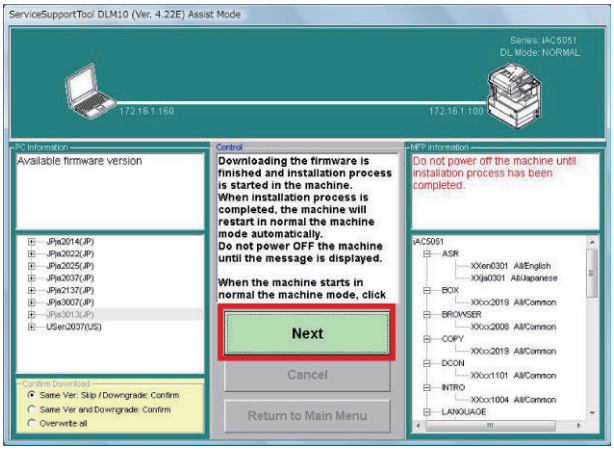
The machine is automatically restarted and the writing process is started when download is completed.
It may be restarted multiple times depending on the option configuration.
Upon completion of the writing process, the machine is restarted again and the main menu is displayed.

NOTE:
Download confirmation modes
Download is confirmed in any of the following 3 modes:

1. Skip the existing versions and confirm whether to download downgraded versions
   - Download is executed when upgrading
   - If the same version exists, download is not executed.
   - Check whether download is executed when downgrading
2. Check that it is the same version/downgrading
   - Download is executed when upgrading
   - If it is the same version, check whether it will overwrite when downloading
   - Check whether download is executed when downgrading
3. Overwrite all
   - Regardless of version upgrade or downgrade, all versions of the system software are downloaded without the confirmation message.

By default, "Skip the existing versions and confirm whether to download downgraded versions" is selected.

5. **Click the “Next” button.**

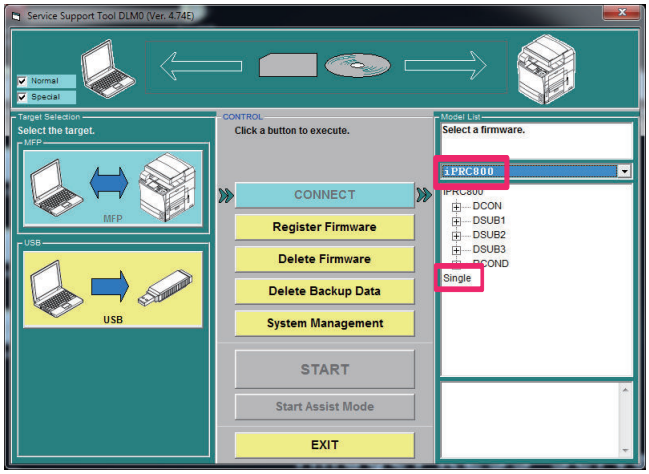


6. **Disconnect the crossover cable from the machine.**
7. **Enter service mode to check the version of the system software.**
8. **Click the "OK" button.**
   The main menu is displayed.

■ Downloading System Software (Single Mode)

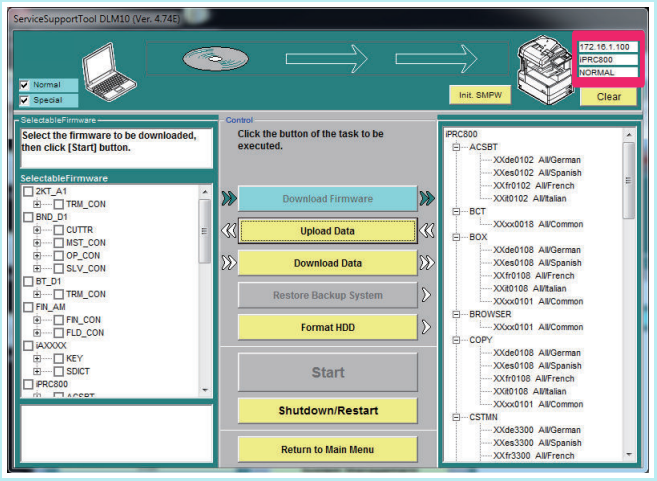
The following is the sample steps to download the DCON. (The other components of the system software can be downloaded similarly.)

1. **Start the machine in the download mode to be used.**
2. **Connect the PC to this machine and start SST.**
3. **Select the model to be connected and “Single”. Check the network setting and click the “Start” button.**

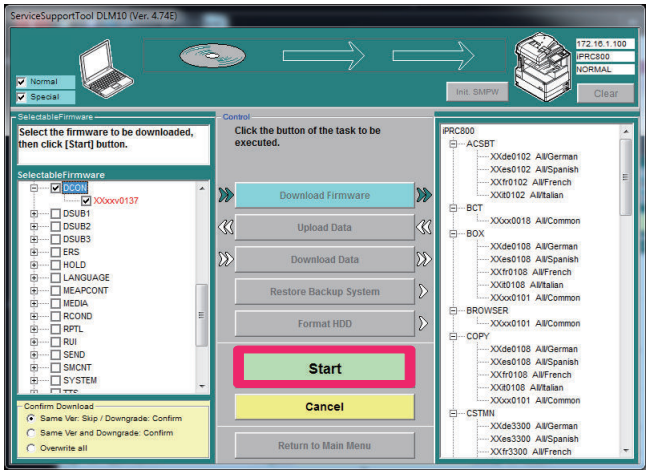


NOTE:
The following device information is displayed at the right top of SST screen.

- IP address
- Model name
- Download Mode



4. **Select the DCON version to be downloaded and click the “Start” button.**
   Multiple files of system software can be selected in this step.

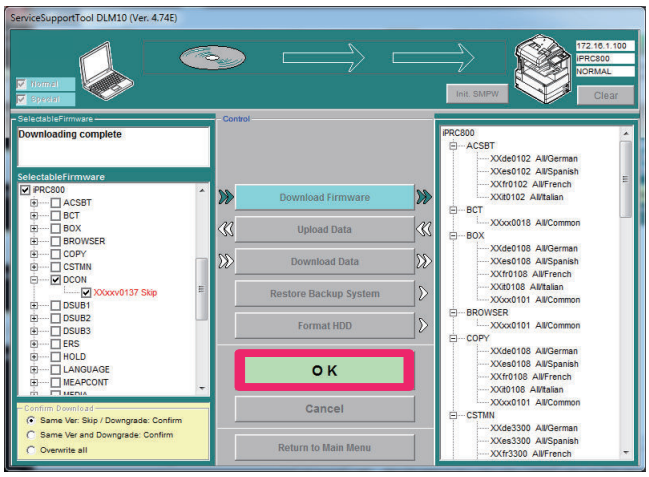


NOTE:
Download confirmation modes
Download is confirmed in any of the following 3 modes:

1. Skip the existing versions and confirm whether to download downgraded versions
   - Download is executed when upgrading
   - If the same version exists, download is not executed.
   - Check whether download is executed when downgrading
2. Check that it is the same version/downgrading
   - Download is executed when upgrading
   - If it is the same version, check whether it will overwrite when downloading
   - Check whether download is executed when downgrading
3. Overwrite all
   - Regardless of version upgrade or downgrade, all selected versions of the system software are downloaded without the confirmation message.

By default, "Skip the existing versions and confirm whether to download downgraded versions" is selected.

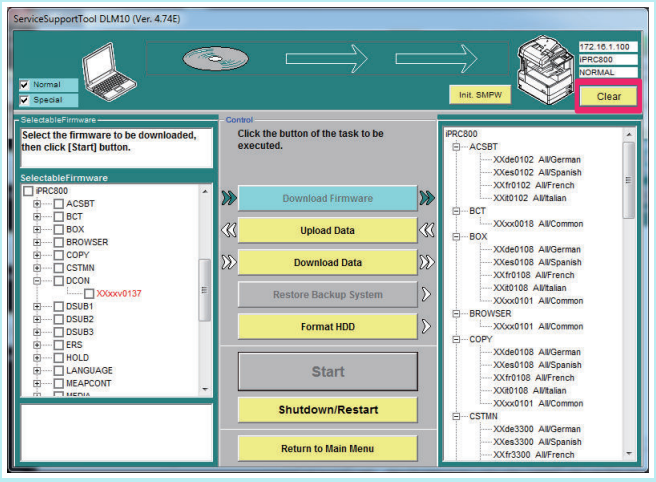
5. When the download is completed, click the “OK” button.



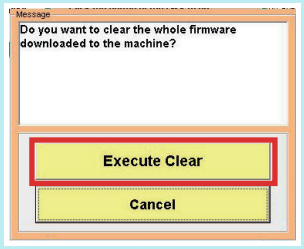
Return to the main menu screen.

NOTE:
After downloading is completed, system software stored in the temporary storage area of the machine can be deleted without writing it to the HDD or Flash ROM as long as it is deleted before restarting the machine. After downloading is completed, system software stored in the temporary storage area of the machine can be deleted without writing it to the HDD or Flash ROM before restarting the machine.

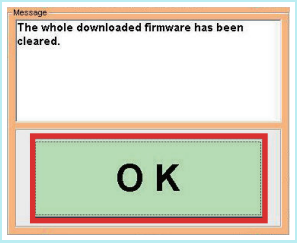
1. Click the "Clear" button.



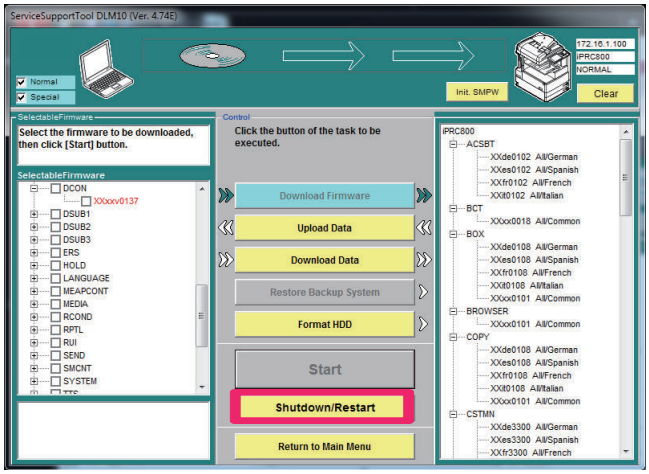
2. Click the "Execute Clear" button.
   System software stored in the temporary storage space in the HDD is deleted.



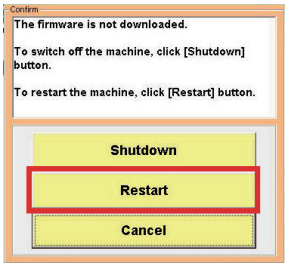
3. Click the "OK" button.
   Return to the previous screen.



6. Click the "Shutdown/Restart" button.



7. **Click the "Restart" button.**



Restart the machine.
The downloaded system software is written to the HDD or Flash ROM.

8. **Click the "OK" button.**
9. **Enter service mode to check the version.**

■ Formatting HDD

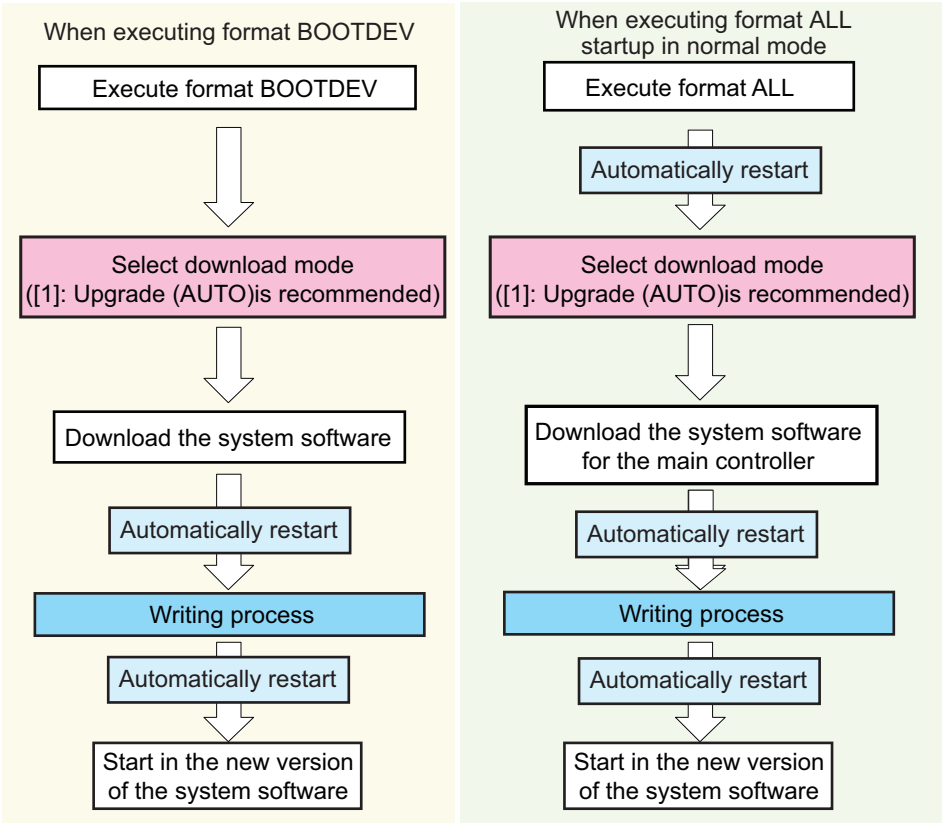
● Overview

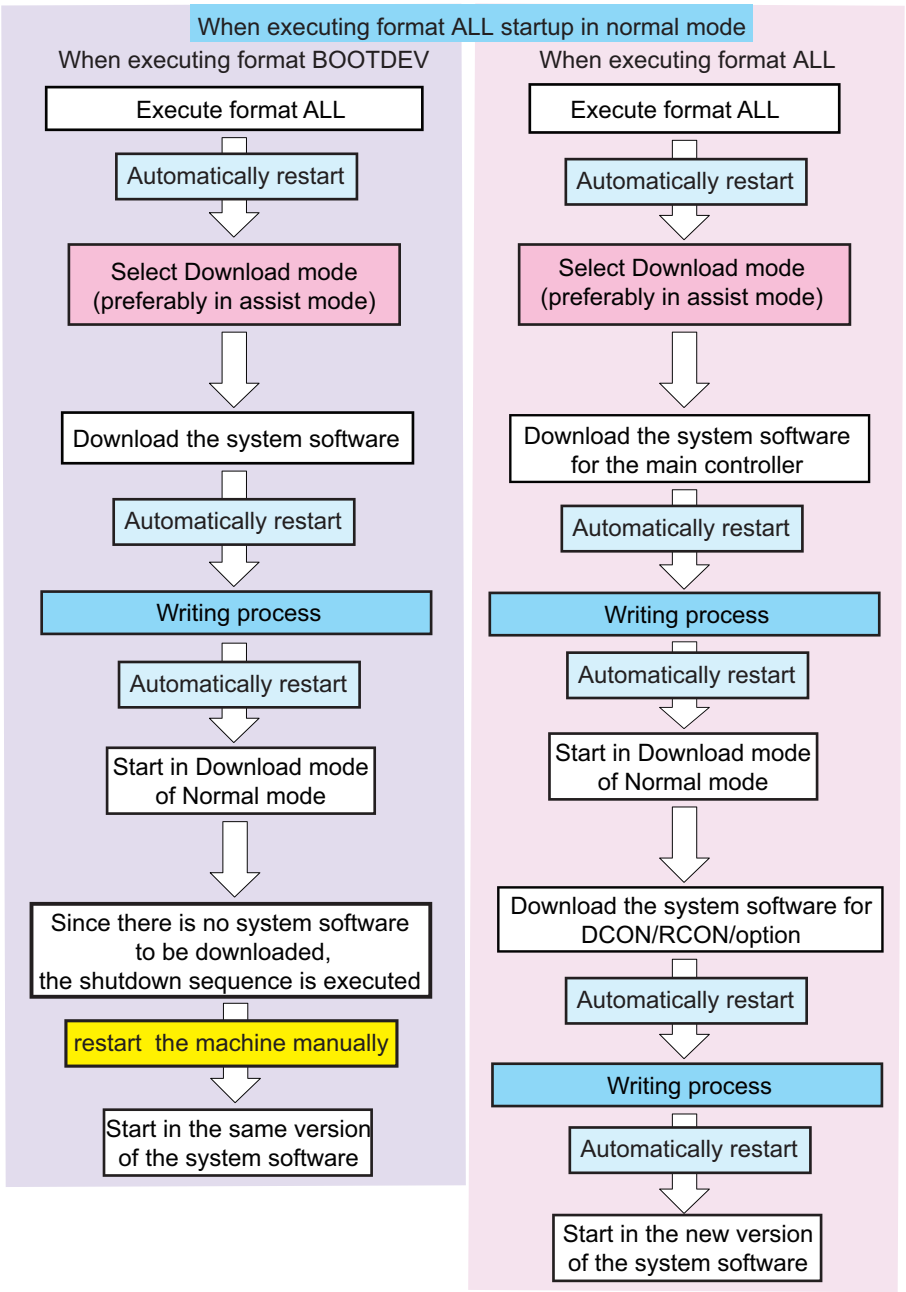
This machine probides the following two types of HDD Formatting.

- ALL:to format the whole HDD
  - When HDD set as the service parts (the new HDD) is mounted
  - When clearing the system software and data completely from HDD and reloading the system software.

  Once Format ALL is executed in your machine, all the user data and MEAP applications held in HDD will be cleared. Ensure to gain an agreement from the user before formatting.
- BOOTDEV: to format the system software storage area on HDD.
  - When clearing the system software storage area and reloading the system software

HDD needs not to be formatted at version upgrade.
HDD can be formatted only in Single mode.
After HDD is formatted, the machine cannot be started before the system software is downloaded.
After Format ALL is executed, the machine is automatically restarted to reflect formatting to HDD. At this time, the machine automatically starts in Download mode. For BOOTDEV format, the machine is ready to download the system software without restarting.
After formatting, enter either Assist mode(recommended) or Single mode to download the system software.

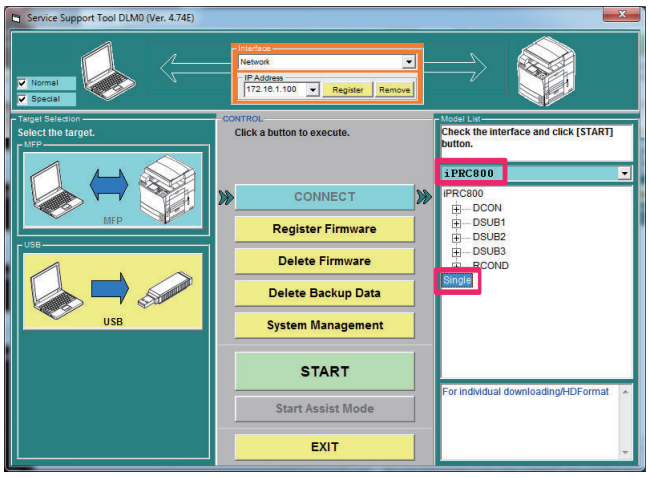




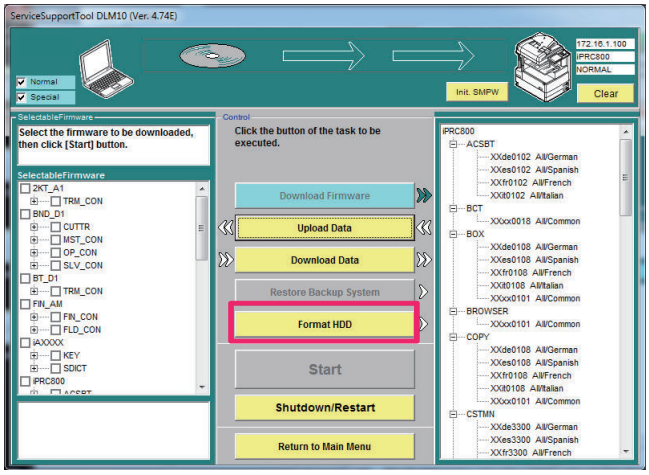
• Steps of Formatting

1. **Enter Download mode. (Enter Safe mode when you mount the new HDD or when the machine is unable to start normally due to HDD failures, etc.)**
2. **Connect the PC to the machine to start SST.**

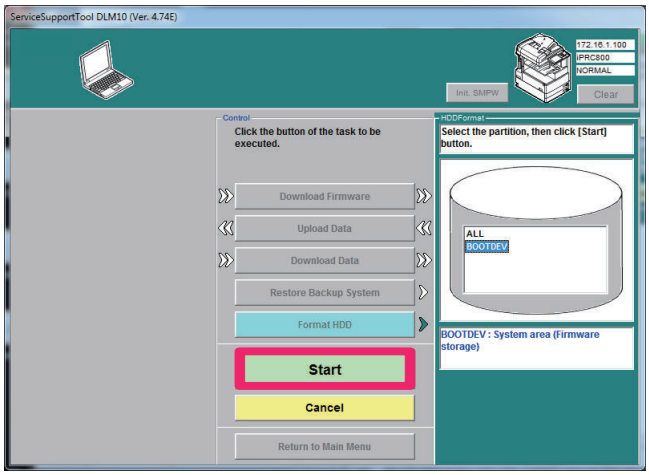
3. **Select the model to be connected and “single”. Check the network settings and click “Start” button.**



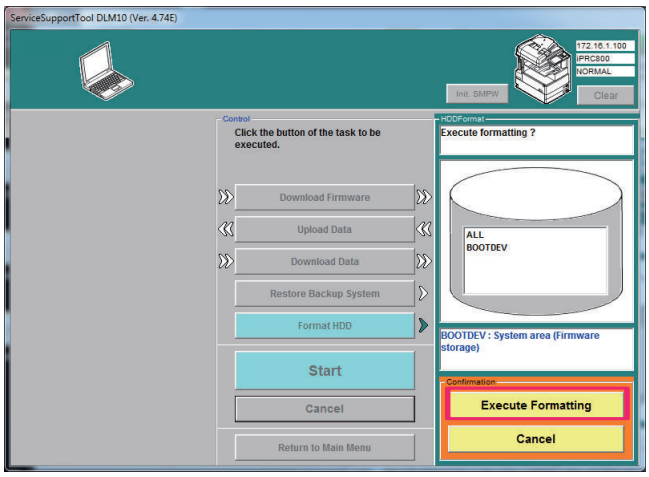
4. **Click“Format HDD”button**



5. **Select "BOOTDEV" or "ALL" to click "Start".**

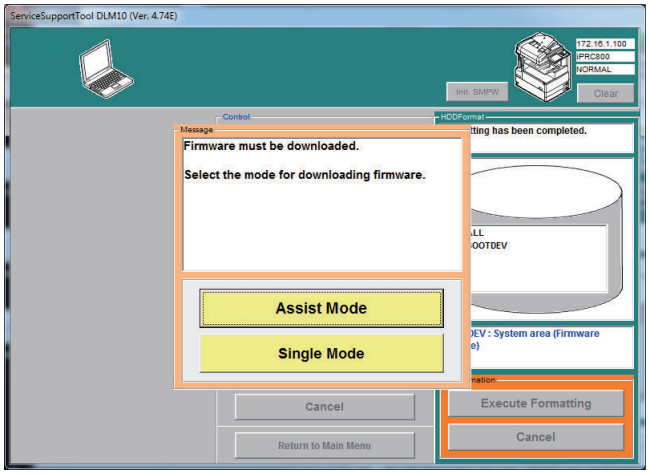


6. **Click "Execute Format" button.**



HDD is formatted.

7. **Download the system software in any Download mode (Assist mode recommended). See the steps to download the system software for details.**



CAUTION:
After HDD is formatted, ensure to download the system software. If the system software is not downloaded, E602 error is triggered at power-on.

CAUTION:
Restarting takes more time after HDD is formatted and the system software is downloaded (to write the downloaded software).
Down time may be approx. 5 minutes in maximum to proceed the writing process. Never turn OFF the machine while Starting screen is shown.

● Mounting New HDD

After HDD set as the service parts is mounted, the new HDD should be formatted initially. In this case, the message is shown to confirm if the new HDD is mounted.
The figure below shows the abbreviated steps.

Replacing HDDs

↓

Start the machine in Safe mode
(by pressing 2 and 8 keys simultaneously on the numeric keypad)

↓

Connect to SST

↓

Confirm that the new HDD is successfully mounted

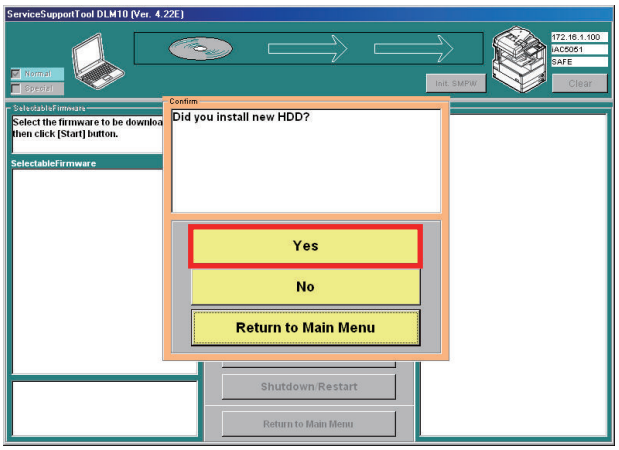
↓

Format HDD (Format ALL)

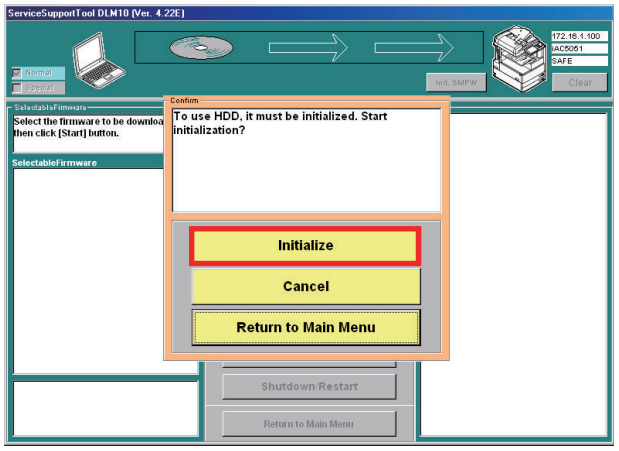
↓

Follow the steps as described in Format ALL section.

When the new HDD is mounted, the machine cannot be started in the normal procedure. Start the machine in Safe mode as Download mode. When gaining connection to SST, the message is shown to confirm if the new HDD is mounted.



Click "Yes" and the message is shown, confirming whether to format HDD.



Click “Initialize” button to initialize HDD (Format ALL). Follow the steps described in Format ALL section to download the system software.

■ Backup

● Overview

When replacing the Controller PCB, the data stored in the PCB can be temporarily saved and migrated to the new PCB by using the backup function.

- Backup via SST

Backup data	File name to be downloaded/uploaded
Backup RAM	SramImg.bin (available to upload/download)
MEAP application	MeapBack.bin (available to upload/download)
Debug log	Sublog.bin (available to upload) See troubleshooting > Debug log
Service Print	Text file of contents printed on paper in service mode (available to upload)

  - Backup RAM is data of the backup RAM of the Main Controller PCB 2.
    (Service mode settings related to parts counter and Main Controller management are saved, so be sure to back them up when replacing the Main Controller PCB and the DC Controller PCB.)
  - MeapBack is the MEAP application and its data stored in the HDD.
- Backup via service mode

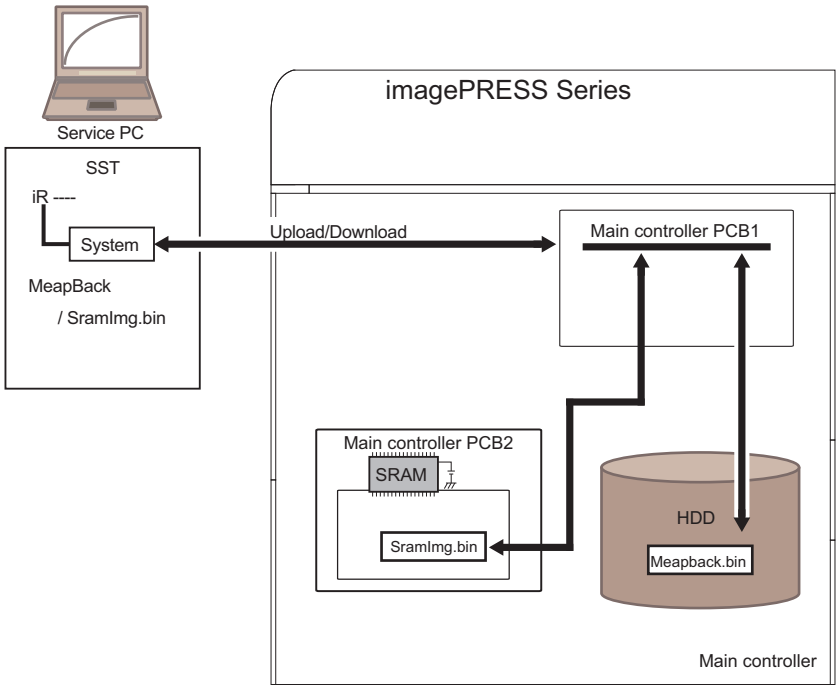
Backup data	Service mode (Lv.2)
Backup of Reader Controller PCB	COPIER > FUNCTION > SYSTEM RSRAMBUP (backup) COPIER > FUNCTION > SYSTEM RSRAMRES (restoration)
Backup of DC Controller PCB	COPIER > FUNCTION > SYSTEM DSRAMBUP (backup) COPIER > FUNCTION > SYSTEM DSRAMRES (restoration)

  - Data is saved in HDD.

NOTE:
- Before replacing the Reader Controller PCB, back up the data in service mode. The backup data can be restored in service mode after replacing the Reader Controller PCB. This enables to maintain the setting data including service mode stored in the old Reader Controller PCB.
- Before replacing the DC Controller PCB, back up the data in service mode. The backup data can be restored in service mode after replacing the DC Controller PCB. This enables to maintain the setting data including service mode stored in the old DC Controller PCB.
- Before replacing the Main Controller PCB 2, upload the data of StramImg.bin. The uploaded data can be restored after the replacement. This enables to maintain the setting data including service mode stored in the old Main Controller PCB 2.
- When saving MeapBack.bin and going through the following: "Settings/Registration > Data Management > Initialize All Data/Settings", it is no longer possible to login to SMS even if the data is restored.
  Restore MeapBack.bin after "Initialize All Data/Settings".

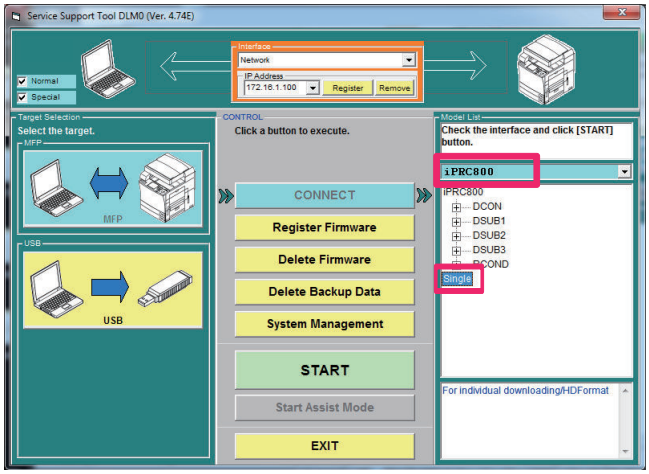
● Upload Procedure

CAUTION:
- Sublog.bin requests collection of debug log when the Canon staff in charge of quality follow-ups determines the need of an analysis by the Design Dept. using debug log.
- The backup data can be downloaded only on the machine from which the data was uploaded.
- Do not use SramRCON and SramDcon with this machine.

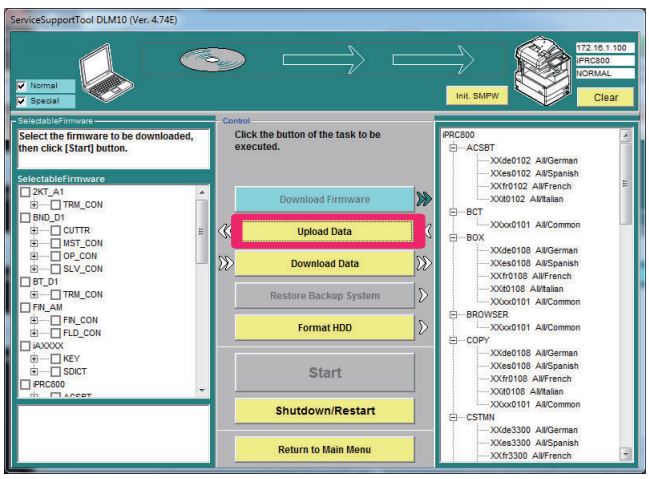


Listed below are the sample procedures to upload MeapBack.

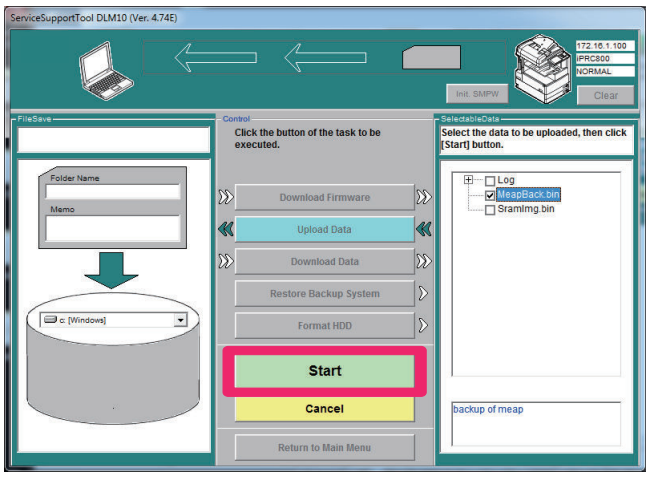
1. **Enter download mode.**
2. **Connect the PC to this machine and start SST.**
3. **Select the model to be connected and “Single”. Check the network setting and click the “Start” button.**



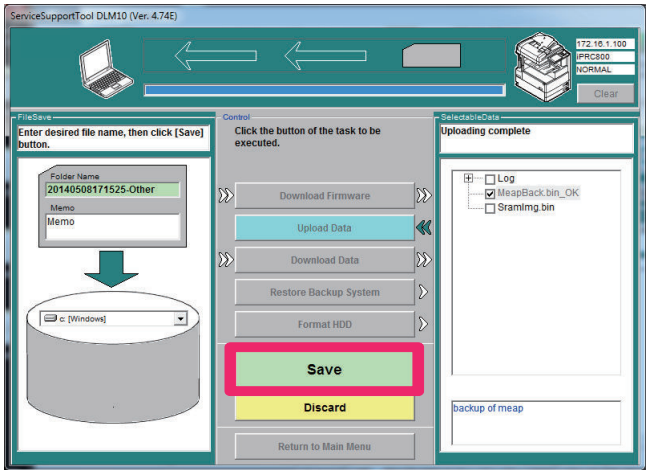
4. **Click the “Upload Data” button.**



5. **Select “MeapBack.bin” and click the “Start” button.**



6. **Enter the file name to be saved and comments when necessary. Click the “Save” button.**



7. **Click the "OK" button.**

● Steps to Download Data

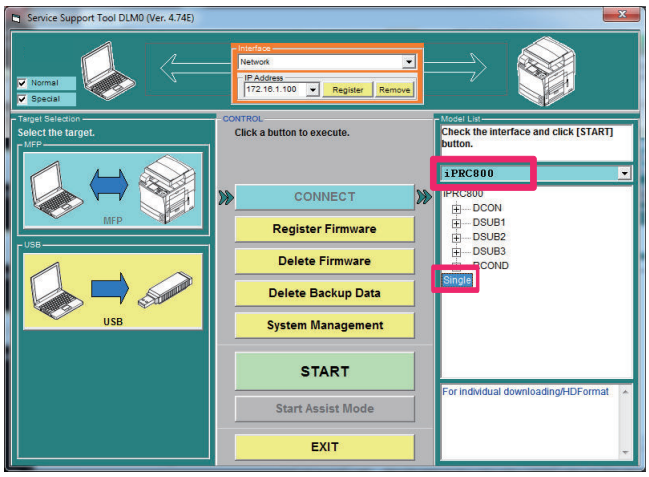
CAUTION:

- The backup data can be downloaded to the machine from which the data were uploaded
- Store Meapbackup.bin; and "Settings/Registration > Data Management> Initialize All Data/Setings"; Restore it; even if it, cannot log in to SMS. Restore Meapbackup.bin which backed up after "Initialize All Data/Setings"; store it.

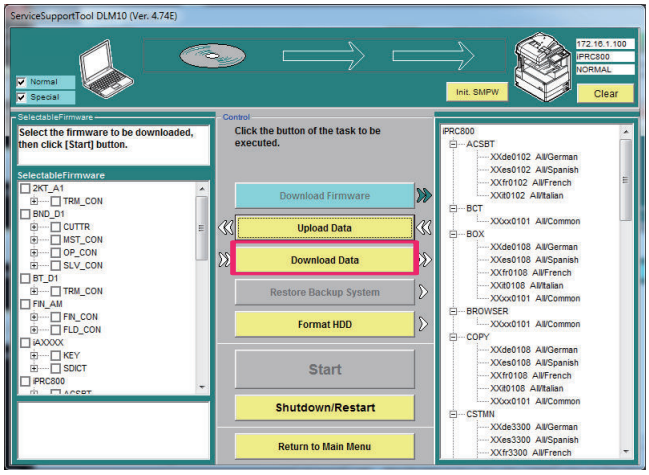
Listed below were the sample steps to download MeapBack.

1. **Enter Download mode**
2. **Connect the PC to the machine and start SST.**

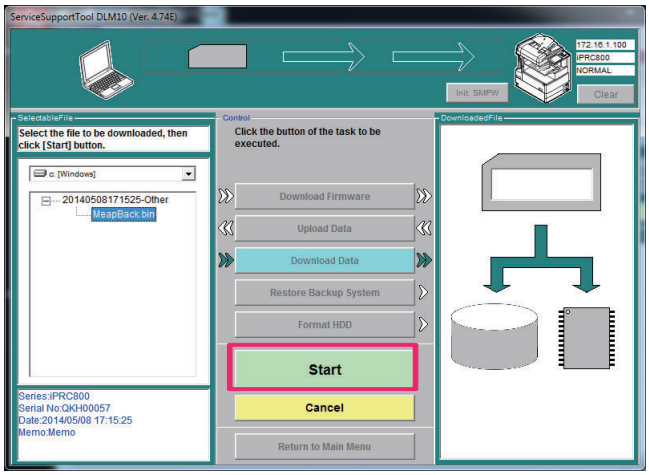
3. **Select the model to be connected and “Single”. Check the network setting and click “Start” button.**



4. **Click “Download Data” button.**



5. **Select the data to be downloaded and click “Start” button.**



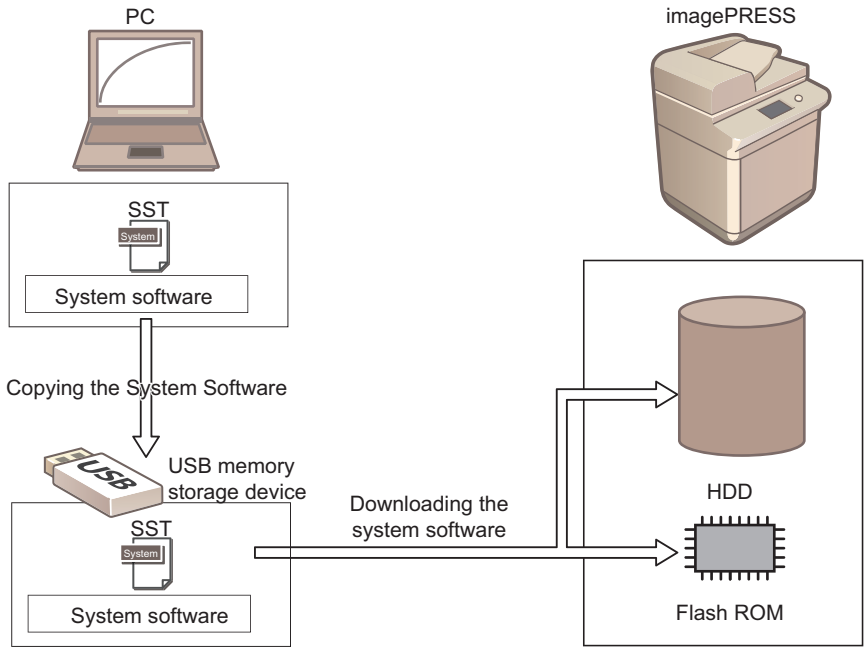
6. **When the data are successfully downloaded, click “OK” button.**

7. **Restart the machine**

Version Upgrade using USB memory Storage Device

■ Relation between SST and USB Flash Drive

When using a USB flash drive for version upgrade, the system software should be copied to the USB flash drive using SST. By inserting the USB flash drive containing the copied system software to the slot of the machine, the system software can be upgraded.
The figure below shows the relation between SST and USB flash drive.

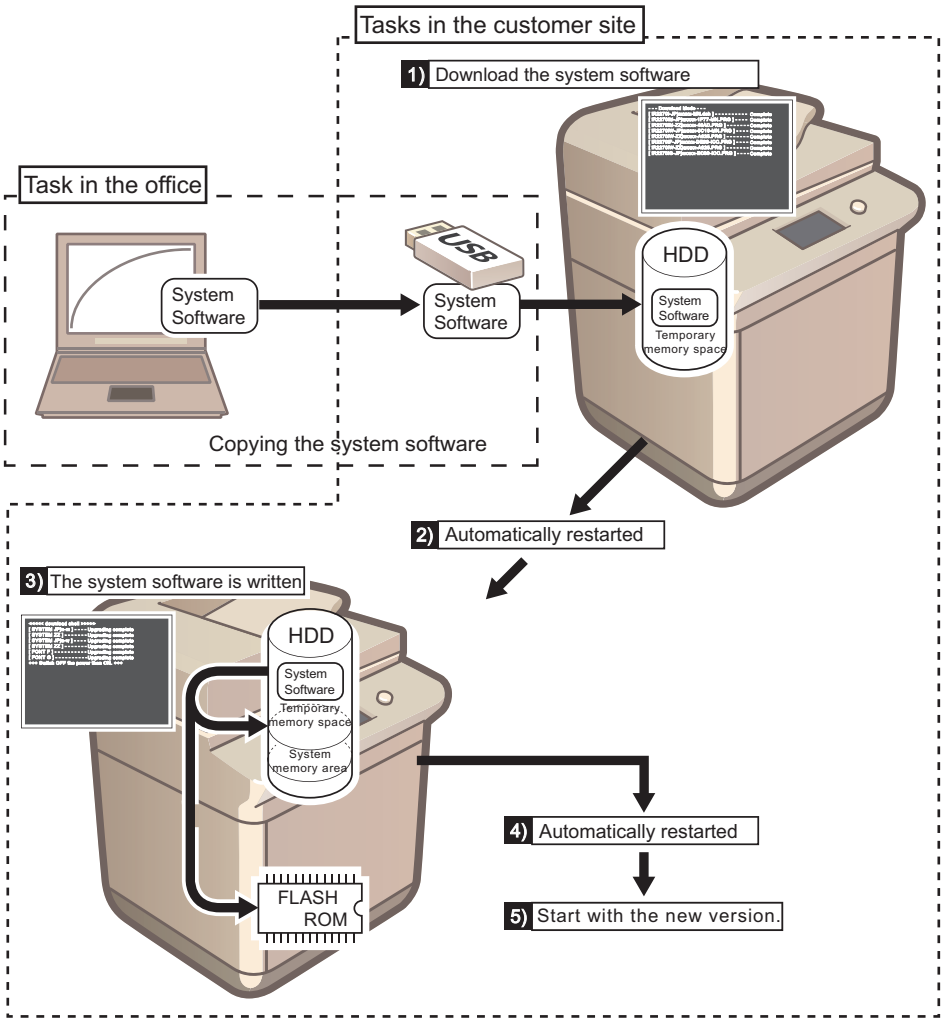


When downloading the system software, enter any of the following download modes.

- Normal mode (Recommended)
  Select the following service mode, and then press [OK].
  COPIER > FUNCTION > SYSTEM > DOWNLOAD
- Safe mode (Not used as a general rule. Only used when normal startup is not possible due to a system error, etc.)
  Press and hold [2] and [8] keys simultaneously on the numeric keypad when turning ON the power switch.

● Downloading System Software

Copy the system software to a USB flash drive using SST.
The system software is stored in the temporary storage space in the HDD immediately after downloading from the USB flash drive.
When the machine is restarted after downloading the system software, it will be written to the system area and flash ROM.
When the system software is successfully written, the machine is automatically restarted with the new version of the system software.



■ Copying System Software

● System CD to SST

Register the system software stored in the system CD to SST.

NOTE:
If the system software capacity exceeds that of the CD, the system software will be recorded in the system CD in a compressed file format.
In such a case, decompress the compressed file and register it in SST.

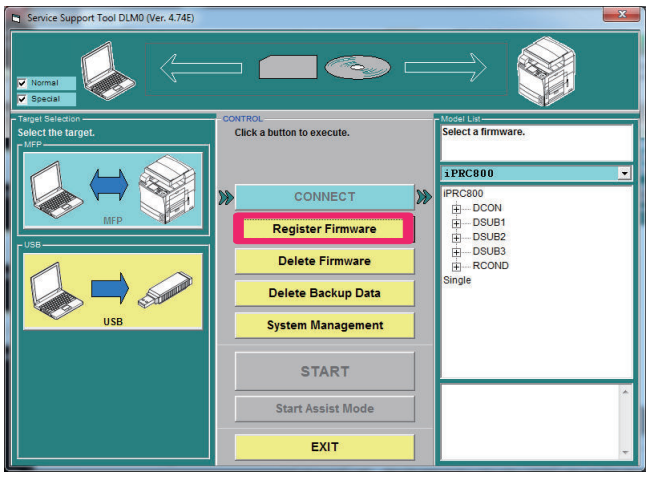
Preparation

What to Prepare:

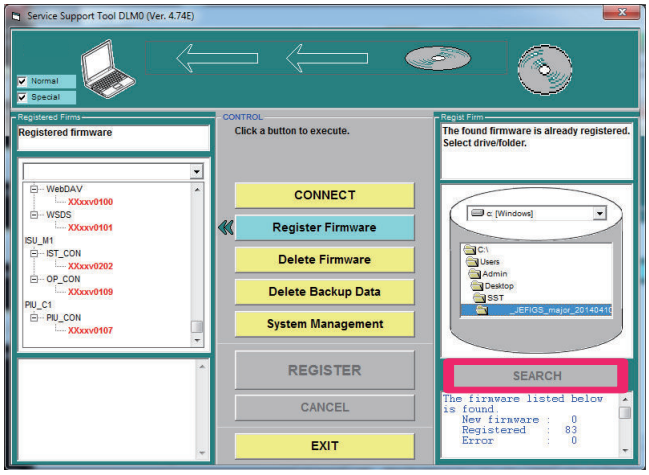
- PC with SST Ver.4.75 or later installed
- System CD for this machine

1. **Start the PC.**
2. **Set the system CD in your PC.**
3. **Start the SST.**

4. **Click the "Register System Software" button.**

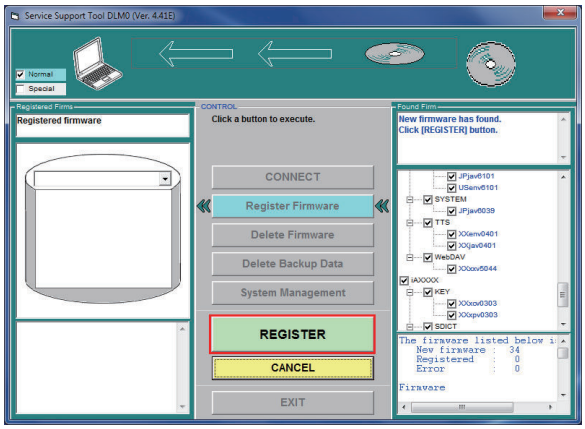


5. **Select the drive where the system CD has been inserted, and click the "SEARCH" button.**

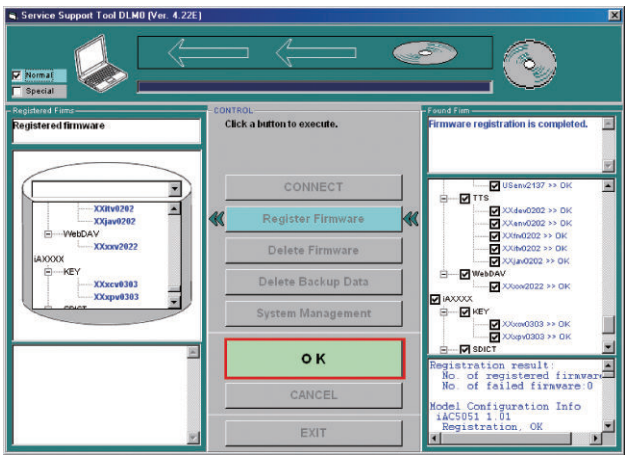


NOTE:
"XXXX" in the figure describes the version of system software.

6. **A list of system software in the system CD is displayed.**
   Deselect the checkbox of unnecessary folder(s) and/or system software and click the "REGISTER" button.



7. **Click the “OK” button after the message indicating completion of system software registration is displayed.**



● SST => USB flash drive

Register the system software registered in SST to the USB flash drive.

Preparation

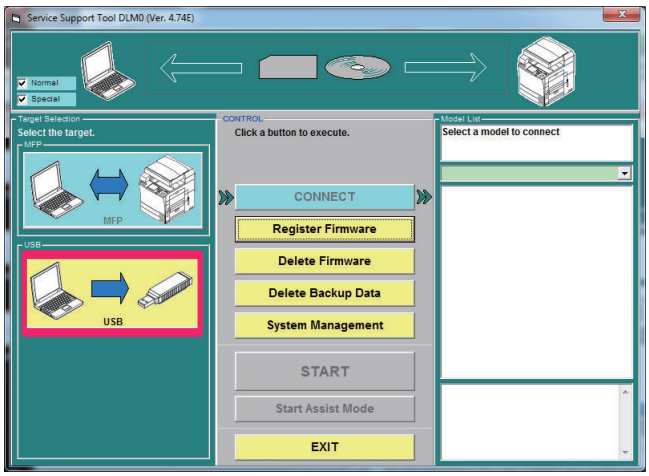
What to Prepare:

- PC with SST Ver.4.75 or later installed
- USB flash drive (*)

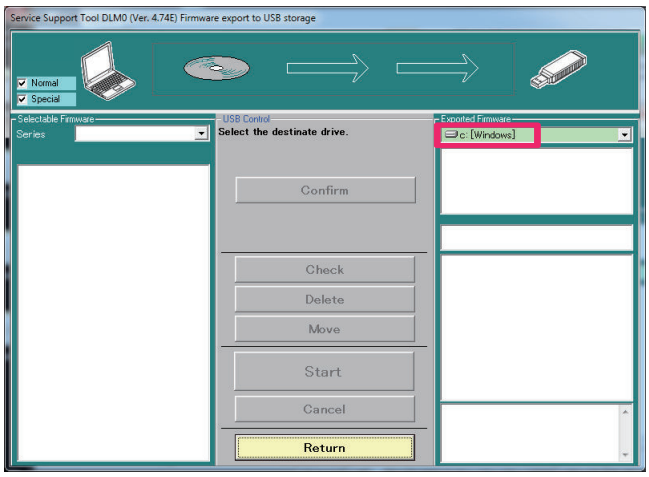
  *: Usable USB flash drive
  - Interface: USB1.1 or later (USB2.0 is recommended.)
  - Memory capacity: 1 GB or more is recommended (because the total file size of the system software is approx. 500 MB).
  - Format: FAT (FAT16), FAT32 (NTFS and HFS are not supported). The memory is formatted in a partition. (Multiple partitions are not supported.)

  Unusable USB flash drive: One that is protected by a password or encryption technology.

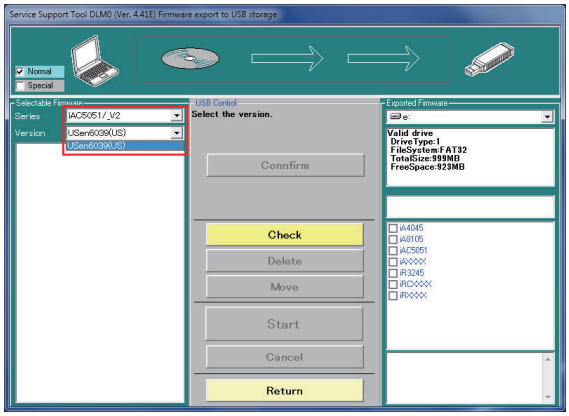
1. **Start the PC.**
2. **Insert the USB flash drive to a USB port of the PC.**
3. **Start the SST.**
4. **Click the USB icon displayed in the target selection screen.**



5. **Select the drive (removable disk) to which a USB flash drive is connected.**

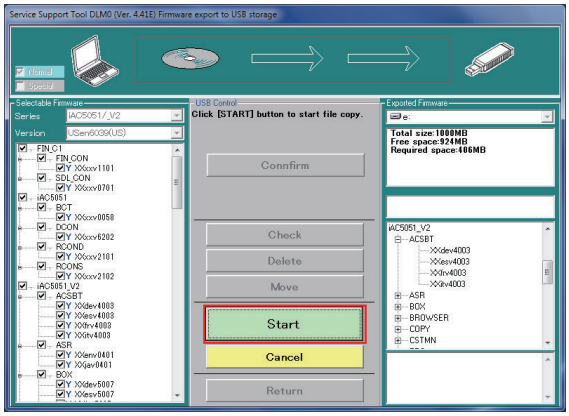


6. **Select "Series" and "Version" (System Version).**



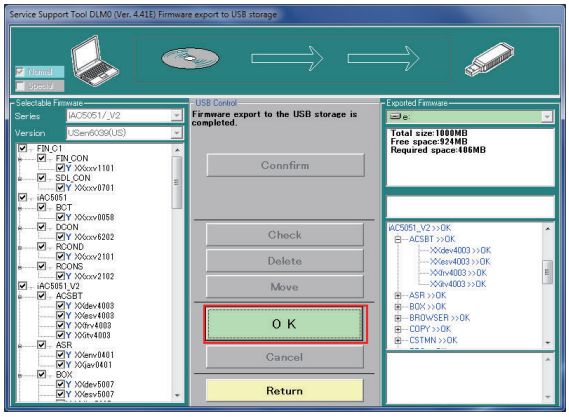
NOTE:
The meanings of symbols displayed in the "System Software Registration Status" column are as follows.
Y: Registered in SST
N: Unregistered in SST

7. **Click the “Start” button.**
   Registration to the USB flash drive is started.



NOTE:
If you know the configuration of options for which system software will be downloaded, deselect system software for the unnecessary options. E753-0001 will occur at the time of downloading if there is any unnecessary software. (If this happens, recover the system by turning OFF and then ON the power if the error is triggered by downloading system software for an unnecessary option.)

8. **When the system software is successfully registered to the USB flash drive, click the “OK” button.**



■ Connection

CAUTION:
This machine does not communicate with SST once it recognizes a USB memory storage device; therefore, SST and a USB memory storage device cannot be used at the same time.

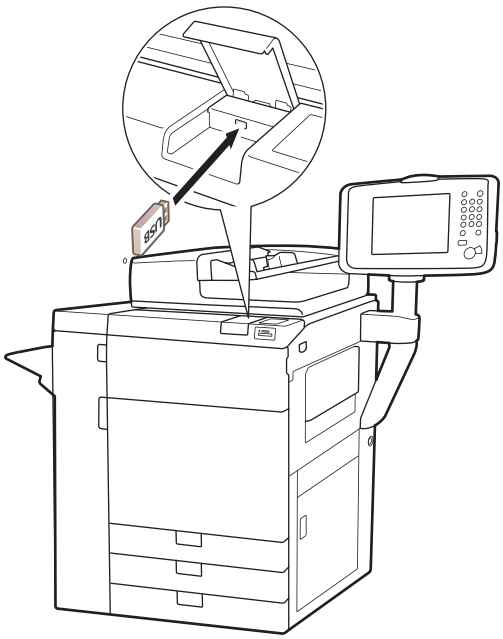
● Preparation

Item to prepare: a USB memory storage device, which the system software for this machine is stored.

● Procedure

1. **Remove the network cable if any network cable is connected to this machine.**

2. Connect the USB flash drive to the USB port.



3. Switch to the download mode to be used.

- Normal mode (recommended)
  Select the following service mode, and then press [OK].
  COPIER > FUNCTION > SYSTEM > DOWNLOAD
- Safe mode (Not used as a general rule. Only used when normal startup is not possible due to a system error, etc.)
  Turn ON the Main Power Switch while pressing the [2] and [8] keys simultaneously.
  When the machine recognizes the USB flash drive, the following menu is displayed on the Control Panel.

```
[[[[[ download Menu (USB) ]]]]]]]]]]
------------------------------------
 [1]: Upgrade (Auto)
 [2]: Upgrade (w Confirmation)
 [3]: Upgrade (Overwrite all)
 [4]: Format HDD
 [5]: Backup
 [7]: Clear downloaded files
 [8]: download Menu 2
 [9]: Other Menu

 /[5] has been selected. Execute?/
 - (OK):0 / (CANCEL):Any other keys -
```

CAUTION:
Depending on the manufacturer or the model, this machine may fail to recognize the USB flash drive.
This machine retries recognition of a USB flash drive for up to 60 seconds after power-on. The above menu is not displayed if the machine fails to recognize a USB flash drive within the time period.
In such a case, use another USB flash drive.

■ Upgrading System Software

● Menu/Function Overview

```
[[[[[ download Menu (USB) ]]]]]]]]]]
------------------------------------
 [1]: Upgrade (Auto)
 [2]: Upgrade (w Confirmation)
 [3]: Upgrade (Overwrite all)
 [4]: Format HDD
 [5]: Backup
 [7]: Clear downloaded files
 [8]: download Menu 2
 [9]: Other Menu

 /[5] has been selected. Execute?/
 - (OK):0 / (CANCEL):Any other keys -
```

Downloading System Software

[1]: Upgrade (Auto)

Downloading/Writing System Software (Automatic)

[2]: Upgrade (w Confirmation)

Downloading System Software (Confirmation)

[3]: Upgrade (Overwrite all)

Downloading System Software (Overwrite)

[4]: Format HDD

Formatting HDD/BOOTDEV partition

[5]: Backup

Collecting debug log and service print (Note that this is for study by R&D; therefore, do not use this function for any purpose other than the purposes described in the left.)

[7]: Clear downloaded files

Clearing System Software immediately after download (before writing)

[8]: Download Menu 2

Moving to Download Menu 2

[9]: Other Menu

Others (Version information, etc.)

[Reset]: Shutdown

To execute shutdown sequence

Press the key on the Control Panel to select or execute the functions.

● Points to Note when Operating/Using

Prohibition of turning OFF the power during the download/writing process

Do not turn OFF the power while downloading/writing the system software.
The machine may not startup even after turning ON the power.
When the machine fails to be started after turning ON the power, try to start it in safe mode (by pressing [2] and [8] keys simultaneously on the numeric keypad).
If the machine can be started up in safe mode, execute BOOTDEV formatting and then download the system software again.
If it does not startup, download the system software after replacing the HDD.

Points to note when turning OFF the power

Be sure to execute the following procedure to quit download mode.

Pressing the [Reset] key and then the [0] key on the menu screen initiates the shutdown sequence. Once the message on the Touch Panel disappears, turn OFF the main power switch.

The following download is recommended when downloading system software at normal operation (other than after HDD replacement or formatting).

- Download mode: Normal mode
- Download menu: [1]: Upgrade (Auto)

■ Downloading/Writing System Software (Automatic)

● [1]: Upgrade (Auto)

The versions of the system software in the host machine, options and the USB flash drive are compared, and only the newest version of the system software in the USB flash drive is downloaded to the temporary storage space in the HDD.
In safe mode, version information can be obtained for only the system software shown below (versions are compared).

- SYSTEM
- LANGUAGE
- RUI
- MEAPCONT
- SDICT

As for system software of the host machine whose version information cannot be obtained, the software for RCON is not downloaded, but other software are downloaded.
The system software of the options which are not connected will be handled as follows.

- < When started in normal mode (recommended) >
  The system software of the options which are not connected are not downloaded.
- < When started in safe mode >
  The system software of the options which are not connected are not downloaded.

When download is completed, the machine will automatically restart and the downloaded system software will be written to the system area of HDD or Flash ROM.

1. **Enter download mode.**
2. **Connect the USB flash drive to the USB port.**

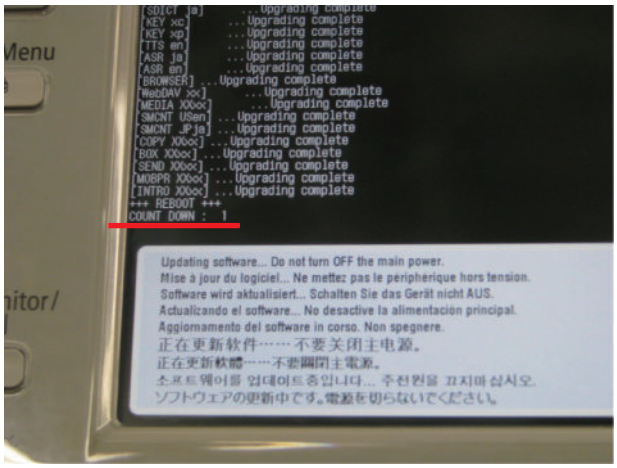
3. **Press the key on the Control Panel.**
   [1] => [0]: Execute download / Any key other than [0]: Return to the menu screen

```
[[[[[ download Menu (USB) ]]]]]]]]]]
------------------------------------
 [1]: Upgrade (Auto)
 [2]: Upgrade (w Confirmation)
 [3]: Upgrade (Overwrite all)
 [4]: Format HDD
 [5]: Backup
 [7]: Clear downloaded files
 [8]: download Menu 2
 [9]: Other Menu

 /[5] has been selected. Execute?/
 - (OK):0 / (CANCEL):Any other keys -
```

During the download process, download status is displayed on the Control Panel.

When download is completed, the machine will automatically restart and start writing to the system area of HDD or Flash ROM.
When the system software is successfully written, countdown is displayed on the screen.



When the countdown reaches "0", the machine is automatically restarted.

4. **After the main menu appears, press the Remove key at the bottom right of the Touch Panel to select removal of the memory media. Then remove the USB flash drive.**

CAUTION:
It takes time to restart after formatting HDD and downloading software. (due to the writing process, etc.)
During the writing process, the startup screen may not change for up to 10 minutes, but do not turn off the power.

■ Downloading System Software (Confirmation)

● [2]: Upgrade (w Confirmation)

The versions of the system software in the host machine, options and the USB flash drive are compared, and the newest version of the system software in the USB flash drive is downloaded to the temporary storage space in the HDD.
When the versions of system software in the USB flash drive are the same or older version, a confirmation message is displayed on the Control Panel so that the user can select whether to overwrite or not.
In safe mode, version information can be obtained for only the system software shown below (versions are compared).

- SYSTEM
- LANGUAGE
- RUI
- MEAPCONT
- SDICT

As for system software of the host machine whose version information cannot be obtained, the software for RCON is not downloaded, but other software are downloaded.
The system software of the options which are not connected will be handled as follows.

- < When started in normal mode (recommended) >
  The system software of the options which are not connected are not downloaded.
- < When started in safe mode >
  The system software of the options which are not connected are not downloaded.

Unlike menu [1], the machine will not automatically restart when the download is completed. By manually turning OFF and then ON the power, writing of system software will be executed at startup. At that time, the downloaded system software stored in the temporary storage space will be deleted when starting the machine in safe mode, so start the machine normally without pressing the numeric keys 2 and 8 to perform writing.

1. **Enter download mode.**
2. **Connect the USB flash drive to the USB port.**

3. **Press the key on the Control Panel.**
   [2] => [0]: Execute download / Any key other than [0]: Return to the menu screen

```
[[[[[ download Menu (USB) ]]]]]]]]]]
------------------------------------
 [1]: Upgrade (Auto)
 [2]: Upgrade (w Confirmation)
 [3]: Upgrade (Overwrite all)
 [4]: Format HDD
 [5]: Backup
 [7]: Clear downloaded files
 [8]: download Menu 2
 [9]: Other Menu

 /[2] has been selected. Execute?/
 - (OK):0 / (CANCEL):Any other keys -
```

   During the download process, download status is displayed on the Control Panel.

NOTE:
When the system software version in the USB flash drive is older than or identical to the system software version in the HDD, a confirmation message as to whether to overwrite or not is displayed. Press the key on the Control Panel.
[0]: Overwrite / Any key other than [0]: Not to overwrite

```
////Copying files from USB-dev.///
[Warning] Same version or old version.
-----------------------------------
[BOOT XXxx]...Same. OVERWRITE?
   -- (YES):0 /(NO):The other keys--
```

   When the download is completed, a message prompting the user to press the "Reset" key is displayed.

4. **Press the "Reset" key.**
   Shutdown sequence is executed.
5. **Once the message on the Touch Panel disappears, turn OFF the main power switch.**
6. **Remove the USB flash drive.**
7. **Confirm that the LED light at the bottom right of the Control Panel is unlit and then turn ON the main power switch.**
   After startup, writing to the system area of HDD or Flash ROM starts.
   When the system software is successfully written, countdown is displayed on the screen. When the countdown reaches "0", the machine is restarted with the downloaded system software.

■ Downloading System Software (Overwriting)

● [3]: Upgrade (Overwrite all)

Regardless of the system software version in the machine, all the system software in the USB flash drive is downloaded. Unlike the menu [1], this machine will not restart automatically even when download is completed. Writing of system software is executed at startup by turning OFF and then ON the power manually. System software downloaded to the temporary storage space is deleted when the machine is started in safe mode, so start up the machine normally without pressing the numeric keys 2 and 8 when perform writing.

1. **Enter download mode.**
2. **Connect the USB flash drive to the USB port.**
3. **Press the key on the Control Panel.**
   [3] => [0]: Execute download / Any key other than [0]: Return to the menu screen

```
[[[[[ download Menu (USB) ]]]]]]]]]]
-----------------------------------
 [1]: Upgrade (Auto)
 [2]: Upgrade (w Confirmation)
 [3]: Upgrade (Overwrite all)
 [4]: Format HDD
 [5]: Backup
 [7]: Clear downloaded files
 [8]: download Menu 2
 [9]: Other Menu

 /[3] has been selected. Execute?/
 - (OK):0 / (CANCEL):Any other keys -
```

During the download process, download status is displayed on the Control Panel.

CAUTION:
All system software stored in the USB flash drive will also be downloaded in the case of overwriting downloads with a USB flash drive. Therefore, take note that E753-0001 will be displayed when writing is complete if the system software of unconnected accessories is included in the USB flash drive.
When an error occurs due to downloading unconnected options, it can be recovered by turning OFF and then ON the power. To prevent the error, deselect the checkbox of system software of the unconnected options not to download it when downloading from SST to the USB flash drive.

When the downloading is completed, a message prompting the user to press the "Reset" key is displayed.

4. **Press the "Reset" key.**
   Shutdown sequence is executed.

5. **Turn OFF the main power switch.**
6. **Remove the USB flash drive.**
7. **Confirm that the LED light at the lower right of the Control Panel is unlit and then turn ON the main power switch.**
   After startup, writing to the HDD system area or Flash ROM is started.
   When the system software is successfully written, it will change to a countdown screen. When the countdown reaches "0", the machine will restart with the downloaded system software.

■ Formatting HDD

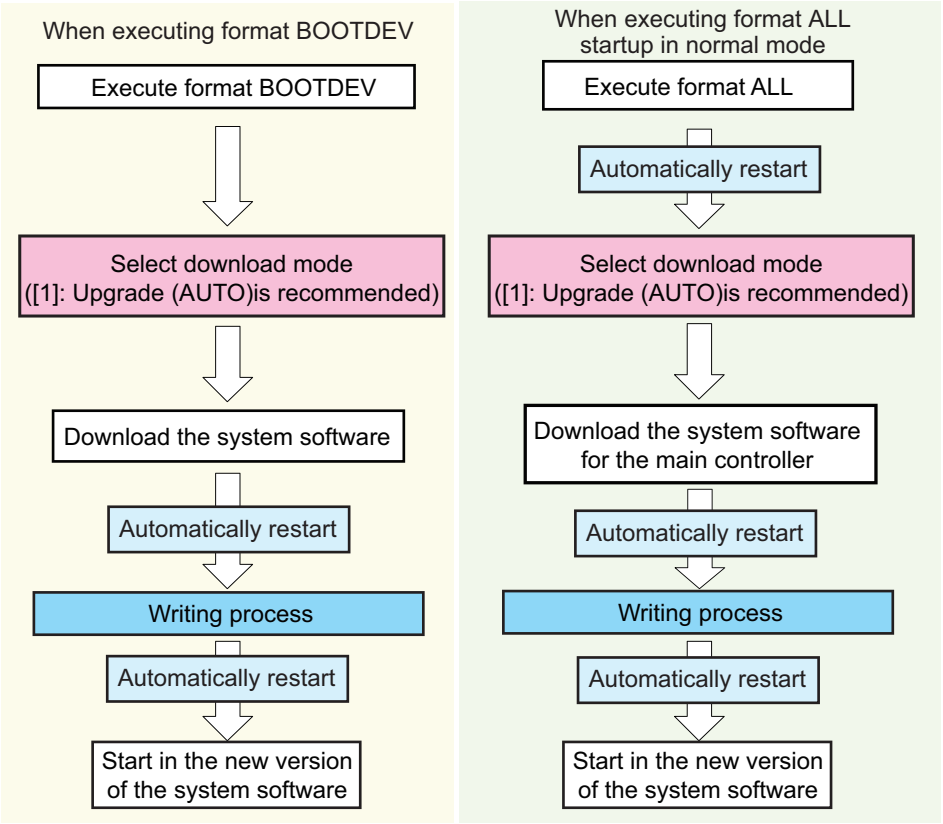
● HDD Format Overview

The following 2 types of formatting methods are available with this machine.

1. ALL: To initialize the entire HDD
   - When installing a new HDD (service part)
   - When clearing all system software and data in the HDD to reinstall system software

   Executing Format ALL on the machine in use deletes all the user data in the HDD as well as the MEAP application; therefore, be sure to get agreement from the user.
2. BOOTDEV: To initialize the storage area of system software in the HDD
   - When clearing the system software storage area and reinstall system software
     User data is not deleted.

For normal version update, there is no need to format the HDD.
After formatting is executed, the machine cannot start without downloading the system software.
When format ALL is executed, the machine will automatically restart to reflect the initialization processing in the HDD, and automatically enter download mode. Executing the BOOTDEV format will enable the system software to be downloaded without restarting the machine.
After formatting is executed, download system software by "[1]: Upgrade (AUTO)" in the main menu.



● [4]: Format HDD

Execute the BOOTDEV partition or the format of the entire HDD.

1. **Enter download mode.**
2. **Connect the USB flash drive to the USB port.**

3. **Press the key on the Control Panel.**
   [4] => [0]: Execute format / Any key other than [0]: Return to the menu screen

```
[[[[[ download Menu (USB) ]]]]]]]]]]
-----------------------------------
 [1]: Upgrade (Auto)
 [2]: Upgrade (w Confirmation)
 [3]: Upgrade (Overwrite all)
 [4]: Format HDD
 [5]: Backup
 [7]: Clear downloaded files
 [8]: download Menu 2
 [9]: Other Menu

 /[4] has been selected. Execute?/
 - (OK):0 / (CANCEL):Any other keys -
```

4. **Press the key on the Control Panel.**
   [1] => [0]: Execute format of BOOTDEV / Any key other than [0]: Return to the menu screen
   [2] => [0]: Execute format of the entire HDD / Any key other than [0]: Return to the menu screen
   [C]: Return to the menu screen

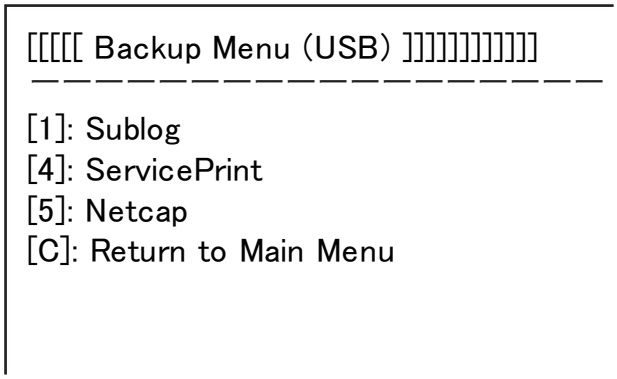
- When formatting of BOOTDEV has been executed
  When the formatting is completed, a message prompting the user to press the key is displayed.
  1. Press any key.
     Return to the menu screen.
  2. Download the system software.
     For more details, see "Downloading/Writing System Software (Automatic)".
- When formatting of the entire HDD has been executed
  When the formatting is completed, the machine is automatically restarted.
  The machine starts in safe mode, and the main menu of download is displayed.
  1. Download the system software.
     For more details, see "Downloading/Writing System Software (Automatic)".

■ Backup

● [5]: Backup

CAUTION:
To collect a log, use the USB flash drive in which the system software for this machine has been registered by using SST. As for the system software, only one system software application of the host machine (e.g. LANG) needs to be stored, and it is not necessary to store the full set of software.

1. **Enter download mode.**
2. **Connect the USB flash drive to the USB port.**
3. **Press the key on the Control Panel.**
   [5] -> [0]
4. **Make a backup of SRAM on the Main Controller PCB 2.**
   - [1] Sublog: Collect debug log.
   - [4] Service Print: Save the service data (which was output on the paper such as P-PRINT) in text format.
   - [5] Netcap: Capture network packets.
   - [6] SRAM (HDD): Temporarily save the SRAM data to the host machine HDD.
   - [7] SRAM (USB): Temporarily save the SRAM data to a USB flash drive.



■ Clearing Download File

● [7]: Clear downloaded files

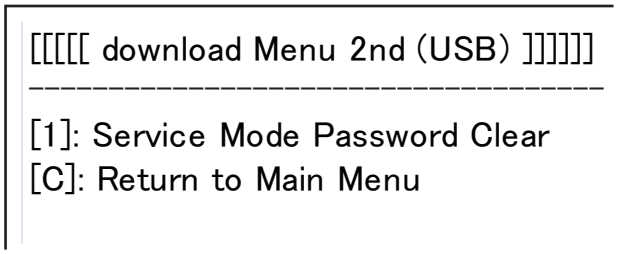
This clears system software saved in the temporary storage space in the HDD.
This function is used to clear downloaded system software with Menu [2] or [3] without writing it to the HDD.

1. **After downloading system software with Menu [2] or [3], press the "Reset" key to execute the shutdown sequence. Turn OFF the main power when the screen display disappears.**
2. **Start the machine in safe mode (turn ON the Main Power Switch while pressing the numeric keys 2 and 8 simultaneously).**
   System software stored in the temporary storage space of the HDD will be deleted when the machine is started in safe mode.
   When this happens, the following message is displayed on the Touch Panel.
   "All downloaded file is deleted."
3. **Turn OFF the main power switch.**
4. **Remove the USB flash drive.**

■ Download Menu 2

● [8]: Download Menu 2

[1]: Service Mode Password Clear



■ Other Menu

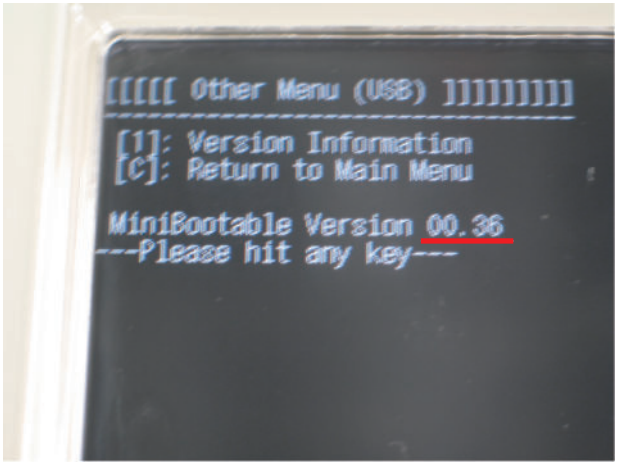
● [9]: Other Menu

Displaying other menus.

1. **Enter download mode.**
2. **Connect the USB flash drive to the USB port.**
3. **Press the key on the Control Panel.**
   [9]=>[0]: Display the Other Menu / Any key other than [0]: Return to the menu screen

● [1]: Version Information

This mode displays the version of download mode.



Press any key to return to the main menu.

Troubleshooting

■ Error Code: E753-0001

● Cause

In the case of an error during writing process of the system software or in the case of writing the system software of the option that is not installed, an error is determined to display E753-0001.

● Remedy

The result of writing process is displayed at the upper side of E753-0001 error display.
Be sure to check the system software with the error (error or NG) displayed.
Check if the target option is properly installed and see if the software to download is for the correct target option, and then execute downloading again.

Upgrading by SST

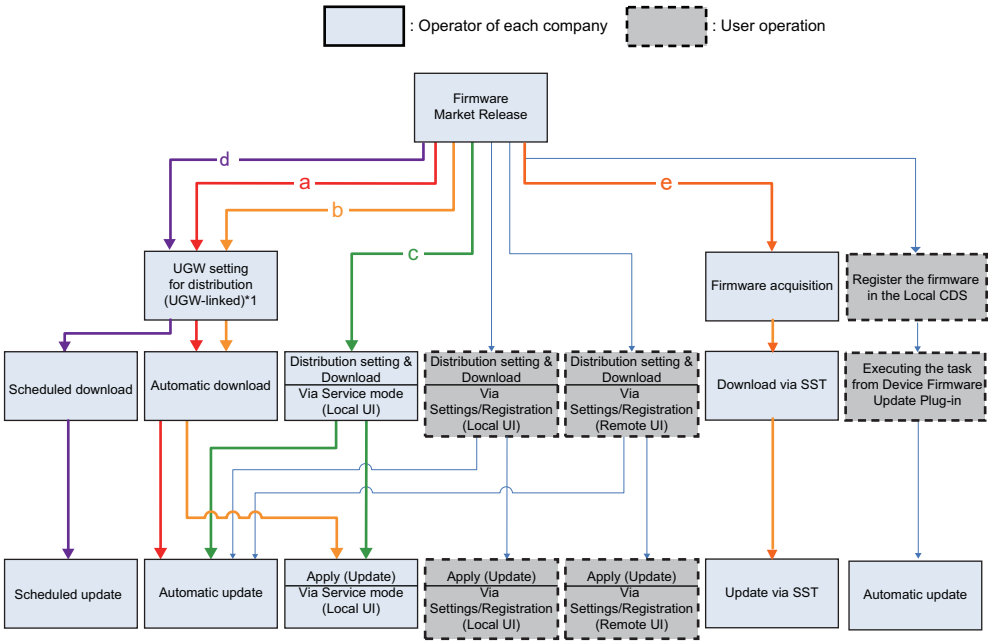
Be sure to use Assist mode as a general rule because the system software of the non-connecting option is not to be downloaded in Assist mode.
In Single mode, it is available to download the system software of the option that is not installed.
In the case of downloading the Finisher's system software, make the download mode of the Host Machine in normal mode and connect to SST, and then download just the system software of the Finisher with the version information displayed at the right side of the SST screen.

Version Upgrade via CDS

■ Overview

There are four ways (a to d) to update the firmware using the Updater.
"a. CDS Remote Update (download and update in conjunction with UGW)" on page 1165

“b. CDS Remote Download (download in conjunction with UGW)” on page 1166
“c. CDS On-site Download (manual download and update)” on page 1168
“d. CDS Scheduled Update” on page 1175
e: Update via SST



*1: Schedules for UGW-linked distribution are maintained on CDS.

NOTE:
- See User Manual of the device for how to connect the device to the external network.
- When needed, perform the communication test before actual download to check if the communication with the distribution server is normal.

■ Preparation

● Preparation

The following preparations are required to upgrade the firmware using the Updater.

Distribution name	Settings of Vice-Company of Sales	Network settings	Enabling linkage with UGW	Enabling the [Update Firmware] button in the [Settings/Registration] menu	Enabling the [Manual Update] button on the remote UI	Enabling scheduled update (*1)	enabling the Local CDS button
CDS remote update method	✓	✓	✓	-	-	-	-
CDS remote download method	✓	✓	✓	-	-	-	-
CDS on-site download method	✓	✓	-	-	-	-	-
CDS scheduled update method	✓	✓	-	✓	-	✓	-
CDS on-site download method by local UI	✓	✓	-	✓	-	-	-
CDS on-site download method by remote UI	✓	✓	-	✓	-	-	-
Special download and update using remote UI	✓	-	-	-	✓	-	-

Distribution name	Settings of Vice-Company of Sales	Network settings	Enabling linkage with UGW	Enabling the [Update Firmware] button in the [Settings/Registration] menu	Enabling the [Manual Update] button on the remote UI	Enabling scheduled update (*1)	enabling the Local CDS button
Local CDS update method	-	-	-	✓	-	-	✓

*1: It is required when configuring the schedule update setting from the Control Panel.

● Settings of Vice-Company of Sales

With devices sold in the following countries, it is necessary to change the settings of vice-company of sales for the device from the default setting in order to use the CDS firmware distribution. Be sure to do this because if the necessary changes are not made, it may not be possible to select the target firmware.

Country of sale	Default setting of the vice-company of sales	Settings of the vice-company of sales after change
Canada	US	CA
Latin America	US/SG	LA
Hong Kong	SG	HK

Service Technicians change the settings of the vice-company of sales in the following service mode.

- COPIER > FUNCTION > INSTALL > CDS-CTL

NOTE:
Settings of the vice-company of sales in CDS-CTL for each country are shown below. Change to the following settings if the settings differ.
<Setting values of CDS-CTL and list of the target vice-companies of sales>

- Japan: JP
- USA: US
- Singapore: SG
- Europe: NL
- Korea: KR
- China: CN
- Hong Kong: HK
- Australia: AU
- Canada: CA
- Latin America: LA

● Network Settings

1. **Connecting to External Network**

   The method of connecting to external network is similar to a normal network connection method. Refer to user manual of the device for details.

NOTE:

- See User Manual for how to connect the device to the external network.
- Before using UGW link or User mode, see the sections below to prepare as required.
  “Enabling Linkage with UGW” on page 1165
  "Enabling [Update Firmware] Button of User Mode"
  "Enabling [Install Application/Options] Button of User Mode"

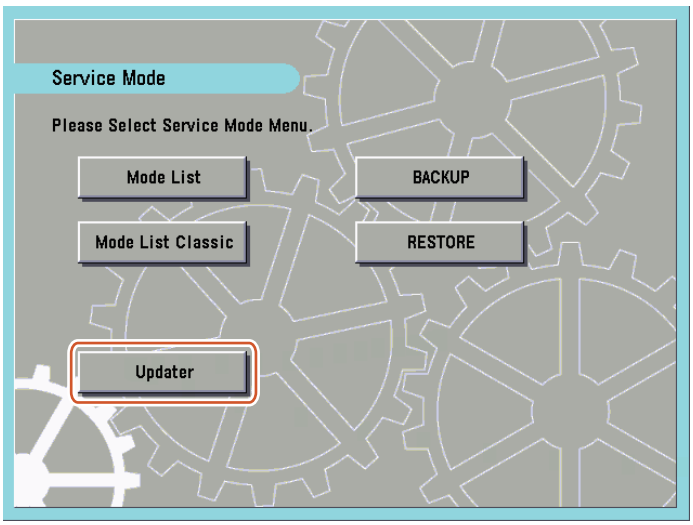
NOTE:
“External Network” here means the network connecting the device to CDS via Internet.

2. **Confirming URL Setting of Distribution Server**

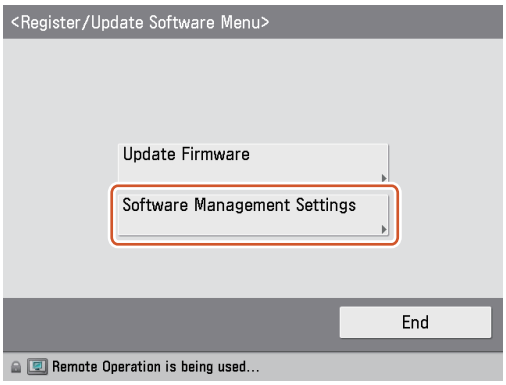
   This section describes how to confirm the URL setting of the distribution server.

   1. Start [Service Mode] at Level 1.

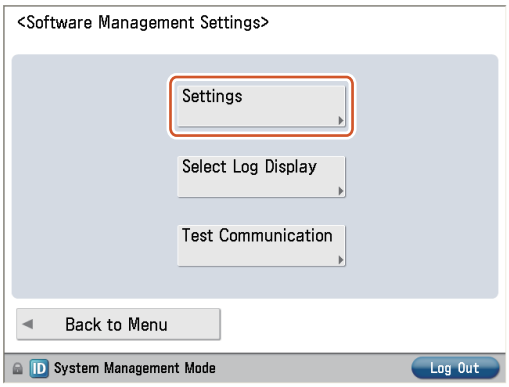
2. Press [Updater] button.



3. Press [Software Management Settings] button.

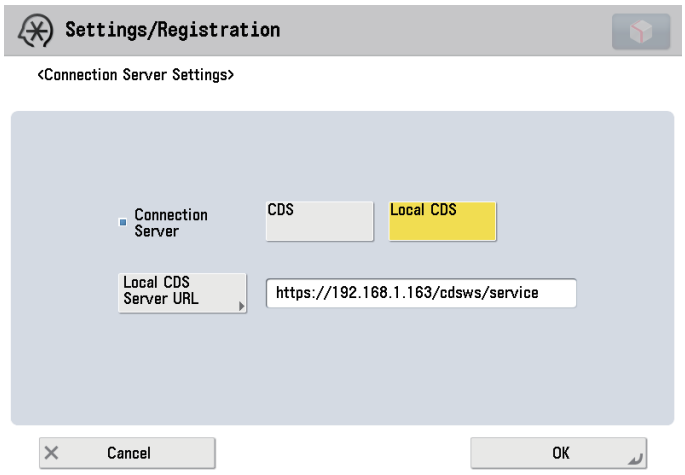


4. Press [Settings] button.



5. Ensure to enter “https://device.c-cdsknn.net/cds_soap/updaterif” in the field beside the [Delivery Server URL] button. If the URL is not entered or a wrong URL is entered in the field, click [Delivery Server URL] button to show the virtual keypad. Check the URL and enter the correct one.
   Delivery Server CDS

   Delivery Server Local CDS



NOTE:
For the URL of the L-CDS server, enter the address beginning with "htts://" specified in L-CDS. If the port number has not been specified, 443 is internally added as the port number.
To display the button of the local CDS, execute Settings/Registration > Management Settings > License/Other > Register/Update Software. It is not displayed in service mode.

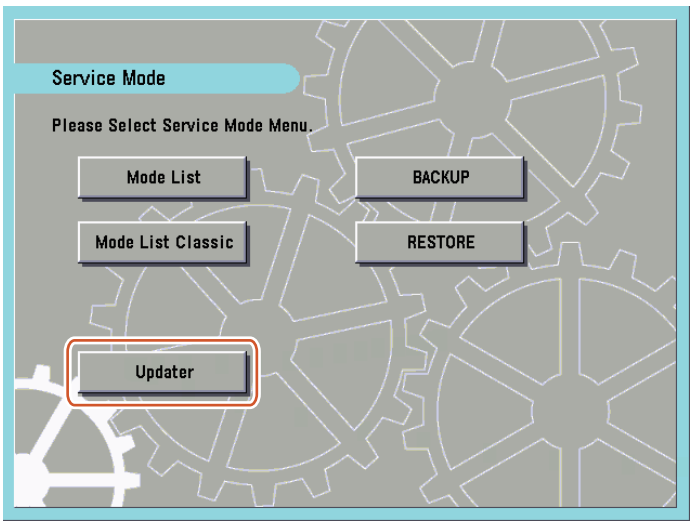
6. Press [OK] to set the entered items. Now the URL of the distribution server is successfully set.

3. Communication Test

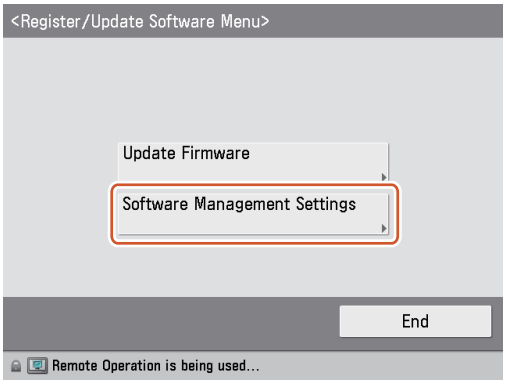
This section describes how to check if the communication is normally done to the distribution server and/or the file server.

1. Start [Service Mode] at Level 1.

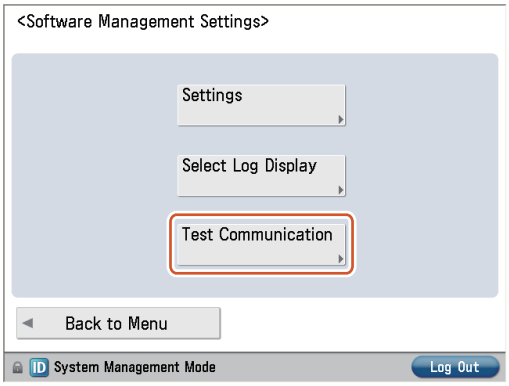
2. Press [Updater] button.



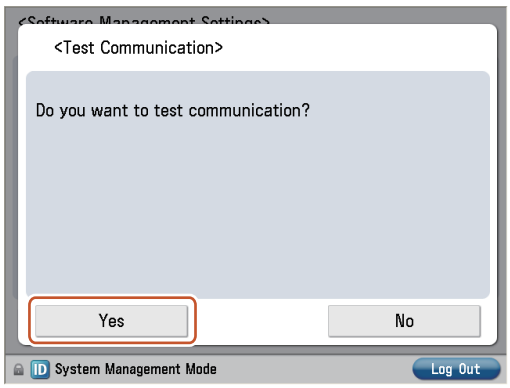
3. Press [Software Management Settings] button.



4. Press [Test Communication] button.

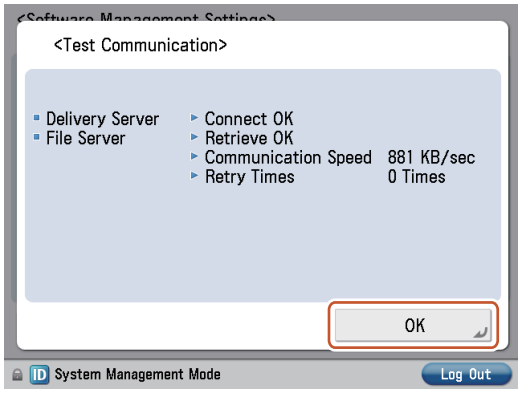


5. Press [Yes] button.



Obtain the download file information for communication test from the distribution server (to execute the communication test to the distribution server).
Using the download file information for communication test, the contents for test are downloaded from the file server (for the communication test to the file server).

6. Upon the communication test completed, the communication test result screen is shown.
Press [OK] button to exit this operation.



● Enabling Linkage with UGW

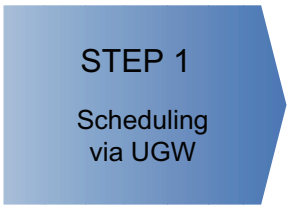
To execute "UGW-linked Download and Update" or "UGW-linked Download" when installing firmware, the service technician must specify the following settings to link with UGW in advance.

1. Change the following service mode setting to "1".
   - COPIER > OPTION > FNC-SW > CDS-UGW
2. Change the setting of "Firmware Distribution" to "Yes" on the [Customer Information Management] screen of UGW Web Portal setting

NOTE:
- Refer to the e-Maintenance/imageWARE Remote Business Operation Manual for information on the operation procedure of UGW Web Portal.
- When the person responsible for setting "Enter Customer Information" or "Instruction of Firmware Distribution" selects the target device in the [Firmware Distribution Information] screen, firmware distribution must be set to "Yes" on the [Customer Information Management] screen to make it a search target.
- When [Firmware Distribution] is not displayed in the [Customer Information Management] screen of the UGW Web Portal, it is possible that display authority for firmware distribution information has not been set to an account. Check with the sales company HQ.

■ a. CDS Remote Update (download and update in conjunction with UGW)

The flow of operations in the "CDS Remote Download Method" is shown in the following figure.



● STEP 1: Schedule Settings from UGW

Configure the schedule settings of firmware distribution from UGW to the device.
Refer to "CDS Remote Update Method" in the business operation and operational manual of the Content Delivery System (Firmware Distribution section).
The device checks with UGW about the schedule every 12 hours. Firmware distribution settings are registered in the device and the download and update of firmware are executed automatically.

CAUTION:
[Devices without Job Completion Wait Function]
- Received print jobs, etc. will be deleted while the firmware is updating, so contact the user in advance. In addition, it is recommended to execute this operation in a time period when jobs such as print jobs are not received.

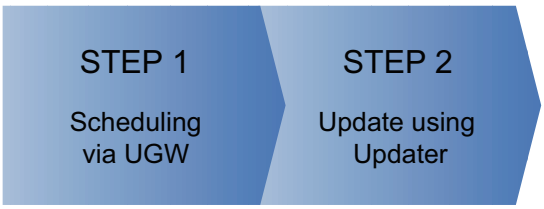
[Devices with Job Completion Wait Function]
- When firmware update is executed, if any of the following jobs exists, the firmware update process is not performed until completion of the job.
  - Print
  - Scan
  - Fax (for i-FAX, it applies only during print/scan operations)

See "“Cautions” on page 327 > Job Completion Wait Function" for more details.

NOTE:
When setting mail notification in the UGW, a firmware update completion mail is sent from the UGW at the time the firmware update is complete.

■ b. CDS Remote Download (download in conjunction with UGW)

The flow of operations in the "CDS Remote Download Method" is shown in the following figure.



● STEP 1: Setting the Schedule from UGW

The firmware distribution schedule is set from the UGW to the device.
For details on the operation method, refer to "CDS Remote Download Method" in the Contents Delivery System Business Operation and Operational Manual (Firmware Distribution).

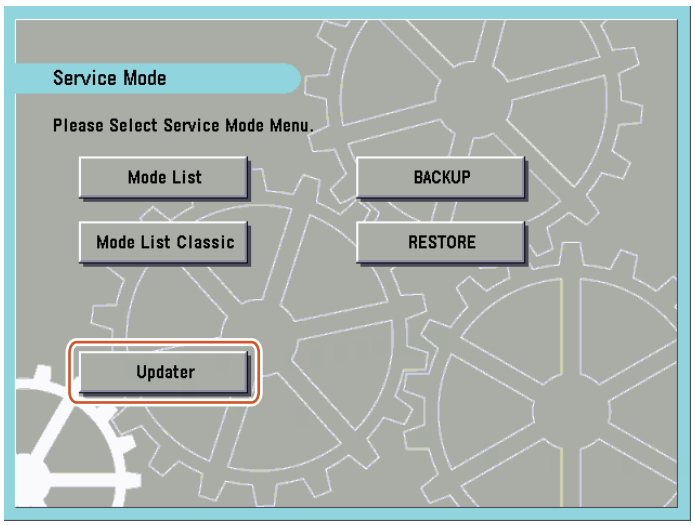
NOTE:
The firmware downloaded by schedule settings made from UGW can be checked/deleted but not uploaded from user mode. Note that if a user downloads firmware from user mode, the firmware downloaded by schedule settings made from UGW will be overwritten by the newly downloaded one. Therefore, caution is required.

● STEP 2: Updating with Updater

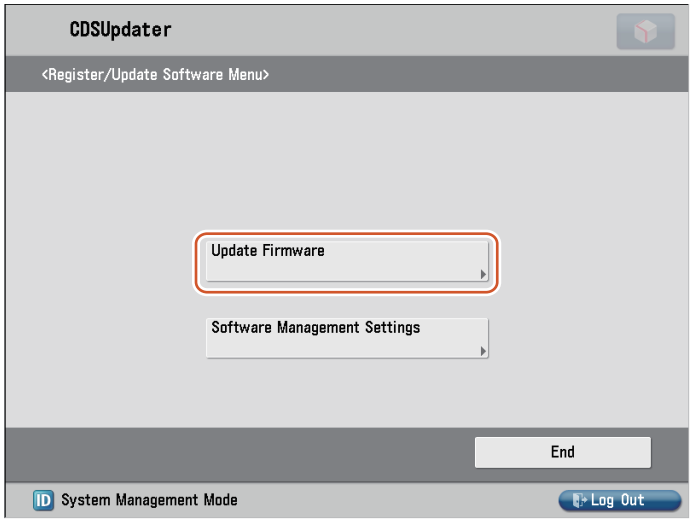
Update the firmware downloaded to a device using Updater.

1. **Start [Service Mode] in Level 1.**

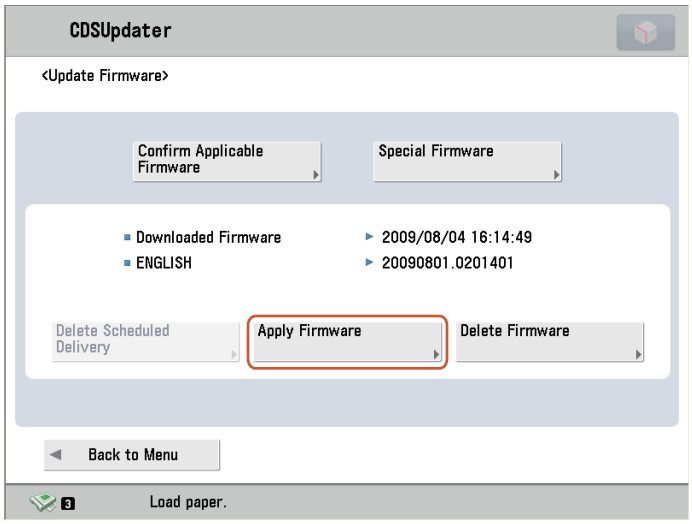
2. **Press the [Updater] button.**



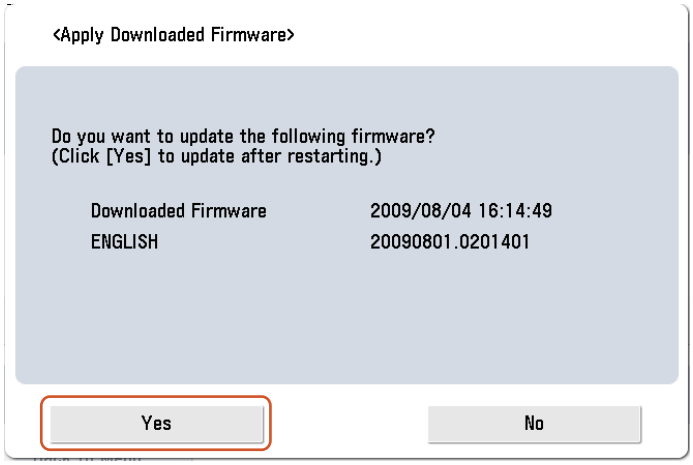
3. **Press the [Update Firmware] button.**



4. **Press the [Apply Firmware] button.**



5. **Check the downloaded firmware, and press the [Yes] button.**



6. **The firmware is applied to the device. When the processing for applying the firmware is completed, the device is automatically restarted.**

7. **After the device is restarted, check the firmware version.**
   1. Press the [Check Counter] button on the Control Panel.
   2. Press the [Check Device Configuration] button.
   3. Check that the controller version is the same as that of the updated firmware.
      This completes the updating of firmware using the "CDS Remote Download Method".

CAUTION:
[Devices without job completion wait function]
- While executing firmware updates, received print jobs etc. will be deleted, so tell the user in advance. In addition, it is recommended to execute this operation in a time period when jobs such as print jobs are not received.

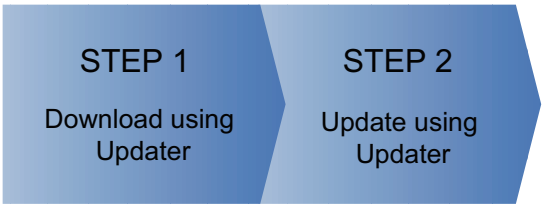
[Devices with job completion wait function]
- When firmware update is executed, if any of the following jobs exists, the firmware update process is not performed until completion of the job.
  - Print
  - Scan
  - Fax (for i-FAX, it applies only during print/scan operations)

See "“Cautions” on page 327 > Job Completion Wait Function" for more details.

NOTE:
When the e-mail notification setting is enabled on UGW, an e-mail will be sent to notify completion of the firmware update.

■ c. CDS On-site Download (manual download and update)

The operation flow of "CDS On-site Download Method" is shown in the following figure.

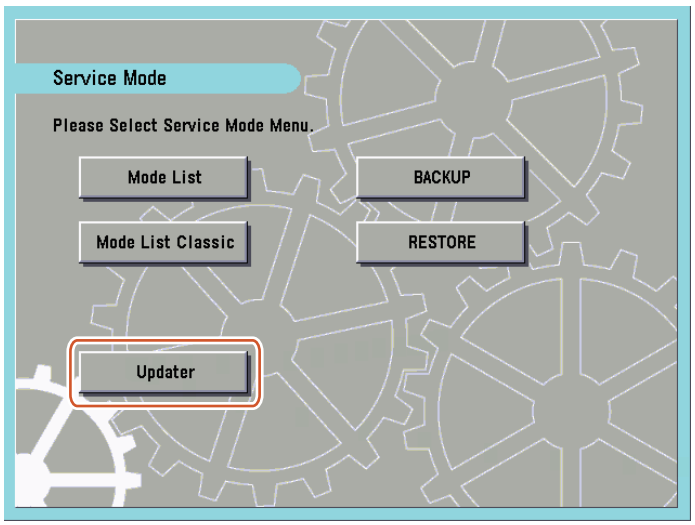


● STEP 1: Downloading with Updater

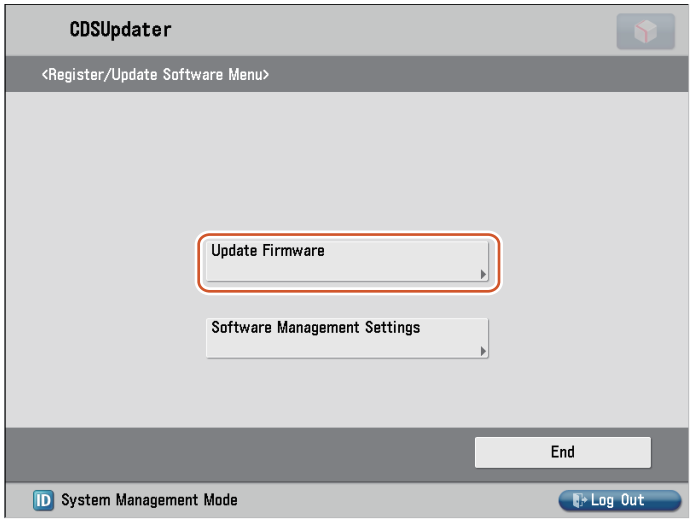
Download firmware to the device from the CDS server.

1. **Start [Service Mode] in Level 1.**

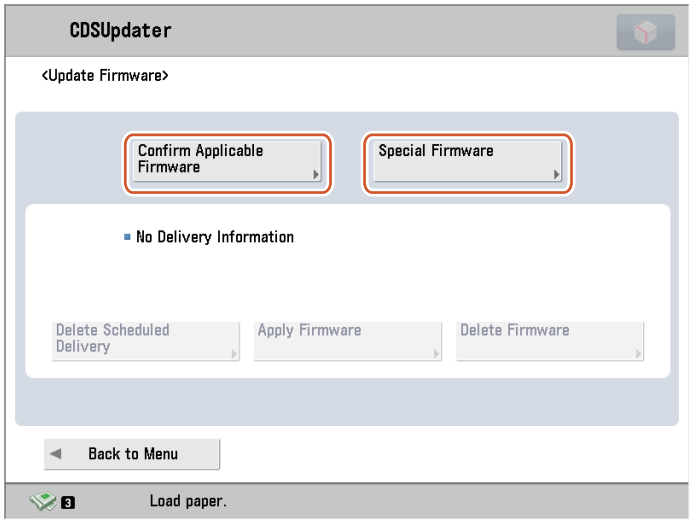
2. **Press the [Updater] button.**



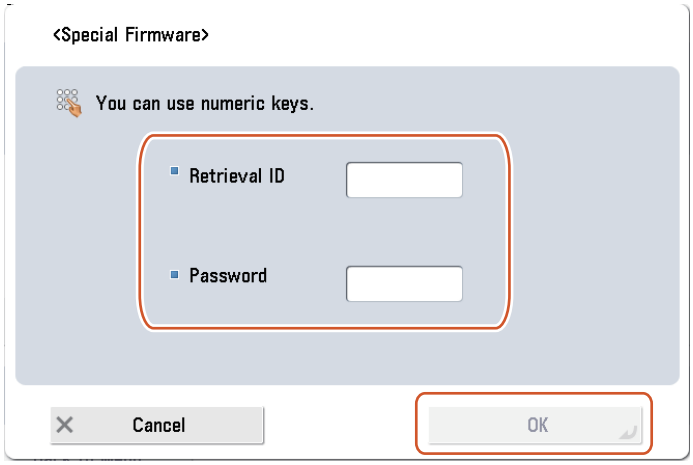
3. **Press the [Update Firmware] button.**



4. **Check the firmware to update. There are two checking methods, which are as follows.**
   - To update to the official version of the firmware, press the [Check Applicable Firmware] button and proceed to step 6.
   - To update to the customized firmware, press the [Check Specific Firmware] button and proceed to step 5.

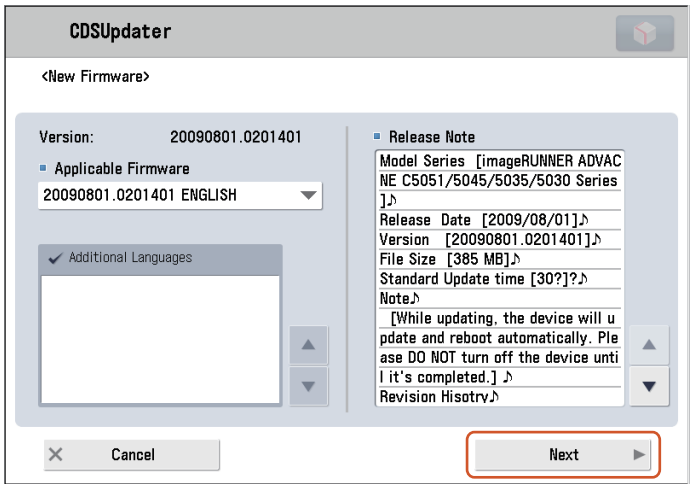


5. **The [Check Specific Firmware] screen is displayed as follows. After entering each item, press the [OK] button.**



- [Collection ID]:
  Enter 8 or less characters.
- [Password]:
  Enter 8 or less characters.

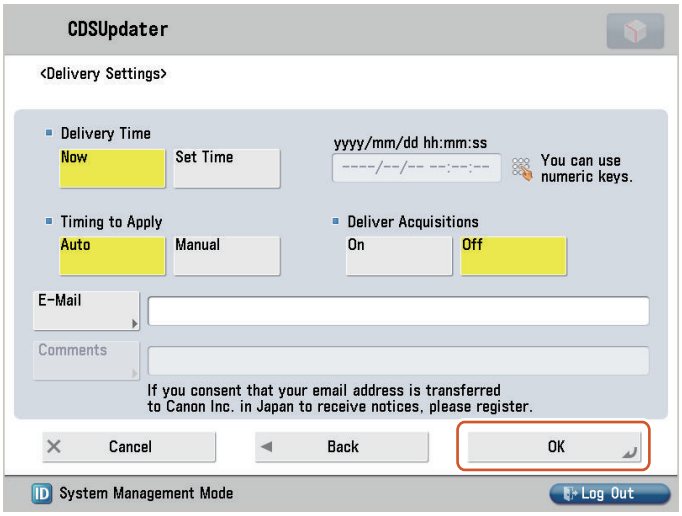
6. **The [Check Firmware] screen is displayed as follows. Check the content and press the [Next] button.**



- [Current version]:
  The current firmware version will be displayed.
- [Applicable firmware]:
  Select the firmware that can be applied to the device from the drop-down list.
- [Additional languages]:
  Additional languages will be displayed if applicable.
  More than 1 language can be selected, and it is possible to add another language when upgrading the firmware.
  Up to 8 languages can be added including Japanese and English. The languages already registered in the device are always selected, and SST is used to delete an unnecessary language from the device.
- [Release notes]:
  If there are release notes, those details will be displayed.

NOTE:
In the case of customized firmware, the firmware that corresponds to the inputted collection ID and password will be displayed in [Applicable firmware].

7. The [Distribution Settings] screen shown below will be displayed, so press the [OK] button after setting each item.



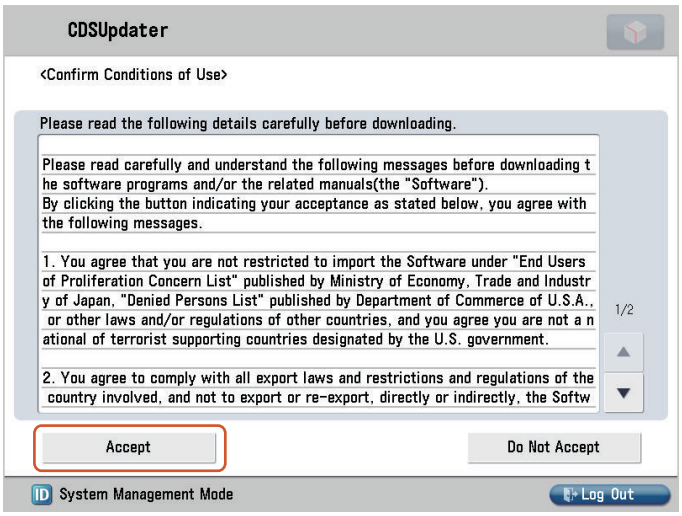
- [Distribution time]:
  Press the [Now] or the [Date and time] button.
  - [Now]:
    The firmware will be downloaded immediately after making the distribution settings.
  - [Date and time]:
    Sets a date within 7 days. The firmware will be downloaded on the specified date and time. Enter the date and time with the numeric keypad in the following format: "yyyy/mm/dd hh:mm:ss".
- [Applicable timing]:
  Press the [Auto] or [Manual] button.
  - [Auto]:
    After completing the firmware download, the firmware is automatically applied.
  - [Manual]:
    Only download of the firmware is performed. To update to the downloaded firmware, configure the setting in [Apply firmware].
- [Updated Module Only]:
  Press the [ON] or [OFF] button.
  - [ON]:
    Only the difference between the current and new firmware is downloaded.
    This is normally selected.
  - [OFF]:
    The whole version of the firmware you want to apply is downloaded.
- [E-mail]:
  It enables to receive e-mail relating to the update status that is sent from the device.
  Enter the name of the service technician.
  Enter 64 or less alphanumeric characters and symbols.
- [Comment]:
  Enter 128 or less alphanumeric characters and symbols.
  Enter a comment that will automatically be attached to the e-mail. Entering the model name allows you to specify what device the status mail will relate to.

NOTE:
[Applicable timing]
- When updating a version of firmware that is not permitted to be updated remotely, [Auto] cannot be selected in [Applicable Timing].

[Updated Module Only]
- When downloading firmware for which [Updated Module Only] is not available, only [OFF] can be selected for this button.

[E-mail]
- When entering multiple e-mail addresses, separate them by "," (comma) or ";" (semi-colon).
- A notification e-mail is sent at the following timing when inputting e-mail addresses.
  - Distribution confirmed
  - Start distribution
  - End distribution
  - Start update
  - End update
  - At occurrence of an error

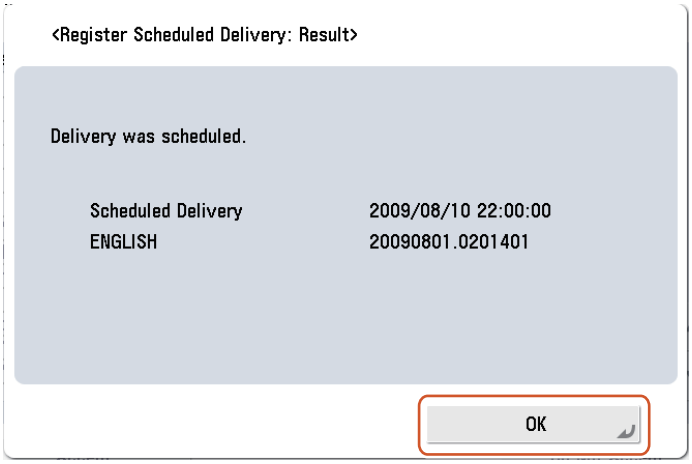
8. The export conditions confirmation screen will appear. Read through it and press the [Accept] button.



9. **The screens shown below will be displayed depending on the settings.**
   - If the distribution time is set to [Now] and the timing to apply to [Auto] in Distribution Settings
     Firmware is automatically downloaded and updated to the device. When updating is completed, the device automatically restarts again. This is the end of STEP 1.

   - If the distribution time is set to [Now] and the timing to apply to [Manual] in Distribution Settings
     Check the firmware and press the [OK] button. This is the end of STEP 1.

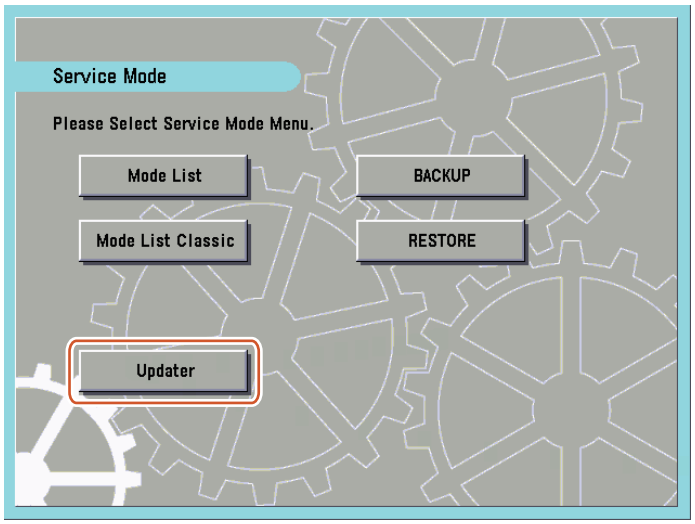
   - If the distribution time is set to [Date and time] in Distribution Settings
     Check the scheduled distribution and press the [OK] button. This is the end of STEP 1.



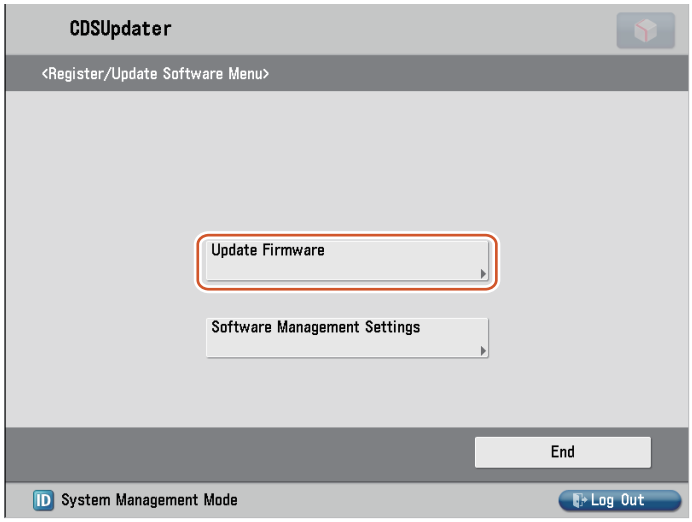
● STEP 2: Updating with Updater

The Updater function is used to update the firmware downloaded to the device.
If [Auto] is selected for the timing to apply distribution settings in STEP 1, the firmware will be updated automatically. Execute the following operation only when [Manual] is selected for the timing to apply.

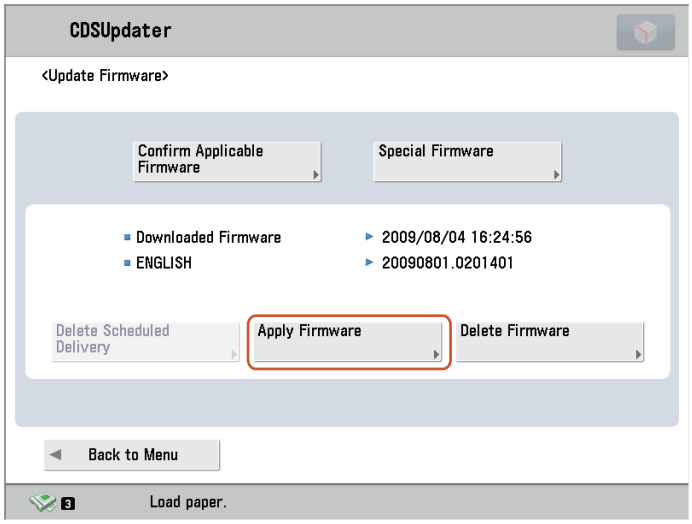
1. **Start [Service Mode] in Level 1.**
2. **Press the [Updater] button.**



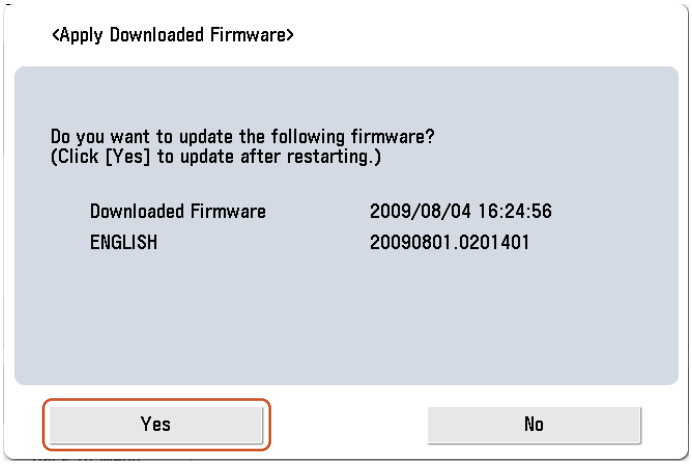
3. **Press the [Update Firmware] button.**



4. **Press the [Apply Firmware] button.**



5. **Check the downloaded firmware, and press the [Yes] button.**



6. **The firmware is applied to the device. When the processing for applying the firmware is completed, the device is automatically restarted.**

7. **After the device is restarted, check the firmware version.**
    1. Press the [Check Counter] button on the Control Panel.
    2. Press the [Check Device Configuration] button.
    3. Check that the controller version is the same as that of the updated firmware.
       This completes the firmware update by the "CDS on-site download method".

CAUTION:
[Devices without Job Completion Wait Function]
- Received print jobs, etc. will be deleted while the firmware is updating, so contact the user in advance. In addition, it is recommended to execute this operation in a time period when jobs such as print jobs are not received.

[Devices with Job Completion Wait Function]
- When firmware update is executed, if any of the following jobs exists, the firmware update process is not performed until completion of the job.
    - Print
    - Scan
    - Fax (for i-FAX, it applies only during print/scan operations)

See "“Cautions” on page 327 > Job Completion Wait Function" for more details.

■ d. CDS Scheduled Update

Configure the schedule settings of firmware distribution from UGW to the machine.
If scheduled update settings are registered on UGW in advance, Updater of the device will periodically and automatically update firmware.
For the operation procedure, refer to the CDS Operation Manual (Firmware Distribution).

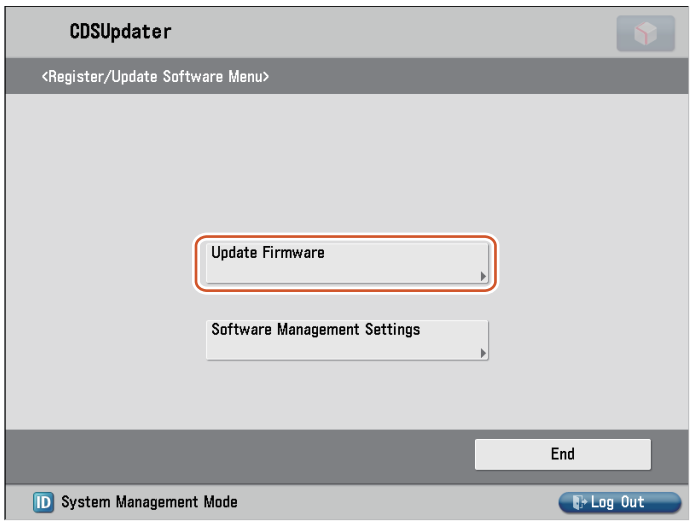
■ Deleting Firmware Distribution Schedule

This section describes how to delete firmware distribution schedule set by Updater.

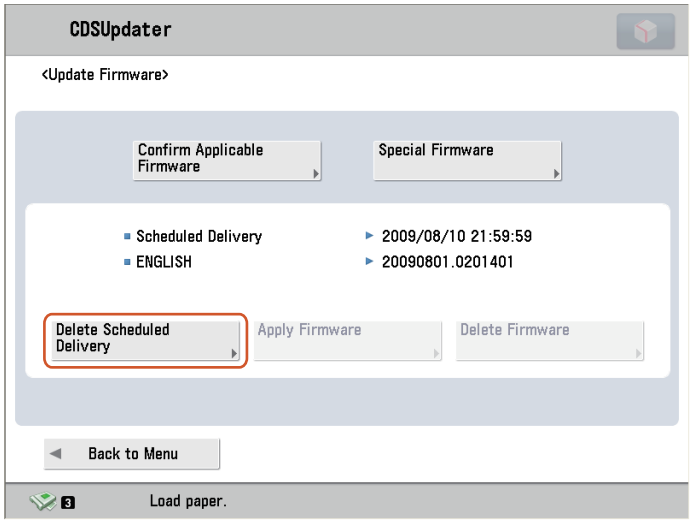
1. **Start [Service Mode] at Level 1.**
    1. Press [Setting/Registration (User Mode)] button on the control panel.
    2. Press [2] and [8] button at a time on the control panel.
    3. Press [Setting/Registration (User Mode)] button on the control panel.
    4. [Service Mode] screen is shown.

2. **Press [Updater] button.**

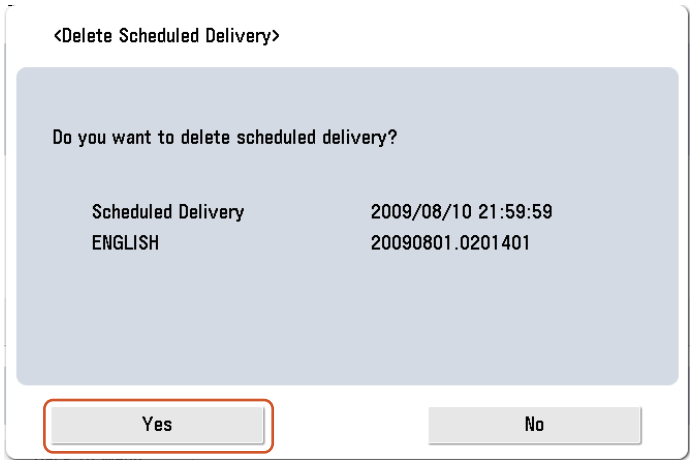
3. **Press [Update Firmware] button.**



4. **Press [Delete Scheduled Delivery] button.**



5. **Confirm the contents of the distribution schedule and press [Yes] button.**

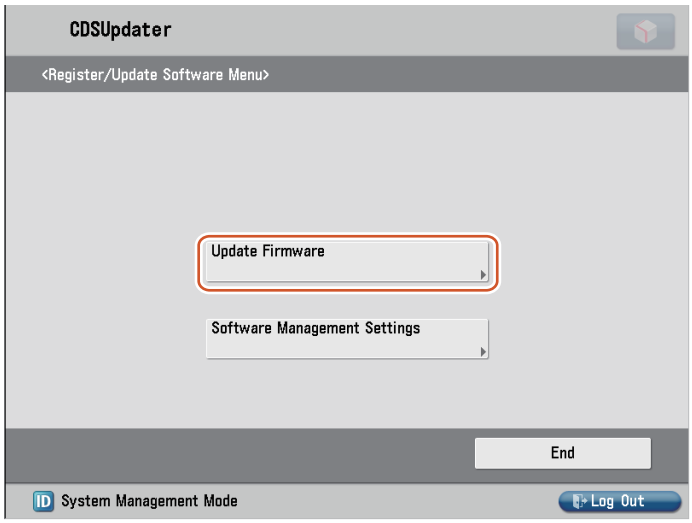


6. **Confirm the result of deletion shown on the screen and press [OK] button. Now the firmware distribution schedule is successfully deleted.**

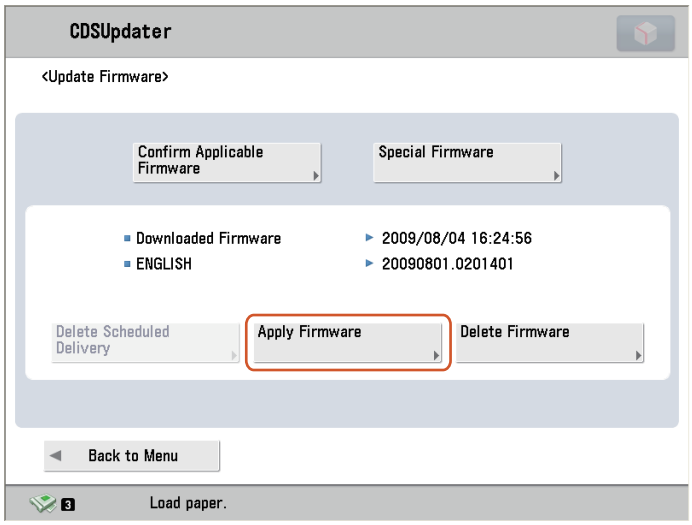
■ Updating Downloaded Firmware (Applying Firmware)

This section describes how to update the downloaded firmware.

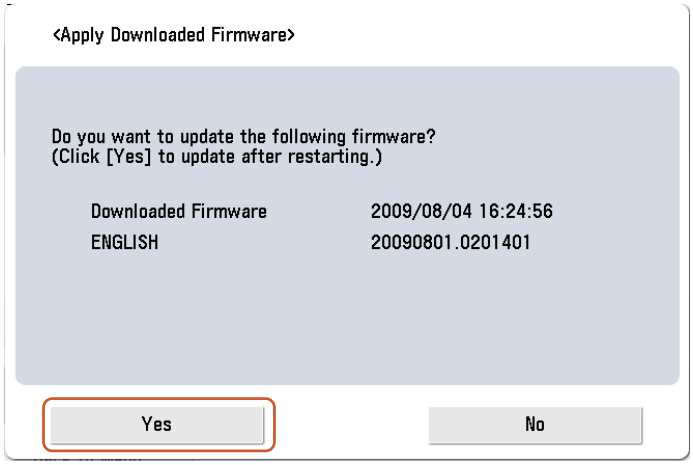
1. **Start [Service Mode] at Level 1.**
    1. Press [Setting/Registration (User mode)] button on the control panel.
    2. Press [2] and [8] buttons at a time on the control panel.
    3. Press [Setting/Registration (User mode)] button on the control panel.
    4. [Service Mode] screen is shown.
2. **Press [Updater] button.**
3. **Press [Update Firmware] button.**



4. **Press [Apply Firmware] button.**



5. **Confirm the downloaded firmware and press [Yes] button.**



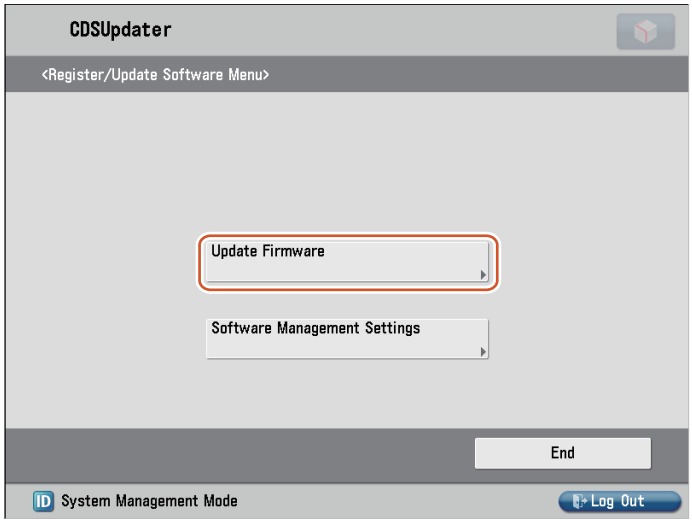
6. **The firmware is applied to the device. The device is automatically restarted when the firmware is successfully applied.**
7. **When the device is restarted, confirm the version of the firmware.**
    1. Press [Check Counter Key] button on the control panel.
    2. Press [Check Device Configuration] button.
    3. Confirm if the updated firmware version corresponds to [Controller Version].

Now the firmware is successfully updated in the method.

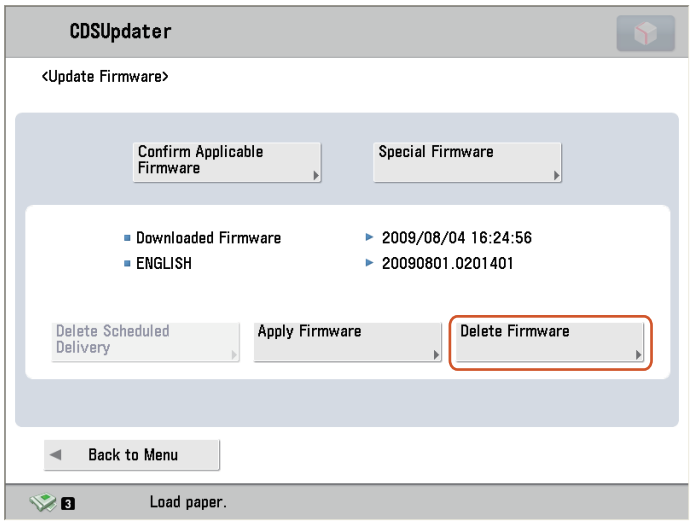
■ Deleting Downloaded Firmware

This section describes how to delete the downloaded firmware using Updater.

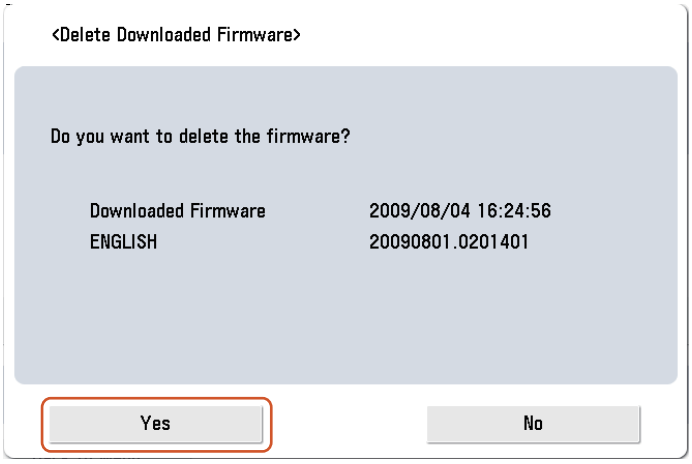
1. **Start [Service Mode] at Level 1.**
    1. Press [Setting/Registration (User Mode)] button on the control panel.
    2. Press [2] and [8] button at a time on the control panel.
    3. Press [Setting/Registration (User Mode)] button on the control panel.
    4. [Service Mode] screen is shown.
2. **Press [Updater] button.**
3. **Press [Update Firmware] button.**



4. **Press [Delete Firmware] button.**



5. **Confirm the downloaded firmware to be deleted and press [Yes] button.**



6. **Confirm the result of deletion and press [OK] button. Now the downloaded firmware is successfully deleted.**

■ Troubleshooting Relating to Firmware Installation

Symptom 1: Unable to confirm the firmware version you want to update to from Updater

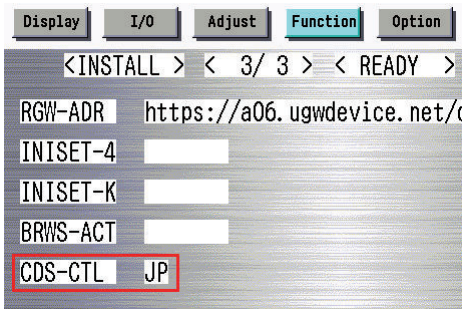
Cause 1:

The RSHQ setting is incorrect.

Remedy 1:

Set "JP" for the following service mode:

- COPIER > FUNCTION > INSTALL > CDS-CTL



Cause 2:

Updating to this firmware version is not permitted from the current firmware version.

Remedy 2:

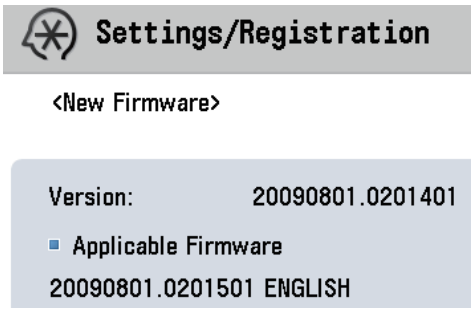
Download the release note from CDS and update the firmware closest to the version you require.

Cause 3:

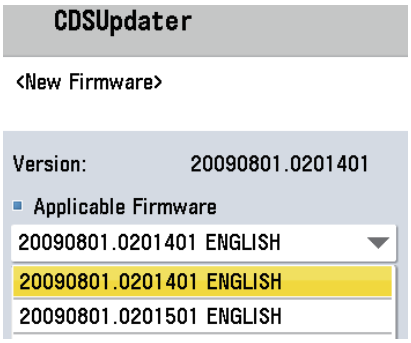
You tried to download the firmware from the updater in user mode. The only firmware that can be updated from user mode is firmware that can be updated to the latest version.

Remedy 3:

Perform either "CDS Remote Download Method" or the "CDS On-site Download Method".
<Settings/Registration>



<Service mode>



Symptom 2: Abnormal termination occurred during download of firmware.

Cause 1:

The network cable was disconnected. Alternatively, power turned off due to a power failure, etc.

Remedy 1:

Perform download again. In the event of abnormal termination during download, all the firmware that was being downloaded is discarded.

Symptom 3: Abnormal termination occurred during update of firmware and the device would not be started.

Cause 1:

Power turned off due to a power failure, etc.

Remedy 1:

A service technician must execute the following operation using SST.

1. Execute [2] + [8] startup.
    1. Immediately after turning ON the power switch, simultaneously hold down the [2] and [8] buttons on the Control Panel.
    2. [Download Mode] is displayed in the local UI.
       If this operation cannot be executed, replacement of BOOT (Flash Memory and service parts) is required. (Rewrite will take up to 1 minute)
       If the device can start, go on to the following steps.
2. Perform HDD format only for BOOT Dev using SST.
3. Install the host machine firmware using SST.

Symptom 4: Firmware scheduled to be distributed was not downloaded.

Cause 1:

After setting the distribution schedule, distribution of another firmware was scheduled. Since only 1 distribution schedule is retained, it will be overwritten by a newly scheduled distribution.

Remedy 1:

Reschedule the firmware distribution.

Cause 2:

The target firmware was not on the CDS server on the specified distribution date and time.

Remedy 2:

Reschedule the firmware distribution.

Cause 3:

After setting the distribution schedule, it was updated to another firmware by SST, etc. (The status of the firmware in the device changed)

Remedy 3:

Reschedule the firmware distribution.

Cause 4:

The device's power was OFF on the specified distribution date and time.

Remedy 4:

Reschedule the firmware distribution.

Cause 5:

The network between the Updater and CDS server was stopped.

Remedy 5:

Perform a communication test to check the status of the network.
Because there are cases of the network being stopped only at nighttime at which update is performed, check the status of the network during the time period of the scheduled update when the communication test succeeds.

Symptom 5: Firmware that should have downloaded to a device is not there.

Cause 1:

Because only one firmware downloaded on a device can be retained, it will be replaced by subsequently downloaded firmware.

Remedy 1:

The firmware needs to be downloaded again.

■ Information required for Reports

● Information required for Service Technicians to Obtain on Site

- Update Logs
- System Logs (Log Level: 4)

● Information to be Reported

1. Occurring symptom
2. Installation site of device
3. Occurrence date
4. Steps to reproduce
5. Firmware/application to be installed and its version
6. Occurrence frequency
7. Did it occur in a specific device? (did it occur in another device?)
8. Did the symptom occur in a specific firmware/MEAP Application/system option?
9. Occurrence environment
    - Model name of the device
    - Version of the installed firmware
    - List of installed MEAP applications
    - Device's network settings information
    - Setting value information of the following service mode
        - COPIER > FUNCTION > INSTALL > CDS-CTL
        - COPIER > OPTION > FNC-SW > CDS-UGW
        - COPIER > OPTION > FNC-SW > CDS-FIRM
        - COPIER > OPTION > FNC-SW > CDS-MEAP
        - COPIER > OPTION > FNC-SW > LOCLFIRM

* An investigation will be conducted even if all the above information cannot be obtained, but try to obtain the information on-site if possible.

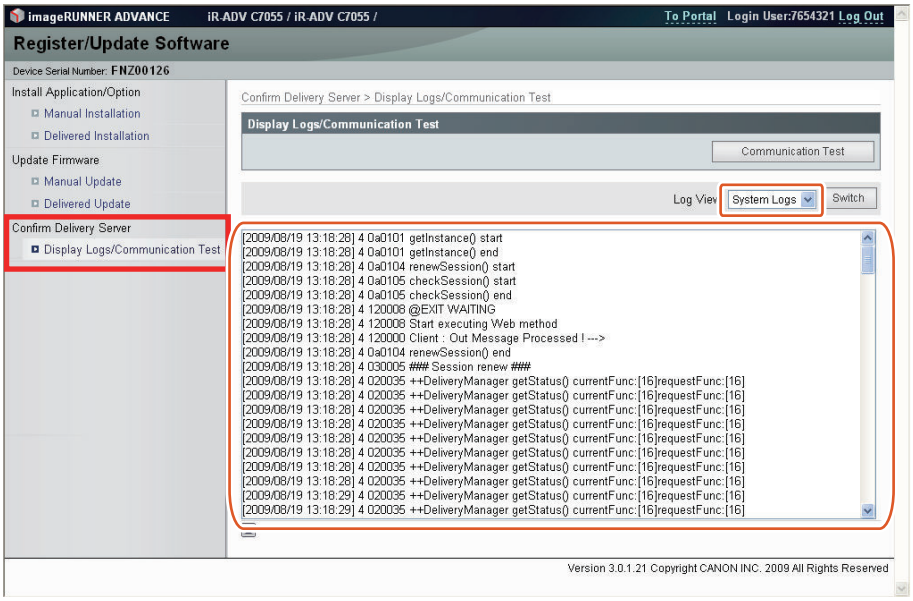
■ Debug Logs

● Log File Collection Method

Updater log files are collected by copying and pasting them from remote UI.

The collection procedure is shown below.

1. **Check that [CDS-MEAP] or [CDS-FIRM] is enabled (value is set to "1") in service mode. If it is not enabled, change the value to "1", and restart the device to enable the setting.**
   - COPIER > OPTION > FNC-SW > CDS-MEAP
   - COPIER > OPTION > FNC-SW > CDS-FIRM
2. **Login to the remote UI (URL: http://<device's IP address or host name>) as system administrator.**
3. **Collect system log (log level 4) and update log by copying and pasting them on the [Display Logs/Communication Test] screen.**
   - Remote UI > [Settings/Registration] > [Management Settings] > [License/Other] > [Register/Update Software] > [Check Distribution Server] > [Display Logs/Communication Test]



NOTE:
See "Log Level Settings" in Chapter 2 Technical Description of this manual for details on how to change the log level of the system log.

4. **If the value of CDS-MEAP or CDS-FIRM was changed in service mode, reset it and restart the device to enable that setting.**

   This completes the operation to collect log files.

■ Error Messages

Error messages displayed in LUI on a device are shown below. As to error codes, see the next list.

No.	Messages	Timing of display	Cause	Remedy
1	An error occurred with the delivery server. Contact your sales representative. Error Code: [xxx]	In communicating with the delivery server.	System error occurred in server.	Obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
2	Delivery server is stopped. Wait a while and then try to perform the operation again. Check the following URL for details. <Stopped Delivery Server URL>	In communicating with the delivery server.	Delivery server stopped.	Check the delivery server stop information. After the delivery server starts, perform the operation from this application. When the delivery server stop information is not available, contact the sales company's Support Department.
3	Failed to connect to delivery server. Check the delivery server and network.	In communicating with the delivery server.	Communication error due to incorrect settings of CDS URL.	Set correct CDS URL in the Updater settings.
			Excluding delivery server stop, communication error to the delivery server occurred.	Check if the network environment is correct to solve the cause of the error occurrence. If the network environment of the device is correct, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
4	Download was stopped because an error occurred with the file server. Check the network.	At the time of file download	Communication error to the delivery server occurred.	Check if the network environment is correct to solve the cause of the error occurrence. If the network environment of the device is correct, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
5	Downloaded files are invalid. Check the network.	At the time of file download	The received file is broken.	After checking the network environment of the device, re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
6	Failed to retrieve information of special firmware. Check the retrieval ID and password.	Acquisition of applicable firmware information	No information exists about firmware for special firmware retrieval ID or Password is invalid.	Enter the correct firmware ID or Password applicable to the firmware information. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
7	Scheduled delivery information of firmware does not exist. Check it because it may already have been deleted.	Acquisition of applicable firmware information	Delivery information with specified delivery ID does not exist.	Register the delivery schedule again. If this occurs at the time of canceling file download, deleting downloaded firmware or deleting scheduled delivery, no remedy is required.
8	Failed to apply firmware.	Firmware application error	Error due to the application (NLM)	Obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
9	Delivery Server : Connect Failed File Server : Retrieve Failed Error Code: [xxxx]	Communication test, etc. (communication test result dialogue)	In the communication test, failed to connect to the delivery server. In SOAP communication, failed to success after 1 min retry.	Check the network environment of the device, and re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			ID and Password required for proxy to connect to the internet are not configured in device.	Set proxy and restart the communication test. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
9	Delivery Server : Connect Failed File Server : Retrieve Failed Error Code: [xxxx]	Communication test, etc. (communication test result dialogue)	The access to the network is limited.	Set the user environment to make the access to the following domain available. https://device.cdsknn.net/ http://cdsknn.net.edge-suite.net/ If it recurs, obtain the log etc. (Refer to "Information required for Reports" on page 1181 under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			Delivery server stopped.	Contact Field Support Group in the sale company. After confirmation that the delivery server has been restored, restart the communication test. If it recurs, obtain the log etc. (Refer to "Information required for Reports" on page 1181 under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company again.
10	Delivery Server : Connect OK File Server : Retrieve Failed Error Code: [xxxx]	Delivery Server : Connect OK File Server : Retrieve Failed Error Code: [XXXX]	Due to no return of data for the communication test, time-out (in HTTP communication, no response for 1min) occurred. After that, retried but failed to connect to server.	Check the network environment of the device and re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" on page 1181 under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			The network cable was disconnected during data download in the communication test.	Reconnect the network cable and then restart the communication test. If it recurs, obtain the log etc. (Refer to "Information required for Reports" on page 1181 under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
10	Delivery Server : Connect OK File Server : Retrieve Failed Error Code: [xxxx]	Delivery Server : Connect OK File Server : Retrieve Failed Error Code: [XXXX]	The file server stopped during data download in the communication test.	Contact the sales company's Support Department. After confirmation that the delivery server has been restored, restart the communication test. If it recurs, obtain the log etc. (Refer to "Information required for Reports" on page 1181 under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company again.
			Hash value in the communication test file is incorrect.	Check the network environment and re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" on page 1181 under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
11	An error occurred. Error Code: [xxx]	communication test, etc. (main screen)	The max value (space/file) was exceeded and new log was not accepted. Normally an old log file is deleted before the max value (space/file) is exceeded, but error may occur due to other element (e.g. I/O error).	Check if the log file exceeded the max value. <Update log> Max space: 128KB/file Max file number: 4 <System log> Max space: 512KB/file Max file number: 4 If it recurs, obtain the log etc. (Refer to "Information required for Reports" on page 1181 under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
		Notice of version information (main screen)	Failed to acquire version information of device due to no CDS registration of firmware version of device.	Re-execute the job. If it recurs, obtain the log etc. (Refer to "Information required for Reports" on page 1181 under "Version Upgrade via CDS", "Version Upgrade" of Chapter 6 "Troubleshooting" of this manual.) and contact Support Div. of the sales company.
			At the time of notifying version information, failed to connect to the delivery server.	Check if the network environment is correct to solve the cause of the error occurrence. If the network environment of the device is correct, obtain the log etc.

No.	Messages	Timing of display	Cause	Remedy
11	An error occurred. Error Code: [xxx]	Notice of version information (main screen)	No return of notifying version information	(Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			Network cable was disconnected during notice of version information.	Re-connect the network cable and re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			Failed to send notice of version information since the main power was turned OFF and then ON during the sending.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			Server stopped at the time of sending notice of version information.	Check the network environment of the device and re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			An internal error occurred at the time of sending notice of version information.	Obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
11	An error occurred. Error Code: [xxx]	UGW linkage (main screen)	UGW linkage was turned ON when eRDS was OFF.	For a device using eRDS, turn ON the eRDS. For a device not using eRDS, turn OFF the UGW linkage. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			An internal error occurred at the time of acquiring delivery information.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
		On-site (error dialogue)	An internal error occurred at the time of acquiring applicable firmware information.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			An internal error occurred at the time of sending approval information.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			An internal error occurred at the time of delivery order	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
		Immediate download (error dialogue)	An internal error occurred at the time of requesting firmware delivery information.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			During the download, all space in the storage disk was occupied. (DiskFull)	After adding vacant space of the storage disk, re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			At the end of receipt, an internal error occurred.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
		Manual update (error dialogue)	At the update start, an internal error occurred.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company
		Automatic update (error dialogue)	At the update start, an internal error occurred.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
		Deletion of downloaded firmware	At the time of notifying cancellation, an internal error occurred.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
12	An error occurred. Check the Update Firmware screen	UGW linkage (main screen)	eRDS sent an order but Updater failed to connect to server.	Conduct a communication test to analyze the cause of the error. After solving the cause, resend the order from the eRDS. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			Delivery server stopped.	Contact the sales company's Support Department. After confirming restoration of the delivery server, re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			Scheduled date and time acquired from the delivery server was before current time (15 or more min had passed.)	Do the delivery setting from UGW again. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			Scheduled data and time acquired from the delivery server did not exist.	Do the delivery setting from UGW again. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
12	An error occurred. Check the Update Firmware screen	Immediate download (main screen)	At the time of immediate download, turned OFF and then ON the power of device main body.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
		Manual update (main screen) Automatic update (main screen)	Updated version was different from the ordered version.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			After the update, failed to connect to the delivery server.	Check the network environment and re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			After the update, delivery server stopped.	Contact the sales company's Support Department. After confirming restoration of the delivery server, re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			After the update, the network cable was disconnected.	Re-connect the network cable and re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
12	An error occurred. Check the Update Firmware screen	Manual update (main screen) Automatic update (main screen)	After the update, server returned an error.	Obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			After the update, an internal error occurred.	If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
13	Delivery Error Error Code: [xxx]	UGW linkage (Update Firmware screen)	eRDS sent an order but Updater failed to connect to the server.	Conduct a communication test to analyze the cause of the error. After solving the cause, resend the order from the eRDS. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			The delivery server stopped.	Contact the sales company's Support Department. After confirming restoration of the delivery server, re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
			The scheduled data and time acquired from delivery server does not exist.	Do the delivery setting from UGW again. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
14	Delivery Error Delivery Time Delivery Firmware Label Delivery Firmware version Error Code: [xxx]	UGW linkage (Update Firmware screen)	The scheduled date and time acquired from delivery server was before current time (15 or more min had passed).	Do the delivery setting from UGW again. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
		Immediate download (Update Firmware screen)	At the time of immediate download, turned OFF and then ON the power of device main body.	Re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
15	Applicable firmware is not registered.	On-site (error dialogue)	At the user site, no latest firmware exists.	This means the current firmware is the latest, so this error has no impact. But when the latest firmware to be retrieved must exist e.g. released new firmware information has been notified, contact Field Support Group in the sales company.
			No applicable firmware exists on CDS, so the service person can't select any applicable firmware.	Contact the sales company's Support Department.
16	Restart failed. Turn the main power OFF and ON.	Manual update (error dialogue)	An error occurred at the time of the device restart.	After turning OFF and then ON the main power of the device, re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.

No.	Messages	Timing of display	Cause	Remedy
16	Restart failed. Turn the main power OFF and ON.	Automatic update (error dialogue)	An error occurred at the time of the device restart.	After turning OFF and then ON the main power of the device, re-execute the job. If it recurs, obtain the log etc. (Refer to “Information required for Reports” on page 1181 under “Version Upgrade via CDS”, “Version Upgrade” of Chapter 6 “Troubleshooting” of this manual.) and contact Support Div. of the sales company.
17	Specify [E-Mail Address] with up to 64 characters.	At the time of periodical update setting	The specified E-mail address exceeded 64 characters.	Specify E-mail address within 64 characters.
18	The following characters cannot be used for the [E-Mail Address]: , : ; “ ( ) [ ] < > \	At the time of periodical update setting	The E-mail address was including the characters which could not be used.	Do not specify E-mail address with characters which cannot be used.
19	Specify [Comments] with up to 128 characters.	At the time of periodical update setting	Comments exceeded 128 characters.	Specify comments within 128 characters.
20	The [Delivery Server URL] is incorrect.	In setting with the deliver server URL.	The specified deliver server URL is wrong.	Enter the right URL(https://device.c-cdsknn.net/cds_soap/updaterif)

● Error Messages of Updater

Error messages displayed on the LUI of the device are shown below. See the List of Error Codes for details about error codes.

No.	Message	The timing of occurrence	Cause/Remedy	
1	An error occurred in the distribution server. Contact the sales company. Error code: [XXX]	At communication with the distribution server	Cause	A system error occurred in the server.
			Remedy	Collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
2	The distribution server has stopped. Wait for a while and repeat the operation. Check the following URL for more details. < URL of stopped distribution server >	At communication with the distribution server	Cause	The distribution server has stopped.
			Remedy	Execute the operation from this application when the distribution server has started after checking the stopped distribution server information. Contact the Support Dept. of the sales company if there is no stopped server information.
3	Connection to the distribution server failed. Check the distribution server and network environment.	At communication with the distribution server	Cause	Communication error due to invalid CDS URL setting.
			Remedy	Set the correct URL of the CDS server in Updater.
			Cause	Communication error with the distribution server other than the stopped distribution server.
			Remedy	Check the network environment of the device and solve the error. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
4	The download was stopped due to an error in the file server. Check the network environment.	When downloading files	Cause	Communication error with the file server occurred.
			Remedy	Check the network environment of the device and solve the error. If the network environment of the device is correct, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
5	The download file is invalid. Check the network environment.	When downloading files	Cause	File was received, but is corrupted.

No.	Message	The timing of occurrence	Cause/Remedy	
5	The download file is invalid. Check the network environment.	When downloading files	Remedy	Check the network environment of the device and execute the operation again. If the network environment of the device is correct, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
6	Collection of the specific firmware information failed. Check the retrieval ID or password.	When collecting applicable firmware information	Cause	There is no firmware information corresponding to the specific firmware retrieval ID or the password is different.
			Remedy	Enter the correct firmware ID or password corresponding to the firmware information. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
7	There is no scheduled distribution information of the firmware. Check this as it may already be deleted.	When collecting applicable firmware information	Cause	There is no delivery information for the specified distribution ID.
			Remedy	Register the distribution schedule again. No remedy needs to be performed if this occurred when canceling file download, deleting downloaded firmware or deleting the distribution schedule.
8	Application of firmware failed.	Firmware application error	Cause	Error occurred at application (NLM).
			Remedy	Collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
9	Distribution server: Connection NG File server: Collection NG Error code: [XXX]	Other communication test (communication test result dialog box)	Cause	Does not connect to the distribution server at communication test. Retrying for 1 minute with SOAP communication was unsuccessful.
			Remedy	Check the network environment of the device and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	ID and password are necessary for Proxy to connect to the Internet, but they are not set in the device.
			Remedy	Configure the proxy settings, and execute the communication test again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	There is restriction on the access to network.
			Remedy	Ask the user to configure the user environment so that access to the following domains becomes possible. https://device.cdsknn.net/ http://cdsknn.net.edgesuite.net/ If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The distribution server has stopped.
			Remedy	Contact the Support Dept. of the sales company. Check that the distribution server is restored and execute the communication test again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
10	Distribution server: Connection OK File server: Collection NG Error code: [XXX]	Other communication test (communication test result dialog box)	Cause	Time-out occurred (no response i HTTP communication for 1 minute) because communication test data was not returned. Retried after that but could not connect to the server.
			Remedy	Check the network environment of the device and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The network cable was disconnected while downloading communication test data.

No.	Message	The timing of occurrence	Cause/Remedy	
10	Distribution server: Connection OK File server: Collection NG Error code: [XXX]	Other communication test (communication test result dialog box)	Remedy	Reconnect the network cable and execute the communication test again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The file server stopped while downloading communication test data.
			Remedy	Contact the Support Dept. of the sales company. Check that the distribution server is restored and execute the communication test again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	Communication test data is corrupted.
			Remedy	Check the network environment of the device and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
11	An error occurred. Error code: [XXX]	Other communication test (Main screen)	Cause	Log cannot be written because the maximum value (capacity/number of files) was exceeded. Normally, old log files are deleted before exceeding the maximum value (capacity/number of files), but an error may occur due to another cause (I/O error, etc.).
			Remedy	Check that the log file has not exceeded the maximum value. <Update log> Max. capacity: 128 KB/file Max. number of files: 4 <System log> Max. capacity: 512 KB/file Max. number of files: 4 If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
		Version information notifications (main screen)	Cause	Retrieval of the device's version information failed because the version of the device's firmware has not been registered in the CDS.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	Does not connect to the distribution server when notifying version information.
			Remedy	Check the network environment of the device and solve the error. If the network environment of the device is correct, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	Notification of version information was not returned.
			Remedy	Check the network environment of the device and solve the error. If the network environment of the device is correct, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The network cable was disconnected while notifying the version information.
			Remedy	Reconnect the network cable and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	Notification of version information failed because of turning OFF and then ON the power during notifying the information.

No.	Message	The timing of occurrence	Cause/Remedy	
11	An error occurred. Error code: [XXX]	Version information notifications (main screen)	Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The distribution server stopped when notifying version information.
			Remedy	Check the network environment of the device and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	An internal error occurred when notifying version information.
			Remedy	Collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
		UGW linkage (Main screen)	Cause	UGW linkage was turned ON while eRDS was OFF.
			Remedy	Turn eRDS ON if the device uses eRDS. Turn UGW linkage OFF if the device does not use eRDS. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	An internal error occurred when obtaining distribution information.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
		On-site (error dialog box)	Cause	An internal error occurred when collecting applicable firmware information.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	An internal error occurred when notifying approval information.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	An internal error occurred with the distribution instruction.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
		Immediate download (error dialog box)	Cause	An internal error occurred when requesting firmware distribution information.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	Free space in the storage disk was ran out during download. (DiskFull)
			Remedy	Increase the free space in the storage disk and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	An internal error occurred at completion of reception.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.

No.	Message	The timing of occurrence	Cause/Remedy	
11	An error occurred. Error code: [XXX]	Manual update (error dialog box)	Cause	An internal error occurred when starting the update.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
		Automatic update (error dialog box)	Cause	An internal error occurred when starting the update.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
		Deletion of downloaded firmware	Cause	An internal error occurred when notifying cancellation
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
12	An error occurred. Check the firmware update screen.	UGW linkage (Main screen)	Cause	Instructions came from eRDS, but Updater did not connect to the server.
			Remedy	Identify the cause by executing a communication test. Issue instructions from eRDS again after performing the remedy. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The distribution server has stopped.
			Remedy	Contact the Support Dept. of the sales company. Check that the distribution server is restored and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The scheduled date and time obtained from the distribution server was before the current time (when at least 15 minutes have elapsed).
			Remedy	Reset the distribution settings from UGW. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The scheduled date and time obtained from the distribution server does not exist.
			Remedy	Reset the distribution settings from UGW. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
		Instant download (Main screen)	Cause	The power of the machine was turned OFF/ON during instant download.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
		Manual update (Main screen) Automatic update (Main screen)	Cause	Version is different from the instructed version after the update.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	Does not connect to the distribution server after completion of update.
			Remedy	Check the network environment of the device and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The distribution server has stopped at completion of update.

No.	Message	The timing of occurrence	Cause/Remedy	
12	An error occurred. Check the firmware update screen.	Manual update (Main screen) Automatic update (Main screen)	Remedy	Contact the Support Dept. of the sales company. Check that the distribution server is restored and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	Network cable was disconnected at completion of update.
			Remedy	Reconnect the network cable and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	An error was returned from the server at completion of update.
			Remedy	Collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	An internal error occurred at completion of update.
			Remedy	Collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
13	• Distribution error • Error code: XXX	UGW linkage (firmware update screen)	Cause	Instructions came from eRDS, but Updater did not connect to the server.
			Remedy	Identify the cause by executing a communication test. Issue instructions from eRDS again after performing the remedy. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The distribution server has stopped.
			Remedy	Contact the Support Dept. of the sales company. Check that the distribution server is restored and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
			Cause	The scheduled date and time obtained from the distribution server does not exist.
			Remedy	Reset the distribution settings from UGW. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
14	• Distribution error • Distribution time • Distribution firmware label • Distribution firmware version • Error code: XXX	UGW linkage (firmware update screen)	Cause	The scheduled date and time obtained from the distribution server was before the current time (when at least 15 minutes have elapsed).
			Remedy	Reset the distribution settings from UGW. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
		Instant download (firmware update screen)	Cause	The power of the machine was turned OFF/ON during instant download.
			Remedy	Execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
15	Applicable firmware has not been registered.	On-site (error dialog box)	Cause	The latest firmware does not exist at the user site.
			Remedy	There is no problem because the current firmware is the latest. However, if a new version of firmware should exist because, for example, you have been informed of a release of a new version, contact the Support Dept. of the sales company.
			Cause	There is no applicable firmware on the CDS server, so no firmware available that can be applied by service technicians.
			Remedy	Contact the Support Dept. of the sales company.

No.	Message	The timing of occurrence	Cause/Remedy	
16	Failed to restart. Turn ON the main power of the host machine again.	Manual update (error dialog box)	Cause	An error occurred when restarting the device
			Remedy	Turn ON the main power of the host machine again, and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
		Automatic update (error dialog box)	Cause	An error occurred when restarting the device
			Remedy	After turning ON the main power of the host machine, reconfigure the setting with UGW and execute the operation again. If the problem persists, collect the log (see "“Information required for Reports” on page 1181" in this manual) and contact the Support Dept. of the sales company.
17	[URL of the Distribution Server] is incorrect.	At URL Setting of the Distribution Server	Cause	Specified [URL of Distribution Server] is incorrect.
			Remedy	Enter the correct URL (https://device.c-cdsknn.net/cds_soap/updaterif).

■ Error Code

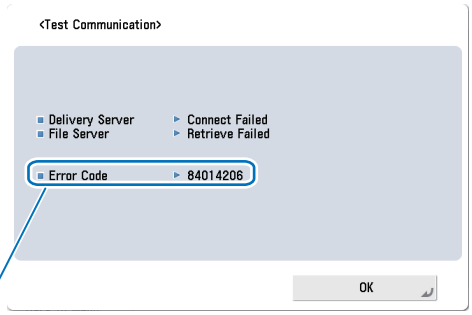
● Explanation on Error Codes and Their Remedies

The following shows the error codes displayed on CDS error dialogs and the Control Panel of the device (local UI) and explanation of those error codes.

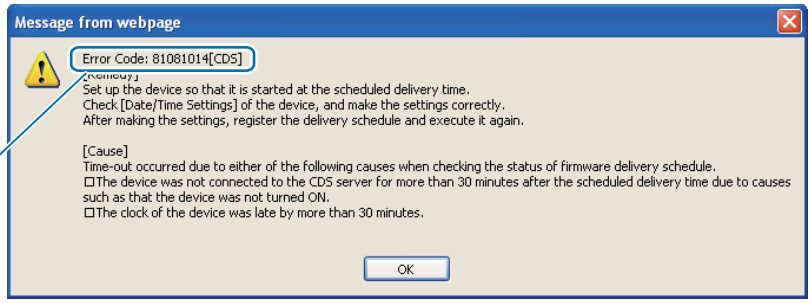
● How to read an error code

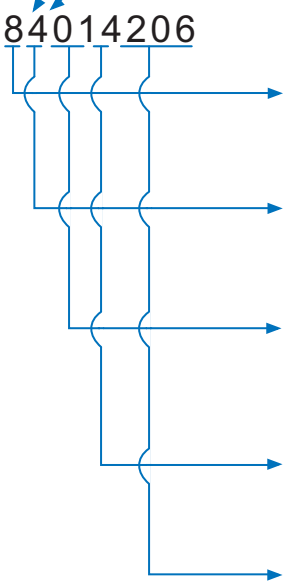
An error code consists of a number of eight digits (hexadecimal number) displayed on the UI shown below.

Local UI



Error Message dialogue





Code	Value	Contents
The first digit Error field	8	Error
The second digit Operator	0 1 2 3 4 5 6	Not defined. CDS server Updater UGW Service person IT administrator (User) Scheduled Update
The 3rd - 4th digits Method category	xx	Method
The 5th digit Category code	0 1 2 3 4 5 6 7	Category code
The 6 - 8th digits Description code	000-	See Error code list

● Remedy by Error Code

Remedy for error codes starting with [81------]

The remedies for error codes starting with 81 are shown below.

1. Perform the remedy by referring to the "“List of Error Codes Starting with 81” on page 1202".
2. If the error is not solved by the remedy in list of error codes, report it to the Support Dept. of the sales company with the following information.
   - Time of occurrence
   - Serial number of the device

Remedy for error codes starting with numbers other than [81------]

The remedies for error codes starting with numbers other than 81 are shown below.

1. Check the last 4-digit of the code, and try the remedy in “List of Error Codes that Start with a Value Other Than 81” on page 1204.

2. Try the remedies shown below if there is an "○" in the "Cause of problem" > "Network" column of the List of Error Codes.
   - Execute the operation again.
   - Execute the communication test in the Touch Panel of the device.
   - Check the status of the connected device (disconnection of LAN cable, etc.).
   - Check the network settings of the device.
   - Check the network environment whether any restriction is applied (restriction on nighttime communication, etc.).
   - Check the status of the customer's proxy server and take the necessary measures if it is not operating correctly. If the problem persists, clear the proxy server cache.
3. If the error is not solved by the above-mentioned remedy, report it to the Support Dept. of the sales company with the following information.
   - Occurred error code
   - Sublog of the device
   - Update log of the device (collect it after setting the log level to 4)

■ Error Code List

● List of Error Codes Starting with 81

A list of error codes starting with 81 is shown below. They are the errors attributed to the CDS server.
When contacting the Support Dept. of the sales company, attach the occurrence time and the serial number of the device.

Error Codes	Description	Remedy	Cause of trouble	
			CDS server	Updater
81--0001	If a value is not set for compulsory items in the input information.	Contact the Support Dept. of the sales company. (Attach the occurrence time and the serial number of the device.)	Yes	Yes
81--0002	In the case of [81--0002] error attributed to any cause other than the following: When the number of digits and type of characters set in string-type items in the input information do not meet the specifications		Yes	Yes
81040002	• The number of digits in the registration ID or password is other than 8 • Characters other than single-byte numeric characters are used for the registration ID or password	Correctly enter the specified firmware ID or password. (User)	Yes	Yes
81060002	• The number of digits or type of characters used for the firmware type, firmware version, firmware group version or firmware label does not meet the specifications • The character string of firmware group version (firmGroupVersion) includes characters other than numeric values. • The e-mail address (mailAddress) is longer than 128 digits • Characters other than single-byte alphanumeric characters and symbols are used for e-mail Address (mailAddress). • An invalid e-mail address was entered (no domain, "." (dot) and "," (comma) were entered incorrectly, etc.)	Register the e-mail address correctly. If this problem persists, contact the Support Dept. of the sales company. (Attach the occurrence time and the serial number of the device.) Re-register a correct firmware if there is firmware type, firmware version or firmware group version error (only applies to Canon, Inc.).	Yes	Yes
81--0003	If a numeric value other than the specified value is set as the numeric value of the input information (e.g. when a value other than 4 for Service Technician or 5 for User IT Administrator is specified in the Operator classification)	Contact the Support Dept. of the sales company. (Attach the occurrence time and the serial number of the device.)	Yes	Yes
81--0004	If there is no corresponding distribution information.		Yes	-
81--0005	If the system settings are faulty.		Yes	-
Error attributed to operation/practical use				
81--1001	In the case of [81--1001] error attributed to any cause other than the following: If the current firmware in the input information is inconsistent with that in the distribution information. (e.g. conditions which enable Auto Update are not met or compulsory additional settings are invalid, etc.)	If firmware distribution is required, search the applicable firmware again and then distribute it.	Yes	Yes
81071001	A cancel notification was sent to CDS when the distribution status was incorrect. (Status change is not delivered to CDS due to network problems, etc.)		Yes	Yes

Error Codes	Description	Remedy	Cause of trouble	
			CDS server	Updater
81091001	• Device firmware information when the distribution is scheduled differs from the information when distribution is performed Result of updating by a method not using CDS while the distribution to the device that supports UGW linkage is scheduled. • Firmware information of the CDS server when the distribution is scheduled differs from the information when the distribution is executed. If the setting to update firmware remotely is disabled after scheduling distribution as Auto Update.	If firmware distribution is required, search the applicable firmware again and then distribute it.	Yes	Yes
81--1002	If release of the installation set which had been released to the market and known by the distributable information notification was stopped.	Contact the Support Dept. of the sales company. (Attach the occurrence time and the serial number of the device.)	Yes	-
81--1003	If there is no e-mail template file.		Yes	-
81--1004	If the serial number of the device in the input information differs from the serial number in the distribution information.		Yes	-
81--1005	If the operator classification in the input information is the user IT administrator and the collection type is other than the latest type.		Yes	-
81--1006	If the collection type in the input information is specified and the registration ID or individual password is not set. (* Cases where the operator did not enter the registration ID and individual password)		Yes	-
81--1007	If the collection type in the input information is specified and the operator classification is other than the service technician.		Yes	-
81--1008	If there is no device product code that corresponds to the device serial No. of the input information.	Contact the Support Dept. of the sales company. (Attach the occurrence time and the serial number of the device.) Check the LMS registration (only applies to Canon, Inc.).	Yes	-
81--1009	If the collection type in the input information is specified and there are no basic settings that correspond to the registration ID and password. (* Cases when the operator entered the wrong registration ID or password)	Enter the correct ID or password.	Yes	-
81--100A	If the distribution status is applying. The firmware update was executed and the update complete notification was not sent to the CDS. In this state, the firmware was distributed again before the update time-out process was executed in CDS.	After at least 2 hours and 30 minutes has elapsed since failure of the firmware distribution operation, search the applicable firmware again and then distribute it.	Yes	-
81--100B	If there is no approval information relating to EULA or export conditions when confirming distribution.	Contact the Support Dept. of the sales company. (Attach the occurrence time and the serial number of the device.)	Yes	-
81--100C	If the distribution status is "Distributing", "Distributed", "Applying", "Finished" or "Failed". Distribution information collection process was notified the CDS while the distribution status was incorrect. (Status change was not notified to the CDS server due to network failure, etc.)	Search the applicable firmware again and then distribute it.	Yes	-
81--100D	If the distribution status is "Distributing", "Distributed", "Applying", "Finished" or "Failed".		Yes	-
8108100D	Schedule information confirmation process was notified the CDS while the distribution status was incorrect. (Status change was not notified to the CDS server due to network failure, etc.)		Yes	-
81--100E	If the distribution status is "New", "Waiting to Distribute", "Distributed", "Applying", "Finished" or "Failed".	Contact the Support Dept. of the sales company.	Yes	-

Error Codes	Description	Remedy	Cause of trouble	
			CDS server	Updater
81--100F	If the distribution status is other than "Distributing". (Firmware distribution)	(Attach the occurrence time and the serial number of the device.)	Yes	-
81--1010	If the distribution status is "New", "Waiting to Distribute", "Distributing", "Applying", "Finished" or "Failed".	Search the applicable firmware again and then distribute it.	Yes	-
810B1010	The update start notification was sent to the CDS in an invalid status. (The CDS server could not receive the status change due to a network error, etc.)		Yes	-
81--1011	If the distribution status is "Distributing", "Distributed", "Applying", "Finished" or "Failed". (Firmware distribution)	Contact the Support Dept. of the sales company. (Attach the occurrence time and the serial number of the device.)	Yes	-
81--1012	The device is "not supporting CDS". (Firmware distribution) * It occurs only when managing the devices that can access CDS.	Register it as the target device for CDS.	Yes	-
81--1013	Specified distribution time was within the CDS distribution stop time. (Firmware distribution)	Contact the Support Dept. of the sales company. (Attach the occurrence time and the serial number of the device.)	Yes	-
81--1014	Time-out of firmware schedule status check occurred. The CDS was not accessed even though 30 minutes had passed from the distribution time. Power-off of the device, network disconnection, etc.	Search the applicable firmware again and then distribute it.	Yes	-
81--1015	Time-out of firmware distribution occurred. The reception complete notification was not sent to the CDS within 24 hours after the start of the distribution. Power-off of the device, network disconnection, etc.		Yes	-
81--1016	Time-out of firmware update occurred. The update complete notification was not sent to the CDS within 2 hours after the start of the update.	Check the device to see whether the update has completed. If the update failed, check the device. If there are no problems, execute the update again.	Yes	-
81--1017	If there was a problem while processing the distribution information according to the firmware distribution information notification.	Contact the Support Dept. of the sales company. (Attach the occurrence time and the serial number of the device.)	Yes	-
81--1018	If there was a problem while processing the scheduled update information according to the firmware distribution information notification.		Yes	-
81--1019	If the status of the scheduled update information is "Set", "Finished" or "Failed".		Yes	-
81--1020	If the status of the scheduled update information is "Waiting to Transmit" or "New".		Yes	-
81--1021	If the status of the scheduled update information is "Set".		Yes	-
81--1022	If the input information and the scheduled update setting information of the distribution information do not match.		Yes	-
81--1023	If the distribution status is "Cancel".		Yes	-
Error code caused by IO				
81--2014	There is no device information corresponding to the device serial No. (There is no device firmware group-related information)	Contact the Support Dept. of the sales company. (Attach the occurrence time and the serial number of the device.)	Yes	-

● List of Error Codes that Start with a Value Other Than 81

A list of error codes that start with a value other than 81 is shown below. If any of these errors occur, search for a remedy based on the last 4 digits of the error code.

When contacting the Support Dept. of the sales company, attach the Sublog and update log of the corresponding device.
The CDS distribution server and the CDS file server are contained in the "CDS Server" in the cause of problem.

Error Codes	Description	Remedy	Cause of problem		
			CDS server	Updater	Network
8X--1001	During exclusive processing	Start the operation again after other Updater operations being executed at the same time are finished.	-	Yes	-
8X--1002	Stopped	Restart the device and start the operation again.	-	Yes	-
8X--1101	Ready for use processing failed.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--1102	End of use processing failed.		-	Yes	-
8X--1103	Time-out occurred during resumption of standby processing.		-	Yes	-
8X--1104	Session time-out occurred because no operation was performed for a certain period of time for reasons other than after an application inquiry (after issuing a distribution ID).	Start the operation again from the beginning.	-	Yes	-
8X--1105	The CDS URL has not been set.	Set the CDS URL.	-	Yes	-
8X--1106	There was another job just before firmware update processing.	Start the operation again after the device jobs are completed.	-	Yes	-
8X--1202	Scheduled update was specified for models that do not support such update.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	Yes	-	-
8X--1203	Firmware processing was executed for models that do not support such processing.		Yes	-	-
8X--1301	SecurityToken verification error		-	-	Yes
8X--1302	An error occurred at the privilege check.	Perform authentication as a user having correct privileges.	-	-	Yes
8X--1303	A parameter error occurred.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	-	Yes
8X--1304	No distribution information from the server		-	-	-
8X--1305	Version notification is not needed		-	-	-
1306	Error due to mismatch of connected server information	Check the settings of the connected server.	-	-	Yes
Error codes caused by data input/output					
8X--21XX	File I/O failed	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--22XX	Internal error relating to XML file operation		-	Yes	-
8X--2301	Output a license file failed		-	Yes	-
8X--2401	Creation of automatic shutdown stop file failed.		-	Yes	-
8X--2402	Deletion of automatic shutdown stop file failed.		-	Yes	-
Error codes caused by devices					
8X--31XX	Internal error in CPCA	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--32XX	Internal error in IMI		-	Yes	-
8X--33XX	Internal error in SMS		-	Yes	-
8X--34XX	Internal error in NLM		-	Yes	-
8X--35XX	Error in Configuration Service properties settings		-	Yes	-
8X--36XX	Internal error relating to APL_CDS partition		-	Yes	-
8X--37XX	DCM-related service error		-	Yes	-
Error codes caused by SOAP communication					
8X--4101	Process thread has stopped	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--4102	During SOAP communication processing		-	Yes	-
8X--4103	Function classification does not match		-	Yes	-

Error Codes	Description	Remedy	Cause of problem		
			CDS server	Updater	Network
8X--4104	Invalid SOAP response error	Check the connection of the network cable. If this problem persists, contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	Yes	-	-
8X--4105	No network cable connection (device-side)	Check the network environment. If this problem persists, contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	Yes	-	-
8X--4201	Internal error relating to application information occurred.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--4202	config.xml file is not found.		-	Yes	-
8X--4203	type.xml file is not found.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--4204	An error occurred when binding type.xml.		-	Yes	-
8X--4205	An error occurred when generating a service tab.		-	Yes	-
8X--4206	A Runtime error occurred when executing Web method.		-	Yes	Yes
8X--4207	An Unknown host error occurred when executing Web method.	• Check the network environment of the device and start the operation again. • Check whether there is a mistake in the CDS Server's URL setting and start the operation again after resetting it.	Yes	Yes	Yes
8X--4301	The distribution server has stopped.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	Yes	-	-
8X--4302	< Scheduled update > The distribution server returns an error relating to the download start notification from the device before a certain period of time for maintenance of the distribution server and stops operation of the device. <Scheduled distribution with specified date and time> The firmware versions of the device differ at the time of scheduling distribution and updating.	< Scheduled update > Reschedule the distribution so that maintenance time of the distribution server and scheduled update time do not overlap. <Scheduled distribution with specified date and time> Register the distribution schedule again so that the firmware versions of the device are the same at the time of scheduling distribution and updating.	Yes	Yes	-
Error codes caused by HTTP communication					
8X--5101	Specified hash algorithm is unknown.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--5102	The URL of the download file is invalid	Check whether there is a mistake in the CDS Server's URL setting and start the operation again after resetting it.	-	Yes	-
8X--5103	No network cable connection (device-side)	Check the network environment of the device and start the operation again.	-	Yes	-

Error Codes	Description	Remedy	Cause of problem		
			CDS server	Updater	Network
8X--5201	HTTP request is disabled	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	Yes	Yes	Yes
8X--5202	Connection to the server failed.	Check the network environment of the device (check for any problem in the DNS server), and start the operation again.	Yes	Yes	Yes
8X--5203	Server is not found.	Check the network environment of the device (proxy setting, etc.) and start the operation again.	Yes	Yes	Yes
8X--5204	An I/O error occurred when establishing a connection with the server.	Check the communication test results. If there is a problem, check the network environment.	Yes	Yes	Yes
8X--5205	Loading of HTTP response failed.		Yes	Yes	Yes
8X--5206	HTTP response error	Check the network environment. (Attach the Sublog and update log of the corresponding device)	Yes	Yes	Yes
8X--5207	Generation of Secure Socket failed.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	Yes	Yes	Yes
8X--5208	CA certificate check error		Yes	Yes	Yes
8X--5209	Connection time-out		-	Yes	Yes
8X--5301	Retrieval of data stream failed.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	Yes
8X--5302	Generation of a file object for reception failed.		-	Yes	Yes
8X--5303	Error in creation of data stream of file for reception		-	Yes	Yes
8X--5304	Data reception failed.	Check the network environment of the device and start the operation again.	Yes	Yes	Yes
8X--5305	Error in storing file data for reception	Check whether there is an HDD problem. If this problem persists, contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--5306	Closing of data stream failed.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--5307	Closing of a file data for reception failed.		-	Yes	-
8X--5308	The hash code of the download file was invalid.	Check the network environment of the device and start the operation again.	Yes	Yes	Yes
8X--5309	Proxy authentication method is not supported or access to the CDS file server is not allowed.	Check the proxy authentication method you are using and start the operation again after changing to a supported method. Check that access to the following URL is allowed. • device.c-cdsknn.net (protocol: https) • cdsknn.net.edgesuite.net (protocol: http*) * The URL for products of iR-ADV C2200 series or later is as follow: a02.c-cdsknn.net (protocol: https) However, this excludes the iR-ADV C5200/9200/7200 series.	-	Yes	Yes
Error codes caused by Socket communication					

Error Codes	Description	Remedy	Cause of problem		
			CDS server	Updater	Network
8X--6101	Connection to the e-RDS failed.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	Yes
8X--6102	No response from e-RDS		-	Yes	Yes
8X--6103	No start notification from e-RDS		-	Yes	Yes
8X--6104	Socket loading error		-	Yes	Yes
8X--6105	Socket communication time-out occurred.		-	Yes	Yes
Error codes caused by other internal codes					
8X--71XX	Error due to use of invalid API	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--72XX	Internal error in SMS		-	Yes	-
8X--7301	Distribution ID does not exist		-	Yes	-
8X--7302	Distribution ID is invalid		-	Yes	-
8X--7303	Information relating to updated firmware and firmware after starting Updater is different.		-	Yes	-
8X--7304	Firmware download processing is incomplete. This occurs when the device's power is turned OFF while downloading.		-	Yes	-
8X--7305	Update processing is incomplete. Power was turned OFF before starting update processing after completion of download.		-	Yes	-
8X--7401	Retrieval of distribution information failed.		-	Yes	-
8X--7501	Execution of distribution process failed.		-	Yes	-
8X--7502	The scheduled distribution was not executed even after a certain period of time for a reason such as the device's power being OFF at the scheduled time.	Register the distribution schedule again because the schedule information is discarded when the distribution is not executed after a certain period of time. Be sure to specify a date and time when the device's power will be ON.	-	Yes	-
8X--7503	Download results could not be obtained.	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-
8X--7504	There is not even a single entry in the download list information.		-	Yes	-
8X--AXXX	Communication error in the internal module	Contact the Support Dept. of the sales company. (Attach the Sublog and update log of the corresponding device)	-	Yes	-

● List of Error Codes relating to Local CDS

A list of the error codes caused by Local CDS is shown below.

Error Codes	Description	Remedy
81--F003	Unregistered firmware information. When there is no firmware information corresponding to the serial No. of the applicable device.	Contact the Support Dept. of the sales company.
81--F007	Invalid firmware version. When the version of the current firmware does not match the version of the firmware at the time it was scheduled.	
81--F008	Firmware information error. When there is no information relating to the firmware to be distributed.	
81--F009	Forcible termination. When the distribution of information from the server UI is forcibly terminated.	
81--F00F	Distribution status error. Distribution status when the request method from the client cannot be accepted by the server.	
81--F010	Parameter error. When the request parameter from the client is incorrect.	
81--F011	Unregistered version information. When version information corresponding to the specified serial No. has not been registered.	

Error Codes	Description	Remedy
81--F012	Distribution time-out. When distribution is not completed even after a certain time has elapsed since the start of distribution.	Contact the Support Dept. of the sales company.
81--F013	The necessity of distribution is indeterminable. Version information of the device has not been registered in the Local CDS. The Local CDS cannot respond even when there is a distribution request from the Updater because the version information of the device is unknown. This led to an error when the request was made.	
81--FFFE	DB error. General DB access error	
81--FFFF	DB error. Internal error other than DB access such as file I/O.	
8X--1204	Local CDS was updated for models that do not support Local CDS.	

● Error Code when Linking with UGW

Codes displayed as e-RDS errors when linking with UGW are shown below.

Error Codes	Description	Remedy
8--X0000	An unexpected error occurred inside the device.	Restart the device and repeat the operation. If the problem persists, reinstall (upgrade) the firmware of the device.
8--X0002	Time-out occurred because there was no response from Updater within the specified period of time (3 sec.).	Collect Sublog and contact the Support Dept. of the sales company.
8--X0101	Processing in the device (event processing) failed.	Restart the device and repeat the operation. If the problem persists, reinstall (upgrade) the firmware of the device.
8--X0303	Processing in the device (event processing) failed and queued transmission could not be performed.	Restart the device and repeat the operation. If the problem persists, reinstall (upgrade) the firmware of the device.
8--X0304	An error occurred at synchronization between concurrently operating processes or at control of interruption processing.	Execute the communication test again after waiting a while.
8--X0706	Communication with Updater could not be established.	Restart the device and repeat the operation after confirming that Updater has started. If the problem persists, collect a Sublog and contact the Support Dept. of the sales company.
8--X0707		
8--X0708		
8--X0709	When updating the firmware, there was a mismatch between the TrackingID specified by UGW and the TrackingID responded to by Updater.	Collect Sublog and contact the Support Dept. of the sales company.

● Error Codes not Listed in the Error Code List and Remedies

Error occurrence situation

When an error code not listed in the error code list is displayed, it is possible that the error occurred in any of the following situations.

< Error occurrence situation and Description >

Error occurrence situation	Description
Communication test, others (main screen)	The log could not be written because the maximum value was exceeded (capacity/no. of files).
Version information notifications (main screen)	The version of the device's firmware has not been registered in the CDS Server.
	The device could not be connected to the distribution server when notifying the version information.
	The network cable was disconnected while the version information is being notified.
	The device was restarted while the version information was being notified.
Linkage with UGW (main screen)	[CDS-UGW] (linkage with UGW) is set to ON when [E-RDS] is OFF in the device's service mode.
On-site (error dialog box)	An internal error occurred when collecting applicable firmware information.
Immediate download (error dialog box)	An internal error occurred when requesting firmware distribution information.
	There was not enough free space in the disk storage destination to complete the download.
Manual/automatic update (error dialog box)	An internal error occurred when starting the update.

Error occurrence situation	Description
Deletion of downloaded firmware	An internal error occurred when notifying cancellation.

Remedy

Check that the size of the log files shown below do not exceed the maximum values and repeat the operation.
If this problem persists, collect a log and contact the Support Dept. of the sales company.

< Logs and their maximum values >

Log name	Maximum capacity	Maximum No. of files
Update log	128 KB/file	4
System log	512 KB/file	4

7 Error/Jam/Alarm

Outline

For PRISMAsync model, refer to PRISMAsync service manual.

Overview

This section describes the error codes that are displayed when failure has occurred. The codes are divided into three categories.

Code types	Description	Reference
Error Codes	This code is displayed when a failure caused by the host machine has occurred.	
Jam code	This code is displayed when a jam occurs inside the machine.	“Jam Code” on page 1550
Alarm Codes	This code is displayed when some functions are disabled.	

Location Code

The error codes and jam codes of this machine contain information on the location.
The location is displayed in 2 digits and has the meaning shown below: (On the error and jam display screens, the location code is shown in the "L" column.)

Device	JAM	ERR	ALARM
imagePRESS C850/C750/C650/C65	00	Main Controller: 00 Printer engine: 05	04, Other than those below
Duplex Color Image Reader Unit-K1 (Reader + DADF)	01	04	02, 50
POD Deck Lite-C1	11	11	04
Multi-drawer Paper Deck-C1	11	11	04
Document Insertion Unit-N1	71	71	67
Multi Function Professional Puncher-A1	31	31	-
Perfect Binder-E1	61	61	66
High Capacity Stacker-H1	51	51	-
Paper Folding Unit-J1	02	02	-
Staple Finisher-W1 PRO/ Booklet Finisher-W1 PRO	02	02	60, 61, 62, 64
Staple Finisher-T1/ Booklet Finisher-T1	02	02	60, 61, 62, 64
External 2/3 Hole Puncher-C1/ External 2/4 Hole Puncher-C1/ External 4 Hole Puncher-C1	02	02	-
Booklet Trimmer-F1	02	02	69
Two-Knife Booklet Trimmer-A1	02	02	-

Pickup position code

When jam occurs, pickup location is indicated with the following pickup position code.
In the jam display screen, the “P” row corresponds to the pickup position code.

Pickup position		Pickup position code
At Finisher jam/At error avoidance jam/At ADF jam without pickup operation (at SEND, Inbox, etc.)		00
Cassette 1		01
Cassette 2		02
Cassette 3		03
Multi-purpose Tray		05
POD Deck Lite		06
Duplex (At duplex printing, jam occurs after paper passes through the Duplex Paper Sensor (PS24).)		F0
Multi-drawer Paper Deck-A1	Upper deck	11
	Middle deck	12

Pickup position		Pickup position code
Multi-drawer Paper Deck-A1	Lower deck	13

Size of Paper Picked Up

The paper size is displayed when a jam occurs. (The paper size is shown in the "SIZE" column on the jam screen .)
The names of some paper sizes may be omitted due to restrictions on the number of displayed characters. The displayed character strings and paper sizes are shown below.
* Below is the display specifications and not the paper that can actually be used.

Displayed	Paper size	Displayed	Paper size

Points to Note When Clearing MN-CON

- Execution of clearing MN-COM deletes all data in Forwarding Settings, Settings/Registration (Preferences), Adjustment/Maintenance, Function Settings, Management Settings, TPM Settings, etc. Before execution of this operation, ask user to back up the data and get approval for this operation.
- When clearing MN-CON while any login application other than Default Authentication is, error such as not displayed login screen occurred. In this case, access SMS once and switch login application to Default Authentication to recover to the normal status.

Points to Note When Clearing HDD

As a remedy for error codes (E602-XXXX), HDD partition is selected and the target partition may be cleared.
When clearing partition, be sure to check which data will be deleted by referring “Details of HDD Partition” on page 2721 and explain to the user before starting work.

Error Code

Error Code Details

001-0001-05	Fixing Main Thermistor high temperature detection error
Detection Description	The Fixing Main Thermistor in the Fixing Assembly detected 240 deg C or higher.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Fixing Belt Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Fixing Main Thermistor. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of below 240 deg C, replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. b. In the case of 240 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-UC" again. a. In the case of below 240 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 240 deg C or higher, replace the Relay PCB.

001-0002-05	Fixing Sub Thermistor 1 high temperature detection error
Detection Description	The Fixing Sub Thermistor 1 in the Fixing Assembly detected 240 deg C or higher.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Sub Thermistor 1 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Sub Thermistor 1 (THM1-2) - Fixing Belt Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Fixing Sub Thermistor 1. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Fixing Sub Thermistor 1 in COPIER> DISPLAY> ANALOG> FIX-UE. a. In the case of below 240 deg C, replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. b. In the case of 240 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-UE" again. a. In the case of below 240 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 240 deg C or higher, replace the Relay PCB.

001-0003-05	Fixing Sub Thermistor 2 high temperature detection error
Detection Description	The Fixing Sub Thermistor 2 in the Fixing Assembly detected 240 deg C or higher.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Sub Thermistor 2 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Sub Thermistor 2 (THM1-3) - Fixing Belt Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Fixing Sub Thermistor 2. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Fixing Sub Thermistor 2 in COPIER> DISPLAY> ANALOG> FIX-UE2. a. In the case of below 240 deg C, replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. b. In the case of 240 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-UE2" again. a. In the case of below 240 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 240 deg C or higher, replace the Relay PCB.

001-0011-05	Fixing Main Thermistor high temperature detection error
Detection Description	The Fixing Main Thermistor in the Fixing Assembly detected 240 deg C or higher 5 times.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Fixing Belt Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Fixing Main Thermistor. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of below 240 deg C, replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. b. In the case of 240 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-UC" again. a. In the case of below 240 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 240 deg C or higher, replace the Relay PCB.

001-0012-05	Fixing Sub Thermistor 1 high temperature detection error
Detection Description	The Fixing Sub Thermistor 1 in the Fixing Assembly detected 240 deg C or higher 5 times.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Sub Thermistor 1 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Sub Thermistor 1 (THM1-2) - Fixing Belt Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Fixing Sub Thermistor 1. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Fixing Sub Thermistor 1 in COPIER> DISPLAY> ANALOG> FIX-UE. a. In the case of below 240 deg C, replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. b. In the case of 240 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-UE" again. a. In the case of below 240 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 240 deg C or higher, replace the Relay PCB.

001-0013-05	Fixing Sub Thermistor 2 high temperature detection error
Detection Description	The Fixing Sub Thermistor 2 in the Fixing Assembly detected 240 deg C or higher 5 times.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Sub Thermistor 2 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Sub Thermistor 2 (THM1-3) - Fixing Belt Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Fixing Sub Thermistor 2. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Fixing Sub Thermistor 2 in COPIER> DISPLAY> ANALOG> FIX-UE2. a. In the case of below 240 deg C, replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. b. In the case of 240 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-UE2" again. a. In the case of below 240 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 240 deg C or higher, replace the Relay PCB.

001-0102-05	Pressure Sub Thermistor 1 high temperature detection error
Detection Description	The Pressure Sub Thermistor 1 in the Fixing Assembly detected 230 deg C or higher.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Sub Thermistor 1 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (6P) 4. Relay Connector (6P) to Relay Connector (2P) 5. Relay Connector (2P) to Pressure Sub Thermistor 1 (THM3) - Pressure Sub Thermistor 1 (THM3) - Pressure Stay Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Pressure Sub Thermistor 1. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Pressure Sub Thermistor 1 in COPIER> DISPLAY> ANALOG> FIX-LE. a. In the case of below 230 deg C 1. Replace the Pressure Sub Thermistor 1. 2. Replace the Pressure Stay Unit. b. In the case of 230 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-LE" again. a. In the case of below 230 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 230 deg C or higher, replace the Relay PCB.

001-0103-05	Pressure Sub Thermistor 2 high temperature detection error
Detection Description	The Pressure Sub Thermistor 2 in the Fixing Assembly detected 245 deg C or higher.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Sub Thermistor 2 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (6P) 4. Relay Connector (6P) to Relay Connector (2P) 5. Relay Connector (2P) to Pressure Sub Thermistor 2 (THM4) - Pressure Sub Thermistor 2 (THM4) - Pressure Stay Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Pressure Sub Thermistor 2. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Pressure Sub Thermistor 2 in COPIER> DISPLAY> ANALOG> FIX-LE2. a. In the case of below 230 deg C 1. Replace the Pressure Sub Thermistor 2. 2. Replace the Pressure Stay Unit. b. In the case of 230 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-LE2" again. a. In the case of below 230 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 230 deg C or higher, replace the Relay PCB.

001-0111-05	Pressure Main Thermistor high temperature detection error
Detection Description	The Pressure Main Thermistor in the Fixing Assembly detected 230 deg C or higher 5 times.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (5P) 4. Relay Connector (5P) to Fixing Thermistor Relay PCB (UN27/J592) 5. Fixing Thermistor Relay PCB (UN27/J591) to Pressure Main Thermistor (THM2) - Pressure Main Thermistor (THM2) - Pressure Stay Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Pressure Main Thermistor. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Pressure Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-LC. a. In the case of below 230 deg C 1. Replace the Pressure Main Thermistor. 2. Replace the Pressure Stay Unit. b. In the case of 230 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-LC" again. a. In the case of below 230 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 230 deg C or higher, replace the Relay PCB.

001-0112-05	Pressure Sub Thermistor 1 high temperature detection error
Detection Description	The Pressure Sub Thermistor 1 in the Fixing Assembly detected 230 deg C or higher 5 times.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Sub Thermistor 1 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (6P) 4. Relay Connector (6P) to Relay Connector (2P) 5. Relay Connector (2P) to Pressure Sub Thermistor 1 (THM3) - Pressure Sub Thermistor 1 (THM3) - Pressure Stay Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Pressure Sub Thermistor 1. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Pressure Sub Thermistor 1 in COPIER> DISPLAY> ANALOG> FIX-LE. a. In the case of below 230 deg C 1. Replace the Pressure Sub Thermistor 1. 2. Replace the Pressure Stay Unit. b. In the case of 230 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-LE" again. a. In the case of below 230 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 230 deg C or higher, replace the Relay PCB.

001-0113-05	Pressure Sub Thermistor 2 high temperature detection error
Detection Description	The Pressure Sub Thermistor 2 in the Fixing Assembly detected 230 deg C or higher 5 times.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Sub Thermistor 2 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (6P) 4. Relay Connector (6P) to Relay Connector (2P) 5. Relay Connector (2P) to Pressure Sub Thermistor 2 (THM4) - Pressure Sub Thermistor 2 (THM4) - Pressure Stay Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harnesses from the Relay PCB to the Pressure Sub Thermistor 2. 2. After pulling out the Fixing Feed Unit, check the detected temperature of the Pressure Sub Thermistor 2 in COPIER> DISPLAY> ANALOG> FIX-LE2. a. In the case of below 230 deg C 1. Replace the Pressure Sub Thermistor 2. 2. Replace the Pressure Stay Unit. b. In the case of 230 deg C or higher, disconnect the Relay PCB Connector (J1810) and then check "FIX-LE2" again. a. In the case of below 230 deg C, replace the harness between the Relay PCB and the Fixing Drawer. b. In the case of 230 deg C or higher, replace the Relay PCB.

002-0001-05	Fixing Belt temperature increase detection error
Detection Description	The detected temperature of the Fixing Main Thermistor did not reach 50 deg C within 120 sec after the Fixing Belt temperature control of the Fixing Assembly started once the main power was turned ON.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Harnesses from the IH Power Supply PCB to the IH Coil 1. IH Power Supply PCB (UN30/J510) to Fixing Belt Unit Drawer 2. Fixing Belt Unit Drawer to IH Coil (H4) - Fixing Belt Unit - Relay PCB (UN7) - IH Power Supply PCB (UN30) - IH Power Supply Unit - IH Coil (H4) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of 0 deg C 1. Check the harnesses from the Relay PCB to the Fixing Main Thermistor. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 3. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the Relay PCB. b. In the case of other than 0 deg C 1. Check the harness between the IH Power Supply PCB and the IH Coil. 2. Replace the IH Power Supply PCB. 3. Replace the IH Power Supply Unit. 4. Replace the IH Coil. 5. Replace the Relay PCB.

002-0002-05	Fixing Main Thermistor temperature increase detection error
Detection Description	The detected temperature of the Fixing Main Thermistor in the Fixing Assembly did not reach 80 deg C within 120 sec after it reached 50 deg C at warm-up.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Harnesses from the IH Power Supply PCB to the IH Coil 1. IH Power Supply PCB (UN30/J510) to Fixing Belt Unit Drawer 2. Fixing Belt Unit Drawer to IH Coil (H4) - Fixing Belt Unit - Relay PCB (UN7) - IH Power Supply PCB (UN30) - IH Power Supply Unit - IH Coil (H4) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of 0 deg C 1. Check the harnesses from the Relay PCB to the Fixing Main Thermistor. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 3. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the Relay PCB. b. In the case of other than 0 deg C 1. Check the harness between the IH Power Supply PCB and the IH Coil. 2. Replace the IH Power Supply PCB. 3. Replace the IH Power Supply Unit. 4. Replace the IH Coil. 5. Replace the Relay PCB.

002-0003-05	Fixing Main Thermistor temperature increase detection error
Detection Description	The detected temperature of the Fixing Main Thermistor in the Fixing Assembly did not reach 110 deg C within 120 sec after it reached 80 deg C at warm-up.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Harnesses from the IH Power Supply PCB to the IH Coil 1. IH Power Supply PCB (UN30/J510) to Fixing Belt Unit Drawer 2. Fixing Belt Unit Drawer to IH Coil (H4) - Fixing Belt Unit - Relay PCB (UN7) - IH Power Supply PCB (UN30) - IH Power Supply Unit - IH Coil (H4) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of 0 deg C 1. Check the harnesses from the Relay PCB to the Fixing Main Thermistor. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 3. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the Relay PCB. b. In the case of other than 0 deg C 1. Check the harness between the IH Power Supply PCB and the IH Coil. 2. Replace the IH Power Supply PCB. 3. Replace the IH Power Supply Unit. 4. Replace the IH Coil. 5. Replace the Relay PCB.

002-0004-05	Fixing Main Thermistor temperature increase detection error
Detection Description	The detected temperature of the Fixing Main Thermistor in the Fixing Assembly did not reach 130 deg C within 120 sec after it reached 110 deg C at warm-up.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Harnesses from the IH Power Supply PCB to the IH Coil 1. IH Power Supply PCB (UN30/J510) to Fixing Belt Unit Drawer 2. Fixing Belt Unit Drawer to IH Coil (H4) - Fixing Belt Unit - Relay PCB (UN7) - IH Power Supply PCB (UN30) - IH Power Supply Unit - IH Coil (H4) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of 0 deg C 1. Check the harnesses from the Relay PCB to the Fixing Main Thermistor. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 3. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the Relay PCB. b. In the case of other than 0 deg C 1. Check the harness between the IH Power Supply PCB and the IH Coil. 2. Replace the IH Power Supply PCB. 3. Replace the IH Power Supply Unit. 4. Replace the IH Coil. 5. Replace the Relay PCB.

002-0005-05	Fixing Main Thermistor temperature increase detection error
Detection Description	The detected temperature of the Fixing Main Thermistor in the Fixing Assembly did not reach 150 deg C within 120 sec after it reached 130 deg C at warm-up.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Harnesses from the IH Power Supply PCB to the IH Coil 1. IH Power Supply PCB (UN30/J510) to Fixing Belt Unit Drawer 2. Fixing Belt Unit Drawer to IH Coil (H4) - Fixing Belt Unit - Relay PCB (UN7) - IH Power Supply PCB (UN30) - IH Power Supply Unit - IH Coil (H4) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of 0 deg C 1. Check the harnesses from the Relay PCB to the Fixing Main Thermistor. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 3. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the Relay PCB. b. In the case of other than 0 deg C 1. Check the harness between the IH Power Supply PCB and the IH Coil. 2. Replace the IH Power Supply PCB. 3. Replace the IH Power Supply Unit. 4. Replace the IH Coil. 5. Replace the Relay PCB.

002-0006-05	Fixing Main Thermistor temperature increase detection error
Detection Description	The detected temperature of the Fixing Main Thermistor in the Fixing Assembly did not reach the target temperature within 300 sec after it reached 150 deg C at warm-up.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Harnesses from the IH Power Supply PCB to the IH Coil 1. IH Power Supply PCB (UN30/J510) to Fixing Belt Unit Drawer 2. Fixing Belt Unit Drawer to IH Coil (H4) - Fixing Belt Unit - Relay PCB (UN7) - IH Power Supply PCB (UN30) - IH Power Supply Unit - IH Coil (H4) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of 0 deg C 1. Check the harnesses from the Relay PCB to the Fixing Main Thermistor. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 3. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the Relay PCB. b. In the case of other than 0 deg C 1. Check the harness between the IH Power Supply PCB and the IH Coil. 2. Replace the IH Power Supply PCB. 3. Replace the IH Power Supply Unit. 4. Replace the IH Coil. 5. Replace the Relay PCB.

002-0101-05	Pressure Belt temperature increase detection error
Detection Description	The detected temperature of the Pressure Main Thermistor did not reach 50 deg C within 250 sec after the Pressure Belt temperature control of the Fixing Assembly started once the main power was turned ON.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (5P) 4. Relay Connector (5P) to Fixing Thermistor Relay PCB (UN27/J592) 5. Fixing Thermistor Relay PCB (UN27/J591) to Pressure Main Thermistor (THM2) - Harnesses from the AC Driver PCB to the Fixing Drawer 1. AC Driver PCB (UN10/J810) to Relay Connector (4P) 2. Relay Connector (4P) to Relay Connector (4P) 3. Relay Connector (4P) to Fixing Drawer (J8001) - Pressure Main Thermistor (THM2) - Pressure Stay Unit - Relay PCB (UN7) - AC Driver PCB (UN10) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check the detected temperature of the Pressure Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-LC. a. In the case of 0 deg C 1. Check the harnesses from the Relay PCB to the Pressure Main Thermistor. 2. Check the harnesses from hte AC Driver PCB to the Fixing Drawer. 3. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 4. Replace the Pressure Main Thermistor. 5. Replace the Pressure Stay Unit. 6. Replace the Relay PCB. b. In the case of other than 0 deg C 1. Replace the AC Driver PCB. 2. Replace the Relay PCB.

002-0102-05	Pressure Main Thermistor temperature increase detection error
Detection Description	The detected temperature of the Pressure Main Thermistor in the Fixing Assembly did not reach 80 deg C within 250 sec after it reached 50 deg C at warm-up.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (5P) 4. Relay Connector (5P) to Fixing Thermistor Relay PCB (UN27/J592) 5. Fixing Thermistor Relay PCB (UN27/J591) to Pressure Main Thermistor (THM2) - Harnesses from the AC Driver PCB to the Fixing Drawer 1. AC Driver PCB (UN10/J810) to Relay Connector (4P) 2. Relay Connector (4P) to Relay Connector (4P) 3. Relay Connector (4P) to Fixing Drawer (J8001) - Pressure Main Thermistor (THM2) - Pressure Stay Unit - Relay PCB (UN7) - AC Driver PCB (UN10) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check whether the detected temperature of the Pressure Main Thermistor has risen in COPIER> DISPLAY> ANALOG> FIX-LC. a. If the temperature has risen 1. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 2. Check the harnesses from the Relay PCB to the Pressure Main Thermistor. 3. Replace the Pressure Main Thermistor. 4. Replace the Pressure Stay Unit. 5. Replace the Relay PCB. b. If the temperature has not risen 1. Check the harnesses from the AC Driver PCB to the Fixing Drawer. 2. Replace the AC Driver PCB. 3. Replace the Relay PCB.

003-0001-05	Fixing Main Thermistor low temperature detection error
Detection Description	The Fixing Main Thermistor in the Fixing Assembly detected 110 deg C or lower for 10 sec after Standby.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Harnesses from the IH Power Supply PCB to the IH Coil 1. IH Power Supply PCB (UN30/J510) to Fixing Belt Unit Drawer 2. Fixing Belt Unit Drawer to IH Coil (H4) - Fixing Belt Unit - Relay PCB (UN7) - IH Power Supply PCB - IH Power Supply Unit - IH Coil [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of 0 deg C 1. Check the harnesses from the Relay PCB to the Fixing Main Thermistor. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 3. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the Relay PCB. b. In the case of other than 0 deg C 1. Check the harness between the IH Power Supply PCB and the IH Coil. 2. Replace the IH Power Supply PCB. 3. Replace the IH Power Supply Unit. 4. Replace the IH Coil. 5. Replace the Relay PCB.

003-0002-05	Pressure Main Thermistor low temperature detection error
Detection Description	The Pressure Main Thermistor in the Fixing Assembly detected 40 deg C or lower for 10 sec after Standby.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (5P) 4. Relay Connector (5P) to Fixing Thermistor Relay PCB (UN27/J592) 5. Fixing Thermistor Relay PCB (UN27/J591) to Pressure Main Thermistor (THM2) - Harnesses from the AC Driver PCB to the Fixing Drawer 1. AC Driver PCB (UN10/J810) to Relay Connector (4P) 2. Relay Connector (4P) to Relay Connector (4P) 3. Relay Connector (4P) to Fixing Drawer (J8001) - Pressure Main Thermistor (THM2) - Pressure Stay Unit - Relay PCB (UN7) - AC Driver PCB (UN10) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check whether the detected temperature of the Pressure Main Thermistor has risen in COPIER> DISPLAY> ANALOG> FIX-LC. a. If the temperature has risen 1. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 2. Check the harnesses from the Relay PCB to the Pressure Main Thermistor. 3. Replace the Pressure Main Thermistor. 4. Replace the Pressure Stay Unit. 5. Replace the Relay PCB. b. If the temperature has not risen 1. Check the harness between the AC Driver PCB and the Fixing Drawer. 2. Replace the AC Driver PCB. 3. Replace the Relay PCB.

003-0003-05	Pressure Sub Thermistor 1 low temperature detection error
Detection Description	The Pressure Sub Thermistor 1 (Rear) in the Fixing Assembly detected 40 deg C or lower for 250 sec after Standby.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Sub Thermistor 1 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (6P) 4. Relay Connector (6P) to Relay Connector (2P) 5. Relay Connector (2P) to Pressure Sub Thermistor 1 (THM3) - Harnesses from the AC Driver PCB to the Fixing Drawer 1. AC Driver PCB (UN10/J810) to Relay Connector (4P) 2. Relay Connector (4P) to Relay Connector (4P) 3. Relay Connector (4P) to Fixing Drawer (J8001) - Pressure Sub Thermistor 1 (THM3) - Pressure Stay Unit - Pressure Belt Unit - AC Driver PCB (UN10) - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check whether the detected temperature of the Pressure Sub Thermistor 1 has risen in COPIER> DISPLAY> ANALOG> FIX-LE. a. If the temperature has risen 1. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 2. Check the harnesses from the Relay PCB to the Pressure Sub Thermistor 1. 3. Replace the Pressure Sub Thermistor 1. 4. Replace the Pressure Stay Unit. 5. Replace the Pressure Belt Unit. [CAUTION] When replacing the Pressure Belt Unit, execute "Adjustment during Pressure Belt replacement" in situation mode. b. If the temperature has not risen 1. Check the harnesses from the AC Driver PCB to the Fixing Drawer. 2. Replace the AC Driver PCB. 3. Replace the Relay PCB.

003-0004-05	Pressure Sub Thermistor 2 low temperature detection error
Detection Description	The Pressure Sub Thermistor 2 (Front) in the Fixing Assembly detected 40 deg C or lower for 250 sec after Standby.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Sub Thermistor 2 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (6P) 4. Relay Connector (6P) to Relay Connector (2P) 5. Relay Connector (2P) to Pressure Sub Thermistor 2 (THM4) - Harnesses from the AC Driver PCB to the Fixing Drawer 1. AC Driver PCB (UN10/J810) to Relay Connector (4P) 2. Relay Connector (4P) to Relay Connector (4P) 3. Relay Connector (4P) to Fixing Drawer (J8001) - Pressure Sub Thermistor 2 (THM4) - Pressure Stay Unit - Pressure Belt Unit - AC Driver PCB (UN10) - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. Check whether the detected temperature of the Pressure Sub Thermistor 2 has risen in COPIER> DISPLAY> ANALOG> FIX-LE2. a. If the temperature has risen 1. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 2. Check the harnesses from the Relay PCB to the Pressure Sub Thermistor 2. 3. Replace the Pressure Sub Thermistor 2. 4. Replace the Pressure Stay Unit. 5. Replace the Pressure Belt Unit. [CAUTION] When replacing the Pressure Belt Unit, execute "Adjustment during Pressure Belt replacement" in situation mode. b. If the temperature has not risen 1. Check the harnesses from the AC Driver PCB to the Fixing Drawer. 2. Replace the AC Driver PCB. 3. Replace the Relay PCB.

003-0005-05	Fixing Main Thermistor low temperature detection error
Detection Description	The detected temperature of the Fixing Main Thermistor in the Fixing Assembly did not reach the target temperature within 300 sec during standby/energy saver mode.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Harnesses from the IH Power Supply PCB to the IH Coil 1. IH Power Supply PCB (UN30/J510) to Fixing Belt Unit Drawer 2. Fixing Belt Unit Drawer to IH Coil (H4) - Fixing Belt Unit - Relay PCB (UN7) - IH Power Supply Unit [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of 0 deg C 1. Check the harnesses from the Relay PCB to the Fixing Drawer. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. b. In the case of other than 0 deg C 1. Check the harness between the IH Power Supply PCB and the IH Coil. 2. Replace the IH Power Supply Unit. 2. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 3. Replace the Relay PCB.

003-0006-05	Fixing Main Thermistor low temperature detection error
Detection Description	The Fixing Main Thermistor in the Fixing Assembly detected a temperature drop of 20 deg C or more after reaching the target temperature for consecutive 20 sec or longer during standby/energy saver mode.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Harnesses from the IH Power Supply PCB to the IH Coil 1. IH Power Supply PCB (UN30/J510) to Fixing Belt Unit Drawer 2. Fixing Belt Unit Drawer to IH Coil (H4) - Fixing Belt Unit - Relay PCB (UN7) - IH Power Supply Unit [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the detected temperature of the Fixing Main Thermistor in COPIER> DISPLAY> ANALOG> FIX-UC. a. In the case of 0 deg C 1. Check the harnesses from the Relay PCB to the Fixing Drawer. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. b. In the case of other than 0 deg C 1. Check the harness between the IH Power Supply PCB and the IH Coil. 2. Replace the IH Power Supply Unit. 2. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 3. Replace the Relay PCB.

004-0001-05	Protection circuit error
Detection Description	Voltage error was detected while the IH Power Supply Relay was turned OFF.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the IH Power Supply PCB 1. Relay PCB (UN7/J1812) to Relay Connector (23P) 2. Relay Connector (23P) to IH Power Supply PCB (UN30/J501) - IH Power Supply PCB - Relay PCB (UN7) [Remedy] Check/replace the related harness/cable, connector and parts.

004-0101-05	Protection circuit error
Detection Description	Triac short-circuit in the Halogen Heater of the Fixing Assembly was detected.
Remedy	[Related parts] R1.00 - Harnesses from the AC Driver PCB to the Pressure Thermoswitch 1. AC Driver PCB (UN10/J810) to Relay Connector (4P) 2. Relay Connector (4P) to Relay Connector (4P) 3. Relay Connector (4P) to Fixing Drawer (J8001) 4. Fixing Drawer (J8001) to Pressure Heater (H5) 5. Pressure Heater (H5) to Pressure Thermoswitch (TP1) - Pressure Heater (H5) - Pressure Stay Unit [Remedy] Check/replace the related harness/cable, connector and parts.

004-0201-05	Protection circuit error
Detection Description	Temperature difference between the Fixing Sub Thermistor 1 and Fixing Sub Thermistor 2 in the Fixing Assembly was greater than the specified value.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Sub Thermistor 1/2 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Sub Thermistor 1/2 (THM1-2/3) - Fixing Belt Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. Check whether the detected temperature of the Fixing Sub Thermistor 1/2 has risen in COPIER> DISPLAY> ANALOG> FIX-UE/UE2. a. If either "FIX-UE" or "FIX-UE2" did not detect temperature (0 deg C) 1. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 2. Check the harnesses from the Relay PCB to the Fixing Drawer and the harness between the Fixing Fuse PCB and the Fixing Drawer. 3. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the Relay PCB. 5. Replace the Fixing Drawer Harness. b. If both "FIX-UE" and "FIX-UE2" detected temperature (not 0 deg C) 1. Replace the Relay PCB. 2. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode.

004-0202-05	Protection circuit error
Detection Description	Temperature difference between the Fixing Main Thermistor and Fixing Sub Thermistor 2 in the Fixing Assembly was greater than the specified value.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor/Fixing Sub Thermistor 2 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor/Fixing Sub Thermistor 2 (THM1-1/3) - Fixing Belt Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. Check whether the detected temperature of the Fixing Main Thermistor/Fixing Sub Thermistor 2 has risen in COPIER> DISPLAY> ANALOG> FIX-UC/UE2. a. If either "FIX-UC" or "FIX-UE2" did not detect temperature (0 deg C) 1. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 2. Check the harnesses from the Relay PCB to the Fixing Drawer and the harness between the Fixing Fuse PCB and the Fixing Drawer. 3. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the Relay PCB. 5. Replace the Fixing Drawer Harness. b. If both "FIX-UC" and "FIX-UE2" detected temperature (not 0 deg C) 1. Replace the Relay PCB. 2. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode.

004-0203-05	Protection circuit error
Detection Description	Temperature difference between the Fixing Main Thermistor and Fixing Sub Thermistor 1 in the Fixing Assembly was greater than the specified value.
Remedy	[Related parts] - Harnesses from the Relay PCB to the Fixing Main Thermistor/Fixing Sub Thermistor 1 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor/Fixing Sub Thermistor 1 (THM1-1/2) - Fixing Belt Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. Check whether the detected temperature of the Fixing Main Thermistor/Fixing Sub Thermistor 1 has risen in COPIER> DISPLAY> ANALOG> FIX-UC/UE. a. If either "FIX-UC" or "FIX-UE" did not detect temperature (0 deg C) 1. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 2. Check the harnesses from the Relay PCB to the Fixing Drawer and the harness between the Fixing Fuse PCB and the Fixing Drawer. 3. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the Relay PCB. 5. Replace the Fixing Drawer Harness. b. If both "FIX-UC" and "FIX-UE" detected temperature (not 0 deg C) 1. Replace the Relay PCB. 2. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode.

004-0204-05	Protection circuit error
Detection Description	Temperature difference between Pressure Sub Thermistor 1 and Pressure Sub Thermistor 2 in the Fixing Assembly was greater than the specified value.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Sub Thermistor 1/2 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (6P) 4. Relay Connector (6P) to Relay Connector (2P) 5. Relay Connector (2P) to Pressure Sub Thermistor 1/2 (THM3/4) - Pressure Sub Thermistor 1 (THM3) - Pressure Sub Thermistor 2 (THM4) - Pressure Stay Unit - Relay PCB (UN7) - Pressure Belt Unit [Remedy] Perform the following in the order while checking whether the error is cleared. Check whether the detected temperature of the Pressure Sub Thermistor 1/2 has risen in COPIER> DISPLAY> ANALOG> FIX-LE/LE2. a. If either "FIX-LE" or "FIX-LE2" did not detect temperature (0 deg C) 1. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 2. Check the harnesses from the Relay PCB to the Pressure Sub Thermistor 1 and the harnesses from the Relay PCB to the Pressure Sub Thermistor 2. 3. Replace the Pressure Sub Thermistor 1. 4. Replace the Pressure Sub Thermistor 2. 5. Replace the Pressure Stay Unit. 6. Replace the Relay PCB. 7. Replace the Fixing Drawer Harness. b. If both "FIX-LE" and "FIX-LE2" detected temperature (not 0 deg C) 1. Replace the Pressure Belt Unit. [CAUTION] When replacing the Pressure Belt Unit, execute "Adjustment during Pressure Belt replacement" in situation mode. 2. Replace the Relay PCB.

004-0301-05	Protection circuit error
Detection Description	Overcurrent in the IH Power Supply PCB was detected.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Fuse PCB 1. Relay PCB (UN7/J1813) to Relay Connector (6P) 2. Relay Connector (6P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (3P) 4. Relay Connector (3P) to Round Terminal (MT7) to Fixing Thermoswitch (TP2) to Fixing Fuse PCB (UN13/J9003) - Harnesses from the IH Power Supply PCB to the IH Coil 1. IH Power Supply PCB (UN30/J510) to Fixing Belt Unit Drawer (J8027) 2. Fixing Belt Unit Drawer (J8027) to IH Coil (H4) - Fixing Belt Unit - IH Coil Unit of the Fixing Assembly - IH Power Supply Unit - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the harnesses from the Relay PCB to the Fixing Fuse PCB. 2. Check the harnesses from the IH Power Supply PCB to the IH Coil. 3. Visually check the Fixing Upper Belt for any tear or damage, and then replace it if there is a problem. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 4. Replace the IH Coil Unit of the Fixing Assembly. 5. Replace the IH Power Supply Unit. 6. Replace the Relay PCB.

004-0302-05	IH Power Supply error
Detection Description	The IH Power Supply PCB consecutively detected a current that was the specified value or less during temperature control of the Fixing Assembly.
Remedy	[Related parts] R1.00 - Harnesses between the AC Driver PCB (UN10/J809 and J812) and the IH Power Supply PCB (UN30/J500 and J503) - Harness between the Relay PCB (UN7/J1812) and the IH Power Supply PCB (UN30/J501) - IH Power Supply PCB (UN30) - Relay PCB (UN7) - AC Driver PCB (UN10) [Remedy] Check/replace the related harness/cable, connector and parts.

004-0401-05	Protection circuit error
Detection Description	An error in the IH Power Supply Unit (12 V line) was detected.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Fuse PCB 1. Relay PCB (UN7?J1813) to Relay Connector (6P) 2. Relay Connector (6P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (3P) 4. Relay Connector (3P) to Round Terminal (MT7) to Fixing Thermoswitch (TP2) to Fixing Fuse PCB (UN13/J9003) - Fixing Fuse PCB (UN13) - Fixing Belt Unit - IH Power Supply Unit [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the harness between the IH Power Supply PCB and the IH Coil. 2. Visually check the Fixing Belt for any tear or damage, and then replace it if there is a problem. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 3. Measure the pin 1 and pin 3 of the Fixing Fuse PCB Connector (J9003) using a tester. a. If there is no electrical continuity, replace the Fixing Fuse PCB. b. If there is electrical continuity, replace the Fixing Belt Unit. 4. Replace the IH Power Supply Unit.

004-0501-05	Protection circuit error
Detection Description	Connection error of Fixing Main Thermistor and Fixing Sub Thermistor 1/2 in the Fixing Assembly
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Main Thermistor 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (8P) 4. Relay Connector (8P) to Fixing Main Thermistor (THM1-1) - Fixing Belt Unit - Fixing Fuse PCB (UN13) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check the Fixing Belt for any tear or damage, and then replace the Fixing Belt Unit if there is a problem. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 3. Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode.

004-0502-05	Protection circuit error
Detection Description	Connection error of Pressure Sub Thermistor 1/2 in the Fixing Assembly
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Pressure Sub Thermistor 1/2 1. Relay PCB (UN7/J1810) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Drawer (J8001) 3. Fixing Drawer (J8001) to Relay Connector (6P) 4. Relay Connector (6P) to Relay Connector (2P) 5. Relay Connector (2P) to Pressure Sub Thermistor 1/2 (THM3/4) - Pressure Sub Thermistor 1 (THM3) - Pressure Sub Thermistor 2 (THM4) - Pressure Stay Unit - Relay PCB (UN7) - Pressure Belt Unit [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check the Pressure Belt for any tear or damage, and then replace the Pressure Belt Unit if there is a problem. 2. Check if the drawers on the host machine side and Fixing Assembly side are soiled. If they are soiled, clean them with a blower. 3. Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Pressure Belt Unit, execute "Adjustment during Pressure Belt replacement" in situation mode.

006-0001-05	Connection error of the Fixing Feed Drawer Connector
Detection Description	An error in the Fixing Drawer was detected.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Fixing Feed Driver PCB 1. DC Controller PCB (UN2/J1035, J1222) to Fixing Drawer (J8023DA) 2. Fixing Drawer (J8023LA) to Relay Connector (19P) 3. Relay Connector (19P) to Fixing Feed Driver PCB (UN5/J2002, J2001) - Fixing Feed Driver PCB (UN5) - Drawer Signal Harness - Fixing Feed Drawer Main Harness - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the connector of the Fixing Drawer is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

006-0002-05	Connection error of the Fixing Feed Drawer Connector
Detection Description	It was detected that the Fixing Feed Unit Switch was open while the Front Door was closed.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Feed Unit Switch 1. Relay PCB (UN7/J1813) to Relay Connector (4P) 2. Relay Connector (4P) to Relay Connector (3P) 3. Relay Connector (3P) to Fixing Feed Unit Switch (SW7) - Fixing Feed Unit Switch (SW7) - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Press the Fixing Feed Unit Switch with a finger and check that it returns to position under its own weight. If it does not return to position, replace the Fixing Feed Unit Switch. 2. Place the tester on pin 5 and pin 6 of J1813 on the Relay PCB while pressing the Fixing Feed Unit Switch with a finger. If the measurement value is less than 10 ohms (conduction state), replace the harness between the Relay PCB and the Fixing Feed Unit Switch.

007-0001-05	Fixing Belt full displacement error
Detection Description	The Fixing Belt full displacement was detected at initialization.
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Fixing Belt Position Sensor 1 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (7P) 2. Relay Connector (7P) to Fixing Belt Position Sensor 1 (PS71/J7220) - Harnesses from the Fixing Feed Driver PCB to the Fixing Belt Position Sensor 2 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (7P) 2. Relay Connector (7P) to Fixing Belt Position Sensor 2 (PS72/J7221) - Fixing Belt Position Sensor 1 (PS71) - Fixing Belt Position Sensor 2 (PS72) - Fixing Belt Unit - Displacement Control Upper Unit - Fixing Feed Driver PCB (UN5) [Remedy] Perform the following in the order while checking whether the error is cleared. Visually check the positions of the Fixing Belt Position Sensor 1 and 2 and the Sensor Flag. a. When the Sensor Flag blocks light to the Fixing Belt Position Sensor 1 and 2 at the same time: 1. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 2. Replace the Displacement Control Upper Unit. b. When the Sensor Flag does not block light to the Fixing Belt Position Sensor 1 and 2 at the same time: 1. Check the harness between the Fixing Feed Driver PCB and the Fixing Belt Position Sensor 1. 2. Check the harness between the Fixing Feed Driver PCB and the Fixing Belt Position Sensor 2. 3. Replace the Fixing Belt Position Sensor 1 and 2 at the same time. 4. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 5. Replace the Fixing Feed Driver PCB.

007-0002-05	Pressure Belt full displacement error
Detection Description	The Pressure Belt full displacement was detected at initialization.
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Pressure Belt Position Sensor 1 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Relay Connector (7P) 3. Relay Connector (7P) to Pressure Belt Position Sensor 1 (PS76/J8953) - Harnesses from the Fixing Feed Driver PCB to the Pressure Belt Position Sensor 2 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Relay Connector (7P) 3. Relay Connector (7P) to Pressure Belt Position Sensor 2 (PS77/J8952) - Pressure Belt Position Sensor 1 (PS76) - Pressure Belt Position Sensor 2 (PS77) - Displacement Control Lower Unit - Pressure Belt Unit - Pressure Stay Unit - Fixing Feed Driver PCB (UN5) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the harness between the Fixing Feed Driver PCB and the Pressure Belt Position Sensor 1. 2. Check the harness between the Fixing Feed Driver PCB and the Pressure Belt Position Sensor 2. 3. Check that the Displacement Control Lower Unit is installed properly. 4. Replace the Pressure Belt Unit. [CAUTION] When replacing the Pressure Belt Unit, execute "Adjustment During Pressure Belt Unit Replacement" in situation mode. 5. Replace the Pressure Stay Unit. 6. Replace the Fixing Feed Driver PCB.

007-0011-05	Fixing Belt full displacement error
Detection Description	The Fixing Belt full displacement was detected at the front.
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Fixing Belt Position Sensor 1 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (7P) 2. Relay Connector (7P) to Fixing Belt Position Sensor 1 (PS71/J7220) - Harnesses from the Fixing Feed Driver PCB to the Fixing Belt Position Sensor 2 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (7P) 2. Relay Connector (7P) to Fixing Belt Position Sensor 2 (PS72/J7221) - Fixing Belt Position Sensor 1 (PS71) - Fixing Belt Position Sensor 2 (PS72) - Fixing Belt Unit - Displacement Control Upper Unit - Fixing Feed Driver PCB (UN5) [Remedy] Perform the following in the order while checking whether the error is cleared. Visually check the positions of the Fixing Belt Position Sensor 1 and 2 and the Sensor Flag. a. When the Sensor Flag blocks light to the Fixing Belt Position Sensor 1 and 2 at the same time: 1. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 2. Replace the Fixing Belt Displacement Control Motor Unit. b. When the Sensor Flag does not block light to the Fixing Belt Position Sensor 1 and 2 at the same time: 1. Check the harness between the Fixing Feed Driver PCB and the Fixing Belt Position Sensor 1. 2. Check the harness between the Fixing Feed Driver PCB and the Fixing Belt Position Sensor 2. 3. Replace the Fixing Belt Position Sensor 1 and 2 at the same time. 4. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 5. Replace the Fixing Feed Driver PCB.

007-0012-05	Pressure Belt full displacement error
Detection Description	The Pressure Belt full displacement was detected at the front.
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Pressure Belt Position Sensor 1 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Relay Connector (7P) 3. Relay Connector (7P) to Pressure Belt Position Sensor 1 (PS76/J8953) - Harnesses from the Fixing Feed Driver PCB to the Pressure Belt Position Sensor 2 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P9 to Relay Connector (7P) 3. Relay Connector (7P) to Pressure Belt Position Sensor 2 (PS77/J8952) - Pressure Belt Position Sensor 1 (PS76) - Pressure Belt Position Sensor 2 (PS77) - Displacement Control Lower Unit - Pressure Belt Unit - Pressure Stay Unit - Fixing Feed Driver PCB (UN5) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the harness between the Fixing Feed Driver PCB and the Pressure Belt Position Sensor 1. 2. Check the harness between the Fixing Feed Driver PCB and the Pressure Belt Position Sensor 2. 3. Check that the Displacement Control Lower Unit is installed properly. 4. Replace the Pressure Belt Unit. [CAUTION] When replacing the Pressure Belt Unit, execute "Adjustment During Pressure Belt Unit Replacement" in situation mode. 5. Replace the Pressure Stay Unit. 6. Replace the Fixing Feed Driver PCB.

007-0021-05	Fixing Belt full displacement error
Detection Description	The Fixing Belt full displacement was detected.
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Fixing Belt Position Sensor 1 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (7P) 2. Relay Connector (7P) to Fixing Belt Position Sensor 1 (PS71/J7220) - Harnesses from the Fixing Feed Driver PCB to the Fixing Belt Position Sensor 2 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (7P) 2. Relay Connector (7P) to Fixing Belt Position Sensor 2 (PS72/J7221) - Fixing Belt Position Sensor 1 (PS71) - Fixing Belt Position Sensor 2 (PS72) - Fixing Belt Unit - Displacement Control Upper Unit - Fixing Feed Driver PCB (UN5) [Remedy] Perform the following in the order while checking whether the error is cleared. Visually check the positions of the Fixing Belt Position Sensor 1 and 2 and the Sensor Flag. a. When the Sensor Flag blocks light to the Fixing Belt Position Sensor 1 and 2 at the same time: 1. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 2. Replace the Fixing Belt Displacement Control Motor Unit. b. When the Sensor Flag does not block light to the Fixing Belt Position Sensor 1 and 2 at the same time: 1. Check the harness between the Fixing Feed Driver PCB and the Fixing Belt Position Sensor 1. 2. Check the harness between the Fixing Feed Driver PCB and the Fixing Belt Position Sensor 2. 3. Replace the Fixing Belt Position Sensor 1 and 2 at the same time. 4. Replace the Fixing Belt Unit. [CAUTION] When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. 5. Replace the Fixing Feed Driver PCB.

007-0022-05	Pressure Belt full displacement error
Detection Description	The Pressure Belt full displacement was detected at the rear.
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Pressure Belt Position Sensor 1 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Relay Connector (7P) 3. Relay Connector (7P) to Pressure Belt Position Sensor 1 (PS76/J8953) - Harnesses from the Fixing Feed Driver PCB to the Pressure Belt Position Sensor 2 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Relay Connector (7P) 3. Relay Connector (7P) to Pressure Belt Position Sensor 2 (PS77/J8952) - Pressure Belt Position Sensor 1 (PS76) - Pressure Belt Position Sensor 2 (PS77) - Displacement Control Lower Unit - Pressure Belt Unit - Pressure Stay Unit - Fixing Feed Driver PCB (UN5) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the harness between the Fixing Feed Driver PCB and the Pressure Belt Position Sensor 1. 2. Check the harness between the Fixing Feed Driver PCB and the Pressure Belt Position Sensor 2. 3. Check that the Displacement Control Lower Unit is installed properly. 4. Replace the Pressure Belt Unit. [CAUTION] When replacing the Pressure Belt Unit, execute "Adjustment During Pressure Belt Unit Replacement" in situation mode. 5. Replace the Pressure Stay Unit. 6. Replace the Fixing Feed Driver PCB.

007-0101-05	Fixing Belt HP detection error
Detection Description	The home position of the Fixing Belt could not be detected.
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Fixing Belt Displacement Control Motor 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (15P) 2. Relay Connector (15P) to Fixing Belt Displacement Control Motor (M46/J7204) - Harnesses from the Fixing Feed Driver PCB to the Fixing Belt HP Sensor 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (15P) 2. Relay Connector (15P) to Fixing Belt HP Sensor (PS69/J8007) - Fixing Belt HP Sensor (PS69) - Fixing Belt Displacement Control Motor (M46) - Fixing Feed Driver PCB (UN5) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check that the Displacement Control Unit is installed properly. 2. Check/replace the related harness/cable, connector and parts.

007-0102-05	Pressure Belt HP detection error
Detection Description	The home position of the Pressure Belt could not be detected.
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Pressure Belt Displacement Control Motor 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (9P) 2. Relay Connector (9P) to Pressure Belt Displacement Control Motor (M49/J7206) - Harnesses from the Fixing Feed Driver PCB to the Pressure Belt HP Sensor 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (9P) 2. Relay Connector (9P) to Pressure Belt HP Sensor (PS78/J7229) - Harnesses from the Fixing Feed Driver PCB to the Relay PCB 1. Fixing Feed Driver PCB (UN5/J2000) to Relay Connector (2P) 2. Relay Connector (2P) to Fixing Drawer (J8023) 3. Fixing Drawer (J8023) to Relay Connector (6P) 4. Relay Connector (6P) to Relay PCB (UN7/J1816) - Displacement Control Lower Unit - Pressure Belt HP Sensor (PS78) - Pressure Belt Displacement Control Motor (M49) - Fixing Feed Driver PCB (UN5) - Relay PCB (UN7) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

007-9901-05	Fixing Belt full displacement error
Detection Description	The Fixing Belt Position Sensor detected an error (an impossible combination of sensor signals occurred).
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Fixing Belt Position Sensor 1 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (7P) 2. Relay Connector (7P) to Fixing Belt Position Sensor 1 (PS71/J7220) - Harnesses from the Fixing Feed Driver PCB to the Fixing Belt Position Sensor 2 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (7P) 2. Relay Connector (7P) to Fixing Belt Position Sensor 2 (PS72/J7221) - Fixing Belt Position Sensor 1 (PS71) - Fixing Belt Position Sensor 2 (PS72) - Fixing Feed Driver PCB (UN5) [Remedy] Check/replace the related harness/cable, connector and parts.

007-9902-05	Pressure Belt full displacement error
Detection Description	The Pressure Belt Position Sensor detected an error (an impossible combination of sensor signals occurred).
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Pressure Belt Position Sensor 1 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Relay Connector (7P) 3. Relay Connector (7P) to Pressure Belt Position Sensor 1 (PS76/J8953) - Harnesses from the Fixing Feed Driver PCB to the Pressure Belt Position Sensor 2 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Relay Connector (7P) 3. Relay Connector (7P) to Pressure Belt Position Sensor 2 (PS77/J8952) - Pressure Belt Position Sensor 1 (PS76) - Pressure Belt Position Sensor 2 (PS77) - Pressure Stay Unit - Fixing Feed Driver PCB (UN5) [Remedy] Check/replace the related harness/cable, connector and parts.

008-0001-05	Pressure Belt Unit life detection error
Detection Description	It was detected that the current level of the Fixing Motor was higher than the specified value due to increase of torque of the Pressure Belt Unit.
Remedy	[Related parts] R1.00 - Pressure Belt Unit - Fixing Drive Idler Gear Z75 (fixing feed side) - Fixing Drive Idler Gear Z27 (fixing feed side) - Fixing Idler Gear (Fixing Assembly side) - Fixing Motor (M48) - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Rotate the Fixing Drive Idler Gear Z75/Fixing Drive Idler Gear Z27/Fixing Idler Gear by hand, and visually check that there is no bent, missing teeth or abnormal abrasion (edge of the gear is no longer tooth-shaped). 2. Check the current values in COPIER> DISPLAY> FIXING> FX-MTR2 to 5. a. If the current value is greater than the specified value (FX-MTR2: 2.7, FX-MTR3: 1.6, FX-MTR4: 1.4, FX-MTR5: 0.9) (A), replace the Pressure Belt Unit. [CAUTION] When replacing the Pressure Belt Unit, execute "Adjustment during Pressure Belt replacement" in situation mode. b. If it does not exceed the specified value, replace the Relay PCB. 3. After replacement of the Fixing Motor, clear the Fixing Motor current value log in COPIER> FUNCTION> CLEAR> FX-L-CLR.

008-0002-05	Fixing Belt Unit life detection error
Detection Description	It was detected that the total rotation time (corresponding value) of the Fixing Belt exceeded 150000 hours.
Remedy	[Remedy] Replace the Fixing Belt Unit. [CAUTION] - When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. - Without clearing the counter value, the accumulated counter value before the replacement is added.

008-0003-05	Fixing Belt Unit life detection error
Detection Description	It was detected that the number of sheets fed through the Fixing Belt (counter value) exceeded the specified value. (The upper limit of the number of the sheets fed varies depending on the location.)
Remedy	[Remedy] Replace the Fixing Belt Unit. [CAUTION] - When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. - Without clearing the counter value, the accumulated counter value before the replacement is added.

008-0004-05	Error due to detection of damage of the belt
Detection Description	The Fixing Wrap Sensor detected paper wrapping for 1 sec or longer during warm-up/recovery/ standby.
Remedy	[Related parts] R1.00 - Fixing Belt Unit (Unit of replacement: UPPER BELT ASSEMBLY) - Pressure Belt Unit (Unit of replacement: LOWER BELT ASSEMBLY) - Harnesses from the Fixing Feed Driver PCB to the Fixing Wrap Sensor 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Relay Connector (6P) 3. Relay Connector (6P) to Fixing Wrap Sensor (PS74/J7224) - Fixing Wrap Sensor (PS74) - Fixing Feed Driver PCB (UN5) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] - When replacing the Fixing Belt Unit, execute "Adjustment during Fixing Belt replacement" in situation mode. - When replacing the Pressure Belt Unit, execute "Adjustment during Pressure Belt replacement" in situation mode. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR.

009-0500-05	Pressure Belt Unit HP error
Detection Description	The home position could not be detected at engagement/disengagement of the Pressure Belt Unit.
Remedy	[Related parts] R1.00 - Gears relating to engagement/disengagement of the Pressure Belt Unit 1. 32T Gear 2. 20T Gear 3. 30T Gear 4. 43T/19T Gear - Harnesses from the Fixing Feed Driver PCB to the Fixing Pressure Release Sensor 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Pressure Release Sensor (PS73/J7223) - Harness between the Fixing Feed Driver PCB (UN5/J2010) and the Fixing Engagement/ Disengagement Motor (M47/J7205) - Fixing Pressure Release Sensor (PS73) - Fixing Engagement/Disengagement Motor (M47) - Fixing Feed Driver PCB (UN5) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the gears relating to engagement/disengagement of the Pressure Belt Unit; replace the gear if damaged. 2. Check/replace the related parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

009-0501-05	Pressure Belt Unit timeout error
Detection Description	Engagement operation of the Pressure Belt Unit did not complete within the specified time.
Remedy	[Related parts] R1.00 - Gears relating to engagement/disengagement of the Pressure Belt Unit 1. 32T Gear 2. 20T Gear 3. 30T Gear 4. 43T/19T Gear - Harnesses from the Fixing Feed Driver PCB to the Fixing Pressure Release Sensor 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Pressure Release Sensor (PS73/J7223) - Harness between the Fixing Feed Driver PCB (UN5/J2010) and the Fixing Engagement/ Disengagement Motor (M47/J7205) - Fixing Pressure Release Sensor (PS73) - Fixing Engagement/Disengagement Motor (M47) - Fixing Feed Driver PCB (UN5) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the gears relating to engagement/disengagement of the Pressure Belt Unit; replace the gear if damaged. 2. Check/replace the related parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

009-0502-05	Pressure Belt Unit timeout error
Detection Description	Disengagement operation of the Pressure Belt Unit did not complete within the specified time.
Remedy	[Related parts] R1.00 - Gears relating to engagement/disengagement of the Pressure Belt Unit 1. 32T Gear 2. 20T Gear 3. 30T Gear 4. 43T/19T Gear - Harnesses from the Fixing Feed Driver PCB to the Fixing Pressure Release Sensor 1. Fixing Feed Driver PCB (UN5/J2004) to Relay Connector (19P) 2. Relay Connector (19P) to Fixing Pressure Release Sensor (PS73/J7223) - Harness between the Fixing Feed Driver PCB (UN5/J2010) and the Fixing Engagement/ Disengagement Motor (M47/J7205) - Fixing Pressure Release Sensor (PS73) - Fixing Engagement/Disengagement Motor (M47) - Fixing Feed Driver PCB (UN5) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the gears relating to engagement/disengagement of the Pressure Belt Unit; replace the gear if damaged. 2. Check/replace the related parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

009-0600-05	Refresh Unit HP error
Detection Description	The home position could not be detected at engagement/disengagement of the Refresh Unit of the Fixing Assembly.
Remedy	[Related parts] R1.00 - Gears relating to engagement/disengagement of the Refresh Unit 1. Worm Wheel 2. Z12 Drive Gear 3. 29T/19T Gear 4. Z23 Drive Gear - Harnesses from the Fixing Feed Driver PCB to the Refresh Engagement/Disengagement HP Sensor 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (15P) 2. Relay Connector (15P) to Refresh Engagement/Disengagement HP Sensor (PS120/J8908) - Harnesses from the Fixing Feed Driver PCB to the Refresh Engagement/Disengagement Motor 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (15P) 2. Relay Connector (15P) to Relay Connector (4P) 3. Relay Connector (4P) to Refresh Engagement/Disengagement Motor (M55/J8978) - Refresh Engagement/Disengagement HP Sensor (PS120) - Refresh Engagement/Disengagement Motor (M55) - Fixing Feed Driver PCB (UN5) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the gears relating to engagement/disengagement of the Refresh Unit; replace the gear if damaged. 2. Check/replace the related parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

009-0601-05	Refresh Unit timeout error
Detection Description	Disengagement operation of the Refresh Unit of the Fixing Assembly did not complete within the specified time.
Remedy	[Related parts] R1.00 - Gears relating to engagement/disengagement of the Refresh Unit 1. Worm Wheel 2. Z12 Drive Gear 3. 29T/19T Gear 4. Z23 Drive Gear - Harnesses from the Fixing Feed Driver PCB to the Refresh Engagement/Disengagement HP Sensor 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (15P) 2. Relay Connector (15P) to Refresh Engagement/Disengagement HP Sensor (PS120/J8908) - Harnesses from the Fixing Feed Driver PCB to the Refresh Engagement/Disengagement Motor 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (15P) 2. Relay Connector (15P) to Relay Connector (4P) 3. Relay Connector (4P) to Refresh Engagement/Disengagement Motor (M55/J8978) - Refresh Engagement/Disengagement HP Sensor (PS120) - Refresh Engagement/Disengagement Motor (M55) - Fixing Feed Driver PCB (UN5) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the gears relating to engagement/disengagement of the Refresh Unit; replace the gear if damaged. 2. Check/replace the related parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

009-0602-05	Refresh Unit timeout error
Detection Description	Engagement operation of the Refresh Unit of the Fixing Assembly did not complete within the specified time.
Remedy	[Related parts] R1.00 - Gears relating to engagement/disengagement of the Refresh Unit 1. Worm Wheel 2. Z12 Drive Gear 3. 29T/19T Gear 4. Z23 Drive Gear - Harnesses from the Fixing Feed Driver PCB to the Refresh Engagement/Disengagement HP Sensor 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (15P) 2. Relay Connector (15P) to Refresh Engagement/Disengagement HP Sensor (PS120/J8908) - Harnesses from the Fixing Feed Driver PCB to the Refresh Engagement/Disengagement Motor 1. Fixing Feed Driver PCB (UN5/J2005) to Relay Connector (15P) 2. Relay Connector (15P) to Relay Connector (4P) 3. Relay Connector (4P) to Refresh Engagement/Disengagement Motor (M55/J8978) - Refresh Engagement/Disengagement HP Sensor (PS120) - Refresh Engagement/Disengagement Motor (M55) - Fixing Feed Driver PCB (UN5) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the gears relating to engagement/disengagement of the Refresh Unit; replace the gear if damaged. 2. Check/replace the related parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

012-0100-05	Drum Motor (Y) rotation detection error
Detection Description	The drive of the Drum Motor (Y) in the Process Drive Unit (Y) could not be detected.
Remedy	[Related parts] R1.00 - Harnesses from the Drum ITB Driver PCB and the Drum Motor (Y) 1. Drum ITB Driver PCB (UN6/J1902) to Relay Connector (19P) 2. Relay Connector (19P) to Drum Motor (Y) (M21/J7300) - Drum Motor (Y) (M21) - Drum ITB Driver PCB (UN6) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0102-05	Drum speed detection error (Y)
Detection Description	It was detected that the speed of the Encoder in the Process Drive Unit (Y) was slow for 1 sec consecutively (10 times detections per 100 msec) for the target speed of the Y-color Drum.
Remedy	[Related parts] R1.00 - Harnesses from the Drum ITB Driver PCB to the Drum Speed Detection PCB (Y) 1 1. Drum ITB Driver PCB (UN6/J1902) to Relay Connector (15P) 2. Relay Connector (15P) to Drum Speed Detection PCB (Y) 1 (UN20/J7316) - Harnesses from the Drum ITB Driver PCB to the Drum Speed Detection PCB (Y) 2 1. Drum ITB Driver PCB (UN6/J1902) to Relay Connector (15P) 2. Relay Connector (15P) to Drum Speed Detection PCB (Y) 2 (UN21/J7317) - Drum Unit (Y) - Drum ITB Driver PCB (UN6) - Drum Motor (Y) (M21) - Drum Speed Detection PCB (Y) 1 (UN20) - Drum Speed Detection PCB (Y) 2 (UN21) - Process Drive Unit (Y) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0103-05	Drum speed detection error (Y)
Detection Description	It was detected that the speed of the Encoder in the Process Drive Unit (Y) was fast for 1 sec consecutively (10 times detections per 100 msec) for the target speed of the Y-color Drum.
Remedy	[Related parts] R1.00 - Drum ITB Driver PCB (UN6) - Drum Motor (Y) (M21) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0200-05	Drum Motor (M) rotation detection error
Detection Description	The drive of the Drum Motor (M) in the Process Drive Unit (M) could not be detected.
Remedy	[Related parts] R1.00 - Harnesses from the Drum ITB Driver PCB to the Drum Motor (M) 1. Drum ITB Driver PCB (UN6/J1902) to Relay Connector (15P) 2. Relay Connector (15P) to Drum Motor (M) (M23/J7302) - Drum Motor (M) (M23) - Drum ITB Driver PCB (UN6) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0202-05	Drum speed detection error (M)
Detection Description	It was detected that the speed of the Encoder in the Process Drive Unit (M) was slow for 1 sec consecutively (10 times detections per 100 msec) for the target speed of the M-color Drum.
Remedy	[Related parts] R1.00 - Harnesses from the Drum ITB Driver PCB to the Drum Speed Detection PCB (M) 1 1. Drum ITB Driver PCB (UN6/J1902) to Relay Connector (15P) 2. Relay Connector (15P) to Drum Speed Detection PCB (M) 1 (UN22/J7314) - Harnesses from the Drum ITB Driver PCB to the Drum Speed Detection PCB (M) 2 1. Drum ITB Driver PCB (UN6/J1902) to Relay Connector (15P) 2. Relay Connector (15P) to Drum Speed Detection PCB (M) 2 (UN23/J7315) - Drum Unit (M) - Drum ITB Driver PCB (UN6) - Drum Motor (M) (M23) - Drum Speed Detection PCB (M) 1 (UN22) - Drum Speed Detection PCB (M) 2 (UN23) - Process Drive Unit (M) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0203-05	Drum speed detection error (M)
Detection Description	It was detected that the speed of the Encoder in the Process Drive Unit (M) was fast for 1 sec consecutively (10 times detections per 100 msec) for the target speed of the M-color Drum.
Remedy	[Related parts] R1.00 - Drum ITB Driver PCB (UN6) - Drum Motor (M) (M23) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0300-05	Drum Motor (C) rotation detection error
Detection Description	The drive of the Drum Motor (C) in the Process Drive Unit (C) could not be detected.
Remedy	[Related parts] R1.00 - Harnesses from the Drum ITB Driver PCB to the Drum Motor (C) 1. Drum ITB Driver PCB (UN6/J1903) to Relay Connector (15P) 2. Relay Connector (15P) to Drum Motor (C) (M25/J7304) - Drum Motor (C) (M25) - Drum ITB Driver PCB (UN6) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0302-05	Drum speed detection error (C)
Detection Description	It was detected that the speed of the Encoder in the Process Drive Unit (C) was slow for 1 sec consecutively (10 times detections per 100 msec) for the target speed of the C-color Drum.
Remedy	[Related parts] R1.00 - Harnesses from the Drum ITB Driver PCB to the Drum Speed Detection PCB (C) 1 1. Drum ITB Driver PCB (UN6/J1903) to Relay Connector (15P) 2. Relay Connector (15P) to Drum Speed Detection PCB (C) 1 (UN24/J7312) - Harnesses from the Drum ITB Driver PCB to the Drum Speed Detection PCB (C) 2 1. Drum ITB Driver PCB (UN6/J1903) to Relay Connector (15P) 2. Relay Connector (15P) to Drum Speed Detection PCB (C) 2 (UN25/J7313) - Drum Unit (C) - Drum ITB Driver PCB (UN6) - Drum Motor (C) (M25) - Drum Speed Detection PCB (C) 1 (UN24) - Drum Speed Detection PCB (C) 2 (UN25) - Process Drive Unit (C) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0303-05	Drum speed detection error (C)
Detection Description	It was detected that the speed of the Encoder in the Process Drive Unit (C) was fast for 1 sec consecutively (10 times detections per 100 msec) for the target speed of the C-color Drum.
Remedy	[Related parts] R1.00 - Drum ITB Driver PCB (UN6) - Drum Motor (C) (M25) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0400-05	Drum Motor (Bk) rotation detection error
Detection Description	The drive of the Drum Motor (Bk) in the Drum Drive Unit (Bk) could not be detected.
Remedy	[Related parts] R1.00 - Harness between the Drum ITB Driver PCB (UN6/J1905) and the Drum Motor (Bk) (M19/J7306) - Drum Motor (Bk) (M19) - Drum ITB Driver PCB (UN6) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0402-05	Drum speed detection error (Bk)
Detection Description	It was detected that the speed of the Encoder in the Drum Drive Unit (Bk) was slow for 1 sec consecutively (10 times detections per 100 msec) for the target speed of the Bk-color Drum.
Remedy	[Related parts] R1.00 - Harness between the Drum ITB Driver PCB (UN6/J1905) and the Drum Speed Detection PCB (Bk) 1 (UN18/J7310) - Harness between the Drum ITB Driver PCB (UN6/J1905) and the Drum Speed Detection PCB (Bk) 2 (UN19/J7311) - Drum Unit (Bk) - Drum ITB Driver PCB (UN6) - Drum Motor (Bk) (M19) - Drum Speed Detection PCB (Bk) 1 (UN18) - Drum Speed Detection PCB (Bk) 2 (UN19) - Process Drive Unit (Bk) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0403-05	Drum speed detection error (Bk)
Detection Description	It was detected that the speed of the Encoder in the Drum Drive Unit (Bk) was fast for 1 sec consecutively (10 times detections per 100 msec) for the target speed of the Bk-color Drum.
Remedy	[Related parts] R1.00 - Drum ITB Driver PCB (UN6) - Drum Motor (Bk) (M19) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0500-05	ITB Drive Motor drive detection error
Detection Description	The drive of the ITB Drive Motor in the ITB Unit could not be detected.
Remedy	[Related parts] R1.00 - Harnesses from the Drum ITB Driver PCB to the ITB Drive Motor 1. Drum ITB Driver PCB (UN6/J1906) to Relay Connector (21P) 2. Relay Connector (21P) to Drawer Connector (J8050) 3. Drawer Connector (J8050) to ITB Relay PCB (UN28/J2706) 4. ITB Relay PCB (UN28/J2707) to Relay Connector (15P) 5. Relay Connector (15P) to ITB Drive Motor (M3/J7518) - ITB Drive Motor (M3) - ITB Relay PCB (UN28) - Drum ITB Driver PCB (UN6) [Remedy] Check/replace the related harness/cable, connector and parts.

012-0502-05	ITB speed detection error
Detection Description	It was detected that the speed of the Encoder in the ITB Unit was slow for 1 sec consecutively (10 times detections per 100 msec) for the target speed of the ITB.
Remedy	[Related parts] R1.00 - Harnesses from the Drum ITB Driver PCB to the ITB Drive Roller Speed Detection PCB 1 1. Drum ITB Driver PCB (UN6/J1906) to Relay Connector (21P) 2. Relay Connector (21P) to Drawer Connector (J8050) 3. Drawer Connector (J8050) to ITB Relay PCB (UN28/J2706) 4. ITB Relay PCB (UN28/J2707) to Relay Connector (15P) 5. Relay Connector (15P) to ITB Drive Roller Speed Detection PCB 1 (UN16/J7318) - Harnesses from the Drum ITB Driver PCB to the ITB Drive Roller Speed Detection PCB 2 1. Drum ITB Driver PCB (UN6/J1906) to Relay Connector (21P) 2. Relay Connector (21P) to Drawer Connector (J8050) 3. Drawer Connector (J8050) to ITB Relay PCB (UN28/J2706) 4. ITB Relay PCB (UN28/J2707) to Relay Connector (15P) 5. Relay Connector (15P) to ITB Drive Roller Speed Detection PCB 2 (UN17/J7319) - ITB Relay PCB (UN28) - ITB Drive Roller Speed Detection PCB 1 (UN16) - ITB Drive Roller Speed Detection PCB 2 (UN17) - Drum ITB Driver PCB (UN6) - ITB Belt Drive Motor (M3) - ITB Unit [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the harness between the Drum ITB Driver PCB and the ITB Drive Roller Speed Detection PCB 1. 2. Check the harness between the Drum ITB Driver PCB and the ITB Drive Roller Speed Detection PCB 2. 3. Visually check the belt of the ITB Belt Unit for any tear, displacement or foreign matters. 4. Check the Photo Interrupters on the ITB Drive Roller Speed Detection PCB 1 and the ITB Drive Roller Speed Detection PCB 2. If they are soiled, clean them with a blower. 5. Replace the ITB Drive Roller Speed Detection PCB 1 and the ITB Drive Roller Speed Detection PCB 2. 6. Replace the ITB Relay PCB. 7. Replace the Drum ITB Driver PCB. 8. Replace the ITB Belt Drive Motor. 9. Replace the ITB Unit.

012-0503-05	ITB speed detection error
Detection Description	It was detected that the speed of the Encoder in the ITB Unit was fast for 1 sec consecutively (10 times detections per 100 msec) for the target speed of the ITB.
Remedy	[Related parts] R1.00 - Drum ITB Driver PCB (UN6) - ITB Drive Motor (M3) [Remedy] Check/replace the related harness/cable, connector and parts.

013-0001-05	Waste Toner Screw Lock detection error
Detection Description	The Waste Toner Screw Lock Detection Switch detected the lock state.
Remedy	[Related parts] R1.00 - Harnesses from the Pickup Feed Driver PCB to the Waste Toner Screw Lock Detection Switch 1. Pickup Feed Driver PCB (UN4/J1426) to Relay Connector (3P) 2. Relay Connector (3P) to Waste Toner Screw Lock Detection Switch (SW10/J8116) - Waste Toner Container - Waste Toner Screw Lock Detection Switch (SW10) - Waste Toner Drive Unit - Pickup Feed Driver PCB [Remedy] Perform the following in the order while checking whether the error is cleared. Pull out the Waste Toner Container to check if the toner in the container is full. a. When the waste toner is full: 1. Remove the toner clogged in the Waste Toner Pipe. 2. Replace the Waste Toner Container. b. When the waste toner is not full: 1. Remove the toner clogged in the Waste Toner Pipe. 2. Replace the Waste Toner Container. 3. Replace the Waste Toner Drive Unit. c. When the waste toner is not full and the Waste Toner Pipe is not clogged: 1. Replace the Waste Toner Screw Lock Detection Switch. 2. Replace the Waste Toner Drive Unit.

013-0003-05	Waste toner full detection error
Detection Description	While the sensor was OFF, 3 V or higher sensor output was detected.
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1251) and the Waste Toner Full Sensor (PS134/J8934) - Waste Toner Full Sensor (PS134) - Pickup Harness (Lower) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

014-0001-05	Fixing Motor error
Detection Description	The Fixing Motor in the Fixing Assembly did not show the lock state although 3 sec have passed after it was turned ON or the speed was changed.
Remedy	[Related parts] R1.00 - Fixing Motor (M48) (Unit of replacement: MOTOR, DC) - Harnesses from the Rely PCB to the Fixing Motor 1. Relay PCB (UN7/J1816) to Relay Connector (6P) 2. Relay Connector (6P) to Drawer Connector (J8023) 3. Drawer Connector (J8023) to Relay Connector (4P) 4. Relay Connector (4P) to Fixing Motor (M48/J7612) - Harness between the Relay PCB (UN7/J1818) and the Fixing Power Supply Relay PCB (UN36/J1DC) - Harness between the Fixing Feed Driver PCB (UN5/J2006) and the Fixing Motor (M48/J7217) - Fixing Feed Driver PCB (UN5) - Fixing Power Supply Relay PCB (UN36) - Relay PCB (UN7) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check whether the Fixing Motor can be turned by hand. If not, replace the Fixing Motor. 2. Check/replace the related harness/cable, connector and parts.

014-0002-05	Fixing Motor error
Detection Description	The Fixing Motor in the Fixing Assembly was unlocked for 1 sec after it was locked.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Fixing Motor 1. Relay PCB (UN7/J1816) to Relay Connector (6P) 2. Relay Connector (6P) to Drawer Connector (J8023) 3. Drawer Connector (J8023) to Relay Connector (4P) 4. Relay Connector (4P) to Fixing Motor (M48/J7612) - Harness between the Relay PCB (UN7/J1818) and the Fixing Power Supply Relay PCB (UN36/J1DC) - Harness between the Fixing Feed Driver PCB (UN5/J2006) and the Fixing Motor (M48/J7217) - Fixing Motor (M48) - Fixing Power Supply Relay PCB (UN36) - Relay PCB (UN7) - Fixing Feed Driver PCB (UN5) - Fixing Drive Idler Gear Z75 (fixing feed side) - Fixing Drive Idler Gear Z27 (fixing feed side) - Fixing Idler Gear (Fixing Assembly side) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Rotate the gears of the Fixing Unit drive system by hand, and visually check for any damage or abnormal abrasion. If there is any problem, replace the gear. 2. Check/replace the related harness/cable, connector and parts.

015-0001-05	Decurler HP Sensor 1 detection error
Detection Description	There was no change in the Decurler HP Sensor 1 although a specified period of time has passed since the drive of Decurler Compression Distance Adjustment Motor 1.
Remedy	[Related parts] R1.00 - Harness between the Buffer Driver PCB (UN11/J2105) and the Decurler HP Sensor 1 (PS88/J7502) - Harness between the Buffer Driver PCB (UN11/J2103) and the Decurler Compression Distance Adjustment Motor 1 (M50/J75082) - Decurler HP Sensor 1 (PS88) - Decurler Compression Distance Adjustment Motor 1 (M50) - Buffer Driver PCB (UN11) [Remedy] Check/replace the related harness/cable, connector and parts.

015-0002-05	Decurler HP Sensor 2 detection error
Detection Description	There was no change in the Decurler HP Sensor 2 although a specified period of time has passed since the drive of Decurler Compression Distance Adjustment Motor 2.
Remedy	[Related parts] R1.00 - Harnesses from the Buffer Driver PCB to the Decurler HP Sensor 2 1. Buffer Driver PCB (UN11/J2105) to Relay Connector (6P) 2. Relay Connector (6P) to Decurler HP Sensor 2 (PS89/J7503) - Harness between the Buffer Driver PCB (UN11/J2104) and the Decurler Compression Distance Adjustment Motor 2 (M53/J75102) - Decurler HP Sensor 2 (PS89) - Decurler Compression Distance Adjustment Motor 2 (M53) - Buffer Driver PCB (UN11) [Remedy] Check/replace the related harness/cable, connector and parts.

015-0003-05	Pre-registration Disengagement HP Sensor timeout error
Detection Description	The Pre-registration Disengagement HP Sensor in the Registration Unit did not detect home position within the specified period of time.
Remedy	[Related parts] R1.00 - Pre-registration Disengagement Drive System Gears 1. Motor Gear 2. 17T Gear 3. 29T Gear 4. Pre-registration Guide Disengagement Crank - Harnesses from the Fixing Feed Driver PCB to the Pre-registration Disengagement HP Sensor 1. Fixing Feed Driver PCB (UN5/J2009) to Relay Connector (3P) 2. Relay Connector (3P) to Pre-registration Disengagement HP Sensor (PS122/J8971) - Harnesses from the Fixing Feed Driver PCB to the Pre-registration Disengagement Motor 1. Fixing Feed Driver PCB (UN5/J2009) to Relay Connector (4P) 2. Relay Connector (4P) to Pre-registration Disengagement Motor (M61/J8974) - Pre-registration Disengagement HP Sensor (PS122) - Pre-registration Disengagement Motor (M61) - Fixing Feed Driver PCB (UN5) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. When the jammed paper is in an accordion-like state at the Pre-registration Unit, visually check the gears of the pre-registration disengagement drive system for any damage or abnormal abrasion. If there is any problem, replace the gear. 2. Check/replace the related harness/cable, connector and parts.

015-0004-05	Registration Disengagement HP Sensor timeout error
Detection Description	The Registration Disengagement HP Sensor in the Registration Unit did not detect home position within the specified period of time.
Remedy	[Related parts] R1.00 - Registration Disengagement Drive System Gears 1. Motor Gear 2. TCRG Idler Gear M-C 3. Registration Disengagement Input Gear 4. Registration Disengagement Cam Gear - Harnesses from the Fixing Feed Driver PCB to the Registration Disengagement HP Sensor 1. Fixing Feed Driver PCB (UN5/J2009) to Relay Connector (4P) 2. Relay Connector (4P) to Registration Disengagement HP Sensor (PS121/J8972) - Harnesses from the Fixing Feed Driver PCB to the Registration Disengagement Motor 1. Fixing Feed Driver PCB (UN5/J2009) to Relay Connector (4P) 2. Relay Connector (4P) to Registration Disengagement Motor (M60/J8976) - Registration Disengagement HP Sensor (PS121) - Registration Disengagement Motor (M60) - Fixing Feed Driver PCB (UN5) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. When the jammed paper is in an accordion-like state at the Pre-registration Unit, visually check the gears of the registration disengagement drive system for any damage or abnormal abrasion. If there is any problem, replace the gear. 2. Check/replace the related harness/cable, connector and parts.

015-0005-11	Multi Deck Right Disengagement Motor (M401) HP error
Detection Description	There was no change in the Right Disengagement HP Sensor (S401) although the Right Disengagement Motor (M401) was driven by 180 pulse at disengagement/engagement operation.
Remedy	1. Check connection of the connector of the Right Disengagement HP Sensor (S401). 2. Replace the Right Disengagement HP Sensor (S401). 3. Replace the Right Disengagement Motor (M401). 4. Replace the Deck Driver PCB (PCB1). 5. Replace the DC Controller PCB (UN2) in the host machine.

015-0006-11	Multi Deck Left Disengagement Motor (M402) HP error
Detection Description	There was no change in the Left Disengagement HP Sensor (S402) although the Left Disengagement Motor (M402) was driven by 180 pulse at disengagement/engagement operation.
Remedy	1. Check connection of the connector of the Left Disengagement HP Sensor (S402). 2. Replace the Left Disengagement HP Sensor (S402). 3. Replace the Left Disengagement Motor (M402). 4. Replace the Deck Driver PCB (PCB1). 5. Replace the DC Controller PCB (UN2) in the host machine.

015-0007-05	Registration Shift HP Sensor timeout error
Detection Description	The Registration Shift HP Sensor in the Fixing Feed Unit did not detect home position within the specified period of time.
Remedy	[Related parts] R1.00 - Harness between the Fixing Feed Driver PCB (UN5/J2009) and the Registration Shift HP Sensor (PS24/J8961) - Harnesses from the Fixing Feed Driver PCB to the Registration Shift Motor 1. Fixing Feed Driver PCB (UN5/J2009) to Relay Connector (4P) 2. Relay Connector (4P) to Registration Shift Motor (M62/J8964) - Registration Shift Drive Assembly (Gear, Sintered Bearing) 1. Motor Gear 2. Shift Stepped Gear 3. Shift Rack 4. 8-12 D-cut Bushing - Registration Shift HP Sensor (PS124) - Registration Shift Motor (M62) - Fixing Feed Driver PCB (UN5) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check the Registration Shift Drive Assembly for any damage or abnormal abrasion. If there is any problem, replace the parts. 2. Check/replace the related harness/cable, connector and parts.

015-0008-05	Delivery Flapper Switch HP Sensor detection error
Detection Description	There was no change in the Delivery Flapper Switch HP Sensor although a specified period of time has passed since the drive of Delivery Flapper Switch Motor in the Reverse Delivery Unit.
Remedy	[Related parts] R1.00 - Harnesses from the Pickup Feed Driver PCB to the Delivery Flapper Switch HP Sensor 1. Pickup Feed Driver PCB (UN4/J1430) to Relay Connector (15P) 2. Relay Connector (15P) to Delivery Flapper Switch HP Sensor (PS148/J7071) - Harnesses from the Pickup Feed Driver PCB to the Delivery Flapper Switch Motor 1. Pickup Feed Driver PCB (UN4/J1430) to Relay Connector (15P) 2. Relay Connector (15P) to Delivery Flapper Switch Motor (M69/J7070) - Delivery Flapper Switch HP Sensor (PS148) - Delivery Flapper Switch Motor (M69) - Pickup Feed Driver PCB (UN4) - Delivery Flapper Switch Drive System Gears 1. Primary Feed Input Gear 2. Reverse Disengagement Cam Gear [Remedy] Check/replace the related harness/cable, connector and parts.

020-01A8-05	Toner Density Sensor (Y) output upper/lower limit error
Detection Description	Output (Vsig_ind) of the Toner Density Sensor (Y) in the Process Unit (Y) showed 245 or higher or 10 or lower once during operation.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3022) and the Primary Charging High Voltage Contact Resistance (Y) (UN59) - Harnesses from the DC Controller PCB to the Toner Density Sensor (Y) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (Y) (TS2/J8944) - Primary Charging High Voltage PCB (CL) (UN38) - Primary Charging High Voltage Contact Resistance (Y) (UN59) - Developing Assembly (Y) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

020-01B8-05	Toner Density Sensor (Y) output upper/lower limit error
Detection Description	When executing the initial installation mode of the Developing Assembly (Y) (COPIER> FUNCTION> INSTALL> INISET-Y), output failed to reach 128 although the control voltage value of the Toner Density Sensor in the Process Unit (Y) reached 255 or higher. Or output failed to reach 128 although the control voltage reached 55 or lower.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Y) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (Y) (TS2/J8944) - Developing Assembly (Y) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

020-02A8-05	Toner Density Sensor (M) output upper/lower limit error
Detection Description	Output (Vsig_ind) of the Toner Density Sensor (M) in the Process Unit (M) showed 245 or higher or 10 or lower once during operation.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3322) and the Primary Charging High Voltage Contact Resistance (M) (UN60) - Harnesses from the DC Controller PCB to the Toner Density Sensor (M) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (M) (TS3/J8943) - Primary Charging High Voltage PCB (CL) (UN38) - Primary Charging High Voltage Contact Resistance (M) (UN60) - Developing Assembly (M) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

020-02B8-05	Toner Density Sensor (M) output upper/lower limit error
Detection Description	When executing the initial installation mode of the Developing Assembly (M) (COPIER> FUNCTION> INSTALL> INISET-M), output failed to reach 128 although the control voltage value of the Toner Density Sensor in the Process Unit (M) reached 255 or higher. Or output failed to reach 128 although the control voltage reached 55 or lower.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (M) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (M) (TS3/J8943) - Developing Assembly (M) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

020-03A8-05	Toner Density Sensor (C) output upper/lower limit error
Detection Description	Output (Vsig_ind) of the Toner Density Sensor (C) in the Process Unit (C) showed 245 or higher or 10 or lower once during operation.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3522) and the Primary Charging High Voltage Contact Resistance (C) (UN61) - Harnesses from the DC Controller PCB to the Toner Density Sensor (C) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (C) (TS4/J8945) - Primary Charging High Voltage PCB (CL) (UN38) - Primary Charging High Voltage Contact Resistance (C) (UN61) - Developing Assembly (C) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

020-03B8-05	Toner Density Sensor (C) output upper/lower limit error
Detection Description	When executing the initial installation mode of the Developing Assembly (C) (COPIER> FUNCTION> INSTALL> INISET-C), output failed to reach 128 although the control voltage value of the Toner Density Sensor (C) in the Process Unit (C) reached 255 or higher. Or output failed to reach 128 although the control voltage reached 55 or lower.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (C) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (C) (TS4/J8945) - Developing Assembly (C) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

020-0424-05	Patch Sensor (Bk) density lower limit error
Detection Description	The detected value (SigD) of the Patch Sensor (Bk) in the Drum Unit (Bk) showed 100 or lower when executing the initial installation mode of the Developing Assembly (Bk) (COPIER> FUNCTION> INSTALL> INISET-K).
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk) 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Patch Sensor (Bk) (PS135/J2658) - Patch Sensor (Bk) - Registration Patch Driver PCB (UN8) - ITB - Developing Assembly (Bk) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor (Bk) is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk). 4. Select "3" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Patch Sensor Solenoid (Bk), replace the Patch Sensor (Bk). [CAUTION] After replacement of the Patch Sensor (Bk), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Replace the Developing Assembly (Bk). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

020-0434-05	Patch Sensor (Bk) density upper limit error
Detection Description	The detected value (SigD) of the Patch Sensor (Bk) in the Drum Unit (Bk) showed 900 or higher when executing the initial installation mode of the Developing Assembly (Bk) (COPIER> FUNCTION> INSTALL> INISET-K).
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk) 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Patch Sensor (Bk) (PS135/J2658) - ITB - Patch Sensor (Bk) - Registration Patch Driver PCB (UN8) - Developing Assembly (Bk) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor (Bk) is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk). 4. Select "3" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Patch Sensor Solenoid (Bk), replace the Patch Sensor (Bk). [CAUTION] After replacement of the Patch Sensor (Bk), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Replace the Developing Assembly (Bk). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

020-04A8-05	Toner Density Sensor (Bk) output upper/lower limit error
Detection Description	Output (Vsig_ind) of the Toner Density Sensor (Bk) in the Drum Unit (Bk) showed 245 or higher or 10 or lower once during operation.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Bk) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (5P) 3. Relay Connector (5P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (Bk) (TS1/J8946) - Developing Assembly (Bk) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

020-04B8-05	Toner Density Sensor (Bk) output upper/lower limit error
Detection Description	When executing the initial installation mode of the Developing Assembly (Bk) (COPIER> FUNCTION> INSTALL> INISET-K), output failed to reach 128 although the control voltage value of the Toner Density Sensor (Bk) in the Drum Unit (Bk) reached 255 or higher. Or output failed to reach 128 although the control voltage reached 55 or lower.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Bk) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (5P) 3. Relay Connector (5P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (Bk) (TS1/J8946) - Developing Assembly (Bk) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

020-5024-05	Patch Sensor (C) density lower limit error
Detection Description	The detected value (SigD) of the Patch Sensor (C) in the ITB Unit showed 100 or lower when executing the initial installation mode of the Developing Assembly (C) (COPIER> FUNCTION> INSTALL> INISET-C).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (C) (PS130/J8980) - Patch Sensor (C) (PS130) - Registration Patch Driver PCB (UN8) - ITB - Developing Assembly (C) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor (C) is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (C). 4. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (C). [CAUTION] After replacement of the Patch Sensor (C), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. 7. Replace the Developing Assembly (C). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

020-5034-05	Patch Sensor (C) density upper limit error
Detection Description	The detected value (SigD) of the Patch Sensor (C) in the ITB Unit showed 900 or higher when executing the initial installation mode of the Developing Assembly (C) (COPIER> FUNCTION> INSTALL> INISET-C).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (C) (PS130/J8980) - Patch Sensor (C) (PS130) - Registration Patch Driver PCB (UN8) - ITB - Developing Assembly (C) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor (C) is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (C). 4. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (C). [CAUTION] After replacement of the Patch Sensor (C), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. 7. Replace the Developing Assembly (C). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

020-6024-05	Patch Sensor (M) density lower limit error
Detection Description	The detected value (SigD) of the Patch Sensor (M) in the ITB Unit showed 100 or lower when executing the initial installation mode of the Developing Assembly (M) (COPIER> FUNCTION> INSTALL> INISET-M).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (M) (PS129/J8982) - Patch Sensor (M) (PS129) - Registration Patch Driver PCB (UN8) - ITB - Developing Assembly (M) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor (M) is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (M). 4. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (M). [CAUTION] After replacement of the Patch Sensor (M), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. 7. Replace the Developing Assembly (M). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

020-6034-05	Patch Sensor (M) density upper limit error
Detection Description	The detected value (SigD) of the Patch Sensor (M) in the ITB Unit showed 900 or higher when executing the initial installation mode of the Developing Assembly (M) (COPIER> FUNCTION> INSTALL> INISET-M).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (M) (PS129/J8982) - Patch Sensor (M) (PS129) - Registration Patch Driver PCB (UN8) - ITB - Developing Assembly (M) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor (M) is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (M). 4. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (M). [CAUTION] After replacement of the Patch Sensor (M), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. 7. Replace the Developing Assembly (M). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

020-7024-05	Patch Sensor (Y) density lower limit error
Detection Description	The detected value (SigD) of the Patch Sensor (Y) in the ITB Unit showed 100 or lower when executing the initial installation mode of the Developing Assembly (Y) (COPIER> FUNCTION> INSTALL> INISET-Y).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (Y) (PS21/J8983) - Patch Sensor (Y) (PS21) - Registration Patch Driver PCB (UN8) - ITB - Developing Assembly (Y) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor (Y) is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (Y). 4. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (Y). [CAUTION] After replacement of the Patch Sensor (Y), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. 7. Replace the Developing Assembly (Y). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

020-7034-05	Patch Sensor (Y) density upper limit error
Detection Description	The detected value (SigD) of the Patch Sensor (Y) in the ITB Unit showed 900 or higher when executing the initial installation mode of the Developing Assembly (Y) (COPIER> FUNCTION> INSTALL> INISET-Y).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (Y) (PS21/J8983) - Patch Sensor (Y) (PS21) - Registration Patch Driver PCB (UN8) - ITB - Developing Assembly (Y) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor (Y) is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (Y). 4. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (Y). [CAUTION] After replacement of the Patch Sensor (Y), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. 7. Replace the Developing Assembly (Y). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

021-0101-05	Developing Sleeve Drive Motor (Y) error
Detection Description	The lock signal of the Developing Sleeve Drive Motor (Y) in the Process Drive Unit (Y) could not be detected within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Developing Sleeve Drive Motor (Y) 1. Registration Patch Driver PCB (UN8/J2403) to Relay Connector (29P) 2. Relay Connector (29P) to Relay Connector (23P) 3. Relay Connector (23P) to Developing Sleeve Drive Motor (Y) (M20/J7535) - Developing Assembly (Y) - Registration Patch Driver PCB (UN8) - Developing Sleeve Drive Motor (Y) (M20) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

021-0102-05	Developing Sleeve Drive Motor (Y) error
Detection Description	The Developing Sleeve Drive Motor (Y) in the Process Drive Unit (Y) was unlocked although it had been locked once.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Developing Sleeve Drive Motor (Y) 1. Registration Patch Driver PCB (UN8/J2403) to Relay Connector (29P) 2. Relay Connector (29P) to Relay Connector (23P) 3. Relay Connector (23P) to Developing Sleeve Drive Motor (Y) (M20/J7535) - Developing Assembly (Y) - Registration Patch Driver PCB (UN8) - Developing Sleeve Drive Motor (Y) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

021-0201-05	Developing Sleeve Drive Motor (M) error
Detection Description	The lock signal of the Developing Sleeve Drive Motor (M) in the Process Drive Unit (M) could not be detected within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Developing Sleeve Drive Motor (M) 1. Registration Patch Driver PCB (UN8/J2403) to Relay Connector (29P) 2. Relay Connector (29P) to Relay Connector (23P) 3. Relay Connector (23P) to Developing Sleeve Drive Motor (M) (M22/J7536) - Developing Assembly (M) - Registration Patch Driver PCB (UN8) - Developing Sleeve Drive Motor (M) (M22) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

021-0202-05	Developing Sleeve Drive Motor (M) error
Detection Description	The Developing Sleeve Drive Motor (M) in the Process Drive Unit (M) was unlocked although it had been locked once.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Developing Sleeve Drive Motor (M) 1. Registration Patch Driver PCB (UN8/J2403) to Relay Connector (29P) 2. Relay Connector (29P) to Relay Connector (23P) 3. Relay Connector (23P) to Developing Sleeve Drive Motor (M) (M22/J7536) - Developing Assembly (M) - Registration Patch Driver PCB (UN8) - Developing Sleeve Drive Motor (M) (M22) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

021-0301-05	Developing Sleeve Drive Motor (C) error
Detection Description	The lock signal of the Developing Sleeve Drive Motor (C) in the Process Drive Unit (C) could not be detected within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Developing Sleeve Drive Motor (C) 1. Registration Patch Driver PCB (UN8/J2403) to Relay Connector (29P) 2. Relay Connector (29P) to Relay Connector (23P) 3. Relay Connector (23P) to Developing Sleeve Drive Motor (C) (M24/J7537) - Developing Assembly (C) - Registration Patch Driver PCB (UN8) - Developing Sleeve Drive Motor (C) (M24) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

021-0302-05	Developing Sleeve Drive Motor (C) error
Detection Description	The Developing Sleeve Drive Motor (C) in the Process Drive Unit (C) was unlocked although it had been locked once.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Developing Sleeve Drive Motor (C) 1. Registration Patch Driver PCB (UN8/J2403) to Relay Connector (29P) 2. Relay Connector (29P) to Relay Connector (23P) 3. Relay Connector (23P) to Developing Sleeve Drive Motor (C) (M24/J7537) - Developing Assembly (C) - Registration Patch Driver PCB (UN8) - Developing Sleeve Drive Motor (C) (M24) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

021-0401-05	Developing Sleeve Drive Motor (Bk) error
Detection Description	The lock signal of the Developing Sleeve Drive Motor (Bk) in the Process Drive Unit (Bk) could not be detected within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Developing Sleeve Drive Motor (Bk) 1. Registration Patch Driver PCB (UN8/J2403) to Relay Connector (29P) 2. Relay Connector (29P) to Developing Sleeve Drive Motor (Bk) (M18/J7538) - Developing Assembly (Bk) - Registration Patch Driver PCB (UN8) - Developing Sleeve Drive Motor (Bk) (M18) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

021-0402-05	Developing Sleeve Drive Motor (Bk) error
Detection Description	The Developing Sleeve Drive Motor (Bk) in the Drum Drive Unit (Bk) was unlocked although it had been locked once.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Developing Sleeve Drive Motor (Bk) 1. Registration Patch Driver PCB (UN8/J2403) to Relay Connector (29P) 2. Relay Connector (29P) to Developing Sleeve Drive Motor (Bk) (M18/J7538) - Developing Assembly (Bk) - Registration Patch Driver PCB (UN8) - Developing Sleeve Drive Motor (Bk) (M18) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

022-0001-05	Drum Cleaning and Waste Toner Feed Drive Motor error
Detection Description	The lock signal of the Drum Cleaning and Waste Toner Feed Drive Motor in the Drum Drive Unit (Bk) could not be detected within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller DIFF PCB to the Drum Cleaning and Waste Toner Feed Drive Motor 1. DC Controller DIFF PCB (UN9/J1039) to Relay Connector (7P) 2. Relay Connector (7P) to Drum Cleaning and Waste Toner Feed Drive Motor (M30/J7539) - Drum Unit (Bk) - Waste Toner Feed Pipe Unit - DC Controller DIFF PCB (UN9) - Drum Cleaning and Waste Toner Feed Drive Motor (M30) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the unit, be sure to remove the toner clogged around the Feed Screw.

022-0002-05	Drum Cleaning and Waste Toner Feed Drive Motor error
Detection Description	The Drum Cleaning and Waste Toner Feed Drive Motor in the Drum Drive Unit (Bk) was unlocked although it had been locked once.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller DIFF PCB to the Drum Cleaning and Waste Toner Feed Drive Motor 1. DC Controller DIFF PCB (UN9/J1039) to Relay Connector (7P) 2. Relay Connector (7P) to Drum Cleaning and Waste Toner Feed Drive Motor (M30/J7539) - Drum Unit (Bk) - Waste Toner Feed Pipe Unit - DC Controller DIFF PCB (UN9) - Drum Cleaning and Waste Toner Feed Drive Motor (M30) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the unit, be sure to remove the toner clogged around the Feed Screw.

023-0101-05	Developing Stirring Motor (Y) error
Detection Description	The lock signal of the Developing Stirring Motor (Y) could not be detected within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Developing Stirring Motor (Y) 1. DC Controller PCB (UN2/J1242) to Relay Connector (19P) 2. Relay Connector (19P) to Drawer (J8031) 3. Drawer (J8031) to Developing Stirring Motor (Y) (M26/J7158) - Developing Assembly (Y) - DC Controller PCB (UN2) - Developing Stirring Motor (Y) (M26) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

023-0102-05	Developing Stirring Motor (Y) error
Detection Description	The Developing Stirring Motor (Y) was unlocked although it had been locked once.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Developing Stirring Motor (Y) 1. DC Controller PCB (UN2/J1242) to Relay Connector (19P) 2. Relay Connector (19P) to Drawer (J8031) 3. Drawer (J8031) to Developing Stirring Motor (Y) (M26/J7158) - Developing Assembly (Y) - DC Controller PCB (UN2) - Developing Stirring Motor (Y) (M26) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

023-0103-05	Developing Stirring coupling disengagement error (Y)
Detection Description	It was detected that amplitude of the Toner Density Sensor in the Developing Assembly (Y) was the specified value or lower.
Remedy	[Related parts] R1.00 - Drive section of the Developing Stirring Motor Unit (Developing Coupling (Small), Developing Coupling Joint, Developing Coupling Gear, Screw A Gear in the Developing Assembly) - Developing Stirring Motor Unit [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Open the Front Inner Door Unit, and check the drive section of the Developing Stirring Motor Unit. If engagement is poor, rotate the gears and adjust the engagement. 2. Replace the Developing Stirring Motor Unit.

023-0201-05	Developing Stirring Motor (M) error
Detection Description	The lock signal of the Developing Stirring Motor (M) could not be detected within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Developing Stirring Motor (M) 1. DC Controller PCB (UN2/J1242) to Relay Connector (19P) 2. Relay Connector (19P) to Drawer (J8031) 3. Drawer (J8031) to Developing Stirring Motor (M) (M28/J7156) - Developing Assembly (M) - DC Controller PCB (UN2) - Developing Stirring Motor (M) (M28) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

023-0202-05	Developing Stirring Motor (M) error
Detection Description	The Developing Stirring Motor (M) was unlocked although it had been locked once.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Developing Stirring Motor (M) 1. DC Controller PCB (UN2/J1242) to Relay Connector (19P) 2. Relay Connector (19P) to Drawer (J8031) 3. Drawer (J8031) to Developing Stirring Motor (M) (M28/J7156) - Developing Assembly (M) - DC Controller PCB (UN2) - Developing Stirring Motor (M) (M28) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

023-0203-05	Developing Stirring coupling disengagement error (M)
Detection Description	It was detected that amplitude of the Toner Density Sensor in the Developing Assembly (M) was the specified value or lower.
Remedy	[Related parts] R1.00 - Drive section of the Developing Stirring Motor Unit (Developing Coupling (Small), Developing Coupling Joint, Developing Coupling Gear, Screw A Gear in the Developing Assembly) - Developing Stirring Motor Unit [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Open the Front Inner Door Unit, and check the drive section of the Developing Stirring Motor Unit. If engagement is poor, rotate the gears and adjust the engagement. 2. Replace the Developing Stirring Motor Unit.

023-0301-05	Developing Stirring Motor (C) error
Detection Description	The lock signal of the Developing Stirring Motor (C) could not be detected within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Developing Stirring Motor (C) 1. DC Controller PCB (UN2/J1243) to Relay Connector (17P) 2. Relay Connector (17P) to Drawer (J8031) 3. Drawer (J8031) to Developing Stirring Motor (C) (M27/J8917) - Developing Assembly (C) - DC Controller PCB (UN2) - Developing Stirring Motor (C) (M27) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

023-0302-05	Developing Stirring Motor (C) error
Detection Description	The Developing Stirring Motor (C) was unlocked although it had been locked once.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Developing Stirring Motor (C) 1. DC Controller PCB (UN2/J1243) to Relay Connector (17P) 2. Relay Connector (17P) to Drawer (J8031) 3. Drawer (J8031) to Developing Stirring Motor (C) (M27/J8917) - Developing Assembly (C) - DC Controller PCB (UN2) - Developing Stirring Motor (C) (M27) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

023-0303-05	Developing Stirring coupling disengagement error (C)
Detection Description	It was detected that amplitude of the Toner Density Sensor in the Developing Assembly (C) was the specified value or lower.
Remedy	[Related parts] R1.00 - Drive section of the Developing Stirring Motor Unit (Developing Coupling (Small), Developing Coupling Joint, Developing Coupling Gear, Screw A Gear in the Developing Assembly) - Developing Stirring Motor Unit [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Open the Front Inner Door Unit, and check the drive section of the Developing Stirring Motor Unit. If engagement is poor, rotate the gears and adjust the engagement. 2. Replace the Developing Stirring Motor Unit.

023-0401-05	Developing Stirring Motor (Bk) error
Detection Description	The lock signal of the Developing Stirring Motor (Bk) could not be detected within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Developing Stirring Motor (Bk) 1. DC Controller PCB (UN2/J1242) to Relay Connector (19P) 2. Relay Connector (19P) to Drawer (J8031) 3. Drawer (J8031) to Developing Stirring Motor (Bk) (M29/J7152) - Developing Assembly (Bk) - DC Controller PCB (UN2) - Developing Stirring Motor (Bk) (M29) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

023-0402-05	Developing Stirring Motor (Bk) error
Detection Description	The Developing Stirring Motor (Bk) was unlocked although it had been locked once.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Developing Stirring Motor (Bk) 1. DC Controller PCB (UN2/J1242) to Relay Connector (19P) 2. Relay Connector (19P) to Drawer (J8031) 3. Drawer (J8031) to Developing Stirring Motor (Bk) (M29/J7152) - Developing Assembly (Bk) - DC Controller PCB (UN2) - Developing Stirring Motor (Bk) (M29) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

023-0403-05	Developing Stirring coupling disengagement error (Bk)
Detection Description	It was detected that amplitude of the Toner Density Sensor in the Developing Assembly (Bk) was the specified value or lower.
Remedy	[Related parts] R1.00 - Drive section of the Developing Stirring Motor Unit (Developing Coupling (Small), Developing Coupling Joint, Developing Coupling Gear, Screw A Gear in the Developing Assembly) - Developing Stirring Motor Unit [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Open the Front Inner Door Unit, and check the drive section of the Developing Stirring Motor Unit. If engagement is poor, rotate the gears and adjust the engagement. 2. Replace the Developing Stirring Motor Unit.

025-0102-05	Toner Feed Screw Rotation Sensor (Y) detection error
Detection Description	The Toner Feed Screw Rotation Sensor (Y) in the Hopper Unit (Y) could not detect the screw rotation.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Hopper Stirring/Supply Motor (Y) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Hopper Stirring/Supply Motor (Y) (M9/J7104) - Harnesses from the DC Controller PCB to the Toner Feed Screw Rotation Sensor (Y) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Feed Screw Rotation Sensor (Y) (PS12/J7418) - Toner Feed Screw Rotation Sensor (Y) (PS12) - Hopper Stirring/Supply Motor (Y) (M9) - Toner Supply Pipe Unit - Hopper Unit (Y) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the Toner Feed Screw Rotation Sensor (Y) is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts.

025-0110-05	Toner Container Reciprocation HP Sensor (Y) timeout error
Detection Description	The Toner Container Reciprocation HP Sensor (Y) in the Hopper Unit (Y) did not detect home position within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Driver Motor (Y) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Drive Motor (Y) (M10/J7100) - Harnesses from the DC Controller PCB to the Toner Container Reciprocation HP Sensor (Y) 1. DC Controller PCB (UN2/J1249) to Relay Connector (5P) 2. Relay Connector (5P) to Toner Container Reciprocation HP Sensor (Y) (PS11/J71750) - Toner Container Drive Motor (Y) (M10) - Toner Container Reciprocation HP Sensor (Y) (PS11) - Hopper Unit (Y) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. If the Toner Container Reciprocation HP Sensor (Y) is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts.

025-0120-05	Toner Container/Toner Container Insertion Inlet Cover (Y) phase error
Detection Description	When the power was turned ON, the Toner Container Cap was detected open (the Toner Container Phase Sensor (Y) light was blocked) and the Toner Container Insertion Inlet Cover was detected open (the Toner Container Insertion Inlet Cover Sensor (Y) light was transmitted).
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1246) and the Toner Container Insertion Inlet Cover Sensor (Y) (PS10/J7122) - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (Y) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Phase Sensor (Y) (PS81/J7123) - Toner Container Insertion Inlet Cover Sensor (Y) (PS10) - Toner Container Phase Sensor (Y) (PS81) [Remedy] Check/replace the related harness/cable, connector and parts.

025-0150-05	Toner Density Sensor (Y) output lower limit error
Detection Description	The Toner Density Sensor (Y) detected that the output (Vsig_ind) was 51 or less 10 consecutive times.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Y) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (Y) (TS2/J8944) - Harnesses from the DC Controller PCB to the Hopper Stirring/Supply Motor (Y) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Hopper Stirring/Supply Motor (Y) (M9/J7104) - Toner Density Sensor (Y) (TS2) - Hopper Stirring/Supply Motor (Y) (M9) - Hopper Unit (Y) - Developing Assembly (Y) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

025-0151-05	Toner Density Sensor (Y) output upper limit error
Detection Description	The Toner Density Sensor (Y) detected that the output (Vsig_ind) was 221 or higher 10 consecutive times.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Y) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (Y) (TS2/J8944) - Harnesses from the Laser Interface PCB to the Laser Scanner Unit (Y) 1. Laser Interface PCB (UN100/J11) to Relay Connector (9P) 2. Relay Connector (9P) to Laser Scanner Unit (Y) - Harness between the DC Controller PCB (UN2/J1266) and the Developing High Voltage PCB (CL) (UN40/J3040) - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3022) and the Primary Charging High Voltage Contact Resistance (Y) (UN59) - Harnesses from the DC Controller PCB to the Hopper Toner Level Sensor (Y) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Hopper Toner Level Sensor (Y) (TS6/J7121) - DC Controller PCB (UN2) - Toner Density Sensor (Y) (TS2) - Laser Interface PCB (UN100) - Laser Scanner Unit (Y) - Primary Charging High Voltage PCB (CL) (UN38) - Primary Charging High Voltage Contact Resistance (Y) (UN59) - Hopper Toner Level Sensor (Y) (TS6) - Hopper Unit (Y) (M) (C) - Developing Assembly (Y) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the harnesses from the DC Controller PCB to the Toner Density Sensor (Y). 2. Check the harnesses from the Laser Interface PCB to the Laser Scanner Unit (Y). 3. Check the harness between the DC Controller PCB and the Developing High Voltage PCB (CL). 4. Check the harness between the Primary Charging High Voltage PCB (CL) and the Charging Terminal Unit (Y). 5. Execute "COPIER> FUNCTION> MISC-P> DEV-RCVR" to return the toner density to normal state. 6. Check the harnesses from the DC Controller PCB to the Hopper Toner Level Sensor (Y). 7. Replace the Hopper Toner Level Sensor (Y). 8. Replace the Hopper Unit (Y) (M) (C), and execute "COPIER> FUNCTION> MISC-P> DEV-RCVR" to return the toner density to normal state. 9. Replace the DC Controller PCB. 10. Replace the Developing Assembly (Y). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-01A0-05	Toner Container Phase Sensor (Y) detection error
Detection Description	Change in status (ON -> OFF) of the Toner Container Phase Sensor (Y) in the Hopper Unit (Y) could not be detected when installing the Toner Container so that open and close status of the cap could not be judged.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (Y) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Phase Sensor (Y) (PS81/J7123) - Developing Drive Assembly (Color) - Toner Container Phase Sensor (Y) (PS81) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the installation of the Toner Container Phase Sensor (Y) and whether it is soiled. If it is soiled, clean it with a blower. 2. Move the Hopper Unit (Y) little by little with the Toner Container Removing Tool, and check if the output value of "COPIER> I/O> DC-CON> P050 bit12" is changed. [CAUTION] Since it is difficult to check the screen while moving it, repeat the operation to move it a little and check the screen until the value is changed. a. If the output value of the sensor is changed, check the drive system of the Hopper Unit such as gears. If it is damaged, replace the Developing Drive Assembly (Color). b. If the output value of the sensor is not changed, check the harnesses from the DC Controller PCB to the Toner Container Phase Sensor (Y). 1. Replace the Toner Container Phase Sensor (Y), and check if the output value of "COPIER> I/O> DC-CON> P050 bit12" is changed. 3. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-01B0-05	Toner Container Phase Sensor (Y) detection error
Detection Description	Change in status (ON -> OFF) of the Toner Container Phase Sensor (Y) in the Hopper Unit (Y) could not be detected when removing the Toner Container so that open and close status of the cap could not be judged.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (Y) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Phase Sensor (Y) (PS81/J7123) - Developing Drive Assembly (Color) - Toner Container Phase Sensor (Y) (PS81) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the installation of the Toner Container Phase Sensor (Y) and whether it is soiled. If it is soiled, clean it with a blower. 2. Move the Hopper Unit (Y) little by little with the Toner Container Removing Tool, and check if the output value of "COPIER> I/O> DC-CON> P050 bit12" is changed. [CAUTION] Since it is difficult to check the screen while moving it, repeat the operation to move it a little and check the screen until the value is changed. a. If the output value of the sensor is changed, check the drive system of the Hopper Unit such as gears. If it is damaged, replace the Developing Drive Assembly (Color). b. If the output value of the sensor is not changed, check the harnesses from the DC Controller PCB to the Toner Container Phase Sensor (Y). 1. Replace the Toner Container Phase Sensor (Y), and check if the output value of "COPIER> I/O> DC-CON> P050 bit12" is changed. 3. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-01C0-05	Toner Container Insertion Inlet Cover Sensor (Y) detection error
Detection Description	When removing the Toner Container, the Toner Container Insertion Inlet Cover Sensor (Y) in the Hopper Unit (Y) could not detect the open status of the Toner Insertion Inlet Cover (Y).
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1246) and the Toner Container Insertion Inlet Cover Sensor (Y) (PS10/J7122) - Toner Container Insertion Inlet Cover Sensor (Y) (PS10) - Hopper Unit - Hopper Tray - Toner Container Replacement Cover Unit - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. If the Toner Container Replacement Cover does not open by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner", check the slide of shaft area). 2. Check the installation of the Toner Container Insertion Inlet Cover Sensor (Y) and whether it is soiled. If it is soiled, clean it with a blower. 3. When opening the Toner Container Replacement Cover by making the Hopper Unit driven with the Toner Container Removal Tool, check if output value of the Toner Container Insertion Inlet Cover Open/Close Sensor (Y) is changed properly. If it's in normal state, the output value of "COPIER> I/O> DC-CON> P050 bit07" shows "0" when opening the cover, and "1" when closing it with your hand. a. When the Toner Container Replacement Cover does not open although the Hopper Unit is driven, check the drive system (Hopper Unit, link mechanism of Hopper Tray, Toner Container Replacement Cover Unit). b. When the output value is not changed properly although the Toner Container Replacement Cover can be opened/closed, check the harness between the DC Controller PCB and the Toner Container Insertion Inlet Cover Sensor (Y). 1. Replace the Toner Container Insertion Inlet Cover Sensor (Y). 4. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-0202-05	Toner Feed Screw Rotation Sensor (M) detection error
Detection Description	The Toner Feed Screw Rotation Sensor (M) in the Hopper Unit (M) could not detect the screw rotation.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Hopper Stirring/Supply Motor (M) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Hopper Stirring/Supply Motor (M) (M12/J7105) - Harnesses from the DC Controller PCB to the Toner Feed Screw Rotation Sensor (M) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Feed Screw Rotation Sensor (M) (PS15/J7419) - Toner Feed Screw Rotation Sensor (M) (PS15) - Hopper Stirring/Supply Motor (M) (M12) - Toner Supply Pipe Unit - Hopper Unit (M) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the Toner Feed Screw Rotation Sensor (M) is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts.

025-0210-05	Toner Container Reciprocation HP Sensor (M) timeout error
Detection Description	The Toner Container Reciprocation HP Sensor (M) in the Hopper Unit (M) did not detect home position within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Drive Motor (M) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Drive Motor (M) (M13/J7101) - Harnesses from the DC Controller PCB to the Toner Container Reciprocation HP Sensor (M) 1. DC Controller PCB (UN2/J1249) to Relay Connector (5P) 2. Relay Connector (5P) to Toner Container Reciprocation HP Sensor (M) (PS14/J71980) - Toner Container Drive Motor (M) (M13) - Toner Container Reciprocation HP Sensor (M) (PS14) - Hopper Unit (M) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. If the Toner Container Reciprocation HP Sensor (M) is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts.

025-0220-05	Toner Container/Toner Container Insertion Inlet Cover (M) phase error
Detection Description	When the power was turned ON, the Toner Container Cap was detected open (the Toner Container Phase Sensor (M) light was blocked) and the Toner Container Insertion Inlet Cover was detected open (the Toner Container Insertion Inlet Cover Sensor (M) light was transmitted).
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1246) and the Toner Container Insertion Inlet Cover Sensor (M) (PS13/J7125) - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (M) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Phase Sensor (M) (PS82/J7126) - Toner Container Insertion Inlet Cover Sensor (M) (PS13) - Toner Container Phase Sensor (M) (PS82) [Remedy] Check/replace the related harness/cable, connector and parts.

025-0250-05	Toner Density Sensor (M) output lower limit error
Detection Description	The Toner Density Sensor (M) detected that the output (Vsig_ind) was 51 or less 10 consecutive times.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (M) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (M) (TS3/J8943) - Harnesses from the DC Controller PCB to the Hopper Stirring/Supply Motor (M) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Hopper Stirring/Supply Motor (M) (M12/J7105) - Toner Density Sensor (M) (TS3) - Hopper Stirring/Supply Motor (M) (M12) - Hopper Unit (M) - Developing Assembly (M) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

025-0251-05	Toner Density Sensor (M) output upper limit error
Detection Description	The Toner Density Sensor (M) detected that the output (Vsig_ind) was 221 or higher 10 consecutive times.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (M) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (M) (TS3/J8943) - Harnesses from the Laser Interface PCB to the Laser Scanner Unit (M) 1. Laser Interface PCB (UN100/J11) to Relay Connector (9P) 2. Relay Connector (9P) to Laser Scanner Unit (M) - Harness between the DC Controller PCB (UN2/J1266) and the Developing High Voltage PCB (CL) (UN40/J3040) - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3322) and the Primary Charging High Voltage Contact Resistance (M) (UN60) - Harnesses from the DC Controller PCB to the Hopper Toner Level Sensor (M) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Hopper Toner Level Sensor (M) (TS7/J7124) - DC Controller PCB (UN2) - Toner Density Sensor (M) (TS3) - Laser Interface PCB (UN100) - Laser Scanner Unit (M) - Primary Charging High Voltage PCB (CL) (UN38) - Primary Charging High Voltage Contact Resistance (M) (UN60) - Hopper Toner Level Sensor (M) (TS7) - Hopper Unit (Y) (M) (C) - Developing Assembly (M) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the harnesses from the DC Controller PCB to the Toner Density Sensor (M). 2. Check the harnesses from the Laser Interface PCB to the Laser Scanner Unit (M). 3. Check the harness between the DC Controller PCB and the Developing High Voltage PCB (CL). 4. Check the harness between the Primary Charging High Voltage PCB (CL) and the Charging Terminal Unit (M). 5. Execute "COPIER> FUNCTION> MISC-P> DEV-RCVR" to return the toner density to normal state. 6. Check the harnesses from the DC Controller PCB to the Hopper Toner Level Sensor (M). 7. Replace the Hopper Toner Level Sensor (M). 8. Replace the Hopper Unit (Y) (M) (C), and execute "COPIER> FUNCTION> MISC-P> DEV-RCVR" to return the toner density to normal state. 9. Replace the DC Controller PCB. 10. Replace the Developing Assembly (M). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-02A0-05	Toner Container Phase Sensor (M) detection error
Detection Description	Change in status (ON -> OFF) of the Toner Container Phase Sensor (M) in the Hopper Unit (M) could not be detected when installing the Toner Container so that open and close status of the cap could not be judged.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (M) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Phase Sensor (M) (PS82/J7126) - Developing Drive Assembly (Color) - Toner Container Phase Sensor (M) (PS82) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the installation of the Toner Container Phase Sensor (M) and whether it is soiled. If it is soiled, clean it with a blower. 2. Move the Hopper Unit (M) little by little with the Toner Container Removing Tool, and check if the output value of "COPIER> I/O> DC-CON> P050 bit11" is changed. [CAUTION] Since it is difficult to check the screen while moving it, repeat the operation to move it a little and check the screen until the value is changed. a. If the output value of the sensor is changed, check the drive system of the Hopper Unit such as gears. If it is damaged, replace the Developing Drive Assembly (Color). b. If the output value of the sensor is not changed, check the harnesses from the DC Controller PCB to the Toner Container Phase Sensor (M). 1. Replace the Toner Container Phase Sensor (M), and check if the output value of "COPIER> I/O> DC-CON> P050 bit11" is changed. 3. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-02B0-05	Toner Container Phase Sensor (M) detection error
Detection Description	Change in status (ON -> OFF) of the Toner Container Phase Sensor (M) in the Hopper Unit (M) could not be detected when removing the Toner Container so that open and close status of the cap could not be judged.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (M) 1. DC Controller PCB (UN2/J1247) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Phase Sensor (M) (PS82/J7126) - Developing Drive Assembly (Color) - Toner Container Phase Sensor (M) (PS82) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the installation of the Toner Container Phase Sensor (M) and whether it is soiled. If it is soiled, clean it with a blower. 2. Move the Hopper Unit (M) little by little with the Toner Container Removing Tool, and check if the output value of "COPIER> I/O> DC-CON> P050 bit11" is changed. [CAUTION] Since it is difficult to check the screen while moving it, repeat the operation to move it a little and check the screen until the value is changed. a. If the output value of the sensor is changed, check the drive system of the Hopper Unit such as gears. If it is damaged, replace the Developing Drive Assembly (Color). b. If the output value of the sensor is not changed, check the harnesses from the DC Controller PCB to the Toner Container Phase Sensor (M). 1. Replace the Toner Container Phase Sensor (M), and check if the output value of "COPIER> I/O> DC-CON> P050 bit11" is changed. 3. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-02C0-05	Toner Container Insertion Inlet Cover Sensor (M) detection error
Detection Description	When removing the Toner Container, the Toner Container Insertion Inlet Cover Sensor (M) in the Hopper Unit (M) could not detect the open status of the Toner Insertion Inlet Cover (M).
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1246) and the Toner Container Insertion Inlet Cover Sensor (M) (PS13/J7125) - Toner Container Insertion Inlet Cover Sensor (M) (PS13) - Hopper Unit - Hopper Tray - Toner Container Replacement Cover Unit - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. If the Toner Container Replacement Cover does not open by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner", check the slide of shaft area). 2. Check the installation of the Toner Container Insertion Inlet Cover Sensor (M) and whether it is soiled. If it is soiled, clean it with a blower. 3. When opening the Toner Container Replacement Cover by making the Hopper Unit driven with the Toner Container Removal Tool, check if output value of the Toner Container Insertion Inlet Cover Open/Close Sensor (M) changes properly. If it's in normal state, the output value of "COPIER> I/O> DC-CON> P051 bit06" shows "0" when opening the cover, and "1" when closing it with your hand. a. When the Toner Container Replacement Cover does not open although the Hopper Unit is driven, check the drive system (Hopper Unit, link mechanism of Hopper Tray, Toner Container Replacement Cover Unit). b. When the output value is not changed properly although the Toner Container Replacement Cover can be opened/closed, check the harness between the DC Controller PCB and the Toner Container Insertion Inlet Cover Sensor (M). 1. Replace the Toner Container Insertion Inlet Cover Sensor (M). 4. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-0302-05	Toner Feed Screw Rotation Sensor (C) detection error
Detection Description	The Toner Feed Screw Rotation Sensor (C) in the Hopper Unit (C) could not detect the screw rotation.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Hopper Stirring/Supply Motor (C) 1. DC Controller PCB (UN2/J1248) to Relay Connector (13P) 2. Relay Connector (13P) to Hopper Stirring/Supply Motor (C) (M15/J7106) - Harnesses from the DC Controller PCB to the Toner Feed Screw Rotation Sensor (C) 1. DC Controller PCB (UN2/J1248) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Feed Screw Rotation Sensor (C) (PS18/J7420) - Toner Feed Screw Rotation Sensor (C) (PS18) - Hopper Stirring/Supply Motor (C) (M15) - Toner Supply Pipe Unit - Hopper Unit (C) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check if the Toner Feed Screw Rotation Sensor (C) is soiled. If it is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts.

025-0310-05	Toner Container reciprocation HP Sensor (C) timeout error
Detection Description	The Toner Container Reciprocation HP Sensor (C) in the Hopper Unit (C) did not detect home position within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Drive Motor (C) 1. DC Controller PCB (UN2/J1248) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Drive Motor (C) (M16/J7102) - Harnesses from the DC Controller PCB to the Toner Container Reciprocation HP Sensor (C) 1. DC Controller PCB (UN2/J1249) to Relay Connector (5P) 2. Relay Connector (5P) to Toner Container Reciprocation HP Sensor (C) (PS17/J71970) - Toner Container Drive Motor (C) (M16) - Toner Container Reciprocation HP Sensor (C) (PS17) - Hopper Unit (C) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. If the Toner Container Reciprocation HP Sensor (C) is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts.

025-0320-05	Toner Container/Toner Container Insertion Inlet Cover (C) phase error
Detection Description	When the power was turned ON, the Toner Container Cap was detected open (the Toner Container Phase Sensor (C) light was blocked) and the Toner Container Insertion Inlet Cover was detected open (the Toner Container Insertion Inlet Cover Sensor (C) light was transmitted).
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1246) and the Toner Container Insertion Inlet Cover Sensor (C) (PS16/J7128) - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (C) 1. DC Controller PCB (UN2/J1248) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Phase Sensor (C) (PS83/J7129) - Toner Container Insertion Inlet Cover Sensor (C) (PS16) - Toner Container Phase Sensor (C) [Remedy] Check/replace the related harness/cable, connector and parts.

025-0350-05	Toner Density Sensor (C) output lower limit error
Detection Description	The Toner Density Sensor (C) detected that the output (Vsig_ind) was 51 or less 10 consecutive times.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (C) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (C) (TS4/J8945) - Harnesses from the DC Controller PCB to the Hopper Stirring/Supply Motor (C) 1. DC Controller PCB (UN2/J1248) to Relay Connector (13P) 2. Relay Connector (13P) to Hopper Stirring/Supply Motor (C) (M15/J7106) - DC Controller PCB (UN2) - Toner Density Sensor (C) (TS4) - Hopper Stirring/Supply Motor (C) (M15) - Hopper Unit (C) - Developing Assembly (C) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

025-0351-05	Toner Density Sensor (C) output upper limit error
Detection Description	The Toner Density Sensor (C) detected that the output (Vsig_ind) was 221 or higher 10 consecutive times.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (C) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (C) (TS4/J8945) - Harnesses from the Laser Interface PCB to the Laser Scanner Unit (C) 1. Laser Interface PCB (UN100/J12) to Relay Connector (9P) 2. Relay Connector (9P) to Laser Scanner Unit (C) - Harness between the DC Controller PCB (UN2/J1266) and the Developing High Voltage PCB (CL) (UN40/J3040) - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3522) and the Primary Charging High Voltage Contact Resistance (C) (UN61) - Harnesses from the DC Controller PCB to the Hopper Toner Level Sensor (C) 1. DC Controller PCB (UN2/J1248) to Relay Connector (13P) 2. Relay Connector (13P) to Hopper Toner Level Sensor (C) - DC Controller PCB (UN2) - Toner Density Sensor (C) (TS4) - Laser Interface PCB (UN100) - Laser Scanner Unit (C) - Primary Charging High Voltage PCB (CL) (UN38) - Primary Charging High Voltage Contact Resistance (C) (UN61) - Hopper Toner Level Sensor (C) (TS8) - Hopper Unit (Y) (M) (C) - Developing Assembly (C) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the harnesses from the DC Controller PCB to the Toner Density Sensor (C). 2. Check the harnesses from the Laser Interface PCB to the Laser Scanner Unit (C). 3. Check the harness between the DC Controller PCB and the Developing High Voltage PCB (CL). 4. Check the harness between the Primary Charging High Voltage PCB (CL) and the Charging Terminal Unit (C). 5. Execute "COPIER> FUNCTION> MISC-P> DEV-RCVR" to return the toner density to normal state. 6. Check the harnesses from the DC Controller PCB to the Hopper Toner Level Sensor (C). 7. Replace the Hopper Toner Level Sensor (C). 8. Replace the Hopper Unit (Y) (M) (C), and execute "COPIER> FUNCTION> MISC-P> DEV-RCVR" to return the toner density to normal state. 9. Replace the DC Controller PCB. 10. Replace the Developing Assembly (C). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-03A0-05	Toner Container Phase Sensor (C) detection error
Detection Description	Change in status (ON -> OFF) of the Toner Container Phase Sensor (C) in the Hopper Unit (C) could not be detected when installing the Toner Container so that open and close status of the cap could not be judged.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (C) 1. DC Controller PCB (UN2/J1248) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Phase Sensor (C) (PS83/J7129) - Developing Drive Assembly (Color) - Toner Container Phase Sensor (C) (PS83) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the installation of the Toner Container Phase Sensor (C) and whether it is soiled. If it is soiled, clean it with a blower. 2. Move the Hopper Unit (C) little by little with the Toner Container Removing Tool, and check if the output value of "COPIER> I/O> DC-CON> P050 bit10" is changed. [CAUTION] Since it is difficult to check the screen while moving it, repeat the operation to move it a little and check the screen until the value is changed. a. If the output value of the sensor is changed, check the drive system of the Hopper Unit such as gears. If it is damaged, replace the Developing Drive Assembly (Color). b. If the output value of the sensor is not changed, check the harnesses from the DC Controller PCB to the Toner Container Phase Sensor (C). 1. Replace the Toner Container Phase Sensor (C), and check if the output value of "COPIER> I/O> DC-CON> P050 bit10" is changed. 3. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-03B0-05	Toner Container Phase Sensor (C) detection error
Detection Description	Change in status (ON -> OFF) of the Toner Container Phase Sensor (C) in the Hopper Unit (C) could not be detected when removing the Toner Container so that open and close status of the cap could not be judged.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (C) 1. DC Controller PCB (UN2/J1248) to Relay Connector (13P) 2. Relay Connector (13P) to Toner Container Phase Sensor (C) (PS83/J7129) - Developing Drive Assembly (Color) - Toner Container Phase Sensor (C) (PS83) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the installation of the Toner Container Phase Sensor (C) and whether it is soiled. If it is soiled, clean it with a blower. 2. Move the Hopper Unit (C) little by little with the Toner Container Removing Tool, and check if the output value of "COPIER> I/O> DC-CON> P050 bit10" is changed. [CAUTION] Since it is difficult to check the screen while moving it, repeat the operation to move it a little and check the screen until the value is changed. a. If the output value of the sensor is changed, check the drive system of the Hopper Unit such as gears. If it is damaged, replace the Developing Drive Assembly (Color). b. If the output value of the sensor is not changed, check the harnesses from the DC Controller PCB to the Toner Container Phase Sensor (C). 1. Replace the Toner Container Phase Sensor (C), and check if the output value of "COPIER> I/O> DC-CON> P050 bit10" is changed. 3. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-03C0-05	Toner Container Insertion Inlet Cover Sensor (C) detection error
Detection Description	When removing the Toner Container, the Toner Container Insertion Inlet Cover Sensor (C) in the Hopper Unit (C) could not detect the open status of the Toner Insertion Inlet Cover (C).
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1246) and the Toner Container Insertion Inlet Cover Sensor (C) (PS16/J7128) - Toner Container Insertion Inlet Cover Sensor (C) (PS16) - Hopper Unit - Hopper Tray - Toner Container Replacement Cover Unit - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. If the Toner Container Replacement Cover does not open by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner", check the slide of shaft area). 2. Check the installation of the Toner Container Insertion Inlet Cover Sensor (C) and whether it is soiled. If it is soiled, clean it with a blower. 3. When opening the Toner Container Replacement Cover by making the Hopper Unit driven with the Toner Container Removal Tool, check if output value of the Toner Container Insertion Inlet Cover Open/Close Sensor (C) changes properly. If it's in normal state, the output value of "COPIER> I/O> DC-CON> P052 bit05" shows "0" when opening the cover, and "1" when closing it with your hand. a. When the Toner Container Replacement Cover does not open although the Hopper Unit is driven, check the drive system (Hopper Unit, link mechanism of Hopper Tray, Toner Container Replacement Cover Unit). b. When the output value is not changed properly although the Toner Container Replacement Cover can be opened/closed, check the harness between the DC Controller PCB and the Toner Container Insertion Inlet Cover Sensor (C). 1. Replace the Toner Container Insertion Inlet Cover Sensor (C). 4. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-0402-05	Toner Feed Screw Rotation Sensor (Bk) detection error
Detection Description	The Toner Feed Screw Rotation Sensor (Bk) in the Hopper Unit (Bk) could not detect the screw rotation.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Hopper Stirring/Supply Motor (Bk) 1. DC Controller PCB (UN2/J1248) to Relay Connector (17P) 2. Relay Connector (17P) to Hopper Stirring/Supply Motor (Bk) (M6/J7107) - Harnesses from the DC Controller PCB to the Toner Feed Screw Rotation Sensor (Bk) 1. DC Controller PCB (UN2/J1248) to Relay Connector (17P) 2. Relay Connector (17P) to Toner Feed Screw Rotation Sensor (Bk) - Toner Feed Screw Rotation Sensor (Bk) (PS9) - Hopper Stirring/Supply Motor (Bk) (M6) - Toner Supply Pipe Unit - Hopper Unit (Bk) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the Toner Feed Screw Rotation Sensor (Bk) is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts.

025-0410-05	Toner Container Reciprocation HP Sensor (Bk) timeout error
Detection Description	The Toner Container Reciprocation HP Sensor (Bk) in the Hopper Unit (Bk) did not detect home position within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Drive Motor (Bk) 1. DC Controller PCB (UN2/J1248) to Relay Connector (17) 2. Relay Connector (17P) to Toner Container Drive Motor (Bk) (M7/J7103) - Harnesses from the DC Controller PCB to the Toner Container Reciprocation HP Sensor (Bk) 1. DC Controller PCB (UN2/J1248) to Relay Connector (17P) 2. Relay Connector (17P) to Relay Connector (4P) 3. Relay Connector (4P) to Toner Container Reciprocation HP Sensor (Bk) (PS8/JJ71750) - Toner Container Drive Motor (Bk) (M7) - Toner Container Reciprocation HP Sensor (Bk) (PS8) - Hopper Unit (Bk) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. If the Toner Container Reciprocation HP Sensor (Bk) is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts.

025-0420-05	Toner Container/Toner Container Insertion Inlet Cover (Bk) phase error
Detection Description	When the power was turned ON, the Toner Container Cap was detected open (the Toner Container Phase Sensor (Bk) light was blocked) and the Toner Container Insertion Inlet Cover was detected open (the Toner Container Insertion Inlet Cover Sensor (Bk) light was transmitted).
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1246) and the Toner Container Insertion Inlet Cover Sensor (Bk) (PS7/J7138) - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (Bk) 1. DC Controller PCB (UN2/J1248) to Relay Connector (17P) 2. Relay Connector (17P) to Toner Container Phase Sensor (Bk) (PS84/J7139) - Toner Container Insertion Inlet Cover Sensor (Bk) (PS7) - Toner Container Phase Sensor (Bk) (PS84) [Remedy] Check/replace the related harness/cable, connector and parts.

025-0450-05	Toner Density Sensor (Bk) output lower limit error
Detection Description	The Toner Density Sensor (Bk) detected that the output (Vsig_ind) was 51 or less 10 consecutive times.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Bk) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (5P) 3. Relay Connector (5P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (Bk) (TS1/J8946) - Harnesses from the DC Controller PCB to the Hopper Stirring/Supply Motor (Bk) 1. DC Controller PCB (UN2/J1248) to Relay Connector (17P) 2. Relay Connector (17P) to Hopper Stirring/Supply Motor (Bk) (M6/J7107) - Toner Density Sensor (Bk) (TS1) - Hopper Stirring/Supply Motor (Bk) (M6) - Hopper Unit (Bk) - Developing Assembly (Bk) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

025-0451-05	Toner Density Sensor (Bk) output upper limit error
Detection Description	The Toner Density Sensor (Bk) detected that the output (Vsig_ind) was 221 or higher 10 consecutive times.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Bk) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (5P) 3. Relay Connector (5P) to Toner Density Sensor (Bk) (TS1/J8946) - Harnesses from the Laser Interface PCB to the Laser Scanner Unit (Bk) 1. Laser Interface PCB (UN100/J12) to Relay Connector (9P) 2. Relay Connector (9P) to Laser Scanner Unit (Bk) - Harness between the Developing High Voltage PCB (CL) (UN40/J3046) and the Developing High Voltage PCB (Bk) (UN39/J3040) - Harness between the Primary Charging High Voltage PCB (Bk) (UN37/J3011) and the Primary Charging High Voltage PCB (CL) (UN38/J3021) - Harnesses from the DC Controller PCB to the Hopper Toner Level Sensor (Bk) 1. DC Controller PCB (UN2/J1248) to Relay Connector (17P) 2. Relay Connector (17P) to Hopper Toner Level Sensor (Bk) (TS5/J7136) - DC Controller PCB (UN2) - Toner Density Sensor (Bk) (TS1) - Laser Interface PCB (UN100) - Laser Scanner Unit (Bk) - Primary Charging High Voltage PCB (Bk) (UN37) - Primary Charging High Voltage PCB (CL) (UN38) - Hopper Toner Level Sensor (Bk) (TS5) - Hopper Unit (Y) (M) (C) - Developing Assembly (Bk) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the harnesses from the DC Controller PCB to the Toner Density Sensor (Bk). 2. Check the harnesses from the Laser Interface PCB to the Laser Scanner Unit (Bk). 3. Check the harness between the Developing High Voltage PCB (CL) and the Developing High Voltage PCB (Bk). 4. Check the harness between the Primary Charging High Voltage PCB (Bk) and the Primary Charging High Voltage PCB (CL). 5. Execute "COPIER> FUNCTION> MISC-P> DEV-RCVR" to return the toner density to normal state. 6. Check the harnesses from the DC Controller PCB to the Hopper Toner Level Sensor (Bk). 7. Replace the Hopper Toner Level Sensor (Bk). 8. Replace the Hopper Unit (Y) (M) (C). 9. Execute "COPIER> FUNCTION> MISC-P> DEV-RCVR" to return the toner density to normal state. If "NG" is displayed, replace the Developing Assembly (Bk). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode. 10. Replace the DC Controller PCB. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-04A0-05	Toner Container Phase Sensor (Bk) detection error
Detection Description	Change in status (ON -> OFF) of the Toner Container Phase Sensor (Bk) in the Hopper Unit (Bk) could not be detected when installing the Toner Container so that open and close status of the cap could not be judged.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (Bk) 1. DC Controller PCB (UN2/J1248) to Relay Connector (17P) 2. Relay Connector (17P) to Toner Container Phase Sensor (Bk) (PS84/J7139) - Developing Drive Assembly (Bk) - Toner Container Phase Sensor (Bk) (PS84) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the installation of the Toner Container Phase Sensor (Bk) and whether it is soiled. If it is soiled, clean it with a blower. 2. Move the Hopper Unit (Bk) little by little with the Toner Container Removing Tool, and check if the output value of "COPIER> I/O> DC-CON> P050 bit09" is changed. [CAUTION] Since it is difficult to check the screen while moving it, repeat the operation to move it a little and check the screen until the value is changed. a. If the output value of the sensor is changed, check the drive system of the Hopper Unit such as gears. If it is damaged, replace the Developing Drive Assembly (Bk). b. If the output value of the sensor is not changed, check the harnesses from the DC Controller PCB to the Toner Container Phase Sensor (Bk). 1. Replace the Toner Container Phase Sensor (Bk), and check if the output value of "COPIER> I/O> DC-CON> P050 bit09" is changed. 3. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-04B0-05	Toner Container Phase Sensor (Bk) detection error
Detection Description	Change in status (ON -> OFF) of the Toner Container Phase Sensor (Bk) in the Hopper Unit (Bk) could not be detected when removing the Toner Container so that open and close status of the cap could not be judged.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Container Phase Sensor (Bk) 1. DC Controller PCB (UN2/J1248) to Relay Connector (17P) 2. Relay Connector (17P) to Toner Container Phase Sensor (Bk) (PS84/J7139) - Developing Drive Assembly (Bk) - Toner Container Phase Sensor (Bk) (PS84) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. Check the installation of the Toner Container Phase Sensor (Bk) and whether it is soiled. If it is soiled, clean it with a blower. 2. Move the Hopper Unit (Bk) little by little with the Toner Container Removing Tool, and check if the output value of "COPIER> I/O> DC-CON> P050 bit09" is changed. [CAUTION] Since it is difficult to check the screen while moving it, repeat the operation to move it a little and check the screen until the value is changed. a. If the output value of the sensor is changed, check the drive system of the Hopper Unit such as gears. If it is damaged, replace the Developing Drive Assembly (Bk). b. If the output value of the sensor is not changed, check the harnesses from the DC Controller PCB to the Toner Container Phase Sensor (Bk). 1. Replace the Toner Container Phase Sensor (Bk), and check if the output value of "COPIER> I/O> DC-CON> P050 bit09" is changed. 3. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

025-04C0-05	Toner Container Insertion Inlet Cover Sensor (Bk) detection error
Detection Description	When removing the Toner Container, the Toner Container Insertion Inlet Cover Sensor (Bk) in the Hopper Unit (Bk) could not detect the open status of the Toner Insertion Inlet Cover (Bk).
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1246) and the Toner Container Insertion Inlet Cover Sensor (Bk) (PS7/J7138) - Toner Container Insertion Inlet Cover Sensor (Bk) (PS7) - Hopper Unit - Hopper Tray - Toner Container Replacement Cover Unit - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. After performing the remedy work, go through the following to clear the error: COPIER> FUNCTION> CLEAR> ERR. 1. If the Toner Container Replacement Cover does not open by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner", check the slide of shaft area). 2. Check the installation of the Toner Container Insertion Inlet Cover Sensor (Bk) and whether it is soiled. If it is soiled, clean it with a blower. 3. When opening the Toner Container Replacement Cover by making the Hopper Unit driven with the Toner Container Removal Tool, check if output value of the Toner Container Insertion Inlet Cover Open/Close Sensor (C) changes properly. If it's in normal state, the output value of "COPIER> I/O> DC-CON> P051 bit04" shows "0" when opening the cover, and "1" when closing it with your hand. a. When the Toner Container Replacement Cover does not open although the Hopper Unit is driven, check the drive system (Hopper Unit, link mechanism of Hopper Tray, Toner Container Replacement Cover Unit). b. When the output value is not changed properly although the Toner Container Replacement Cover can be opened/closed, check the harness between the DC Controller PCB and the Toner Container Insertion Inlet Cover Sensor (Bk). 1. Replace the Toner Container Insertion Inlet Cover Sensor (Bk). 4. Replace the DC Controller PCB. After a recovery from the error, check that toner can be replaced properly (setting the removed toner container again) by selecting the following: "Adjustment/Maintenance> Maintenance> Replace Specified Toner> Replace. Not Needed> Remove Toner> xx Toner". [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

026-0101-05	Developing Thermistor (Y) high temperature detection error
Detection Description	The Thermistor of the Toner Density Sensor (Y) in the Process Unit (Y) detected 55 deg C or higher.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Y) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) to Toner Density Sensor (Y) (TS2/J8944) - Developing Assembly (Y) - Primary Charging Dustproof Filter - Ozone Filter - Fixing Dustproof Filter [Remedy] Perform the following in the order while checking whether the error is cleared. a. If you touch the Toner Density Sensor (Y) of the Developing Assembly (Y) and it is cooled down: 1. Check the harness between the DC Controller PCB and the Toner Density Sensor (Y). 2. Replace the Developing Assembly (Y). [CAUTION] When replacing the Developing Assembly, execute "Adjustment During Developing Unit Replacement" in situation mode. b. If you touch the Toner Density Sensor (Y) of the Developing Assembly (Y) and it is still hot, or if the error does not occur during a service visit but is found in the log: 1. Clean the inlet on the side where the Developing Cooling Suction Fan (Y)/(M)/(C) is installed and remove dust. 2. Clean the exhaust outlet on the side where the Developing Cooling Exhaust Fan is installed and remove dust. 3. Clean the Ozone Filter/Fixing Dustproof Filter and remove dust. 4. Clean the exhaust outlet of the Fixing Heat Fan and remove dust. 5. Clean the Primary Charging Dustproof Filter and remove dust. 6. Clean the exhaust outlet of the Primary Charging Suction Fan and remove dust. 7. If the space behind the host machine is less than 10 cm, ask the user to secure enough space. 8. Check that the Rear Curtain Unit is installed.

026-0102-05	Developing Thermistor (Y) low temperature detection error
Detection Description	The Thermistor of the Toner Density Sensor (Y) in the Process Unit (Y) detected 20 deg C or lower.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Y) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) to Toner Density Sensor (Y) (TS2/J8944) - Developing Assembly (Y) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment During Developing Assembly Replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

026-0201-05	Developing Thermistor (M) high temperature detection error
Detection Description	The Thermistor of the Toner Density Sensor (M) in the Process Unit (M) detected 55 deg C or higher.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (M) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) to Toner Density Sensor (M) (TS3/J8943) - Developing Assembly (M) - Primary Charging Dustproof Filter - Ozone Filter - Fixing Dustproof Filter [Remedy] Perform the following in the order while checking whether the error is cleared. a. If you touch the Toner Density Sensor (M) of the Developing Assembly (M) and it is cooled down: 1. Check the harness between the DC Controller PCB and the Toner Density Sensor (M). 2. Replace the Developing Assembly (M). [CAUTION] When replacing the Developing Assembly, execute "Adjustment During Developing Assembly Replacement" in situation mode. b. If you touch the Toner Density Sensor (M) of the Developing Assembly (M) and it is still hot, or if the error does not occur during a service visit but is found in the log: 1. Clean the inlet on the side where the Developing Cooling Suction Fan (Y)/(M)/(C) is installed and remove dust. 2. Clean the exhaust outlet on the side where the Developing Cooling Exhaust Fan is installed and remove dust. 3. Clean the Ozone Filter/Fixing Dustproof Filter and remove dust. 4. Clean the exhaust outlet of the Fixing Heat Fan and remove dust. 5. Clean the Primary Charging Dustproof Filter and remove dust. 6. Clean the exhaust outlet of the Primary Charging Suction Fan and remove dust. 7. If the space behind the host machine is less than 10 cm, ask the user to secure enough space. 8. Check that the Rear Curtain Unit is installed.

026-0202-05	Developing Thermistor (M) low temperature detection error
Detection Description	The Thermistor of the Toner Density Sensor (M) in the Process Unit (M) detected 20 deg C or lower.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (M) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) to Toner Density Sensor (M) (TS3/J8943) - Developing Assembly (M) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment During Developing Assembly Replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

026-0301-05	Developing Thermistor (C) high temperature detection error
Detection Description	The Thermistor of the Toner Density Sensor (C) in the Process Unit (C) detected 55 deg C or higher.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (C) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) to Toner Density Sensor (C) (TS4/J8945) - Developing Assembly (C) - Primary Charging Dustproof Filter - Ozone Filter - Fixing Dustproof Filter [Remedy] Perform the following in the order while checking whether the error is cleared. a. If you touch the Toner Density Sensor (C) of the Developing Assembly (C) and it is cooled down: 1. Check the harness between the DC Controller PCB and the Toner Density Sensor (C). 2. Replace the Developing Assembly (C). [CAUTION] When replacing the Developing Assembly, execute "Adjustment During Developing Assembly Replacement" in situation mode. b. If you touch the Toner Density Sensor (C) of the Developing Assembly (C) and it is still hot, or if the error does not occur during a service visit but is found in the log: 1. Clean the inlet on the side where the Developing Cooling Suction Fan (Y)/(M)/(C) is installed and remove dust. 2. Clean the exhaust outlet on the side where the Developing Cooling Exhaust Fan is installed and remove dust. 3. Clean the Ozone Filter/Fixing Dustproof Filter and remove dust. 4. Clean the exhaust outlet of the Fixing Heat Fan and remove dust. 5. Clean the Primary Charging Dustproof Filter and remove dust. 6. Clean the exhaust outlet of the Primary Charging Suction Fan and remove dust. 7. If the space behind the host machine is less than 10 cm, ask the user to secure enough space. 8. Check that the Rear Curtain Unit is installed.

026-0302-05	Developing Thermistor (C) low temperature detection error
Detection Description	The Thermistor of the Toner Density Sensor (C) in the Process Unit (C) detected 20 deg C or lower.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (C) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (5P) to Toner Density Sensor (C) (TS4/J8945) - Developing Assembly (C) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment During Developing Assembly Replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

026-0401-05	Developing Thermistor (Bk) high temperature detection error
Detection Description	The Thermistor of the Toner Density Sensor (Bk) in the Drum Unit (Bk) detected 55 deg C or higher.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Bk) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (5P) 3. Relay Connector (5P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (Bk) (TS1/J8946) - Developing Assembly (Bk) - Primary Charging Dustproof Filter - Ozone Filter - Fixing Dustproof Filter [Remedy] Perform the following in the order while checking whether the error is cleared. a. If you touch the Toner Density Sensor (Bk) of the Developing Assembly (Bk) and it is cooled down: 1. Check the harness between the DC Controller PCB and the Toner Density Sensor (Bk). 2. Replace the Developing Assembly (Bk). [CAUTION] When replacing the Developing Assembly, execute "Adjustment During Developing Assembly Replacement" in situation mode. b. If you touch the Toner Density Sensor (Bk) of the Developing Assembly (Bk) and it is still hot, or if the error does not occur during a service visit but is found in the log: 1. Clean the inlet on the side where the Developing Cooling Suction Fan (Y)/(M)/(C) is installed and remove dust. 2. Clean the exhaust outlet on the side where the Developing Cooling Exhaust Fan is installed and remove dust. 3. Clean the Ozone Filter/Fixing Dustproof Filter and remove dust. 4. Clean the exhaust outlet of the Fixing Heat Fan and remove dust. 5. Clean the Primary Charging Dustproof Filter and remove dust. 6. Clean the exhaust outlet of the Primary Charging Suction Fan and remove dust. 7. If the space behind the host machine is less than 10 cm, ask the user to secure enough space. 8. Check that the Rear Curtain Unit is installed.

026-0402-05	Developing Thermistor (Bk) low temperature detection error
Detection Description	The Thermistor of the Toner Density Sensor (Bk) in the Drum Unit (Bk) detected 20 deg C or lower.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Toner Density Sensor (Bk) 1. DC Controller PCB (UN2/J1244) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (5P) 3. Relay Connector (5P) to Relay Connector (5P) 4. Relay Connector (5P) to Toner Density Sensor (Bk) to (TS1/J8946) - Developing Assembly (Bk) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Developing Assembly, execute "Adjustment During Developing Assembly Replacement" in situation mode. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

029-0400-05	Patch Sensor (Bk) soiled window error at initial installation
Detection Description	LED light intensity upper limit alarm with the Patch Sensor (Bk) occurred when executing the initial installation mode of the Developing Assembly.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk) 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Patch Sensor (Bk) (PS135/J2658) - Patch Sensor Unit (Bk) (PS135) - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk). 3. Select "3" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Patch Sensor Solenoid (Bk), replace the Patch Sensor Unit (Bk). [CAUTION] After replacement of the Patch Sensor (Bk), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 4. Execute "COPIER> DISPLAY> ALARM", and check if the alarm is cleared. 5. Once the alarm is cleared, execute the initial installation mode of the Developing Assembly (COPIER> FUNCTION> INSTALL> INISET-K). 6. Replace the Registration Patch Driver PCB.

029-0408-05	Patch Sensor (Bk) sampling detection value error
Detection Description	Variation in P-wave light value of the Patch Sensor (Bk) in the Drum Unit (Bk) showed 100 or higher when executing the initial installation mode of the Developing Assembly (Bk) (COPIER> FUNCTION> INSTALL> INISET-K).
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk) 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Patch Sensor (Bk) - ITB - Patch Sensor (Bk) - Registration Patch Driver PCB (UN8) - Developing Assembly (Bk) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (Bk). 4. Select "3" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Patch Sensor Solenoid (Bk), replace the Patch Sensor (Bk). [CAUTION] After replacement of the Patch Sensor (Bk), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. [Reference] After installing/removing the ITB Unit or replacement of the ITB, refer to "Parts Replacement and Cleaning> Image Formation System> Adjustment when Installing/Removing the ITB Unit> Procedure". 7. Replace the Developing Assembly (Bk). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

029-0410-05	Patch Sensor (Bk) soiled window error
Detection Description	Although LED light intensity of the Patch Sensor (Bk) reaches the upper limit (744), reflected light intensity of the Guide Plate is less than 360 at warm-up rotation at first power-on and at initial installation of the Developing Assembly.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk) 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Patch Sensor (Bk) (PS135/J2658) - Patch Sensor Unit (Bk) (PS135) - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk). 3. Select "3" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (Bk). [CAUTION] After replacement of the Patch Sensor (Bk), execute "Adjustment during Patch Sensor replacement" in situation mode. 4. Replace the Registration Patch Driver PCB.

029-0421-05	Patch Sensor (Bk) density upper/lower limit error
Detection Description	Density of ATR patch (Bk) is either 79 or lower or 970 or higher during printing/at initial installation.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk) 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (9P) 3. Relay Connector (9P) to Patch Sensor (Bk) (PS135/J2658) - Harnesses from the Developing High Voltage PCB (Bk) to the Developing Toner Collection High Voltage PCB (Bk) 1. Developing High Voltage PCB (Bk) (UN39/J3742) to Relay Connector (2P) 2. Relay Connector (2P) to Developing Toner Collection High Voltage PCB (Bk) (UN51) - Patch Sensor (Bk) (PS135) - ITB - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harnesses from the Registration Patch Driver PCB to the Patch Sensor (Bk). 4. Check the harnesses from the Developing High Voltage PCB (Bk) to the Developing Toner Collection High Voltage PCB (Bk). 5. Select "3" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (Bk). [CAUTION] After replacement of the Patch Sensor (Bk), execute "Adjustment during Patch Sensor replacement" in situation mode. 6. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 7. Replace the ITB if it is damaged. 8. Replace the Registration Patch Driver PCB.

029-5000-05	Patch Sensor (C) soiled window error at initial installation
Detection Description	LED light intensity upper limit alarm with the Patch Sensor (C) occurred when executing the initial installation mode of the Developing Assembly.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (C) (PS130/J8980) - Patch Sensor (C) (PS130) - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (C). 3. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (C). [CAUTION] After replacement of the Patch Sensor (C), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 4. Execute "COPIER> DISPLAY> ALARM", and check if the alarm is cleared. 5. Once the alarm is cleared, execute the initial installation mode of the Developing Assembly (COPIER> FUNCTION> INSTALL> INISET-C). 6. Replace the Registration Patch Driver PCB.

029-5008-05	Patch Sensor (C) sampling detection value error
Detection Description	Variation in S-wave light value of the Patch Sensor (C) in the ITB Unit showed 100 or higher when executing the initial installation mode of the Developing Assembly (C) (COPIER> FUNCTION> INSTALL> INISET-C).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (C) (PS130/J8980) - ITB - Patch Sensor (C) (PS130) - Registration Patch Driver PCB (UN8) - Developing Assembly (C) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor (C) is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (C). 4. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (C). [CAUTION] After replacement of the Patch Sensor (C), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. 7. Replace the Developing Assembly (C). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

029-5010-05	Patch Sensor (C) soiled window error
Detection Description	Although LED light intensity of the Patch Sensor (C) reaches the upper limit (837), reflected light intensity of the Guide Plate is less than 135 at warm-up rotation at first power-on, at PASCAL control, at initial installation of the Developing Assembly, and at density controls (ATR, real-time multiple tone control) during printing.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (C) (PS130/J8980) - Patch Sensor (C) (PS130) - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (C). 3. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (C). [CAUTION] After replacement of the Patch Sensor (C), execute "Adjustment during Patch Sensor replacement" in situation mode. 4. Replace the Registration Patch Driver PCB.

029-5021-05	Patch Sensor (C) density upper/lower limit error
Detection Description	Density of ATR patch (C) is either 79 or lower or 970 or higher during printing/at initial installation.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (C) (PS130/J8980) - Harnesses from the Developing High Voltage PCB (CL) to the Developing Toner Collection High Voltage PCB (C) 1. Developing High Voltage PCB (CL) (UN40/J3542) to Relay Connector (2P) 2. Relay Connector (2P) to Developing Toner Collection High Voltage PCB (C) (UN54) - Patch Sensor (C) (PS130) - ITB - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (C). 4. Check the harnesses from the Developing High Voltage PCB (CL) to the Developing Toner Collection High Voltage PCB (C). 5. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (C). [CAUTION] After replacement of the Patch Sensor (C), execute "Adjustment during Patch Sensor replacement" in situation mode. 6. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 7. Replace the ITB if it is damaged. 8. Replace the Registration Patch Driver PCB.

029-6000-05	Patch Sensor (M) soiled window error at initial installation
Detection Description	LED light intensity upper limit alarm with the Patch Sensor (M) occurred when executing the initial installation mode of the Developing Assembly.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (M) (PS129/J8982) - Patch Sensor (M) (PS129) - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (M). 3. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (M). [CAUTION] After replacement of the Patch Sensor (M), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 4. Execute "COPIER> DISPLAY> ALARM", and check if the alarm is cleared. 5. Once the alarm is cleared, execute the initial installation mode of the Developing Assembly (COPIER> FUNCTION> INSTALL> INISET-M). 6. Replace the Registration Patch Driver PCB.

029-6008-05	Patch Sensor (M) sampling detection value error
Detection Description	Variation in S-wave light value of the Patch Sensor (M) in the ITB Unit showed 100 or higher when executing the initial installation mode of the Developing Assembly (M) (COPIER> FUNCTION> INSTALL> INISET-M).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (M) (PS129/J8982) - ITB (Unit of replacement: BELT, INTER. TRANSFER) - Patch Sensor (M) (PS129) - Registration Patch Driver PCB (UN8) - Developing Assembly (M) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (M). 4. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (M). [CAUTION] After replacement of the Patch Sensor (M), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. 7. Replace the Developing Assembly (M). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

029-6010-05	Patch Sensor (M) soiled window error
Detection Description	Although LED light intensity of the Patch Sensor (M) reaches the upper limit (837), reflected light intensity of the Guide Plate is less than 135 at warm-up rotation at first power-on, at PASCAL control, at initial installation of the Developing Assembly, and at density controls (ATR, real-time multiple tone control) during printing.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (M) (PS129/J8982) - Patch Sensor (M) (PS129) - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (M). 3. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (M). [CAUTION] After replacement of the Patch Sensor (M), execute "Adjustment during Patch Sensor replacement" in situation mode. 4. Replace the Registration Patch Driver PCB.

029-6021-05	Patch Sensor (M) density upper/lower limit error
Detection Description	Density of ATR patch (M) is either 79 or lower or 970 or higher during printing/at initial installation.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (M) (PS129/J8982) - Harnesses from the Developing High Voltage PCB (CL) to the Developing Toner Collection High Voltage PCB (M) 1. Developing High Voltage PCB (CL) (UN40/J3342) to Relay Connector (2P) 2. Relay Connector (2P) to Developing Toner Collection High Voltage PCB (M) (UN53) - Patch Sensor (M) (PS129) - ITB - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (M). 4. Check the harnesses from the Developing High Voltage PCB (CL) to the Developing Toner Collection High Voltage PCB (M). 5. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (M). [CAUTION] After replacement of the Patch Sensor (M), execute "Adjustment during Patch Sensor replacement" in situation mode. 6. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 7. Replace the ITB if it is damaged. 8. Replace the Registration Patch Driver PCB.

029-7000-05	Patch Sensor (Y) soiled window error at initial installation
Detection Description	LED light intensity upper limit alarm with the Patch Sensor (Y) occurred when executing the initial installation mode of the Developing Assembly.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (Y) (PS21/J8983) - Patch Sensor (Y) (PS21) - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (Y). 3. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (Y). [CAUTION] After replacement of the Patch Sensor (Y), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 4. Execute "COPIER> DISPLAY> ALARM", and check if the alarm is cleared. 5. Once the alarm is cleared, execute the initial installation mode of the Developing Assembly (COPIER> FUNCTION> INSTALL> INISET-Y). 6. Replace the Registration Patch Driver PCB.

029-7008-05	Patch Sensor (Y) sampling detection value error
Detection Description	Variation in S-wave light value of the Patch Sensor (Y) in the ITB Unit showed 100 or higher when executing the initial installation mode of the Developing Assembly (Y) (COPIER> FUNCTION> INSTALL> INISET-Y).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (Y) (PS21/J8983) - ITB - Patch Sensor (Y) (PS21) - Registration Patch Driver PCB (UN8) - Developing Assembly (Y) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (Y). 4. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (Y). [CAUTION] After replacement of the Patch Sensor (Y), select the following to enter the alpha value of the Patch Sensor: COPIER> ADJUST> DENS> ALF-C; and then execute the following: COPIER> FUNCTION> MISC-P> PT-LPADJ. 5. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 6. Replace the ITB if it is damaged. 7. Replace the Developing Assembly (Y). [CAUTION] When replacing the Developing Assembly, execute "Adjustment during Developing Unit replacement" in situation mode.

029-7010-05	Patch Sensor (Y) soiled window error
Detection Description	Although LED light intensity of the Patch Sensor (Y) reaches the upper limit (837), reflected light intensity of the Guide Plate is less than 135 at warm-up rotation at first power-on, at PASCAL control, at initial installation of the Developing Assembly, and at density controls (ATR, real-time multiple tone control) during printing.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (Y) (PS21/J8983) - Patch Sensor (Y) (PS21) - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (Y). 3. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (Y). [CAUTION] After replacement of the Patch Sensor (Y), execute "Adjustment during Patch Sensor replacement" in situation mode. 4. Replace the Registration Patch Driver PCB.

029-7021-05	Patch Sensor (Y) density upper/lower limit error
Detection Description	Density of ATR patch (Y) is either 79 or lower or 970 or higher during printing/at initial installation.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Patch Sensor (Y) (PS21/J8983) - Harnesses from the Developing High Voltage PCB (CL) to the Developing Toner Collection High Voltage PCB (Y) 1. Developing High Voltage PCB (CL) (UN40/J3042) to Relay Connector (2P) 2. Relay Connector (2P) to Developing Toner Collection High Voltage PCB (Y) (UN52) - Patch Sensor (Y) (PS21) - ITB - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check if the Developing Assembly and the Drum Unit are installed properly. 2. If the sensor surface of the Patch Sensor is soiled, clean it with wet and tightly-wrung cloth. 3. Check the harness between the Registration Patch Driver PCB and the Patch Sensor (Y). 4. Check the harnesses from the Developing High Voltage PCB (CL) to the Developing Toner Collection High Voltage PCB (Y). 5. Select "1" in "COPIER> FUNCTION> PART-CHK> SL", and then select "SL-ON". If there is no operation sound from the Registration Patch Shutter Solenoid, replace the Patch Sensor (Y). [CAUTION] After replacement of the Patch Sensor (Y), execute "Adjustment during Patch Sensor replacement" in situation mode. 6. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 7. Replace the ITB if it is damaged. 8. Replace the Registration Patch Driver PCB.

056-0001-05	Reverse Roller Disengagement HP Sensor timeout error
Detection Description	The Reverse Roller Detachment HP Sensor could not detect home position despite an operation of the Reverse Disengagement Motor in the Reverse Delivery Unit at initialization.
Remedy	[Related parts] R1.00 - Harnesses from the Pickup Feed Driver PCB to the Reverse Disengagement Motor 1. Pickup Feed Driver PCB (UN4/J1405) to Relay Connector (15P) 2. Relay Connector (15P) to Reverse Disengagement Motor (M64/J7030) - Harnesses from the Pickup Feed Driver PCB to the Reverse Roller Detachment HP Sensor 1. Pickup Feed Driver PCB (UN4/J1405) to Relay Connector (15P) 2. Relay Connector (15P) to Reverse Roller Detachment HP Sensor (PS101/J7008) - Reverse Disengagement Motor (M64) - Reverse Roller Detachment HP Sensor (PS101) - Pickup Feed Driver PCB (UN4) [Remedy] Check/replace the related harness/cable, connector and parts.

056-0002-05	Reverse Roller Detachment HP Sensor timeout error
Detection Description	The Reverse Roller Detachment HP Sensor could not detect home position despite an operation of the Reverse Disengagement Motor in the Reverse Delivery Unit at disengagement/engagement operation during paper feeding.
Remedy	[Related parts] R1.00 - Harnesses from the Pickup Feed Driver PCB to the Reverse Disengagement Motor 1. Pickup Feed Driver PCB (UN4/J1405) to Relay Connector (15P) 2. Relay Connector (15P) to Reverse Disengagement Motor (M64/J7030) - Harnesses from the Pickup Feed Driver PCB to the Reverse Roller Detachment HP Sensor 1. Pickup Feed Driver PCB (UN4/J1405) to Relay Connector (15P) 2. Relay Connector (15P) to Reverse Roller Detachment HP Sensor (PS101/J7008) - Reverse Disengagement Motor (M64) - Reverse Roller Detachment HP Sensor (PS101) - Pickup Feed Driver PCB (UN4) [Remedy] Check/replace the related harness/cable, connector and parts.

060-0001-05	Primary Charging Wire Shutter HP open error
Detection Description	The Primary Wire HP Sensor detected the open status although the shutter of the Primary Charging Assembly was moved to the close position.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Primary Charging Wire Cleaning Motor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Primary Charging Wire Cleaning Motor (M1/J7147) - Harnesses from the Registration Patch Driver PCB to the Primary Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Primary Wire HP Sensor (PS92/J10021) - Primary Charging Wire Cleaning Motor (M1) - Primary Wire HP Sensor (PS92) - Primary Charging Assembly - Registration Patch Driver PCB (UN8) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Primary Charging Assembly, execute "Adjustment during Primary Charging Assembly replacement" in situation mode.

060-0002-05	Primary Charging Wire Shutter HP close error
Detection Description	The Primary Wire HP Sensor detected the close status although the shutter of the Primary Charging Assembly was moved to the open position.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Primary Charging Wire Cleaning Motor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Primary Charging Wire Cleaning Motor (M1/J7147) - Harnesses from the Registration Patch Driver PCB to the Primary Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Primary Wire HP Sensor (PS92/J10021) - Primary Charging Wire Cleaning Motor (M1) - Primary Wire HP Sensor (PS92) - Primary Charging Assembly - Registration Patch Driver PCB (UN8) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Primary Charging Assembly, execute "Adjustment during Primary Charging Assembly replacement" in situation mode.

060-0011-05	Primary Charging Wire Shutter HP open error
Detection Description	When cleaning, the Primary Wire HP Sensor did not detect the closed status although 10 sec have passed since the Primary Charging Assembly started its shutter operation.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Primary Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Primary Wire HP Sensor (PS92/J10021) - Primary Wire HP Sensor (PS92) - Primary Charging Assembly - Registration Patch Driver PCB (UN8) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Primary Charging Assembly, execute "Adjustment during Primary Charging Assembly replacement" in situation mode.

060-0012-05	Primary Charging Wire Shutter HP close error
Detection Description	When cleaning, the Primary Wire HP Sensor did not detect the open status although 10 sec have passed since the Primary Charging Assembly completed its shutter operation.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Primary Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Primary Wire HP Sensor (PS92/J10021) - Primary Wire HP Sensor (PS92) - Primary Charging Assembly - Registration Patch Driver PCB (UN8) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Primary Charging Assembly, execute "Adjustment during Primary Charging Assembly replacement" in situation mode.

060-0023-05	Primary Charging Wire Shutter error
Detection Description	The Primary Wire HP Sensor in the Primary Charging Assembly detected the OFF status while the Bk Drum was rotated.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Primary Charging Wire Cleaning Motor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Primary Charging Wire Cleaning Motor (M1/J7147) - Harnesses from the Registration Patch Driver PCB to the Primary Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Primary Wire HP Sensor (PS92/J10021) - Primary Charging Wire Cleaning Motor (M1) - Primary Wire HP Sensor (PS92) - Primary Charging Assembly - Registration Patch Driver PCB (UN8) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Primary Charging Assembly, execute "Adjustment during Primary Charging Assembly replacement" in situation mode.

061-0001-05	Primary charging dark area potential (Bk) upper/lower limit error
Detection Description	The Drum surface potential Vd at the potential control during initial rotation showed -500 V or higher, or -1050 V or lower.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Primary Charging Wire Cleaning Motor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Primary Charging Wire Cleaning Motor (M1/J7147) - Harnesses from the Registration Patch Driver PCB to the Primary Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Primary Wire HP Sensor (PS92/J10021) - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3050) and the Primary Charging High Voltage PCB (Bk) (UN37/J3010) - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3021) and the Primary Charging High Voltage PCB (Bk) (UN37/J3011) - Harness between the Drum ITB Driver PCB (UN6/J1905) and the Drum Motor (Bk) (M19/J7306) - Harnesses from the Registration Patch Driver PCB to the Potential Control PCB Unit 1. Registration Patch Driver PCB (UN8/J2408) to Potential Control PCB (UN29/J3530) 2. Potential Control PCB (UN29/J3531) to Potential Sensor (Bk) - Harness between the Registration Patch Driver PCB (UN8/J2408) and the Relay PCB (UN7/J1815) - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3021) and the Relay PCB (UN7/J1814) - Harness between the Laser Interface PCB (UN100/J10) and the Riser PCB (UN83/J3) - Harness between the Laser Interface PCB (UN100/J13) and the Riser PCB (UN83/J4) - Harness between the Laser Interface PCB (UN100/J17) and the Riser PCB (UN83/J5) - Harnesses from the Laser Interface PCB to the APC PCB (Bk) 1. Laser Interface PCB (UN100/J8 and J9) to Laser Driver PCB (Bk) (UN107/J1 and J2) 2. Laser Driver PCB (Bk) (UN107/J3) to APC PCB (Bk) (J8081K) - Harnesses from the Laser Interface PCB to the BD PCB (Bk) 1. Laser Interface PCB (UN100/J12) to Relay Connector (9P) 2. Relay Connector (9P) to BD PCB (Bk) (UN108/J7530K) - Primary Charging Assembly - Primary Charging High Voltage PCB (Bk) (UN37) - Primary Charging High Voltage PCB (CL) (UN38) - Drum Motor (Bk) (M19) - Drum ITB Driver PCB (UN6) - Registration Patch Driver PCB (UN8) - Potential Control PCB Unit - Relay PCB (UN7) - Laser Interface PCB (UN100) - Laser Driver PCB (Bk) - Riser PCB (UN83) - Drum Unit (Bk) - Laser Scanner Unit (Bk) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] - When replacing the Primary Charging Assembly, execute "Adjustment during Primary Charging Assembly replacement" in situation mode. - When replacing the Laser Scanner Unit (Bk), execute "Adjustment During Laser Scanner Unit replacement" in situation mode.

061-0002-05	Potential Sensor offset error
Detection Description	The offset adjustment for Potential Sensor resulted +/-30 V or higher.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Potential Control PCB Unit 1. Registration Patch Driver PCB (UN8/J2408) to Potential Control PCB (UN29/J3530) 2. Potential Control PCB (UN29/J3531) to Potential Sensor (Bk) - Registration Patch Driver PCB (UN8) - Potential Control PCB Unit [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the installation of the electrode for checking the Potential Sensor. 2. Check/replace the related harness/cable, connector and parts. [Reference] - After replacement of the Potential Control PCB Unit, execute offset adjustment of the Potential Sensor. - For installation of the electrode for checking the Potential Sensor and method of offset adjustment of the Potential Sensor, refer to "Parts Replacement and Cleaning Procedure> Image Formation System> Potential Sensor> When Replacing the Potential Control PCB" in the Service Manual.

061-0003-05	Potential control dark area potential error
Detection Description	The Drum surface potential Vd measured at potential control was +10 V or less or +200 V or higher against Vgrid.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Cleaning Pre-exposure LED (Bk) (LED1/J7142) - Harnesses from the Registration Patch Driver PCB to the Cleaning Post-exposure LED 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Cleaning Post-exposure LED (Bk) (LED5/J2660) - Harnesses from the Registration Patch Driver PCB to the Primary Charging Wire Cleaning Motor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Primary Charging Wire Cleaning Motor (M1/J7147) - Harnesses from the Registration Patch Driver PCB to the Primary Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Primary Wire HP Sensor (PS92/J10021) - Harnesses from the Laser Interface PCB to the APC PCB (Bk) 1. Laser Interface PCB (UN100/J8 and J9) to Laser Driver PCB (Bk) (UN107/J1 and J2) 2. Laser Driver PCB (Bk) (UN107/J3) to APC PCB (Bk) (J8081K) - Cleaning Pre-exposure LED (Bk) (LED1) - Cleaning Post-exposure LED (Bk) (LED5) (Unit of replacement: BLADE ASSEMBLY(BK)) - Primary Charging Assembly (Unit of replacement: PRIMARY CORONA ASSEMBLY) - Registration Patch Driver PCB (UN8) (Unit of replacement: REG. PATCH DRIVER PCB ASSEMBLY) - Drum (Bk) - Laser Interface PCB (UN100) - Laser Driver PCB (Bk) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Primary Charging Assembly, execute "Adjustment during Primary Charging Assembly replacement" in situation mode.

061-0004-05	Potential control laser intensity error
Detection Description	Potential difference in Laser Power (LPW40h to LPWDBh) showed 150 V or lower when measuring VL at potential control.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J8 and J9) and the Laser Driver PCB (Bk) (UN107/J1 and J2) - Harnesses from the Laser Interface PCB to the BD PCB (Bk) 1. Laser Interface PCB (UN100/J12) to Relay Connector (9P) 2. Relay Connector (9P) to BD PCB (Bk) (UN108/J7530K) - Laser Scanner Unit (Bk) - Laser Interface PCB (UN100) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the Dustproof Glass is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts. [Reference] After replacement of the Laser Scanner Unit (Bk), execute "Settings/Registration> Adjustment/Maintenance> Adjust Image Quality> Auto Correct Color Mismatch".

061-0005-05	Cleaning Pre-/Post-exposure LED (Bk) activation error
Detection Description	The drum surface potential was -350 V or less after charging high voltage was turned OFF at last rotation.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2406) and the Cleaning Pre-exposure LED (Bk) (LED1/J7142) - Harnesses from the Registration Patch Driver PCB to the Cleaning Post-exposure LED (Bk) 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Cleaning Post-exposure LED (Bk) (LED5/J2660) - Cleaning Pre-exposure LED (Bk) (LED1) - Cleaning Post-exposure LED (Bk) (LED5) - Registration Patch Driver PCB (UN8) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the Dustproof Glass is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts.

061-0006-05	Laser power (Bk) lower limit error
Detection Description	Laser power (LPW) determined at the time of potential control for Bk patch was 40 h or lower.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3050) and the Primary Charging High Voltage PCB (Bk) (UN37/J3010) - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3021) and the Primary Charging High Voltage PCB (Bk) (UN37/J3011) - Harnesses from the Laser Interface PCB to the APC PCB (Bk) 1. Laser Interface PCB (UN100/J8 and J9) to Laser Driver PCB (Bk) (UN107/J1 and J2) 2. Laser Driver PCB (Bk) (UN107/J3) to APC PCB (Bk) (J8081K) - Primary Charging Assembly (Unit of replacement: PRIMARY CORONA ASSEMBLY) - Primary Charging High Voltage PCB (Bk) (UN37) - Primary Charging High Voltage PCB (CL) (UN38) - Laser Scanner Unit (Bk) - Laser Interface PCB (UN100) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] After replacement of the Laser Scanner Unit (Bk), execute "Settings/Registration> Adjustment/Maintenance> Adjust Image Quality> Auto Correct Color Mismatch".

061-0007-05	Laser power (Bk) upper limit error
Detection Description	Laser power (LPW) determined at the time of potential control for Bk patch was DB h or higher.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3050) and the Primary Charging High Voltage PCB (Bk) (UN37/J3010) - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3021) and the Primary Charging High Voltage PCB (Bk) (UN37/J3011) - Harnesses from the Laser Interface PCB to the APC PCB (Bk) 1. Laser Interface PCB (UN100/J8 and J9) to Laser Driver PCB (Bk) (UN107/J1 and J2) 2. Laser Driver PCB (Bk) (UN107/J3) to APC PCB (Bk) (J8081K) - Primary Charging Assembly - Primary Charging High Voltage PCB (Bk) (UN37) - Primary Charging High Voltage PCB (CL) (UN38) - Laser Scanner Unit (Bk) - Laser Interface PCB (UN100) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] After replacement of the Laser Scanner Unit (Bk), execute "Settings/Registration> Adjustment/Maintenance> Adjust Image Quality> Auto Correct Color Mismatch".

064-1100-05	Primary charging AC bias (Y) output error
Detection Description	It was detected that the output value of the primary charging AC bias (Y) was out of the specified range.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3022) and the Primary Charging High Voltage Contact Resistance (Y) (UN59) - Primary Charging High Voltage PCB (CL) (UN38) [Remedy] Check/replace the related harness/cable, connector and parts.

064-1101-05	Primary charging DC bias (Y) output error
Detection Description	It was detected that the output value of the primary charging DC bias (Y) was out of the specified range.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3022) and the Primary Charging High Voltage Contact Resistance (Y) (UN59) - Primary Charging High Voltage PCB (CL) (UN38) [Remedy] Check/replace the related harness/cable, connector and parts.

064-1103-05	Developing DC bias (Y) output error
Detection Description	It was detected that the output value of the developing DC bias (Y) was out of the specified range.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3050) and the Pre-primary Transfer Charging High Voltage PCB (Bk) (UN50/J3544) - Harnesses from the Developing High Voltage PCB (CL) to Developing Toner Collection High Voltage PCB (Y) 1. Developing High Voltage PCB (CL) (UN40/J3042) to Relay Connector (2P) 2. Relay Connector (2P) to Developing Toner Collection High Voltage PCB (Y) (UN52) - Developing High Voltage PCB (CL) (UN40) - Primary Charging High Voltage PCB (CL) (UN38) [Remedy] Check/replace the related harness/cable, connector and parts.

064-1200-05	Primary charging AC bias (M) output error
Detection Description	It was detected that the output value of the primary charging AC bias (M) was out of the specified range.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3322) and the Primary Charging High Voltage Contact Resistance (M) (UN60) - Primary Charging High Voltage PCB (CL) (UN38) [Remedy] Check/replace the related harness/cable, connector and parts.

064-1201-05	Primary charging DC bias (M) output error
Detection Description	It was detected that the output value of the primary charging DC bias (M) was out of the specified range.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3322) and the Primary Charging High Voltage Contact Resistance (M) (UN60) - Primary Charging High Voltage PCB (CL) (UN38) [Remedy] Check/replace the related harness/cable, connector and parts.

064-1203-05	Developing DC bias (M) output error
Detection Description	It was detected that the output value of the developing DC bias (M) was out of the specified range.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3050) and the Pre-primary Transfer Charging High Voltage PCB (Bk) (UN50/J3544) - Harnesses from the Developing High Voltage PCB (CL) to Developing Toner Collection High Voltage PCB (M) 1. Developing High Voltage PCB (CL) (UN40/J3342) to Relay Connector (2P) 2. Relay Connector (2P) to Developing Toner Collection High Voltage PCB (M) (UN53) - Developing High Voltage PCB (CL) (UN40) - Primary Charging High Voltage PCB (CL) (UN38) [Remedy] Check/replace the related harness/cable, connector and parts.

064-1300-05	Primary charging AC bias (C) output error
Detection Description	It was detected that the output value of the primary charging AC bias (C) was out of the specified range.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3522) and the Primary Charging High Voltage Contact Resistance (C) (UN61) - Primary Charging High Voltage PCB (CL) (UN38) [Remedy] Check/replace the related harness/cable, connector and parts.

064-1301-05	Primary charging DC bias (C) output error
Detection Description	It was detected that the output value of the primary charging DC bias (C) was out of the specified range.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3522) and the Primary Charging High Voltage Contact Resistance (C) (UN61) - Primary Charging High Voltage PCB (CL) (UN38) [Remedy] Check/replace the related harness/cable, connector and parts.

064-1303-05	Developing DC bias (C) output error
Detection Description	It was detected that the output value of the developing DC bias (C) was out of the specified range.
Remedy	[Related parts] R1.00 - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3050) and the Pre-primary Transfer Charging High Voltage PCB (Bk) (UN50/J3544) - Harnesses from the Developing High Voltage PCB (CL) to the Developing Toner Collection High Voltage PCB (C) 1. Developing High Voltage PCB (CL) (UN40/J3542) to Relay Connector (2P) 2. Relay Connector (2P) to Developing Toner Collection High Voltage PCB (C) (UN54) - Developing High Voltage PCB (CL) (UN40) - Primary Charging High Voltage PCB (CL) (UN38) [Remedy] Check/replace the related harness/cable, connector and parts.

064-1403-05	Developing DC bias (Bk) output error
Detection Description	It was detected that the output value of the developing DC bias (Bk) was out of the specified range.
Remedy	[Related parts] R1.00 - Harnesses from the Developing High Voltage PCB (Bk) to the Developing Toner Collection High Voltage PCB (Bk) 1. Developing High Voltage PCB (Bk) (UN39/J3742) to Relay Connector (2P) 2. Relay Connector (2P) to Developing Toner Collection High Voltage PCB (Bk) (UN51) - Harness between the Developing High Voltage PCB (Bk) (UN39/J3040) and the Developing High Voltage PCB (CL) - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3050) and the Pre-primary Transfer Charging High Voltage PCB (Bk) (UN50/J3544) - Harness between the Primary Charging High Voltage PCB (CL) (UN38/J3050) and the Primary Charging High Voltage PCB (Bk) (UN37/J3010) - Developing High Voltage PCB (Bk) (UN39) - Developing High Voltage PCB (CL) (UN40) - Primary Charging High Voltage PCB (CL) (UN38) [Remedy] Check/replace the related harness/cable, connector and parts.

064-2001-05	Primary charging DC bias output error
Detection Description	The charging DC bias was not output from the Primary Charging High Voltage PCB (CL).
Remedy	[Remedy] Replace the Primary Charging High Voltage PCB (CL) (UN38).

064-2003-05	Developing DC bias output error
Detection Description	The developing DC bias was not output from the Primary Charging High Voltage PCB (CL).
Remedy	[Remedy] Replace the Primary Charging High Voltage PCB (CL) (UN38).

066-0001-05	Pre-transfer Charging Wire Shutter HP open error
Detection Description	The Pre-transfer Charging Wire HP Sensor in the Pre-transfer Charging Assembly detected the open status although the Pre-transfer Charging Wire Shutter was moved to the close position.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Pre-transfer Charging Wire Cleaning Motor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Pre-transfer Charging Wire Cleaning Motor (M2/J7148) - Harnesses from the Registration Patch Driver PCB to the Pre-transfer Charging Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Pre-transfer Charging Wire HP Sensor (PS93/J10023) - Pre-transfer Charging Wire Cleaning Motor (M2) - Pre-transfer Charging Wire HP Sensor (PS93) - Pre-transfer Charging Assembly - Registration Patch Driver PCB (UN8) [Remedy] Check/replace the related harness/cable, connector and parts.

066-0002-05	Pre-transfer Charging Wire Shutter HP close error
Detection Description	The Pre-transfer Charging Wire HP Sensor in the Pre-transfer Charging Assembly detected the close status although the Pre-transfer Charging Wire Shutter was moved to the open position.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Pre-transfer Charging Wire Cleaning Motor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Pre-transfer Charging Wire Cleaning Motor (M2/J7148) - Harnesses from the Registration Patch Driver PCB to the Pre-transfer Charging Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Pre-transfer Charging Wire HP Sensor (PS93/J10023) - Pre-transfer Charging Wire Cleaning Motor (M2) - Pre-transfer Charging Wire HP Sensor (PS93) - Pre-transfer Charging Assembly - Registration Patch Driver PCB (UN8) [Remedy] Check/replace the related harness/cable, connector and parts.

066-0011-05	Pre-transfer Charging Wire Shutter HP open error
Detection Description	When cleaning, the Pre-transfer Charging Wire HP Sensor in the Pre-transfer Charging Assembly did not detect the closed status although a specified period of time has passed since the Pre-transfer Charging Wire Shutter started its operation.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Pre-transfer Charging Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Pre-transfer Charging Wire HP Sensor (PS93/J10023) - Pre-transfer Charging Wire HP Sensor (PS93) - Pre-transfer Charging Assembly - Registration Patch Driver PCB (UN8) [Remedy] Check/replace the related harness/cable, connector and parts.

066-0012-05	Pre-transfer Charging Wire Shutter HP close error
Detection Description	When cleaning, the Pre-transfer Charging Wire HP Sensor in the Pre-transfer Charging Assembly did not detect the open status although a specified period of time has passed since the Pre-transfer Charging Wire Shutter started its operation.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Pre-transfer Charging Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Pre-transfer Charging Wire HP Sensor (PS93/J10023) - Pre-transfer Charging Wire HP Sensor (PS93) - Pre-transfer Charging Assembly - Registration Patch Driver PCB (UN8) [Remedy] Check/replace the related harness/cable, connector and parts.

066-0023-05	Pre-transfer Charging Wire Shutter error
Detection Description	The Pre-transfer Charging Wire HP Sensor in the Pre-transfer Charging Assembly detected the OFF status while the Bk Drum was rotated.
Remedy	[Related parts] R1.00 - Harnesses from the Registration Patch Driver PCB to the Pre-transfer Charging Wire Cleaning Motor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Pre-transfer Charging Wire Cleaning Motor (M2/J7148) - Harnesses from the Registration Patch Driver PCB to the Pre-transfer Charging Wire HP Sensor 1. Registration Patch Driver PCB (UN8/J2401) to Relay Connector (27P) 2. Relay Connector (27P) to Relay Connector (7P) 3. Relay Connector (7P) to Pre-transfer Charging Wire HP Sensor (PS93/J10023) - Pre-transfer Charging Wire Cleaning Motor (M2) - Pre-transfer Charging Wire HP Sensor (PS93) - Pre-transfer Charging Assembly - Registration Patch Driver PCB (UN8) [Remedy] Check/replace the related harness/cable, connector and parts.

069-0001-05	Transfer cleaning bias output error
Detection Description	When creating the ITB edge profile (COPIER> FUNCTION> INSTALL> INIT-ITB), the output value of the transfer cleaning bias became out of the specified range.
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the ITB Relay PCB 1. DC Controller PCB (UN2/J1240) to Relay Connector (19P) 2. Relay Connector (19P) to Drawer (J8050) 3. Drawer (J8050) to ITB Relay PCB (UN28/J2700) - Contact points of the Transfer Cleaning Unit (Unit of replacement: CONTACT BLOCK UNIT) - High voltage contact points in the ITB Unit - Terminals (MT85 and MT89) to Terminals (MT87 and MT91) - Terminals (MT87 and MT91) to Terminals (MT88 and MT92) - Terminal (MT95) to Terminal (MT96) - Terminal (MT97) to Terminal (MT98) - ITB Relay PCB (UN28) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the contact point is soiled with toner, clean it with a cloth tightly wrung out of water. 2. Check/replace the related harness/cable, connector and parts.

073-0001-05	Interlock error
Detection Description	The Interlock (24 V) was not detected although all the doors (Front Door, Buffer Door, Multi Door) of the host machine were closed.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Front Door Switch 1 and 2 1. Relay PCB (UN7/J1850) to Relay Connector (3P) 2. Relay Connector (3P) to Relay Connector (3P) 3. Relay Connector (3P) to Front Door Switch 1 and 2 (SW1 and SW2) - Harnesses from the Relay PCB (UN7/J1850) to the Multi-purpose Tray Unit Switch 1. Relay PCB (UN7/J1850) to Relay Connector (2P) 2. Relay Connector (2P) to Relay Connector (2P) 3. Relay Connector (2P) to Multi-purpose Tray Unit Switch (SW3) - Harnesses from the Relay PCB to Delivery Door Open/Close Switch 1. Relay PCB (UN7/J1821) to Relay Connector (6P) 2. Relay Connector (6P) to Relay Connector (2P) 3. Relay Connector (2P) to Relay Connector (2P) 4. Relay Connector (2P) to Delivery Door Open/Close Switch (SW4) - Front Door Switch 1 (SW1) - Front Door Switch 2 (SW2) - Multi-purpose Tray Unit Switch (SW3) - Delivery Door Open/Close Switch (SW4) - Relay PCB (UN7) [Remedy] Check/replace the related harness/cable, connector and parts. If the Multi-purpose Tray Pickup Unit is not installed, attach the Short Connector to the Relay Connector (J80560) instead of the Multi-purpose Tray Unit Switch.

074-0001-05	Primary Transfer Roller Detachment HP Sensor timeout error
Detection Description	The Primary Transfer Roller Detachment HP Sensor in the ITB Unit did not detect home position within the specified period of time.
Remedy	[Related parts] R1.00 - Harness between the ITB Relay PCB (UN28/J2701) and the Primary Transfer Roller Detachment HP Sensor (PS4/J7113) - Harnesses from the ITB Relay PCB to the Primary Transfer Roller Detachment Motor 1. ITB Relay PCB (UN28/J2701) to Relay Connector (4P) 2. Relay Connector (4P) to Primary Transfer Roller Detachment Motor (M5/J7114) - Harnesses from the DC Controller PCB to the ITB Relay PCB 1. DC Controller PCB (UN2/J1240) to Relay Connector (19P) 2. Relay Connector (19P) to Drawer (J8050) 3. Drawer (J8050) to ITB Relay PCB (UN28/J2700) - Link part of the Primary Transfer Roller - Primary Transfer Roller Detachment HP Sensor (PS4) - ITB Relay PCB (UN28) - Engagement/Disengagement Drive Unit - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Visually check the link part of the Primary Transfer Roller (Pressure Release Lever/Link Lever/Cam) for any damage/wear/soiling. If it is soiled, wipe it with dry lint-free paper. 2. Rotate the gear of the Engagement/Disengagement Unit by hand, and visually check that there is no bent, missing teeth or abnormal abrasion (edge of the gear is no longer tooth-shaped). If there is any problem, replace the Engagement/Disengagement Drive Unit. 3. Check/replace the related parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

074-0002-05	ITB Unit pressure error
Detection Description	When applying pressure on the ITB Unit (at power-on/recovery from sleep/opening and closing of the door), pressure failure was detected.
Remedy	[Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check that the ITB Pressure Release Lever is in the engaged state. 2. When pulling out the ITB Unit, check that the unit is on the rails and the edges of the 2 ITB Pressure Arms at the front side of the unit are fitted in the grooves of the ITB Frame. [CAUTION] If the ITB Pressure Arm is soiled with toner, clean it with a cloth tightly wrung out of water. 3. Check that the shafts of the Primary Transfer Roller are fitted in the Shaft Support.

075-0000-05	ITB displacement control error
Detection Description	The Steering Drive HP Sensor in the ITB Unit did not detect home position, or there was no change after the home position was detected.
Remedy	[Related parts] R1.00 - Harnesses from the ITB Relay PCB to the Steering Drive HP Sensor 1. ITB Relay PCB (UN28/J2701) to Relay Connector (3P) 2. Relay Connector (3P) to Steering Drive HP Sensor (PS3/J7416) - Harnesses from the ITB Relay PCB to the Steering Drive Motor 1. ITB Relay PCB (UN28/J2701) to Relay Connector (4P) 2. Relay Connector (4P) to Steering Drive Motor (M4/J7414) - Steering Drive HP Sensor (PS3) - Steering Drive Motor (M4) - ITB Relay PCB (UN28) [Remedy] Check/replace the related harness/cable, connector and parts.

075-0001-05	ITB displacement control error
Detection Description	ITB Displacement Sensor 1 in the ITB Unit continuously outputs the lower limit value.
Remedy	[Related parts] R1.00 - Harness between the ITB Relay PCB (UN28/J2705) and the ITB Displacement Sensor 1 (PS2/J7415) - ITB Relay PCB (UN28) - ITB Displacement Sensor 1 (PS2) - Sensor Flag of the ITB Displacement Sensor 1 - Mechanical parts for steering control - ITB [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the Sensor Flag of ITB Displacement Sensor 1. 1-1. Check that the Sensor Flag has not gotten under the ITB. 1-2. Check that the Sensor Flag is installed properly. 1-3. Replace the Sensor Flag if it is damaged. 2. Rotate the drive section of steering control by hand, and visually check that it rotates smoothly. 3. Check the harness between the ITB Relay PCB and ITB Displacement Sensor 1. 4. Clean the ITB Displacement Sensor 1 with a blower or a cloth tightly wrung out of water. [CAUTION] Do not use a dry cloth for cleaning. Otherwise, it may generate static electricity. 5. Replace the ITB Displacement Sensor 1. 6. Replace the ITB Relay PCB. 7. Replace the ITB if it is damaged. [Reference] After replacement of the ITB, perform the following. - Execute "COPIER> FUNCTION> INSTALL> INIT-ITB". - Execute "Settings/Registration> Adjustment/Maintenance> Adjust Image Quality> Auto Correct Color Mismatch".

075-0002-05	ITB displacement control error
Detection Description	ITB Displacement Sensor 1 in the ITB Unit continuously outputs the upper limit value.
Remedy	[Related parts] R1.00 - Harness between the ITB Relay PCB (UN28/J2705) and the ITB Displacement Sensor 1 (PS2/J7415) - ITB Relay PCB (UN28) - ITB Displacement Sensor 1 (PS2) - Sensor Flag of the ITB Displacement Sensor 1 - Mechanical parts for steering control - ITB [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the Sensor Flag of ITB Displacement Sensor 1. 1-1. Check that the Sensor Flag has not gotten under the ITB. 1-2. Check that the Sensor Flag is installed properly. 1-3. Replace the Sensor Flag if it is damaged. 2. Rotate the drive section of steering control by hand, and visually check that it rotates smoothly. 3. Check the harness between the ITB Relay PCB and ITB Displacement Sensor 1. 4. Clean the ITB Displacement Sensor 1 with a blower or a cloth tightly wrung out of water. [CAUTION] Do not use a dry cloth for cleaning. Otherwise, it may generate static electricity. 5. Replace the ITB Displacement Sensor 1. 6. Replace the ITB Relay PCB. 7. Replace the ITB if it is damaged. [Reference] After replacement of the ITB, perform the following. - Execute "COPIER> FUNCTION> INSTALL> INIT-ITB". - Execute "Settings/Registration> Adjustment/Maintenance> Adjust Image Quality> Auto Correct Color Mismatch".

077-0001-05	Secondary Transfer Roller Detachment HP Sensor timeout error
Detection Description	The Secondary Transfer Roller Detachment HP Sensor in the Secondary Transfer Unit did not detect home position within the specified period of time.
Remedy	[Related parts] R1.00 - Harnesses from the Fixing Feed Driver PCB to the Secondary Transfer Roller Detachment HP Sensor 1. Fixing Feed Driver PCB (UN5/J2012) to Relay Connector (15P) 2. Relay Connector (15P) to Secondary Transfer Roller Detachment HP Sensor (PS22/J8959) - Harness between the Pickup Feed Driver PCB (UN4/J1407) and the Secondary Transfer Roller Detachment Motor (M31/J7003) - Mechanical parts for the Secondary Transfer Roller disengagement control (Cam, Arm, Secondary Transfer Outer Roller Holder) - Secondary Transfer Disengagement Drive Assembly - Secondary Transfer Roller Detachment HP Sensor (PS22) - Fixing Feed Driver PCB (UN5) - Secondary Transfer Roller Detachment Motor (M31) - Pickup Feed Driver PCB (UN4) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. Check the harness between the Fixing Feed Driver PCB and the Secondary Transfer Roller Detachment HP Sensor. 2. Check the harness between the Pickup Feed Driver PCB and the Secondary Transfer Roller Detachment Motor. 3. Check the installation of the mechanical parts for the Secondary Transfer Roller disengagement control (Cam, Arm, and Secondary Transfer Outer Roller Holder). 4. Check the gears in the Secondary Transfer Disengagement Drive Assembly. 5. Replace the Secondary Transfer Roller Detachment HP Sensor. 6. Replace the Pickup Feed Driver PCB. 7. Replace the Fixing Feed Driver PCB. 8. Replace the Secondary Transfer Roller Detachment Motor. 9. Replace the Secondary Transfer Disengagement Drive Assembly.

078-0001-05	Transfer Cleaning Motor error
Detection Description	The lock signal of the Transfer Cleaning Motor in the ITB Unit could not be detected within the specified period of time.
Remedy	[Related parts] R1.00 - Harness between the ITB Relay PCB (UN28/J2707) and the Transfer Cleaning Motor (M68/J2655) - Harnesses from the ITB Relay PCB to the DC Controller DIFF PCB 1. ITB Relay PCB (UN28/J2706) to Drawer (J8050) 2. Drawer (J8050) to Relay Connector (21P) 3. Relay Connector (21P) to DC Controller DIFF PCB (UN9/J2646) - Transfer Cleaning Motor (M68) - DC Controller DIFF PCB (UN9) - ITB Relay PCB (UN28) [Remedy] Check/replace the related harness/cable, connector and parts.

078-0002-05	Transfer Cleaning Motor error
Detection Description	The Transfer Cleaning Motor in the ITB Unit was unlocked although it had been locked once.
Remedy	[Related parts] R1.00 - Harness between the ITB Relay PCB (UN28/J2707) and the Transfer Cleaning Motor (M68/J2655) - Harnesses from the ITB Relay PCB to the DC Controller DIFF PCB 1. ITB Relay PCB (UN28/J2706) to Drawer (J8050) 2. Drawer (J8050) to Relay Connector (21P) 3. Relay Connector (21P) to DC Controller DIFF PCB (UN9/J2646) - Transfer Cleaning Motor (M68) - DC Controller DIFF PCB (UN9) - ITB Relay PCB (UN28) [Remedy] Check/replace the related harness/cable, connector and parts.

100-0101-05	Laser Scanner Motor BD (Y) error
Detection Description	The PLOCK signal (Y) could not be detected while the Laser Scanner Motor BD was rotated.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harnesses from the Laser Interface PCB to APC PCB (Y) 1. Laser Interface PCB (UN100/J2 and J3) to Laser Driver PCB (Y) (UN101/J1 and J2) 2. Laser Driver PCB (Y) (UN101/J3) to APC PCB (Y) (J8081Y) - Harnesses from the Laser Interface PCB to the BD PCB (Y) 1. Laser Interface PCB (UN100/J11) to Relay Connector (9P) 2. Relay Connector (9P) to BD PCB (Y) (UN102/J7530Y) - Laser Scanner Unit (Y) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Y), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

100-0201-05	Laser Scanner Motor BD (M) error
Detection Description	The PLOCK signal (M) could not be detected while the Laser Scanner Motor BD was rotated.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harnesses from the Laser Interface PCB to the APC PCB (M) 1. Laser Interface PCB (UN100/J4 and J5) to Laser Driver PCB (M) (UN103/J1 and J2) 2. Laser Driver PCB (M) (UN103/J3) to APC PCB (M) (J8081M) - Harnesses from the Laser Interface PCB to the BD PCB (M) 1. Laser Interface PCB (UN100/J11) to Relay Connector (9P) 2. Relay Connector (9P) to BD PCB (M) (UN104/J7530M) - Laser Scanner Unit (M) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (M), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

100-0301-05	Laser Scanner Motor BD (C) error
Detection Description	The PLOCK signal (C) could not be detected while the Laser Scanner Motor BD was rotated.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harnesses from the Laser Interface PCB to the APC PCB (C) 1. Laser Interface PCB (UN100/J6 and J7) to Laser Driver PCB (C) (UN105/J1 and J2) 2. Laser Driver PCB (C) (UN105/J3) to APC PCB (C) (J8081C) - Harnesses from the Laser Interface PCB to the BD PCB (C) 1. Laser Interface PCB (UN100/J12) to Relay Connector (9P) 2. Relay Connector (9P) to BD PCB (C) (UN106/J7530C) - Laser Scanner Unit (C) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (C), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

100-0401-05	Laser Scanner Motor BD (Bk) error
Detection Description	The PLOCK signal (Bk) could not be detected while the Laser Scanner Motor BD was rotated.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harnesses from the Laser Interface PCB to the APC PCB (Bk) 1. Laser Interface PCB (UN100/J8 and J9) to Laser Driver PCB (Bk) (UN107/J1 and J2) 2. Laser Driver PCB (Bk) (UN107/J3) to APC PCB (Bk) (J8081K) - Harnesses from the Laser Interface PCB to the BD PCB (Bk) 1. Laser Interface PCB (UN100/J12) to Relay Connector (9P) 2. Relay Connector (9P) to BD PCB (Bk) (UN108/J7530K) - Laser Scanner Unit (Bk) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Bk), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

101-0001-05	Abnormal laser light emission (Y)
Detection Description	- An error was detected when operating voltage of laser (Y) was checked at power-on. - Combination of versions of the DC Controller PCB and Laser Interface PCB was not correct.
Remedy	[Related parts] R1.00 - Harnesses from the Laser Interface PCB to the APC PCB (Y) 1. Laser Interface PCB (UN100/J2 and J3) to Laser Driver PCB (Y) (UN101/J1 and J2) 2. Laser Driver PCB (Y) (UN101/J3) to APC PCB (Y) (J8081Y) - Laser Scanner Unit (Y) [Remedy] - Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Y), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode. - Enter safe mode using (2+8) startup, and execute Upgrade (Overwrite all) using SST or a USB memory to reinstall the latest system software.

101-0002-05	Abnormal laser light emission (M)
Detection Description	- An error was detected when operating voltage of laser (M) was checked at power-on. - Combination of versions of the DC Controller PCB and Laser Interface PCB was not correct.
Remedy	[Related parts] R1.00 - Harnesses from the Laser Interface PCB to the APC PCB (M) 1. Laser Interface PCB (UN100/J4 and J5) to Laser Driver PCB (M) (UN103/J1 and J2) 2. Laser Driver PCB (M) (UN103/J3) to APC PCB (M) (J8081M) - Laser Scanner Unit (M) [Remedy] - Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (M), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode. - Enter safe mode using (2+8) startup, and execute Upgrade (Overwrite all) using SST or a USB memory to reinstall the latest system software.

101-0003-05	Abnormal laser light emission (C)
Detection Description	- An error was detected when operating voltage of laser (C) was checked at power-on. - Combination of versions of the DC Controller PCB and Laser Interface PCB was not correct.
Remedy	[Related parts] R1.00 - Harnesses from the Laser Interface PCB to APC PCB (C) 1. Laser Interface PCB (UN100/J6 and J7) to Laser Driver PCB (C) (UN105/J1 and J2) 2. Laser Driver PCB (C) (UN105/J3) to APC PCB (C) (J8081C) - Laser Scanner Unit (C) [Remedy] - Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (C), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode. - Enter safe mode using (2+8) startup, and execute Upgrade (Overwrite all) using SST or a USB memory to reinstall the latest system software.

101-0004-05	Abnormal laser light emission (Bk)
Detection Description	- An error was detected when operating voltage of laser (Bk) was checked at power-on. - Combination of versions of the DC Controller PCB and Laser Interface PCB was not correct.
Remedy	[Related parts] R1.00 - Harnesses from the Laser Interface PCB to the APC PCB (Bk) 1. Laser Interface PCB (UN100/J8 and J9) to Laser Driver PCB (Bk) (UN107/J1 and J2) 2. Laser Driver PCB (Bk) (UN107/J3) to APC PCB (Bk) (J8081K) - Laser Scanner Unit (Bk) [Remedy] - Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Bk), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode. - Enter safe mode using (2+8) startup, and execute Upgrade (Overwrite all) using SST or a USB memory to reinstall the latest system software.

101-0005-05	System software version mismatch
Detection Description	An error was detected because combination of versions of the DC Controller PCB and Laser Interface PCB was not correct.
Remedy	[Remedy] Enter safe mode using (2+8) startup, and execute Upgrade (Overwrite all) using SST or a USB memory to reinstall the latest system software.

102-0101-05	EEPROM error
Detection Description	An error was detected in the data written in EEPROM of Laser Scanner Unit (Y).
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harness between the Laser Interface PCB (UN100/J2 and J3) to Laser Driver PCB (Y) (UN101/J1 and J2) - Laser Scanner Unit (Y) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Y), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

102-0201-05	EEPROM error
Detection Description	An error was detected in the data written in EEPROM of Laser Scanner Unit (M).
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harness between the Laser Interface PCB (UN100/J4 and J5) and the Laser Driver PCB (M) (UN103/J1 and J2) - Laser Scanner Unit (M) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (M), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

102-0301-05	EEPROM error
Detection Description	An error was detected in the data written in EEPROM of Laser Scanner Unit (C).
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harness between the Laser Interface PCB (UN100/J6 and J7) and the Laser Driver PCB (C) (UN105/J1 and J2) - Laser Scanner Unit (C) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (C), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

102-0401-05	EEPROM error
Detection Description	An error was detected in the data written in EEPROM of Laser Scanner Unit (Bk).
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harness between the Laser Interface PCB (UN100/J8 and J9) and the Laser Driver PCB (Bk) (UN107/J1 and J2) - Laser Scanner Unit (Bk) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Bk), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

104-0101-05	Abnormal laser light emission (Y)
Detection Description	An error was detected when operating voltage of laser (Y) was checked at power-on.
Remedy	[Related parts] R1.00 - Harnesses from the Laser Interface PCB to the APC PCB (Y) 1. Laser Interface PCB (UN100/J2 and J3) to Laser Driver PCB (Y) (UN101/J1 and J2) 2. Laser Driver PCB (Y) (UN101/J3) to APC PCB (Y) (J8081Y) - Laser Scanner Unit (Y) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Y), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

104-0201-05	Abnormal laser light emission (M)
Detection Description	An error was detected when operating voltage of laser (M) was checked at power-on.
Remedy	[Related parts] R1.00 - Harnesses from the Laser Interface PCB to the APC PCB (M) 1. Laser Interface PCB (UN100/J4 and J5) to Laser Driver PCB (M) (UN103/J1 and J2) 2. Laser Driver PCB (M) (UN103/J3) to APC PCB (M) (J8081M) - Laser Scanner Unit (M) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (M), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

104-0301-05	Abnormal laser light emission (C)
Detection Description	An error was detected when operating voltage of laser (C) was checked at power-on.
Remedy	[Related parts] R1.00 - Harnesses from the Laser Interface PCB to APC PCB (C) 1. Laser Interface PCB (UN100/J6 and J7) to Laser Driver PCB (C) (UN105/J1 and J2) 2. Laser Driver PCB (C) (UN105/J3) to APC PCB (C) (J8081C) - Laser Scanner Unit (C) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (C), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

104-0401-05	Abnormal laser light emission (Bk)
Detection Description	An error was detected when operating voltage of laser (Bk) was checked at power-on.
Remedy	[Related parts] R1.00 - Harnesses from the Laser Interface PCB to the APC PCB (Bk) 1. Laser Interface PCB (UN100/J8 and J9) to Laser Driver PCB (Bk) (UN107/J1 and J2) 2. Laser Driver PCB (Bk) (UN107/J3) to APC PCB (Bk) (J8081K) - Laser Scanner Unit (Bk) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Bk), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

110-0101-05	Laser Scanner Motor (Y) FG error
Detection Description	The VLOCK signal (Y) could not be detected while the Laser Scanner Motor FG was rotated.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harnesses from the Laser Interface PCB to the APC PCB (Y) 1. Laser Interface PCB (UN100/J2 and J3) to Laser Driver PCB (Y) (UN101/J1 and J2) 2. Laser Driver PCB (Y) (UN101/J3) to APC PCB (Y) (J8081Y) - Harnesses from the Laser Interface PCB to the BD PCB (Y) 1. Laser Interface PCB (UN100/J11) to Relay Connector (9P) 2. Relay Connector (9P) to BD PCB (Y) (UN102/J7530Y) - Laser Scanner Unit (Bk) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Y), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

110-0201-05	Laser Scanner Motor (M) FG error
Detection Description	The VLOCK signal (M) could not be detected while the Laser Scanner Motor FG was rotated.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harnesses from the Laser Interface PCB to the APC PCB (M) 1. Laser Interface PCB (UN100/J4 and J5) to Laser Driver PCB (M) (UN103/J1 and J2) 2. Laser Driver PCB (M) (UN103/J3) to APC PCB (M) (J8081M) - Harnesses from the Laser Interface PCB to the BD PCB (M) 1. Laser Interface PCB (UN100/J11) to Relay Connector (9P) 2. Relay Connector (9P) to BD PCB (M) (UN104/J7530M) - Laser Scanner Unit (M) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (M), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

110-0301-05	Laser Scanner Motor (C) FG error
Detection Description	The VLOCK signal (C) could not be detected while the Laser Scanner Motor FG was rotated.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harnesses from the Laser Interface PCB to the APC PCB (C) 1. Laser Interface PCB (UN100/J6 and J7) to Laser Driver PCB (C) (UN105/J1 and J2) 2. Laser Driver PCB (C) (UN105/J3) to APC PCB (C) (J8081C) - Harnesses from the Laser Interface PCB to the BD PCB (C) 1. Laser Interface PCB (UN100/J12) to Relay Connector (9P) 2. Relay Connector (9P) to BD PCB (C) (UN106/J7530C) - Laser Scanner Unit (C) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (C), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

110-0401-05	Laser Scanner Motor (Bk) FG error
Detection Description	The VLOCK signal (Bk) could not be detected while the Laser Scanner Motor FG was rotated.
Remedy	[Related parts] R1.00 - Harnesses from the Relay PCB to the Laser Interface PCB 1. Relay PCB (UN7/J1817) to DC Controller PCB (UN2/J1200) 2. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 3. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Harnesses from the Laser Interface PCB to the APC PCB (Bk) 1. Laser Interface PCB (UN100/J8 and J9) to Laser Driver PCB (Bk) (UN107/J1 and J2) 2. Laser Driver PCB (Bk) (UN107/J3) to APC PCB (Bk) (J8081K) - Harnesses from the Laser Interface PCB to the BD PCB (Bk) 1. Laser Interface PCB (UN100/J12) to Relay Connector (9P) 2. Relay Connector (9P) to BD PCB (Bk) (UN108/J7530K) - Laser Scanner Unit (Bk) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Bk), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

193-0110-05	Image sequence error (Y)
Detection Description	The Main Controller could not receive the request to start writing an image (Y) sent from the DC Controller.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J10) and the Riser PCB (UN83/J3) - Laser Interface PCB (UN100) - Riser PCB (UN83) - Main Controller PCB 2 (UN82) [Remedy] Check/replace the related harness/cable, connector and parts.

193-0210-05	Image sequence error (M)
Detection Description	The Main Controller could not receive the request to start writing an image (M) sent from the DC Controller.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J10) and the Riser PCB (UN83/J3) - Laser Interface PCB (UN100) - Riser PCB (UN83) - Main Controller PCB 2 (UN82) [Remedy] Check/replace the related harness/cable, connector and parts.

193-0310-05	Image sequence error (C)
Detection Description	The Main Controller could not receive the request to start writing an image (C) sent from the DC Controller.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J10) and the Riser PCB (UN83/J3) - Laser Interface PCB (UN100) - Riser PCB (UN83) - Main Controller PCB 2 (UN82) [Remedy] Check/replace the related harness/cable, connector and parts.

193-0410-05	Image sequence error (Bk)
Detection Description	The Main Controller could not receive the request to start writing an image (Bk) sent from the DC Controller.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J10) and the Riser PCB (UN83/J3) - Laser Interface PCB (UN100) - Riser PCB (UN83) - Main Controller PCB 2 (UN82) [Remedy] Check/replace the related harness/cable, connector and parts.

194-1004-05	Color displacement correction control patch reading error
Detection Description	Patches at front and/or center and/or rear could not be read during rough adjustment for color displacement (display of E194-1004 has a priority over that of E194-2004/3004 if they occur at the same time).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2405) and the Registration Patch Sensor (Front) (PS19/J8958) - Registration Patch Sensor (Front) (PS19) - Registration Patch Driver PCB (UN8) - ITB [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Registration Patch Sensor (Front/Center/Rear) is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Registration Patch Sensor (Front). 3. Replace the Registration Patch Sensor Unit. 4. Replace the Registration Patch Driver PCB. 5. Clean/replace the ITB. 5-1. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 5-2. Replace the ITB if it is damaged.

194-1014-05	Color displacement correction control patch reading error
Detection Description	Patches at front and/or center and/or rear could not be read during fine adjustment for color displacement (display of E194-1014 has a priority over that of E194-2014/3014 if they occur at the same time).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2405) and the Registration Patch Sensor (Front) (PS19/J8958) - Registration Patch Sensor (Front) (PS19) - Registration Patch Driver PCB (UN8) - ITB [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Registration Patch Sensor (Front/Center/Rear) is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Registration Patch Sensor (Front). 3. Replace the Registration Patch Sensor Unit. 4. Replace the Registration Patch Driver PCB. 5. Clean/replace the ITB. 5-1. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 5-2. Replace the ITB if it is damaged.

194-2004-05	Color displacement correction control patch reading error
Detection Description	Patches at center and/or rear could not be read during rough adjustment for color displacement (display of E194-2004 has a priority over that of E194-3004 if they occur at the same time).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2405) and the Registration Patch Sensor (Center) (PS127/J8957) - Registration Patch Sensor (Center) (PS127) - Registration Patch Driver PCB (UN8) - ITB [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Registration Patch Sensor (Front/Center/Rear) is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Registration Patch Sensor (Center). 3. Replace the Registration Patch Sensor Unit. 4. Replace the Registration Patch Driver PCB. 5. Clean/replace the ITB. 5-1. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 5-2. Replace the ITB if it is damaged.

194-2014-05	Color displacement correction control patch reading error
Detection Description	Patches at center and/or rear could not be read during fine adjustment for color displacement (display of E194-2014 has a priority over that of E194-3014 if they occur at the same time).
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2405) and the Registration Patch Sensor (Center) (PS127/J8957) - Registration Patch Sensor (Center) (PS127) - Registration Patch Driver PCB (UN8) - ITB [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Registration Patch Sensor (Front/Center/Rear) is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Registration Patch Sensor (Center). 3. Replace the Registration Patch Sensor Unit. 4. Replace the Registration Patch Driver PCB. 5. Clean/replace the ITB. 5-1. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 5-2. Replace the ITB if it is damaged.

194-3004-05	Color displacement correction control patch reading error
Detection Description	Patches at rear could not be read during rough adjustment for color displacement.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2405) and the Registration Patch Sensor (Rear) (PS20/J8956) - Registration Patch Sensor (Rear) (PS20) - Registration Patch Driver PCB (UN8) - ITB [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Registration Patch Sensor (Front/Center/Rear) is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Registration Patch Sensor (Rear). 3. Replace the Registration Patch Sensor Unit. 4. Replace the Registration Patch Driver PCB. 5. Clean/replace the ITB. 5-1. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 5-2. Replace the ITB if it is damaged.

194-3014-05	Color displacement correction control patch reading error
Detection Description	Patches at rear could not be read during fine adjustment for color displacement.
Remedy	[Related parts] R1.00 - Harness between the Registration Patch Driver PCB (UN8/J2405) and the Registration Patch Sensor (Rear) (PS20/J8956) (Unit of replacement: REG. PATCH DETECT ASSEMBLY) - Registration Patch Sensor (Rear) (PS20) (Unit of replacement: REG. PATCH DETECT ASSEMBLY) - Registration Patch Driver PCB (UN8) (Unit of replacement: REG. PATCH DRIVER PCB ASSEMBLY) - ITB [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the sensor surface of the Registration Patch Sensor (Front/Center/Rear) is soiled, clean it with wet and tightly-wrung cloth. 2. Check the harness between the Registration Patch Driver PCB and the Registration Patch Sensor (Rear). 3. Replace the Registration Patch Sensor Unit. 4. Replace the Registration Patch Driver PCB. 5. Clean/replace the ITB. 5-1. Execute the following if the ITB is soiled: COPIER> FUNCTION> CLEANING> TBLT-CLN. 5-2. Replace the ITB if it is damaged.

197-1000-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the Primary Charging High Voltage PCB (CL)
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1227) and the Primary Charging High Voltage PCB (CL) (UN38/J3040) - Primary Charging High Voltage PCB (CL) (UN38) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-1001-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the Developing High Voltage PCB (CL)
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1266) and the Developing High Voltage PCB (CL) (UN40/J3040) - Developing High Voltage PCB (CL) (UN40) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-1002-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the Primary Charging High Voltage PCB (CL)/Developing High Voltage PCB (CL)
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1227) and the Primary Charging High Voltage PCB (CL) (UN38/J3040) - Harness between the DC Controller PCB (UN2/J1266) and the Developing High Voltage PCB (CL) (UN40/J3040) - Primary Charging High Voltage PCB (CL) (UN38) - Developing High Voltage PCB (CL) (UN40) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-2000-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the Fixing Feed Driver PCB
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Fixing Feed Driver PCB 1. DC Controller PCB (UN2/J1222) to Fixing Drawer (J8023DB) 2. Fixing Drawer (J8023LB) to Relay Connector (17P) 3. Relay Connector (17P) to Fixing Feed Driver PCB (UN5/J2001) - Fixing Feed Driver PCB (UN5) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-2001-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the Pickup Feed Driver PCB
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1223) and the Pickup Feed Driver PCB (UN4/J1400) - Pickup Feed Driver PCB (UN4) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-2002-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the Drum ITB Driver PCB
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1261) and the Drum ITB Driver PCB (UN6/J1901) - Drum ITB Driver PCB (UN6) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-2003-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the Registration Patch Driver PCB
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1225) and the Registration Patch Driver PCB (UN8/J2402) - Registration Patch Driver PCB (UN8) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-2004-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the CIS Driver PCB
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Fixing Feed Driver PCB 1. DC Controller PCB (UN2/J1222) to Fixing Drawer (J8023DB) 2. Fixing Drawer (J8023LB) to Relay Connector (17P) 3. Relay Connector (17P) to Fixing Feed Driver PCB (UN5/J2001) - Harness between the Fixing Feed Driver PCB (UN5/J2011) and the CIS Driver PCB (UN111/J2900) - Fixing Feed Driver PCB (UN5) - CIS Driver PCB (UN111) - DC Controller PCB (UN2) [Remedy] Perform the following in the order while checking whether the error is cleared. 1. If the connector of the drawer is soiled, clean it with a blower. 2. Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-2005-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the Relay PCB
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1224) and the Relay PCB (UN7/J1805) - Relay PCB (UN7) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-2006-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the DC Controller Interface PCB
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1262) and the DC Controller DIFF PCB (UN9/J1032) - DC Controller DIFF PCB (UN9) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-2007-05	Serial communication error
Detection Description	Communication error between the DC Controller PCB and the Buffer Driver PCB
Remedy	[Related parts] R1.00 - Harnesses from the DC Controller PCB to the Buffer Driver PCB 1. DC Controller PCB (UN2/J1226) to Relay Connector (9P) 2. Relay Connector (9P) to Relay Connector (9P) 3. Relay Connector (9P) to Buffer Driver PCB (UN11/J2102) - Buffer Driver PCB (UN11) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-2008-05	Serial communication error
Detection Description	Communication error in the DC Controller PCB
Remedy	[Remedy] Replace the DC Controller PCB (UN2). (Unit of replacement: DC CONTROLLER I/F PCB ASS'Y) [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-5001-05	Serial communication error
Detection Description	A communication error between the DC Controller PCB and the Laser Interface PCB was detected. (It was detected at the DC Controller PCB side.)
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J16) and the DC Controller PCB (UN2/J1219) - Harnesses from the DC Controller PCB to the Laser Interface PCB 1. DC Controller PCB (UN2/J1201) to Laser Power Supply Relay PCB (UN109/J2) 2. Laser Power Supply Relay PCB (UN109/J1) to Laser Interface PCB (UN100/J15) - Laser Interface PCB (UN100) - Laser Power Supply Relay PCB (UN109) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-5002-05	Serial communication error
Detection Description	A communication error between the DC Controller PCB and the Laser Interface PCB was detected. (It was detected at the Laser Interface PCB side.)
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J16) and the DC Controller PCB (UN2/J1219) - Laser Interface PCB (UN100) - DC Controller PCB (UN2) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

197-5004-05	Serial communication error
Detection Description	A communication error between the Laser Interface PCB and the Riser PCB was detected.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J10) and the Riser PCB (UN83/J3) - Laser Interface PCB (UN100) - Riser PCB (UN83) [Remedy] Check/replace the related harness/cable, connector and parts.

197-5103-05	Serial communication error
Detection Description	A communication error between the Laser Interface PCB and the Laser Driver PCB (Y) was detected.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J2, J3) and the Laser Driver PCB (Y) (UN101/J1, J2) - Laser Interface PCB (UN100) - Laser Scanner Unit (Y) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Y), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

197-5105-05	Serial communication error
Detection Description	An error in ASIC (Y) on the Laser Interface PCB was detected at startup.
Remedy	[Remedy] Replace the Laser Interface PCB (UN100). (Unit of replacement: LASER INTERFACE PCB ASSEMBLY)

197-5106-05	Serial communication error
Detection Description	At startup, communication with the Serial Flash (Y) on the Laser Interface PCB could not be established, or an error in the Serial Flash (Y) was detected.
Remedy	[Remedy] Replace the Laser Interface PCB (UN100). (Unit of replacement: LASER INTERFACE PCB ASSEMBLY)

197-5107-05	Serial communication error
Detection Description	At startup, communication between the Laser Interface PCB and the Laser Driver PCB (Y) could not be established, or an error in the Laser Driver PCB (Y) was detected.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J2, J3) and the Laser Driver PCB (Y) (UN101/J1, J2) - Laser Interface PCB (UN100) - Laser Scanner Unit (Y) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Y), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

197-5203-05	Serial communication error
Detection Description	A communication error between the Laser Interface PCB and the Laser Driver PCB (M) was detected.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J4, J5) and the Laser Driver PCB (M) (UN103/J1, J2) - Laser Interface PCB (UN100) - Laser Scanner Unit (M) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (M), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

197-5205-05	Serial communication error
Detection Description	An error in ASIC (M) on the Laser Interface PCB was detected at startup.
Remedy	[Remedy] Replace the Laser Interface PCB (UN100). (Unit of replacement: LASER INTERFACE PCB ASSEMBLY)

197-5206-05	Serial communication error
Detection Description	At startup, communication with the Serial Flash (M) on the Laser Interface PCB could not be established, or an error in the Serial Flash (M) was detected.
Remedy	[Remedy] Replace the Laser Interface PCB (UN100). (Unit of replacement: LASER INTERFACE PCB ASSEMBLY)

197-5207-05	Serial communication error
Detection Description	At startup, communication between the Laser Interface PCB and the Laser Driver PCB (M) could not be established, or an error in the Laser Driver PCB (M) was detected.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J4, J5) and the Laser Driver PCB (M) (UN103/J1, J2) - Laser Interface PCB (UN100) - Laser Scanner Unit (M) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (M), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

197-5303-05	Serial communication error
Detection Description	A communication error between the Laser Interface PCB and the Laser Driver PCB (C) was detected.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J6, J7) and the Laser Driver PCB (C) (UN105/J1, J2) - Laser Interface PCB (UN100) - Laser Scanner Unit (C) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (C), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

197-5305-05	Serial communication error
Detection Description	An error in ASIC (C) on the Laser Interface PCB was detected at startup.
Remedy	[Remedy] Replace the Laser Interface PCB (UN100). (Unit of replacement: LASER INTERFACE PCB ASSEMBLY)

197-5306-05	Serial communication error
Detection Description	At startup, communication with the Serial Flash (C) on the Laser Interface PCB could not be established, or an error in the Serial Flash (C) was detected.
Remedy	[Remedy] Replace the Laser Interface PCB (UN100). (Unit of replacement: LASER INTERFACE PCB ASSEMBLY)

197-5307-05	Serial communication error
Detection Description	At startup, communication between the Laser Interface PCB and the Laser Driver PCB (C) could not be established, or an error in the Laser Driver PCB (C) was detected.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J6, J7) and the Laser Driver PCB (C) (UN105/J1, J2) - Laser Interface PCB (UN100) - Laser Scanner Unit (C) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (C), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

197-5403-05	Serial communication error
Detection Description	A communication error between the Laser Interface PCB and the Laser Driver PCB (Bk) was detected.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J8, J9) and the Laser Driver PCB (Bk) (UN107/J1, J2) - Laser Interface PCB (UN100) - Laser Scanner Unit (Bk) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Bk), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

197-5405-05	Serial communication error
Detection Description	An error in ASIC (Bk) on the Laser Interface PCB was detected at startup.
Remedy	[Remedy] Replace the Laser Interface PCB (UN100). (Unit of replacement: LASER INTERFACE PCB ASSEMBLY)

197-5406-05	Serial communication error
Detection Description	At startup, communication with the Serial Flash (Bk) on the Laser Interface PCB could not be established, or an error in the Serial Flash (Bk) was detected.
Remedy	[Remedy] Replace the Laser Interface PCB (UN100). (Unit of replacement: LASER INTERFACE PCB ASSEMBLY)

197-5407-05	Serial communication error
Detection Description	At startup, communication between the Laser Interface PCB and the Laser Driver PCB (Bk) could not be established, or an error in the Laser Driver PCB (Bk) was detected.
Remedy	[Related parts] R1.00 - Harness between the Laser Interface PCB (UN100/J8, J9) and the Laser Driver PCB (Bk) (UN107/J1, J2) - Laser Interface PCB (UN100) - Laser Scanner Unit (Bk) [Remedy] Check/replace the related harness/cable, connector and parts. [CAUTION] When replacing the Laser Scanner Unit (Bk), execute "Adjustment During Laser Scanner Unit Replacement" in situation mode.

198-0001-05	DC Controller PCB output (12 V) error
Detection Description	It was detected that the fuse (12 V) of the DC Controller PCB was blown out.
Remedy	[Related parts] R1.00 - Harness between the DC Controller PCB (UN2/J1223) and the Pickup Feed Driver PCB (UN4/J1400) - Harness between the DC Controller PCB (UN2/J1262) and the DC Controller DIFF PCB (UN9/J1032) - Harness between the DC Controller PCB (UN2/J1225) and the Registration Patch Driver PCB (UN8/J2402) - Harnesses from the DC Controller PCB to the Buffer Driver PCB 1. DC Controller PCB (UN2/J1226) to Relay Connector (9P) 2. Relay Connector (9P) to Relay Connector (9P) 3. Relay Connector (9P) to Buffer Driver PCB (UN11/J2102) [Remedy] Measure the left end of the fuse (FU1) located at the lower side of J1223 on the DC Controller PCB and the plate of the host machine using a tester. a. If there is electrical continuity (less than 10 ohm), check/replace the harness. b. If there is no electrical continuity (10 ohm or higher), replace the DC Controller PCB. [Reference] Before replacing the DC Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> DSRAMRES

202-0001-04	Reader Scanner Unit HP error
Detection Description	The Reader Scanner Unit could not detect the home position when starting scanning operation.
Remedy	[Related parts] R1.00 - Harness between the Scanner Unit HP Sensor (SR2/J5202) and the Reader Controller PCB (PCB1/J102) - Harness between the Scanner Motor (M1/J601) and the Reader Controller PCB (PCB1/J108) - Scanner Unit HP Sensor (SR2) - Scanner Motor (M1) - Reader Controller PCB (PCB1) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the Reader Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> RSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> RSRAMRES

202-0002-04	Reader Scanner Unit HP error
Detection Description	The Reader Scanner Unit could not detect the home position when completing scanning operation.
Remedy	[Related parts] R1.00 - Harness between the Scanner Unit HP Sensor (SR2/J5202) and the Reader Controller PCB (PCB1/J102) - Harness between the Scanner Motor (M1/J601) and the Reader Controller PCB (PCB1/J108) - Scanner Unit HP Sensor (SR2) - Scanner Motor (M1) - Reader Controller PCB (PCB1) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the Reader Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> RSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> RSRAMRES

202-0003-04	Reader Scanner Unit HP error
Detection Description	An error in the Reader Scanner Unit position was detected when reading of a job was started.
Remedy	[Related parts] R1.00 - Harness between the Scanner Unit HP Sensor (SR2/J5202) and the Reader Controller PCB (PCB1/J102) - Harness between the Scanner Motor (M1/J601) and the Reader Controller PCB (PCB1/J108) - Scanner Unit HP Sensor (SR2) - Scanner Motor (M1) - Reader Controller PCB (PCB1) [Remedy] Check/replace the related harness/cable, connector and parts. [Reference] Before replacing the Reader Controller PCB, back up the service mode data (approx. 2 min) and restore the backup data after the replacement so the data may be able to be protected. - Backup: COPIER (LEVEL2)> FUNCTION> SYSTEM> RSRAMBUP - Restoration: COPIER (LEVEL2)> FUNCTION> SYSTEM> RSRAMRES

202-0101-04	DADF Scanner Unit HP error
Detection Description	The DADF Scanner Unit could not detect the home position when starting scanning operation.
Remedy	[Related parts] R1.00 - Harnesses from the Glass HP Sensor to the DADF Driver PCB 1. Glass HP Sensor (SR11/J708) to Relay Connector (6P) 2. Relay Connector (6P) to Relay Connector (9P) 3. Relay Connector (9P) to Relay Connector (9P) 4. Relay Connector (9P) to DADF Driver PCB (PCB1/J411) - Harnesses from the Glass Shift Motor to the DADF Driver PCB 1. Glass Shift Motor (M9/J714) to Relay Connector (9P) 2. Relay Connector (9P) to Relay Connector (9P) 3. Relay Connector (9P) to DADF Driver PCB (PCB1/J409) - Glass HP Sensor (SR11) - Glass Shift Motor (M9) - DADF Driver PCB (PCB1) [Remedy] Check/replace the related harness/cable, connector and parts.

202-0102-04	DADF Scanner Unit HP error
Detection Description	The DADF Scanner Unit could not detect the home position when completing scanning operation.
